A vertically-reciprocating pick-stock, jointed near its lower end, is arranged upon a suitable carriage with a crank-shaft, tappet, and spring for operating it. The carriage slides upon ways parallel to the radial line of the stone, and is fed backward and forward upon such ways by means of the pinions upon the carriage, operating in the racks which are arranged above and below them.

Claim.—1. The sliding platform, carrying the tool-stock, combined with a pinion of the feed-gear working between two rack-bars, in the manner and for the purpose set forth.

2. The pick *d* fastened in a socket, *e*, jointed to the pick stock at *g*, as and for the purpose specified.

141,289.—*Wrench.*—ANDREW PARTRIDGE, Springfield, Mass. Application filed March 19, 1873.

The worm-piece fits into a recess in the movable jaw, and is held in position by a collar inserted between it and the guide-piece. The worm is operated by a rod and thumb-piece.

Claim.—1. In an improved screw-wrench, a threaded worm-piece, *d*, having the ends of its threads d' made sharp and of full size to fill the recesses c' in the bar, as and for the purposes set forth.

2. The worm-piece *d*, operated by a flattened or equivalent-shaped rod, *a*, passing through a correspondingly-shaped hole, a', in combination with a collar, *c*, substantially as described.

3. The combination of the movable jaw C, worm-piece *d*, collar *c*, guide-piece *n*, rod *a*, and bar A, substantially as described.

141,290.—*Car-Coupling.*—ENOS W. PELOUBET, Newark, N. J. Application filed May 23, 1873.

The jaws are held together by a draw-bar, wedge-shaped in front, and held forward by a horizontal pin. When the cars come together, the pin being withdrawn, the lock-head L forces the jaws apart until they strike the buffer-head N, when they are forced together. The pin J is then inserted, and the coupling is securely locked.

Claim.—1. The jaws A A, operated by the curved buffer-head N, or its equivalent, substantially as and for the purpose set forth.

2. The jaws A A, in combination with the curved buffer-head N and the lock-head L, substantially as and for the purpose set forth.

3. The combination of the jaws A A, the straps *b b*, the wedge-piece D, and the draw-bar O, substantially as and for the purpose set forth.

4. The combination of the jaws A A with the draw-bar O, the pin J, and the gravitating lever K, substantially as and for the purpose set forth.

5. The combination of the jaws A A, the buffer-bar B, the draw-bar O, having wedge-piece D, and the pin J, substantially as and for the purpose set forth.

141,291.—*Burglar-Alarm.*—MICHAEL R. PERKINS, Portsmouth, N. H. Application filed April 22, 1873.

A collar upon the door-knob spindle has two inclined arms projecting from opposite sides. When the knob is turned in either direction one of these arms operates a lever connected with the gong-hammer, so as to sound an alarm.

Claim.—The combination and arrangement of the collar on the knob-shank having inclined arms *a c*, the lever *g* having outer end bent, as shown, and the dog *i* pivoted at its other end, and bell-hammer *l*, substantially as shown.

141,292.—*Wagon-Seat Fastener.*—GEORGE RUSTON, Freeport, Ill. Application filed May 16, 1873.

A hinged fastening device secures the seat to the supporting-strip of the body, and is locked in place by means of a sliding bolt.

Claim.—The combination, with the side A, the side support grooved to fit over it, and the guide-strip B, of the latch D, hinge-fastener E, and bolt *d*, as and for the purpose described.

141,293.—*Bridge-Truss.*—FREDERICK SCHWATKA, United States Army, now at North Platte, Neb. Application filed April 26, 1873.

A novel combination of the tension and compression members of a truss, with the object of improved distribution of material to secure strength with lightness. The compression-members are built up of flanged iron placed back to back, and where the greatest strength is required four flanged pieces are combined.

Claim.—1. A truss-bridge having each beam combined with two other beams traversing the width of span, and meeting in sets of three or more, as herein shown and described.

2. The beams C *k*, &c., formed of two beams, made with right-angled flanges along their side edges, and bolted back to back, substantially as shown and described.

3. The beams E *m*, &c., formed of four beams, made with right-angled flanges along their side edges, and bolted to each other in the manner herein shown and described.

141,294.—*Pneumatic-Dispatch Apparatus.*—CHARLES WILLIAM SIEMENS, Westminster, England. Application filed December 26, 1871.

The current of air in the pneumatic tube is generated by a steam-ejector, having an annular orifice for the issue of high-pressure steam located between outer and inner concentric annular orifices, through which air is drawn by the traction of the steam-jet. A rocking frame is placed in the circuit for the reception of the carrier. This frame consists of two sections of tube of the same diameter as the dispatch-tube, having planed-end surfaces formed to fit accurately the opening in the dispatch-tube without leakage, the whole arranged so that the sectional tubes can be alternately brought into position. One of the tubes is continuous with the main pipe when in position. The other, or receiver, is closed at the farther end, with the exception of perforations for the gradual escape of the air compressed by the arrival of the carrier, by which means an air-cushion is formed. A by-way is arranged for the passage of the air-current when the receiver is in place. A valve operated by the rocking frame automatically opens and closes the by-way at the proper times.

Claim.—1. A pneumatic-dispatch apparatus having, in combination, an open circuit-tube for the transmission of the carriers, one or more rocking frames for receiving and sending, and the propelling apparatus described, with concentric steam and air jets O^1 P^1 Q^1 opening into the converging and diverging passages I^2 I, substantially as described.

2. In receiving and sending apparatus for pneumatic tubes, the movable sections A^2 and F, sliding in a rocking frame between face-plates B B, and arranged to be brought alternately in line with the pneumatic tubes A^1 A^3, substantially as and for the purposes set forth.

141,295.—*Chair-Seat.*—JAMES P. SINCLAIR, Elbridge, N. Y. Application filed January 25, 1873.

The seat is composed of strips of wood having one or more strips of metal passing transversely through them, said metallic strips being secured in the opposite bars of the chair-seat frame. The side bars of the seat-frame are grooved to receive the ends of the wooden strips.

Claim.—The combination of the strips A, the bars of the frame B C, grooved upon their inner edges, and the metallic strips D, one or more passing transversely through the strips A and secured to the bars of the frame B C, with each other, substantially as herein shown and described.

141,296.—*Shaft-Coupling.*—JOSEPH M. STONE, North Andover, Mass. Application filed July 22, 1872.

The coupling is made of two halves which are recessed and held together by bolts strengthened by means of iron bands driven upon said coupling.

Claim.—The combination, with the two parts of the sleeve, of the recesses D and the band F, substantially as described.

141,297.—*Hoisting and Conveying Apparatus.*—CHARLES B. STOUGH, Monticello, Ill. Application filed June 7, 1873.

The hoisting apparatus has a crank-frame and a roller-frame, over which the chain is stretched by means of which the articles or material is conveyed. The chain passes over the rollers, which have separate shafts placed at some distance from each other to allow the passage of the hooks between them.

Claim.—1. The hoisting and conveying apparatus, consisting of frame A, roller-frames B B^1 B^2, and crank-frame D, in connection with chain C, guides E, table F, boxes G, platform H, and inclined plane L, substantially as and for the purpose described.

2. The roller-frame B, consisting of recessed blocks *a*, pieces *f f'*, connecting-piece *g*, and bolts *g'*, as described.

3. The roller-block *a*, with journals *b*, carrying-shafts *d* having rollers *e*, with projecting parts e', arranged substantially as set forth.

4. The table F, having recess *h* for passage of hook M, as set forth.

5. The crank-frame D, provided with lateral piece a', with rollers *e*, recessed lateral piece *i*, handles *n*, and fulcrum O, and carrying-shafts *g g'*, with cranks I, cog-wheels *q q'*, spur-wheel *r*, ratchet-wheel *s*, and pawl s', substantially as described.

6. The crank-frame D, having lateral piece a', with rollers *e*, as described.

7. The crank-frame D, having lateral piece *i*, with vertical pieces i^1, recessed for support i^2 of guides E, as specified.

8. The recessed guides E, having side supports i^2, arranged as described.

9. The guides E, having staple *u* and hook u' for stretching chain C, as set forth.

10. The upper roller-frame B^1, having rollers *e* and vertical pieces e^1, substantially as set forth.

11. The chain C, constructed of open links *y* and solid links y', and connected as described.

12. The link y' having lugs *z*, rollers z', and hook M, forming the hook-carriage, substantially as set forth.

13. In combination with the lower roller-frame B^2, the inclined plane L and board *w*, for the purpose described.

141,298.—*Harvester-Cutter.*—FREDERICK R. SUTTON and WILLIAM O. SUTTON, Wellington, Ill. Application filed May 24, 1873.

The rear ends of detachable ledger-plates are held in position by means of side lugs clasping the guard-fingers, and an independent pressure-bar screwed to the front edge of the finger-bar. Notches in the front ends of the plates fit corresponding projections in the fingers.

Claim.—The ledger-plates, detachably secured to the fingers by the lips E and bar F, the bar being secured to the front edge of the finger-bar by screws, and the plates being secured at the front ends, substantially as specified.

141,299.—*Screw-Cutting Machine.*—CALEB C. WALWORTH, Boston, Mass. Application filed February 27, 1873.

The feed-screw attached to the spindle works in a sliding nut, held in place, while the tool is operating, by a weighted pawl *g*, catching on a shoulder on the nut. The lever *l* is connected with the nut by a pin passing through a slot in its upper end, and carries a slide, *k*, that is thrown forward a distance equal to the length of the slot in the lever to release the pawl *g* before the nut is moved back, carrying with it the spindle.

Claim.—In combination with feed-screw and its tool-carrying spindle, the nut *f*, pawl *g*, lever *l*, and slide *k*, substantially as described.

141,300.—*File-Cutting Machine.*—ALFRED WEED, Boston, Mass. Application filed March 8, 1873.

The file-blank and its bed are fed forward by a feed-foot, P, acting against the spur last formed. The foot is pivoted to the cutter-stock A just behind the cutter, and the stock itself is pivoted to a pendent arm, *k*, that is vibrated intermittingly by a cam, A^5, on the driving-shaft.

Claim.—1. In combination with the cutter having an upward movement after the blow and rise of the hammer, the feed-foot *p*, which moves forward against the spur raised by the cutter and feeds the file, substantially as described.

2. In combination with the file-feed and cutting mechanism, the griper-pin i^3 extending out from the arm I^2 of the shaft i^2, said shaft being turned by the action of the spring w^3 produced by the pin p^2 or its equivalent, substantially as described.

3. The improvement in file-cutting machines, the same consisting of the shaft o^2, hammer *y*, arm I^2, spring d^3, cam and driving shaft i^2, cam A^5, eccentric or cam A^2, arm *k*, arm *n*, cutter-arm A, and spring *w*, combined and arranged to operate substantially as shown.

141,301.—*Current-Wheel.*—CHRISTOPH WERNER, St. Charles, Mo. Application filed April 26, 1873.

A pair of boats arranged at some distance apart, connected by frame-work and supporting a couple of revolving drums between them, whereon endless chains with a series of buckets work, one of the drums being provided with tackle for swinging it up and down, and having deflections connected with it to vary the influence of the water on the buckets according to the power required. The other drum, which is in stationary bearings, gears with a vertical drum, which is to transmit the power by a belt, and is as long as the extreme distance between high and low water to allow the boats to rise and fall and yet work the driving-belt properly.

Claim.—The boats A B, drums C D, chains E, buckets F, guards M, slotted housings J, adjusting-screws L, drum O, and the connecting-wheels N, combined and arranged substantially as specified.

141,302.—*Water-Regulator for Boilers.*—CALVIN J. WELD, Brattleborough, Vt. Application filed February 15, 1873.

Claim.—The combination, with boiler A, of the auxiliary cylinder B, connected with reservoir by a pipe, D, and provided with a float, to which is attached a stopper, which shuts the said pipe at the times and in the manner described.

141,303.—*Sewing-Machine.*—WILLIAM M. WHITING, Brooklyn, N. Y., assignor to THE PLUMMER SEWING-MACHINE COMPANY, New York, N. Y. Application filed June 21, 1873.

For sewing straw-braid, and an improvement on patent No. 79,856. The throat plate or bar for the needle is adjustable, and the point of the needle is raised or lowered so that the stitch will show more or less on the surface.

Claim.—The throat-bar 6, adjustable vertically and forming a guide to the needle, in combination with the mechanism, substantially as set forth, for presenting the material to be sewed in a bent condition to the needle, as specified.

141,304.—*Oiler for Steam-Engines.*—ALVA WOODEN, Ypsilanti, Mich. Application filed April 24, 1873.

The inlet of steam into the steam-chest lifts the spindle and valve from the lower seat, and before the valve reaches the upper

seat a small volume of steam passes into the cap, there condenses and displaces an equal volume of oil, which is raised above the cap. By opening a port to fill the cylinder with steam the pressure in the steam-chest is slightly reduced during the outflow of the steam, and the spring at the lower end of the spindle seats the valve in the lower seat, and thus the space between the two seats is filled with oil, which, when the valve is again raised, flows down the tube into the steam-chest.

Claim.—1. The cap D, provided with a seat, *f'*, in combination with the tube D provided with the seat *f*, and the spindle *b* provided with the spherical or double-faced valve *e*, substantially as and for the purpose set forth.

2. The construction and arrangement of the hollow standard A, cap B, plug C, tube D, spindle *b*, piston *c*, spring *d*, valve *e*, seat *f*, cap D', and seat *f'*, substantially as and for the purpose set forth.

141,306.—*Process of Ornamenting Glass.*—SAMUEL M. ADAMS, New York, N. Y., assignor of one-third his right to JOHN JOHNSTON, same place. Application filed June 2, 1870.

Claim.—1. Attaching temporarily with mucilage or other suitable adhesive substance metallic foil to the article to be ornamented, then producing upon such foil and surface the desired pattern by means of a stencil or guide plate and suitable cutting-tool.

2. Etching the design, so formed, by corrosion in the usual manner, all substantially as described, for the purpose set forth.

141,308.—*Device for Securing Corners of Wagon-Bodies and Seats.*—ERWIN ANDREWS, Bryan, Ohio, assignor to EDWARD L. BRADLEY and WILLIAM A. CLARK, New Haven, Conn. Application filed November 28, 1870.

The seat-corners are secured by casting a corner upon the wood, the metal running through holes in the wood.

Claim.—The corner pieces for carriage seats or bodies, consisting of soft metal cast upon the adjoining ends of the pieces that form the seat or body, the ends being suitably recessed upon their outer faces, and having holes through which the metal can flow, whereby the parts are firmly united, all as set forth.

141,307.—*Registering Steam-Gage.*—EDWARD H. ASHCROFT, Boston, Mass. Application filed February 5, 1873.

A registering-lever for operating a ratchet-wheel, so as to indicate the number of excesses of pressure reached, is adjustably attached to the toothed sector which controls the ordinary index.

Claim.—1. The lever-bar J for operating the registering-index H, and attached directly and solely to the segment-lever D, substantially as set forth and described.

2. The lever-bar J for operating the registering-index H at a prescribed limit of pressure, and provided with an adjustment, *i*, the lever and its adjustment both being attached to and carried solely by the segment-lever.

141,308.—*Hoe.*—JAMES M. BAIRD, Wheeling, W. Va., assignor to himself and RICHARD STABLEY, same place. Application filed November 24, 1871.

Attaching hoes to handles by means of a semi-tubular piece riveted to the blade and fastened to the handle by means of a ferrule. To the inside of the semi-tubular piece is secured a projection, which is embedded into the wood as the ferrule is forced into position.

Claim.—As an improved article of manufacture, the acute-angled socket A, formed of a flat arm or shank having screw-holes, and a semi-tubular portion provided with an inner projection, *a*, whereby it is adapted to be applied to cover the end of a handle and connect it with a hoe-blade in the manner specified.

141,309.—*Pump-Valve.*—WILSON BARNES, Maquoketa, Iowa. Application filed December 7, 1872.

Claim.—The poppet-valve A *a a'*, provided with end-curved legs *f*, combined with tube C, having valve-seat B, flange *d*, and taper from middle to each end, as and for the purpose described.

141,310.—*Iron Bridge.*—CHARLES BENDER, New York, N. Y., CHARLES H. LATROBE, Baltimore, Md., and CHARLES S. SMITH, St. Louis, Mo. Application filed July 7, 1873.

The skew-backs are separated from the anchorage-abutments, and the cantilevers are supported upon them by hinged connections, which permit play under thermal changes as well as variable loads. The anchorage-lines are rigid so as to afford resistance to compressive as well as tensile strains, the arch-members being hinged throughout and capable of transmitting resultants of pressure in opposite directions. A viaduct approach is inserted between the anchorage-abutments and the backs of the hinged cantilevers, and supported upon the same. These carry the anchorage-lines and help to resist the compressive strains upon the anchors.

Claim.—1. A cantilever-bridge, in which the abutments of the ribs are separated from the anchorage of the back ties or struts, and in which the cantilevers are hinged at their abutments, as herein set forth.

2. The combination of a cantilever trussed or arched bridge with a viaduct, by which the back-ties are supported or stiffened, as herein set forth.

3. An arched bridge, constructed with three hinges intermediate between the skew-backs, combined with a rigid anchorage capable of resisting compression as well as tension, or combined with piers of such weight and stability as will obviate the necessity of any other anchorage.

141,311.—*Lantern.*—LEWIS F. BEITS, Philadelphia, Pa. Application filed October 29, 1872.

The flange of the upper gallery is extended so as to form, with one guard-wire, a hinge, and, with the opposite one, a hook, thus securing the gallery to the guard. The vertical guard-wires extend down through the lower gallery and rest upon the top of the lamp-fount to relieve the connections at this point from strain. An inverted conical cup surrounds the burner to deflect currents of air therefrom.

Claim.—1. The hinge *b* and hook *d*, formed in one piece with the flange G' of the dome of the lantern, and adapted to the guard-wires H, substantially as herein described.

2. The combination, with the hinge *i* and spring-catch *j*, or other equivalent connections, of legs *k* extending between the body of the lantern and the deflector I, and resting on the top of the oil-reservoir, all substantially as specified.

141,312.—*Car-Coupling.*—ELIAS BICKELL, Milton, Pa. Application filed May 14, 1873.

The object is to render the ordinary pin and link self-coupling and self-adjusting for cars of different heights.

Claim.—1. The sliding tongue G having lip *b* at the front end, and an inclined elongated slot, *a*, through which the pin B passes that pivots the bumper in the draw-bar, substantially as and for the purposes herein set forth.

2. The curved end of the pivoted bumper A having notches *d d*, in combination with spring H with projection *e*, substantially as and for the purposes herein set forth.

3. The combination of the bumper A, pin B, draw-bar C, tongue G with slot *a* and pin *b*, the notches *d d*, and spring H with projection *e*, all substantially as and for the purposes herein set forth.

141,313.—*Curtain-Fastener.*—JOHN F. A. BLATTERLEIN, West Meriden, Conn. Application filed March 28, 1873.

An eccentric button is attached to the window-frame beyond the edge of the curtain, so that by turning the button the edge of the curtain is firmly clamped against the frame.

Claim.—The arrangement of an eccentric button on the frame or casing of a window beyond the edges of the curtain, attached to said window, substantially as and for the purpose shown and described.

141,314.—*Rotary Printing-Press.*—WILLIAM BRADWOOD and HORATIO J. HEWITT, New York, N. Y. Application filed April 16, 1873.

Both sides of the sheet are printed in succession, the first by one set of cylinders, the second by another. An endless ink-distributing apron serves to transmit ink from the fountain to a series of inking-rollers, which bear against the type-cylinder, and are so placed in a frame as to embrace a large part of the circumference of said cylinder. A stationary cutting-blade on end of cutting-table, acting in conjunction with a knife suspended from bell-crank levers, actuated by cams secured to last type-cylinder, cuts web into suitable sheets. A retaining-pad acts in conjunction with the movable knife.

Claim.—1. The endless apron *a*, arranged upon rollers mounted upon the hinged frame B, in combination with the ink-fountain *f* and a series of inking-rollers, *d*, which bear directly against the surface of the type-cylinder, substantially as herein described, for the object specified.

2. In combination with a type-cylinder and an impression-cylinder, the offset-sheet C and interchangeable or reversible rollers D E, substantially as described, for the purpose specified.

3. The draw-roller F, turning-roller G, and impression-roller T', all geared together as described, in combination with the roller *i*, cords A, and table H, substantially as described, for the purpose specified.

4. The knife K, suspended from the bell-crank levers *l l*, having arms *m m*, and operated by cams on the impression-cylinder T', in combination with each other and with the stationary knife *j*, substantially as described, for cutting the web S, as set forth.

5. The presser-pad *q*, in combination with the knife *k*, stationary cutting-blade *j*, bell-crank lever *l*, cam-disk *o*, and spring *p*, and with the web passing to said knife, substantially as described.

141,315.—*Rotary Printing-Press.*—WILLIAM BRAIDWOOD and HORATIO J. HEWITT, New York, N. Y. Application filed June 8, 1871.

The type-cylinder is constructed with furniture-rings *k l m*. The impression-cylinder is provided with a recess to receive a clamping-strip, for the purpose of retaining a tympan-sheet. With the type-cylinder and impression-cylinder of each set is combined a stripping-roller to insure the separation of the sheet.

Claim.—1. The furniture-rings *k l m*, slides A, and clamping-screws *j*, in combination with the forms and with the type-cylinder C, substantially as set forth.

2. The clamping-strips *r*, in combination with the tympan-sheet *s* of an impression-cylinder, D, substantially as described.

3. The stripping-rollers H H', in combination with the type-cylinders C C', impression-cylinders D D', and feed-roller I, substantially as set forth.

4. The feed-roller I positively geared with and in combination with the last impression-cylinder, substantially as and for the purpose set forth.

141,316.—*Apparatus for Extracting Saccharine Matter from Cane, &c.*—MARIUS S. BRINGIER, Ascension Parish, La. Application filed July 21, 1873.

The cane or other saccharine vegetable is first subjected to pressure, as in the ordinary sugar-mill, and then to subsequent treatment in accordance with the process set forth in the inventor's patent, No. 140,461, of July 1, 1873; or that portion of said process requiring the employment of digesters may be omitted, and the bagasse passed directly from the hasher to the final pressure-rollers. A cutting mechanism particularly adapted to cut bagasse is also described.

Claim.—1. The treatment of sugar-cane or other saccharine vegetable substance, for the purpose of extracting the saccharine therefrom, by first subjecting it to pressure, as in the ordinary sugar-mill, and then dividing or reducing it into small pieces, which are subjected to subsequent heating and pressure, substantially in the manner and by the means shown and described.

2. The method of extracting saccharine from sugar-cane and other vegetable saccharine substances by subjecting the same to preliminary pressure, as in the ordinary sugar-mill, followed by the process described in my Letters Patent, No. 140,461, of July 1, 1873, substantially as set forth.

3. The herein-described cutting mechanism for dividing the bagasse or other saccharine vegetable substance, the same being constructed and operating substantially as shown and specified.

141,317.—*Machine for Dressing and Crozing Barrels.*—WILLIAM BROWN, St. Louis, Mo. Application filed June 4, 1872.

The turning and crozing tools are attached to a sliding bar which is guided in its movement by an arm passing over a former having a curvature corresponding to the bulge of the barrel.

Claim.—1. The chuck, consisting essentially of the collars J K and draw-rods I, with device for operating the moving collar, substantially as set forth.

2. The combination of the tilting rest P, slider R, arm T, and guide U, substantially as and for the purpose set forth.

141,318.—*Reclining-Chair.*—GEORGE BUCHANAN, Washington, Pa. Application filed June 28, 1873.

The back legs extend to the lower side of the arm-rests, and are hinged thereto, so that when the arm-rests are released at their front ends they can be thrown up and form extensions of the back legs. The front ends of the arm-rests are provided with spring-bolts that are operated by pins passing through the upper ends of the front legs. The back is pivoted to the arm-rests, and also to the rear of the seat. The front of the seat rests loosely on a transverse round.

Claim.—1. The combination, with the chair-frame A B, of the hinged arm-rests C C, pivoted back D, and pivoted seat G, the front end of the seat being supported on the round A, all as herein set forth.

2. The spring-bolt *b* in the front end of the arm-rest C, in combination with the movable pin or bolt *d* in the leg A, for the purpose set forth.

141,319.—*Manufacture of Refined Cast-Iron.*—CHARLES BURGESS, Portsmouth, Ohio. Application filed March 21, 1873.

The furnace has a deep hearth and high bridge, and is used without a blast. The pig from the time it is melted remains at rest until jets of blue flame about the size of a candle-flame appear near the fire-bridge, when the tap-hole is opened and the metal run into shallow cast-iron molds.

Claim.—The process herein described for the manufacture of refined iron—to wit, reducing the pig to the condition of puddle upon the hearth of a reverberatory furnace separately from the fuel, then raising the heat and allowing the iron to remain in a state of rest until jets of blue flame appear, after which the charge is drawn.

141,320.—*Manufacture of Steel.*—CHARLES BURGESS, Portsmouth, Ohio, assignor to BURGESS STEEL AND IRON WORKS, same place. Application filed March 21, 1873.

The materials used are the ordinary cast-iron, and stone-coal for fuel. The iron having been brought to the state of fusion the stopper-hole is closed and the heat raised, the mass remaining at rest from five to fifteen minutes, or until blue flames appear. When the blue flames have disappeared, and the cinder begins to bubble up through the mass, the damper is closed and the mass rabbled and balled.

Claim.—The process herein described for manufacturing steel from cast-iron, in the puddling or reverberatory furnace—that is to say, exposing the mass to a high heat to burn out the impurities and partially decarbonize it; then working it with closed dampers; then reopening them for boiling, and subsequently closing them while the mass is acquiring its final spongy condition, after which it is withdrawn.

141,321.—*Polish for Stoves.*—ELI CHAMNESS, Greensburg, and JOHN VAUGHN, Chesterfield, assignors to themselves and JOHN RAYMOND, Greensburg, Ind. Application filed September 2, 1872.

Claim.—The combination of plumbago, soap, and glycerine, used substantially as and for the purposes set forth.

141,322.—*Wash-Boiler Attachment.*—CLARINDA P. CHAPMAN, Afton, Iowa. Application filed March 22, 1873.

A wash-boiler attachment constructed with a shield surrounding its bottom, with a center upright conductor for water and steam, separated by a center partition and cross partition at each end. To the center partition, at its upper end, is attached a curved cap to give direction to the water and steam for their distribution over the clothes.

Claim.—The wash-boiler attachment herein described, consisting of the bottom A, shield B, and cap G, and tube D, the bottom being provided with partition-walls *d f* h, substantially as specified.

141,323.—*Leak-Hinge.*—CHARLES B. CLARK, Buffalo, N. Y. Application filed June 23, 1873.

Double-inclined parts to avoid concussion.

Claim.—1. The inclines *a b* and plane *d* on the part B, in combination with the double inclines *e f* on the part A, substantially as and for the purposes set forth.

2. The bevel *i* on the latch C, in combination with the inclines *e f* and *a b*, substantially as and for the purpose set forth.

3. The elongated slot *j* and beveled latch C, in combination with the inclines *a b e f* and plane *d* of the parts B A, substantially as and for the purpose set forth.

141,324.—*Expansive Bit.*—WILLIAM A. CLARK, New Haven, Conn. Application filed December 5, 1872.

Claim.—An adjustable or expanding bit having its cutter B secured in a recess in its shank by means of the clamp C and screw *c*, substantially as shown and described.

141,325.—*Rotary Meter.*—ISAAC COOK, St. Louis, Mo. Application filed June 24, 1873.

Two axially-perforated diaphragms are arranged one above and the other below the wheel, and are made conical to increase the water-space vertically toward the center. The outflow-passage communicating with the upper and lower discharges is provided with means to regulate the quantity of water passing through the two passages to balance the wheel vertically. The bucket-wheel, and shaft are made of hard rubber to prevent corrosion, the upper end of the shaft bearing against the glass face to admit of its inspection and enable the proper vertical adjustment.

Claim.—1. Bucket-wheel consisting of a disk, L, and buckets *l* and shaft M, all constructed of hard rubber, as and for the purpose set forth.

2. The combination of the peripheral water-inlet B, horizontal wheel L *l* at or near the mid-height of the water-inlet, and upper and lower axial discharges *o p*, substantially as set forth.

3. The combination of the water-inlet B, wheel L *l*, and conical diaphragms O P, as set forth.

4. The combination of wheel L located at the mid-height of the water-inlet B, the outflow-passages *o p* S R, and adjusting screw or pin *s*, substantially as set forth.

5. The combination of the meter-shaft M and glass top bearing W, substantially as and for the purpose set forth.

6. The combination of water-passage B, adjustable plate H, temper-screw I, and automatic tongue h, substantially as set forth.

141,326.—*Car-Starter.*—JOSEPH CORNELL, Lind, Wis. Application filed January 18, 1873.

Claim.—In combination with the toothed wheel of a street-car, the hand-lever provided with the two pawls, when arranged as shown and described, so that the vibration of the lever causes a continuous forward strain upon the wheels.

141,327.—*Car-Mover.*—RENSSELAER A. COWELL, Cleveland, Ohio. Application filed June 18, 1873.

The head of the car-mover is cast hollow to receive the holding-dog, which is operated by a sliding bar, chain, and bolt. To the head are pivoted two staves or legs operated by the vibration of the handle, also pivoted to the head, and provided with holding-feet, formed with sharp holding-edges in the axial line of their staves.

Claim.—1. An adjustable holding-dog combined with the hollow cast head of a car-mover, substantially as described, for the purpose specified.

2. The holding-dog D, operated from the head A by means of the sliding bar C, chain N, and the operating-bolt O, substantially as described, for the purpose specified.

3. In combination with the hollow head carrying the adjustable holding-dog, the hinged plate G carrying the operating-handle, and the pivoted staves carrying the holding-feet J, substantially as described.

4. The cast-metal feet J, formed with sharp holding-edges in the axial line of their staves, substantially as described, for the purpose specified.

5. The cast-metal staff-sockets constructed with claws to embrace the tread of a railroad rail, when their rear faces are beveled to admit of their holding-edges being ground, substantially as described, for the purpose specified.

141,328.—*Cotton-Planter.*—WILLIAM J. COX and WILLIAM T. SMITH, Lilesville, N. C. Application filed June 17, 1873.

A delivering-spout, having its upper end cut in form of a lip to receive and agitate the grain, revolves in a hopper; the lower end is provided with a gear-wheel which is driven by a wheel on the main axle, so that when the drive-wheels move forward a rotary motion is given to the spout.

Claim.—The vertical seed-delivering tube *e*, cut as described at the upper end, with a lip, *i*, on one side, and operated by the gears *d b*, shaft *a*, and wheels J J, as set forth.

141,329.—*Machine for Bending Sheet Metal.*—WILLIAM F. COZENS and WILLIAM H. WIGGIN, St. Louis, Mo. Application filed October 18, 1872.

The lever-plate is provided with a concavity on its applied edge. The operator is able to change the degree of the curve without withdrawing the work from the vise. The leaf is connected to the machine by means of hooks, and can be readily detached.

Claim.—1. The leaf F provided with the concavity A, in combination with the jaws *b b'*, as described, for the purpose set forth.

2. The leaves E F having hooks *e f*, in combination with the studs *c' c'* upon the iron C, as described, for the purpose set forth.

141,330.—*Method of Coating and Ornamenting Walls and Ceilings.*—JAMES H. CRITTENDEN, Fall River, Mass. Application filed January 28, 1873.

The walls are first sized, and then flock of any or various colors, according to taste, is applied directly to said walls by compressed air or other suitable means.

Claim.—The method herein described of coating and ornamenting walls and ceilings by means of flock applied directly to the same, substantially in the manner specified, and for the purpose set forth.

141,331.—*Corpse-Cooler.*—SAVILLA H. CRUMP, Reading, Pa. Application filed April 30, 1873.

Claim.—1. A corpse-preserving case in which the boxes containing the freezing-mixture are separated by partitions from the

central chamber but are in communication therewith, substantially as described.

2. The combination, with the corpse-preserving case, of longitudinal partitions G, formed wholly or partially of glass, and separating the interior of the said case into central and side chambers, as specified.

3. The combination of the ice-boxes D, the partitions G, and the doors B in the sides of the case opposite the ice-boxes.

141,332.—*Sewing-Machine.*—CYRUS S. CUSHMAN, of Philadelphia, Pa., assignor to ROBERT D. STOOPS, same place. Application filed June 4, 1873.

The clutch controlled by the stop and operated through a system of levers from the main shaft engages the lifting-bar secured to a projection on the presser-bar and raises the presser a certain distance above the cloth, whatever may be its thickness. The two pins are secured by screw connection, and support the vibrating needle and presser-operating arms.

Claim.—1. The clutch F, in combination with the presser lifting-bar H, stop G, and tension-spring P, for elevating the presser-foot, substantially as described.

2. The pin Q having screw-thread *l*, in combination with the fulcrum-pin R having screw-stem *m*, substantially as and for the purpose set forth.

3. The combination of the lifting-bar H, having a slotted arm, *f*, the presser-foot bar L, having a neck, *g*, and arm *h*, and the stock J, having in its upper end a vertical groove, *i*, for securing the presser-foot in its lower and allowing it to be turned laterally when in its upward position, substantially as set forth.

141,333.—*Manufacture of Chlorine.*—HENRY DEACON, Lancaster county, England. Application filed July 18, 1873.

Claim.—The employment of a mixture of an inactive but accelerating substance, such as sulphate of soda, with an active substance, such as sulphate of copper, for the production of chlorine in what is known as Deacon's process for the manufacture of chlorine.

141,334.—*Bridle-Bit.*—VINCENZO COUNT DE TERGOLINA, Bernard Street, England. Application filed April 12, 1873.

Claim.—In combination with the cheek-plates *c*, the loose side levers *m*, as and for the purpose described.

141,335.—*Shifting-Rail for Carriage-Seats.*—HERRMAN DRESSEL, Springfield, Vt. Application filed July 1, 1873.

The rail can be adjusted to seats of different sizes.

Claim.—The combination of the extension-bars *a a a'*, tubular connections *b b*, and the supporting-brackets *c*, the whole adapted to the seat of a carriage, substantially in the manner shown and described.

141,336.—*Ticket Printing and Registering Apparatus.*—JOHN DYER, Chicago, Ill. Application filed May 9, 1873.

A strip-ticket, consecutively numbered and printed with the initial station, is fed automatically a distance equal to the ticket's length by a sparred cylinder at each vibration of the actuating-lever, and completed by being printed with the terminal station, the name of which is upon a die which is removable and changeable, and which also registers the printing upon a numbered strip automatically advanced, as in the former patent. The ticket thus completed is cut off by a vibrating knife.

Claim.—1. A continuous consecutively-numbered and partially-printed ticket-blank, in combination with suitable mechanism for feeding said blank forward, and for completing and severing the completed tickets, substantially as and for the purpose specified.

2. The means employed for operating the feed-roller E', consisting of the pawl G', pivoted upon and moving with the arm M, and the ratchet-wheel H'', secured to said roller and engaging with said ratchet, substantially as set forth.

3. The means employed for operating the feed-roller E'', consisting of the disk Q, pivoted upon the shaft H', the curved bar R' pivoted to said disk and to the arm M, and the pawl S' pivoted upon said disk Q', and engaging with a ratchet-wheel, H'', attached to said roller, substantially as is shown and described.

4. In combination with the feed-rollers E' and E'', provided with the notches *e''*, the detents I', provided with the spurs *i'*, and pivoted to or upon the casing A, substantially as and for the purpose specified.

5. In combination with the feed-rollers E' and E'' and detents I', provided with the lugs *i''*, the shaft L', journaled within the casing C, and provided with the arms M' and K', and the cam O', secured upon and revolving with the shaft H, substantially as and for the purpose shown.

6. The station and register dies S, consisting of the angle-plate base, provided with the type *s*, the spur *s'*, and the opening *s''*, substantially as and for the purpose set forth.

7. In combination with the die S, provided with the spur *s'* and opening *s''*, the spring-bar T, provided with the opening *t*, fitted into the face of the die-holder L, and engaging with said spur *s'*, and the spring-latch U working within the end of said die-holder, and engaging with said opening *s''*, substantially as and for the purpose shown and described.

8. In combination with the feed-rollers E' and E'', provided with the engaging studs *e'*, the springs F', partially encircling said rollers and pressing against the same, the register and ticket blanks, substantially as and for the purpose specified.

141,337.—*Hat-Stretching Machine.*—RUDOLPH EICKEMEYER, Yonkers, N. Y. Application filed July 11, 1873.

A radial sectional clamp is arranged to firmly hold the hat when interposed between the coincident radial surfaces of the sections, one of which is inside the hat and the other outside. A sectional stretcher engages with the hat in like manner, with radial arms which occupy the spaces between the radiations of the clamp. The clamp is stationary, but the stretcher is capable of being partially rotated on the axis, from which its several arms radiate. By moving the stretcher to the right or the left the several portions of the hat between the radiating holding-surfaces of the clamp are strained or stretched. A spring is arranged to secure the sections of the stretcher in proper position.

Claim.—1. In a hat-stretching machine, the combination, substantially as described, of a sectional clamp, arranged to hold an interposed hat or hat-body by means of coincident radial compressing-surfaces, with a sectional stretcher composed of radial arms provided with coincident hat-holding surfaces, arranged to engage with the hat-body at points thereon between the radiations of the clamp, and also so arranged that its several stretcher-arms, while engaged with the hat, will be capable of being laterally vibrated, as and for the purposes specified.

2. The combination, with a sectional stretcher, of a spring, which is arranged to engage therewith, substantially as described.

141,338.—*Expansible Hat-Block.*—RUDOLPH EICKEMEYER, Yonkers, N. Y. Application filed June 28, 1873.

Numerous non-pivoted block-sections are arranged around a common center, to form, as a whole, a round or oval hat-block. Each section has an interior inclined edge which engages with an interior circular head-plate, having an inclined edge which corresponds with the inclined edge of each section. The vertical play of the head-plate forces each section bodily outward radially from the center. A foot-plate is provided with a series of slots, arranged as to position so as to correspond with the arrangement of the sections. Each end of each slot is inclined to correspond with the inclined edge of the head-plate, and the bases of the sections occupy the slots and have edges which are inclined to correspond therewith, so that the said bases of the sections are forced outward or drawn inward, respectively, by the raising and the lowering of the foot-plate.

Claim.—1. An expansible hat-block composed of non-pivoted sections, which are actuated radially by one or more interior inclined planes, substantially as described.

2. The combination of the several sections of an expansible hat-block with an inclined plane, which not only advances but withdraws the sections in radial lines.

3. The combination, in an expansible hat-block, of the several sections, the foot-plate, head-plate, and operative lever, substantially as described.

4. The combination, with the size-gage, of a lever holding-hook which maintains a fixed relation to the gage-block, substantially as described.

141,339.—*Machine for Lustering Hats.*—RUDOLPH EICKEMEYER, Yonkers, N. Y. Application filed July 25, 1872.

Claim.—1. The independently-driven and rapidly-revolving lustering-wheel, and the revolving oval hat block chuck mounted on separate spindles, the positions of which are variable with relation to each other in a plane common to the longitudinal axes of both, in combination with the movable guide for controlling the chuck and the mechanism for connecting the movable guide with the axis of the lustering-wheel, substantially as described, whereby the hat-block chuck will be made to revolve in concentric or eccentric lines, respectively, in proportion as the axes of the wheel and chuck are in or out of coincidence, as and for the purposes specified.

2. The combination, substantially as described, of the oval or eccentric chuck for carrying and rotating the oval hat-block with the mechanism for controlling its eccentricity while in motion, whereby, without change in the rapidity of its rotating movement, the hat-block may be made to revolve concentrically or eccentrically, as and for the purposes specified.

3. The combination of the brim-bed G with the lustering-wheel, substantially as described, and for the purposes specified.

141,340.—*Means of Propelling Vessels.*—JAMES W. EVANS, New York, N. Y. Application filed March 1, 1873.

Open-mouthed cylinders are arranged at the stern of a vessel and have branch-pipes leading from them toward the bow, so that when the water-pistons are drawn in the water flows through the branches and joins with the main body of water aft to assist in forming a resisting medium for the pistons when they are pushed out.

Claim.—The combination of the cylinders A A, provided with branches G G, and arranged at an incline to the keel of the boat, and the pistons B B and their valves *a a*, essentially as and for the purpose set forth.

141,341.—*Stump-Extractor.*—IRA FLANDERS, Paw Paw, Mich. Application filed July 5, 1873.

Claim.—1. The combination, with the lever of a stump-extractor, of the rack-bar *b*, lever E, rods *d d* with cross-bars *i i*, and the bearing-block G, all substantially as and for the purposes herein set forth.

2. The combination of the beam A, frames B, lever C, tackles D, rack-bar *b*, lever E, rods *d i*, block G, links *f*, and chain H, all substantially as and for the purposes herein set forth.

141,342.—*Device for Reducing and Screw-Threading Rods.*—ROBERT F. FOWLER, Canton, Ohio, assignor to himself and CHAS. T. MARTINCOURT, same place. Application filed June 6, 1873.

Between two plates which form part of the cutter-head are situated four adjustable cylindrical cutters for cutting screw-threads, which are pivoted upon clamping-bolts that serve to prevent the cutters from turning, and extending from one of the plates is a guide-sleeve for directing the bar between the cutters. Reducing-cutters of a peculiar form are used interchangeably with the screw-thread cutters for reducing rods before cutting the threads.

Claim.—1. The herein-described cutter-head A B C D, consisting of the base-plate A, with guide-sleeve *a*, top clamping-plate B, axial clamping-bolts C C C inserted in spirally-arranged bolt-holes *b b b*, and thread-cutters D D D, having their thread-cutting edges arranged in different planes, so as to follow the screw-thread on the bolt or pipe, the several parts being combined and operating as herein specified.

2. The shaft-cutters F, having their cutting-edges *h i* formed as described, in combination with the cutter-head A B C, substantially as and for the purpose herein specified.

141,343.—*Steam-Engine.*—ANDREW FRASER, Virginia City, Nev. Application filed May 2, 1873.

By means of the system of valves and the arrangement of the pipes shown the steam-cylinder may be used as a pump to force air into a suitable reservoir.

Claim.—1. The steam-cylinder A A, provided with the steam-valve N and automatic air-valves H H I I, in combination with the pipes O O, valve J, and an air-receiver, substantially as described.

141,344.—*Reamer for Enlarging Oil-Wells.*—MARTIN GILLESPIE, Smith's Ferry, Pa. Application filed June 17, 1873.

A tubular centering device. The size of the original bore is placed at the top of the well, filled again with sand, and the reaming-tool is adjusted thereto, by a pin at the end, which fits into the tube of the centering device, and thus guides the cutter.

1. A reaming-tool having the cutter *b* and pin *b'*, combined with a centering device that receives said pin.

2. A centering device, C, for a reamer, made tubular.

141,345.—*Bit-Stock.*—ALBERT D. GOODELL, Miller's Falls, Mass., assignor to MILLER'S FALLS MANUFACTURING COMPANY, same place. Application filed December 16, 1872.

The jaws which clasp the shank of the tool are united by a U-shaped metal spring which enables the jaws to readily adjust themselves to shanks of different shapes.

Claim.—The self-adjusting jaws D D, and spring *c*, in combination with cylinder A and screw-sleeve C, constructed and operating substantially as and for the purpose described.

141,346.—*Animal and Insect Trap.*—WILLIAM W. HANNAH, Hudson, N. Y. Application filed May 20, 1873.

Claim.—1. The trap-doors *m*, constructed of mica, for the purpose set forth.

2. The trap-doors *m*, pivoted upon needles extending through slits or holes in the mica, substantially as described, for the purposes specified.

3. The trap-doors *m*, combined with the plate G, having supporting and protecting flanges *h* under the doors, substantially as described, for the purposes set forth.

4. The passages leading toward the bait-holder, the pivoted doors *m*, the side-flanges *i i'*, the overarching flange I, and the projecting cover I', combined and arranged substantially as and for the purposes described.

5. The inclines *f*, arranged around the trap and combined with the openings *d* and *e*, substantially as described, for the purposes set forth.

6. The combination of a single central bait-holder, H, and a single receiving-chamber, B, with a series of passages arranged above the receiving-chamber and converging toward the bait-holder, substantially as and for the purposes specified.

7. The parts I I' H *m i' h* and plate G, which fits the top of the chamber B, when said parts and plate are constructed, combined, and relatively arranged in the manner described.

141,347.—*Lathe.*—DAVID HERR, Philadelphia, Pa., assignor to HENRY D. HIRST, same place. Application filed April 5, 1873.

The lathe-spindle carries a former, which, in connection with a stationary inclined bar, guides the cutting-tools.

Claim.—1. The combination, with a former, E, of a carriage operated by the former, and provided with a series of independent cutters, B, attached to levers B', and adjustable to and from the work, substantially as set forth.

2. The combination, with the carriage, of the head A', carrying the cutter-levers, and adjustable on a vertical axis, *s*, as and for the purpose set forth.

3. The combination, substantially as described, of the said cutter-levers B' with the yielding cam-like incline *i*, and fixed projection *i'*.

4. The combination of the arm G on the carriage, the spring-rod F', and the devices described, through the medium of which the said rod may be released by the arm.

5. The combination, with the former E and arm D, of the carriage, projection *b*, and trigger *c*, substantially as and for the purpose set forth.

141,348.—*Rotary Churn.*—ELISHA A. HEWITT, Groton, Conn. Application filed February 12, 1873.

A horizontal revolving shaft having rows of curved arms, concave on their working sides; a flange from the shaft, concave on the same side, fitting closely to the inner ends of the arms; the case having abutments inclining from the center of the sides toward the ends.

Claim.—The combination of the arms C radiating from the shaft, the projecting ribs P upon opposite sides of the said shaft and in the relative position to the arms described, with diagonal ribs or abutments M M upon opposite sides of the churn, the angles of the said ribs M upon one side being the reverse of the angles of the ribs on the opposite side, all substantially as described.

141,349.—*Ejector.*—GEORGE HERBERT, Wheeling, W. Va. Application filed July 16, 1873.

A plurality of steam-nozzles and water-nozzles converging toward a central point in a chamber common to all, so as to concentrate their streams, and thus augment the aggregate effect.

Claim.—1. The improved siphon-pump herein described, having a plurality of steam-nozzles, J, and water-nozzles K, arranged so as to converge toward a given central point in the force-chamber or discharge-pipe, so as to concentrate their jets or streams, as set forth.

2. The combination of the inlet *z*, suction-chamber F, force-chamber G, perforated diaphragm I, annular steam-chest H, and nozzles J K, as specified.

141,350.—*Car-Axle Box.*—HENRY H. HILL and GEORGE M. SARGENT, Moline, Ill. Application filed April 23, 1873.

The lining is detachable, and may be replaced when worn.

Claim.—A journal-box, consisting of a malleable-iron shell, in combination with a detachable lining, B, all constructed and arranged to operate as described, whereby we are enabled to use a light shell and replace the lining at will, as set forth.

141,351.—*Photography.*—WILLIAM H. HILL, Worcester, Mass. Application filed March 7, 1873.

Claim.—A photographic plate, consisting of a sheet coated with a composition of collodion and kaolin, or equivalent opaque backing, and having a surface film solely of wax or paraffine, substantially as described.

141,352.—*Electro-Magnetic Date-Time Printer and Stamp.*—JOHN C. HINCHMAN, Summit, N. J. Application filed February 24, 1873.

A time-piece, provided with minute, hour, and calendar wheels, having raised figures and letters on their edges, arranged in line side by side, and operated from the time-piece by a pawl and armature lever of a magnet, is combined with a suitable inking and spring-plate device, so that the time and date may be at any time printed, either by a hand-pad or by the action of a second electro-magnet.

Claim.—1. In a time-printing machine, the combination of an electro-magnet, K *k*, and a time-transmitter, N O P, with printing-wheels and a lever, J, connecting with and operating said wheels.

2. A time-printing machine having the combination therein of printing devices, an electro-magnet for operating such devices, a transmitter of time thereto, and a presser operated by an electro-magnet.

3. In a time-printing machine having the combination next-above stated, and a hand-stamp arranged to be operated to make the record of time without interfering with the electro-magnetic connection, thus combining the facilities of an automatic and a hand stamp in one machine.

4. In a time-printing machine, the meridian-wheel E, having its ante and post divisions A and P arranged to operate in combination with a fixed meridian division, M, as described.

5. The hour and meridian wheels B E, operated by means of cams G G', arranged upon the axis F' of the minute-wheel F, as described.

6. The escapement-lever J with its pawls L n^2, stop n^3, and ratchet-wheels M n^1, and their stop-pawls m n, to form a positive lock to the lever, as described, in a time-printing machine.

7. The arrangement, in a time-printing machine, of the dial S and its indicating-hands upon the shaft F' of the minute-wheel, in combination with the lever J, which operates both the printing-wheels and the indicator, to determine the position of the printing-wheels for correct time printing and to indicate the required changes of the wheel for that purpose, as described.

141,353.—*Mold for Casting Stench-Traps.*—ALBERT H. HOOK, New York, N. Y., assignor to CHAS. F. HERVEY, C. C. TRACY, and WM. A. SHAW, same place. Application filed April 16, 1873.

Claim.—The herein-described apparatus for casting S and half-S lead or composition plumbers' traps in one piece, consisting of a metallic mold formed as described, in combination with a sectional metallic core, a^1 b^1 c^1, each section straight from end to end, the end sections joining the intermediate section at opposite ends thereof, and said intermediate section provided with a screw-thread, *d'*, said parts being fitted together and adapted for joint operation as herein shown and set forth.

141,354.—*Brewer's Stocking-Cask.*—JOHN JAKEL, Detroit, Mich., assignor to himself and F. LOUIS DOHMSTREICH, same place. Application filed April 8, 1873.

Sheet-iron cask, tinned on its inner surface, with a peculiar man-hole cover upon one head. The valve is so arranged as to open when the tap is screwed in, and to close when the tap is removed.

Claim.—1. The metallic stocking-cask A B C, constructed as herein described, provided with the man-hole plate B', as herein shown and set forth.

2. The bung D, provided with the angular passage *a*, and screwed into the bung-rim D', as shown and set forth.

3. The valve-cylinder E, provided with the perforated diaphragm *c*, the valve-stem *d*, and valve *f*, in combination with the faucet F provided with the perforated diaphragm *e*, as and for the purpose set forth.

141,355.—*Cotton-Scraper.*—WILLIAM JARRELL, Humboldt, Tenn. Application filed June 14, 1873.

An extension or toe piece is formed on the plow-frame extending leftward from the front standard, by which a firm seat is formed for the scraper, and its center is brought in the line of draft.

Claim.—The obliquely-extending frontward and leftward toe-piece F G H of the standard C, in combination with the scraper I and beam E, all constructed and arranged as shown and described.

141,356.—*Sash-Balance.*—GEORGE N. JOEL, New Philadelphia, Ohio. Application filed June 18, 1873.

Sliding shaft with pinion, to engage with rack on sash, with springs and slides on pinion.

Claim.—The combination of the shaft *b*, pinion *d*, toothed slides *f f*, springs *e e*, and stops *h h* and *m m*, all substantially as and for the purpose herein set forth.

141,357.—*Manufacture of Boots and Shoes.*—JOSEPH L. JOYCE, New Haven, Conn. Application filed June 18, 1873.

Claim.—1. In the manufacture of boots and shoes, the insole beveled from the lower side back toward the top, and from the upper, or so as to form a space between the edge of the insole and the upper, substantially as and for the purpose specified.

2. In combination with the insole beveled so as to form a space between the edge and upper, as described, the outsole formed with a recess or upwardly-projecting edge, substantially as and for the purpose described.

141,358.—*Paper-Making Machine.*—NICE KEELY, Philadelphia, Pa., assignor to himself and WILLIAM P. OUTERSON, Akron, Ohio. Application filed April 30, 1873.

The blanket and its adhering web of pulp pass between wire-covered straining-rollers, into which the water is expelled, and from which it is conducted by interior buckets inclined from the middle to the journal ends.

Claim.—1. The combination, in a paper-making machine, substantially in the manner described, of a straining roller or rollers with the endless blanket, for the purpose specified.

2. The within-described straining-roller, composed of a shaft having longitudinal inclined channels formed by ribs *c*, to which is attached the perforated circumference of the roller, as set forth.

141,359.—*Straw-Burning Attachment for Steam-Boilers.*—DAN. W. KELLOGG, Battle Creek, Mich., and BERNARD C. COFFIN, New York, N. Y. Application filed March 3, 1873.

The sliding front being raised, fuel, such as straw from threshing-machines, is introduced into the furnace by means of the pivoted apron. A small door is provided in said front for the introduction of ordinary fuel.

Claim.—1. The combination with the standards B B, attached to an open fire-box boiler, and the front C, sliding in said standards, of the apron G, substantially in the manner and for the purpose set forth.

2. The combination, with the sliding fire-front C, of the fire-door F, as and for the purpose set forth.

141,360.—*Bottling Liquid.*—JOHN KLEE, Dayton, Ohio. Application filed June 16, 1873.

The perforated plunger-tube has a sharpened end, which is brought down upon the stem of the stopper with sufficient force to fasten the stopper to it and hold it away from the mouth during the operation of filling, and afterward drawing it into position in the neck of the bottle.

Claim.—1. The pointed perforated tube I for filling the bottle from the bottom upward, and drawing the stopper into position for closing the bottle, substantially as shown and described.

2. The method described of drawing the stoppers into position by the plunger, substantially as specified.

141,361.—*Steam-Injector.*—ERNST KORTING, Vienna, Austria. Application filed May 23, 1873.

The steam that escapes condensation is passed into a second nozzle and then bringing it again in contact with the condensing water. An exhaust is used for withdrawing any air that may find its way into the condenser.

Claim.—1. A jet-condenser, in which all the steam is passed through a condensing-nozzle with the water-jet, and then the remaining uncondensed steam conducted into a second nozzle, and again brought in contact with the water, when constructed substantially as herein shown and described.

2. A jet-condenser having two or more condensing-nozzles, so arranged that the steam which is not condensed in the first or main nozzle can pass to the others, substantially as described and shown.

3. In combination with a jet-condenser, a jet-exhauster, constructed and applied substantially as shown, and for the purpose set forth.

141,362.—*Fence-Post Stub.*—GEORGE LAKINS, East Norwalk, Ohio. Application filed May 16, 1873.

A drive-stub formed of vertically-intersecting flanges internally notched to form a socket for the post, and connected at their upper ends by a horizontal cap-plate covering said ends, all cast in one piece to secure strength in driving and avoid joint-rusting.

Claim.—The cast-iron drive-stub for fence-posts, consisting of the vertical flanges *c*, centrally connected in their lower portion, and separated in their upper portion by the internal notches to form a socket, c^2, and the convex cap c^1 covering and connecting the upper ends of the separated portions of the flanges, all said parts being cast in one piece, substantially as specified.

141,363.—*Horse-Power.*—ZACHARIAH P. LANDRUM, Columbus, Miss. Application filed May 27, 1873.

Claim.—The combination of wheel B, bars C C′, having, respectively, step and shoulder sweep D and oblique bar E, in the manner and for the purpose described.

141,364.—*Washing Fluid.*—NATHAN W. LANE, Mendocino, Cal. Application filed March 31, 1873.

Refined potash, carbonate of potash, liquor of ammonia, bicarbonate of soda.

Claim.—A washing-fluid composed of the ingredients above enumerated, compounded in the proportions above specified.

141,365.—*Hoe.*—THOMAS B. LOCKWOOD, SMYRNA, Del. Application filed December 19, 1872.

Claim.—The hoe herein described consisting of an elongated eye made of malleable iron, with a square shoulder on its inside face, and a blade fitted to said shoulder and secured by rivets to the eye-plate, as specified.

141,366.—*Machine for Dressing the Teeth of Saws.*—JOEL LUCIA, Little Suamico, Wis. Application filed October 26, 1872.

The saw is fastened to the block E and so adjusted that the back of one tooth shall rest upon the holder C, the block *w* being raised to bear against the saw and prevent its turning. The cutter has a convex edge that operates to gouge out a portion of the metal near the point of the tooth.

Claim.—1. In a machine for forming saw-teeth, the tool a^3, armed with the under cutter *d*, in combination with the shaft a^1, eccentric a^2, upper die *c*, and adjustable block E, substantially as specified.

2. The adjustable block E, adjusting-screw F, gearing I, vertical shaft H, and hand-wheel *n*, combined substantially as specified.

3. The adjustable block L, shafts K J, and hand-wheel J′, in combination with the slotted frame A of a machine for forming saw-teeth, substantially as specified.

141,367.—*Sewing-Machine Motor.*—GEORGE W. MANSON, Auburn, Me. Application filed January 20, 1873.

Claim.—1. In a sewing-machine motor, the frame H, suspended from and turning freely upon the winding-shaft C, and carrying the pawl I, in combination with the winding-ratchet G, treadle J, and connecting-rod K, arranged to operate as described.

2. The spring O, in combination with the treadle J, and the swinging frame H arranged to maintain the treadle and winding-pawl frame in position to wind the driving-spring without loss of motion, as described.

3. The stops *s s* and spring O, in combination with the treadle J and the swinging frame H, when said stops are arranged to support the treadle and frame H in positions for use against the action of the spring O, as described.

4. The ratchet-wheels G M, having teeth constructed to receive and hold rubber bands, as described, whereby the clicking noise of the spring-pawls is avoided in winding up the power.

141,368.—*Implement for Washing Windows, &c.*—THOMAS J. MAYALL, Boston, Mass. Application filed June 28, 1873.

Claim.—The herein-described implement consisting of a tubular perforated stem fitted with a sponge, held thereon by a nut and washer of rubber, said stem being adapted to connect with a water pipe or hose, either directly or through the intermediary of a handle, as shown and set forth.

141,369.—*Apparatus for Teaching in Schools.*—MALCOLM MCVICAR, Potsdam, N. Y. Application filed April 28, 1873.

A series of slide-bars are arranged to move horizontally in the sides of a supporting-case, and to cover or uncover different sets of figures at the pleasure of the teacher. A sliding frame for holding various objects slides in ways back of the slide-bars.

Claim.—1. In apparatus for teaching in schools, the slide-frame *c*, constructed substantially as described, and adapted for presenting either cards, letter-blocks, or other objects before the opening, as specified.

2. An apparatus for teaching in schools, consisting of the frame *a*, hinged slat-frame *b*, slide-bars 1, and slide frame *c*, substantially as described.

141,370.—*Horse Hay-Rake.*—JOHN H. MEARS, Oshkosh, Wis. Application filed April 26, 1873.

The rake-head of a sulky-rake is adjusted vertically by means of arms pivoted to the frame, and the teeth adjusted horizontally by means of washers and set-screws.

Claim.—1. The castings A′′′′, riveted to the sides of the frame A supporting the stub axle, and provided with the ears *a* and *c* for supporting the swinging arms E, in which the rake-head D is pivoted, substantially as and for the purpose set forth.

2. The rake-teeth A, adjustable in its relation to the upper side of the rake-head by means of the U-shaped curvature *k*, in combination with the bolts and washers *i* and staples *z*, constructed and operating substantially as and for the purpose set forth.

141,371.—*Reverberatory Furnace.*—JOHN MORRISON, Joliet, Ill. Application filed May 8, 1873.

The arrangement of the furnaces side by side and in reverse order permits the products of combustion from either furnace to pass through the other, being admitted to the second through the fire upon the grate thereof and over the fire-bridge, insuring perfect consumption of the waste gases. The flues may be filled with fire-bricks, and act as regenerators.

Claim.—The combination of the two reversed furnaces A and B, their stacks *a* and *d*, the connecting-flues *g* and *f*, and the dampers in the said stacks and flues, all substantially as and for the purpose specified.

141,372.—*Apparatus for Heating and Ventilating Railroad Cars.*—THOMAS H. MOTT, New York, N. Y. Application filed May 2, 1873.

An outside spring left open below and arranged so that it is compressed in bringing the two sections or halves of the joint together, so that the rubber tube in sagging is free from abrasion by the spring. The coupling heads are provided with tooth-shaped guides projecting beyond the faces or ends of said heads at suitable distances apart around their peripheries, whereby the half-couplings are automatically guided.

Claim.—1. The combination of the springs D of a spiral-arched construction, or made open below with the rubber or flexible tubes B, arranged to pass within said springs, and the half-couplings or heads C carried by said springs, substantially as specified.

2. The coupling-heads C provided on their peripheries with wedge or tooth shaped guides G, arranged to project in front of the faces of said heads, essentially as described.

141,373.—*Self-Winding Watch.*—DON J. MOZART, Ann Arbor, Mich. Application filed May 14, 1873.

The winding mechanism is operated by opening and closing the case. The detent-pawl is automatically disengaged from the toothed wheel on the barrel arbor, so that the spring will not be sustained beyond a proper point of winding.

Claim.—1. The combination of the hinged part G of the outer casing, the connecting-bar E, slide I with tooth or arm J, and the wheels *f f′* having the cams *i i*, substantially as and for the purposes herein set forth.

2. The combination, with the shaft *a* and mainspring D, of the cog-wheels *f f′* with cams *i i*, and the spring-pawl A, constructed and arranged substantially as and for the purposes herein set forth.

3. The combination of the single-toothed wheel *b*, wheel *d* with flange *e*, and the rocking bar *p* with pin *s*, constructed and arranged substantially as and for the purposes herein set forth.

141,374.—*Seat or Back of Chairs.*—RICHARD W. MYERS, New York, N. Y. Application filed January 16, 1873.

The bottom or back is constructed of alternate layers of veneer and paper, glued or otherwise suitably connected together.

Claim.—A seat or back for a chair or other article of furniture for sitting or recumbent purposes, composed of alternate layers of veneer and paper, or vice versa, substantially as shown and described.

141,375.—*Plow.*—CHARLES O. NASON, Moline, Ill., assignor to DEERE & Co., same place. Application filed June 21, 1873.

Plates with a recess or socket and set-screw, for the double purpose of a clevis and an adjustable holder for the arms of the plow-wheel.

Claim.—1. The clevis jaw-plates B B, when constructed with sockets or recesses D, for the purpose specified.

2. The combination of the plates B B, having sockets D, with the gage-wheel bands F, beam A, and thumb-screw or nut C, for the purpose specified.

141,376.—*Fire-Proof Safe.*—DAVID O. PAIGE, Detroit, Mich. Application filed August 14, 1872.

Claim.—In a fire-proof safe, a door and a door-frame, when their impinging or contiguous surfaces are constructed of or from corrugated plates of wrought metal, substantially as and for the purpose specified.

141,377.—*Carriage-Top.*—WAYNE I. PECK, Carthage, N. Y. Application filed May 5, 1873.

The top frame *i* are connected by a cushion, which forms a complete back-rest.

Claim.—1. The hinged seat A, having the notched arc or hook *b* and staple *c*, for the purpose of holding the seat up while bringing the frame E in position, as set forth.

2. The carriage-top frame, composed of the sides and cushion-back K, connecting-bar D with dogs I, as described, and for the purpose set forth.

3. The top frame E, bar D, journal-boxes *a c*, arms or dogs I, socket-frames H, levers F F with hand-bar G, and springs *f*, all combined and arranged as described, and for the purpose set forth.

141,378.—*Fire-Escape.*—ABRAM PELHAM, Plymouth, Mich., assignor to himself, LAFAYETTE C. HALL, and SEBE H. FAIRMAN, same place. Application filed April 5, 1873.

The unwinding of the reel actuates the piston by means of the screw-threaded shank. The piston meets with the resistance of the water in the confined chamber, which can only escape therefrom by a narrow opening. This resistance is regulated by the screw-valve G to any required extent.

Claim.—The construction and arrangement of the frame A, reel B with its nut B′ and stud *b* projecting into the groove *a* of the threaded piston-rod D, the piston E, cylinder F provided with the passage *c* and valve G, and the cord H, substantially as and for the purpose set forth.

141,379.—*Manufacture of Glue.*—WILLIAM PLUMER, Lexington, Mass. Application filed January 20, 1873.

The cases are connected by suitable pipes to a heater or steam-chest having a series of air-pipes, whereby the air is heated before entering the drying-cases. The liquid glue is fed to the trays by a hose-pipe, and when the trays are filled the case is closed and air-currents induced by a blower or exhaust. The air, being passed over the glue in fan-shaped currents, prevents the wavy formations in the product.

Claim.—1. The combination of a series of compartments, C, provided with an air-blast and dampers for shutting off the blast from any one or more of the series, whereby either of the compartments can be emptied or replenished at will while the others are being operated on by the blast, substantially as described.

2. The combination of the drying frame or racks *m* with the supply-pipes H and the pipes I, having the narrow slits therein, arranged to deliver the air over or across the pans or racks in a fan-like form, substantially as described.

141,380.—*Machine for Shaping Piano-Keys.*—MILON PRATT, Deep River, Conn. Application filed May 23, 1873.

By the traverse of the tool-carrier C the ends of the keys are trimmed to the uniform shape required, as at K, Fig. 2.

Claim.—In combination with the bed and clamping device for holding the key, the cutter-holder C, carrying the cutter *d* and guided in its proper path, substantially as set forth, and for the purpose specified.

141,381.—*Master-Key Lock.*—ANDREW RANKIN, Philadelphia, Pa. Application filed July 2, 1873.

A lock adapted to be operated by a master-key or an ordinary key. The tumblers are provided with two gates for the reception of the bolt-stump, and with slotted openings for the reception of the pin on which they turn, so that the bolt may be unlocked by either key, and when unlocked may be locked by either key.

Claim.—A master-key lock in which some or all of the tumblers are provided with two gates, and have slotted openings adapted to the pivot-pin, as specified.

141,382.—*Door-Hanger.*—ALEXANDER K. RIDER, Walden, N. Y., assignor to GEO. C. WOOSTER, JAMES GOWDY, and ALEXANDER K. RIDER, same place. Application filed June 16, 1873.

Combination within the hanger of friction-rollers and bearing for same.

Claim.—In a hanger or carrier for sliding doors and gates, the combination of the series of friction-rollers G G and the flat bearing for the same, said rollers passing over the track E, substantially as and for the purpose herein set forth.

141,383.—*Breech-Loading Fire-Arm.*—JOSEPH RIDER, Newark, Ohio. Application filed March 15, 1873.

The extractor is hung on a hub of the breech-block eccentric to its axis to give power for starting the cartridge, while allowing of a sudden impulse for ejection by means of a spring. Also, a projection is formed on the guard-strap, so as to insure the engagement of the catch. Also, other devices indicated by the claims.

Claim.—1. The extractor *u*, in combination with the eccentric *d*, constructed and arranged to operate substantially as described.

2. In combination with the pivoted catch *a*, the projection *y* on the guard-strap, when arranged to operate as set forth.

3. The fly A, constructed and arranged to operate as described, whereby it holds the hammer while the arm is being loaded, and is disengaged therefrom when the hammer is set at full-cock.

4. The bent spring G, having its lower end split to form two springs of different lengths, and arranged as described, whereby it serves to operate the hammer with its locking-dog and catch, and also the trigger and fly, as set forth.

5. The combination of the breech-block D, provided with the shoulder *n* and eccentric *d*, the extractor provided with the shoulder *o*, incline *r*, and wedge-shaped point *u*, working in the inclined groove, and spring *j*, all constructed and arranged to operate substantially as herein described.

6. The spring-button *w*, having the screw that holds it in position formed thereon, or rigidly attached thereto, substantially as described.

141,384.—*Breech-Loading Fire-Arm.*—JOSEPH RIDER, Newark, Ohio. Application filed October 24, 1872.

Claim.—1. The extractor I, provided with the projection *a*, fitted in the recess, whereby a pivot-pin is dispensed with and the extractor made to operate as described.

2. The lever G, arranged as described in relation to the breech-piece C and the trigger T, whereby it is made to lock the trigger in the half and full-cock notches, hold the breech-piece closed, and serve as a cam or incline to operate the firing-pin retracting-lever *t*, as set forth.

3. The locking-brace E, mounted on a pivot independent from that of the hammer, and provided with a catch to engage with the hammer, in combination with the swinging breech-piece C and hammer D, all constructed and arranged to operate substantially as described.

4. The lever F, pivoted to the hammer, and arranged to have its front end bear against the independent locking-brace E, and its rear end forming the bearing for the mainspring, all constructed and arranged to operate substantially as described.

5. The arrangement of the pins A, *i*, and *g* with the button *l* and screw *y*, whereby the three pins are all held in place by means of a single screw, and all the pins still be free to turn in their bearings, substantially as described.

141,385.—*Sash-Fastener.*—AMOS C. RODGERS, Suffield, Conn., assignor to himself and JAMES A. HAMILTON, same place. Application filed May 1, 1873.

Both a frictional and positive fastening.

Claim.—A spring-slide, A, provided with a pad, *e*, for bearing against the edge of a sash, and with a projection, *f*, for locking the sash, in combination with an inclined and slotted socket, B, adapted to the slide and secured to the window-frame, all substantially as specified.

141,386.—*Device for Preventing Horses from Crowding.*—OLIVER C. ROSE, Penfield, N. Y. Application filed May 31, 1873.

A blade provided with a projecting pin. The blade is inserted through one of the loops of the tug and back-strap.

Claim.—The device herein described, consisting of the blade *a*, head *b*, and pin *c*, arranged to be inserted in the loops of the harness, as herein shown and described.

141,387.—*Electric Railway-Signal.*—DAVID ROUSSEAU, New York, N. Y., assignor to himself and WILLIAM C. SMITH, same place. Application filed February 17, 1873.

Signal rotated by weight controlled by electro-magnet. Two

circuits to magnet form different points closed by train. One closed, setting the signal, circuit is shifted by arms *f* on the signal-shaft to other closer, so as to release signal, when circuit is again shifted to setting-closer. Lamp-guard cannot be opened till weight is wound up.

Claim.—1. The signal-stem C, provided with arms or projections *b*, which lock it against the armature F both in its displayed and concealed positions, as specified.

2. The cams or projections *f* and *g* on the stem C, arranged in combination with the springs *i* and *h*, for operation in the manner set forth.

3. The signal connected metallically with one electro-magnet and alternately with one of two operating instruments, as specified.

4. A lamp-guard, I, locked to a signal apparatus so that the said guard cannot be opened without the previous winding of the signal-operating clock-work, substantially as herein described.

5. The combination of the rotary pin *r* with the lever J, hook *n*, and guard I, as set forth.

141,388.—*Cement-Pipe Mold.*—FRANKLIN I. SAGE, Springfield, Mass. Application filed June 7, 1873.

A contractible core cylinder controlled by a vertical shaft operating through suitable mechanism.

Claim.—The inner or core cylinder D, made of a single piece of sheet metal with the edges overlapping, and provided with vertical flanges *f f* and vertical bar h, pivoted at its upper end between said flanges, substantially as and for the purposes herein set forth.

2. The plate J attached to the arms *k k*, and provided with slot *i*, in combination with the pin *m* on the end of the bar h, substantially as and for the purposes herein set forth.

3. The combination of the shaft G, arms *k k* passing through slots *i i* in the cylinder, and disk H for operating the ring I surrounding the cylinder D, substantially as shown, and for the purposes set forth.

141,389.—*Fruit-Crate.*—LOUIS SELLING, Detroit, Mich. Application filed June 27, 1873.

A crate constructed from rounds connected by tenons and mortises so arranged as to operate in sections for a retransportation, after use, in small packages. The parts are of proper length to form the crate, and for use are held together by rings and bolts to secure the fruit in transit.

Claim.—The combination of the bottom A, sides B C, top D, and ends E with the rings *a* and bolts *d*, when the parts are arranged as and for the purposes set forth.

141,390.—*Table-Caster.*—CEVEDRA B. SHELDON, New York, N. Y. Application filed June 17, 1873.

Claim.—1. The combination with balls and standard of a bearing-plate, E, for the caster-holder, consisting of the inverted cup *e* with hole *e*', to bring the bottom edge of said cup on the outer side of the balls, to take the bearing-plate entirely out of contact with the bolt, and thus throw all the friction on the balls, in the manner set forth.

2. The socket *b*, enlarged so as to have a bearing on bolt only at the top, in combination with the cup *e* having a bearing on the outside of balls, but not touching bolt, to produce a minimum of sliding friction, in the manner set forth.

141,391.—*Stool.*—CEVEDRA B. SHELDON, New York, N. Y. Application filed June 17, 1873.

A ring provided with journal-arms and friction-rollers is arranged between the seat and standard, the upper end of the standard being provided with a circular groove to receive the friction-rollers.

Claim.—The ring K provided with journals *k* and friction-wheels L, arranged between seat and stand, as and for the purpose set forth.

141,392.—*Machine for Dressing Millstones.*—SAMUEL SHIVE, Forks, and DAVID SAVAGE, Orangeville, Pa.; said SAVAGE assignor of one-third his right to said SHIVE. Application filed June 3, 1873.

The pick, together with the cam-shaft for operating it, are hung in a frame-work which admits of the same being moved to any point about the millstone.

Claim.—1. The frame *c*, secured to the floor by means of the pins *c'*, and carrying the operating-shaft for communicating motion to the pick, substantially as set forth.

2. The pick 4, constructed as described, in combination with the spring 5, levers 6 6', and catch 7', substantially as shown and described.

3. The combination of the frame *c*, shaft *d*, arms *l n*, cam-shaft 2, picks 4, and the connecting belts and pulleys, substantially as shown and described.

141,393.—*Cotton-Press.*—THOMAS S. SMITH, Toomer's Station, Texas., assignor of one-half his right to JOHN P. GILDERSLEEVE, Niverville, N. Y., and JOHN W. BLAKE, Springfield, Mass. Application filed July 9, 1873.

A platform raised and lowered by a pair of arms, with adjustable levers operated by ropes attached to a revolving drum.

Claim.—The cotton-press herein described, consisting of the levers D, pivoted to the under side of the movable follower C, toggle-arms *d d* attached to shafts *d*[1] and levers D, pulley F provided with the windlass E and ratchet-wheel F', windlass G, and ropes *d*[2], all arranged and operating in the manner set forth.

141,394.—*Force-Pump.*—OSCAR SNELL, Williamsburg, Ohio, assignor to R. B. HERRON, Danville, Ind. Application filed March 22, 1873.

The sliding valve of the pump has a single port, and has imparted to it a positive movement by means of a projection on the plunger acting against two adjustable tappets on the valve-rod. The valve-seat is made detachable, and the part upon which the valve slides is raised above the common surface, and in length is shorter than the length and stroke of the valve, in order that the wear may be evenly distributed.

Claim.—In combination with the pump proper A, the detachable valve-seat N, substantially as shown and described.

141,395.—*Electric Railway Signal Apparatus.*—HENRY W. SPANG, Reading, Pa. Application filed May 11, 1872.

Geissler tube used for visual signal at night.

Claim.—1. A Geissler or vacuum coil bulb or tube illuminated by electricity, in combination with a track or railway switch circuit-closer, for general railway-signal purposes.

2. In combination with a railway-signal apparatus, a visual signal illuminated by an induced electrical current, for the purpose set forth.

141,396.—*Fog-Alarm.*—COLLINS STEVENS and GEORGE M. STEVENS, Boston, Mass. Application filed March 27, 1872.

A series of pins on a pendulum-escapement-wheel is arranged with a suitable let-off lever to regulate the period of the hammer-strokes upon the bell, while another escapement-wheel, by which the hammer is reciprocated, carries a count or pattern wheel by which the intervals between the strokes may be varied as desired.

Claim.—1. The combination of the time-disk D^2 with its pins, the latch D^3, rocker-shaft D^4, weight D^6, cam D^7, and bent lever B^6, operating, in connection with the lever B^5 and arm B^1, as a timing and stopping device for the striker.

2. The combination of the subject-matter of the first claim with the count-wheel B^3, operating substantially as described, and for the purpose set forth.

141,397.—*Sewing-Machine for Banding Hats.*—JAMES STEWART, Jr., Yonkers, N. Y. Application filed April 25, 1873.

The presser is provided with a finger-guide to bear against the brim, and is adjustable laterally on the presser-rod so as to sew the band at either edge or centrally. The gage is adjustable about the presser-bar so as to accommodate the band to any shaped crown.

Claim.—1. The presser-foot E provided with a back finger-guide, F, and adjustable in direction of its width, or transversely to the feed and relatively to the needle, substantially as specified.

2. The combination, with the transversely-adjustable presser-foot E, of the adjustable gage G, when the latter is connected with the presser-bar by a lever, H, adjustable around the axis of said bar, and by a sliding pivot, *f*, in transverse relation with the feed, essentially as and for the purposes herein described.

141,398.—*Machinery for Folding Leather.*—EDWIN B. STIMPSON, New York, N. Y. Application filed July 9, 1873.

The machine is composed of a reciprocating bed; a hinged clamp, consisting of two plates, for holding the leather in position; a tongue arranged between the two plates of the clamp, capable of being moved forward and backward for folding the leather; and a heated flat-iron, which may be vertically adjusted, so that the fold may be permanently secured.

Claim.—1. The machine for folding leather, composed of the reciprocating bed B, the holding device with its tongue I, and the iron, shaped to conform to the intended profile of the leather, and having a reciprocating movement in a plane perpendicular to that of the bed's motion, the whole combined and organized substantially as and for the purpose specified.

2. The iron C, formed with a flange, *f*, extending along its front at its bottom edge, whereby the leather is first turned up, and is afterward folded over and pressed down, substantially as herein described.

3. The combination of the socket-like shank *g* of the iron C, the screw D working therein, and its operating device, essentially as and for the purpose set forth.

4. The combination, with the lever K pivoted to the upper of the plates G G, and connected with the tongue, as described, of the supplementary lever S pivoted to the aforesaid lever, and provided with a pin to lock into the plate G just mentioned, essentially as and for the purpose set forth.

141,399.—*Shoe-Edge-Burnishing Machine.*—NATHAN C. STOW, Rockland, Me. Application filed April 7, 1873.

Claim.—The arrangement of the wheels or disks of a sole-burnishing machine, as herein described, as a consequence of which each one projects beyond the one in the rear of it for the purpose of enabling more than one person to work on each end of the machine at one and the same time, as set forth.

141,400.—*Cultivator-Tooth.*—GEORGE F. STROUD, Oshkosh, Wis., assignor to WILLIAM D. STROUD, same place. Application filed June 3, 1873.

A slip-tooth, released from working position when brought in contact with any fixed obstruction, in the manner shown in the drawing, can be replaced by a blow of the foot, without the use of a wrench or the loosening of a bolt.

Claim.—The shank B provided with the knuckle D and pin C, and the slotted and recessed plate G provided with projections F F, in combination with the drag-bar K and spring J, substantially as and for the purpose herein before set forth.

141,401.—*Machine for Forming Auger-Bits.*—JAMES SWAN, Seymour, Conn. Application filed April 10, 1873.

The moving die or former I, with operative face divided into two planes oblique to its axis and to one another, and with a slight taper to properly graduate the thickness of the spurs which it swages against the wall of the recess, is in its forward movement partly turned over by means of the inclined plane L, and a sudden supplemental movement in the same direction, when at the end of its stroke, is imparted by a cam on the driving-shaft that strikes an arm projecting laterally from the die-arbor.

Claim.—1. In a machine for forming the heads of augers, the dies B B', having the rib *a* and the enlarged recess *d* forward of the said rib, and upon which rib and within said recess the head is formed.

2. In combination with the dies B B', the die I, having a partial rotation imparted thereto as it advances toward the holding-dies, substantially as set forth.

3. In combination with the dies B B', the die I, provided with a mechanism substantially such as described, for imparting a partial rotation thereto after it has arrived at its extreme forward movement, substantially as set forth.

141,402.—*Washing-Machine.*—JAMES W. TAYLOR, Ashland, Va. Application filed June 13, 1873.

Is constructed with a square receptacle with bar or grate, center shaft, and door. The journals extend through the outer box or tub, to which a crank is attached, by which motion is imparted. The outer tub or box is constructed with cross or projecting bars in each corner to give motion to the water in its revolution. The crank is connected to a pin projecting from a plate, to which the gears are attached.

Claim.—The combination of the rack C, corner-pieces S S, bracket G, and its gearing E D, as and for the purposes set forth.

141,403.—*Nut-Lock.*—FREDERICK P. THOMPSON, Fredericktown, Canada. Application filed June 2, 1873.

A base-plate, fitted with a collar having a projecting fastening, is placed eccentrically on the bolt and under the nut. When the nut is screwed down in position the collar is turned around until the fastening device engages with a corner of the nut.

Claim.—1. The combination of the base A, provided with shoulder *a* and points *c*, with the annular plate B having fastener *b*, all being constructed and operating as set forth.

2. In combination with the base A, provided with shoulder *a* and points *c*, and annular plate B provided with fastener *b*, the eccentric axis formed by screw-bolt *c*, as shown.

141,404.—*Brick-Kiln.*—HOREA TUGBY, Woodville, England. Application filed May 6, 1873.

The heated products of combustion may be used successively in all the chambers, or they may be conveyed away to the exit-flue F through the branch flue H, with which each compartment is provided.

Claim.—1. The combination, in a kiln, of external fire-places *a*, shields *b*, arranged parallel to and and a short distance from the side walls, and perforated shields D, between which and the end walls are vertical flues communicating with horizontal flues E, substantially as set forth.

2. A kiln, consisting of a series of chambers, fire-places *a* communicating with each chamber, flues E arranged below the perforated bottoms of the chambers and forming the communications between them, and a flue, F, communicating independently with each flue E and with the chimney G, all substantially as described.

141,405.—*Paper-Folding Machine.*—GEORGE W. D. UPTON, Springfield, Mass. Application filed March 19, 1873.

Many sheets are squared against gages and folded by a reciprocating blade through a recess in the table, between one pair of two rollers into the bite of a second pair. The latter feed them through a third pair, which deliver the package to discharge-belts.

Claim.—1. In combination with the rolls D, having their bearings against the springs *g*, the reciprocating blade E, operating between said rolls, the endless aprons *c'*, and the rolls which carry the same, all constructed and operating substantially as described.

2. In combination with the endless aprons *c'* and the rolls *c* and *e*, the swinging pieces I and rolls *c'*, whereby the endless aprons may always be adjusted taut, to properly adhere to said rolls, substantially as described.

141,406.—*Belt-Pulley.*—ALVIN V. VROOMAN, Roxbury, N. Y. Application filed May 24, 1873.

Claim.—The combination of the adjustable blade D with adjustable gage G when arranged upon block or head A, as described, and for the purpose set forth.

141,407.—*Plaiting Attachment for Sewing-Machines.*—WILLIAM WALKER, Brooklyn, assignor to GEORGE H. WOOSTER, New York, N. Y.—Case B. Application filed May 15, 1873.

The "tongs" or nippers are provided with blades that engage the fabric to be plaited at both sides. The nippers have a horizontal as well as a vertical motion, and the blades grasp and release the fabric, and, as they move forward and rise by the beveled edge of the cloth-plate, the plait is formed with certainty.

Claim.—1. The tongs I arranged to vibrate horizontally and also vertically with reference to the stationary plate A, having a pendent or beveled edge, *m*, to produce the plaites or ruffles by their motion toward and along such edge *m*, substantially as described.

2. The blade *f* attached to the rock-shaft H, which turns in the vibrating frame G, in combination with the blade *g* attached to the bar h, and operated substantially as herein shown and described.

141,408.—*Attaching Knobs to Spindles.*—HENRY J. P. WHIPPLE, Meriden, Conn. Application filed June 19, 1873.

Claim.—The combination of a brake, operating on the wheels of a railway locomotive, car, or truck, with an air-reservoir, an independent steam-pump, operated by steam from the locomotive-

Claim.—The detached knob and neck D and E, in combination with the spindle A, when the said knob is provided with a screw, C, and latch *b*, and the neck constructed with one or more notches, *a*, by means of which and the said latch the knob and neck are coupled together, substantially as set forth.

141,409.—*Work-Box.*—HENRY E. WILCOX, Ilion, N. Y. Application filed March 25, 1873.

Claim.—1. The method of holding the detachable cover *a* in place by means of the molding O, arranged substantially as described.

2. The molding O having the cover *a* secured to it, and arranged in connection with the cushion C and lid E, as and for the purpose set forth.

3. In combination with the box, the drawer D, having the button or fastening *l* on the inside, substantially as and for the purpose described.

4. As a new article of manufacture, the herein-described work-box, consisting of the body A, drawer D, and lid B, with the cushion C, all arranged to operate as set forth.

141,410.—*Apparatus for Emptying Sinks and Cesspools.*—FRANCIS J. WILDENTHALER, Philadelphia, Pa. Application filed May 26, 1873.

When it is necessary to prime the pump the valve is withdrawn and the inlet-channel filled with water. The sliding valve is connected loosely to its shaft by a yoke, and is held against its seat by a spring, which permits it to lift when any hard substance becomes entangled. The form of the inlet and exit channels permits the free passage of the gases.

Claim.—1. The L-shaped inlet-channel provided with a valve, K, for priming the pump, as shown and described.

2. The valve F, combined with the yoke F^1 and spring F^2, to operate on the ports J and J', substantially as shown and described.

3. The cage O, with closed bottom, arranged to open at the top, as and for the purpose set forth.

4. The inclined channels leading upward from the highest point in the cylinder to the valve F, and, in combination with said valve, operating as set forth and described.

141,411.—*Wheel for Vehicles.*—HUGH WILLIAMS, Apple River, Ill. Application filed March 29, 1873.

An annulus having sockets for the spokes is placed on the inner portion of the hub, which forms the axle-box and inner flange.

Claim.—The hub-core cylinder A, constructed with the broad inner flange B and conical extension *a*, in combination with the annulus C, having the disk-flanges *b* and *d* and partitions *c*, substantially as and for the purpose specified.

REISSUE PATENTS.

5,502.—*Nail Extractor.*—GEORGE J. CAPEWELL, Cheshire, Conn. Patent No. 129,310, dated July 16, 1872. Application filed March 14, 1873.

The nipping-points can be driven into the wood retaining the nail by the solid rod B. The pipe A serves as a lever. The extended arm C is the fulcrum.

Claim.—A nail-extractor, provided with a movable jaw and fulcrum, in combination with a percussive device, constructed and operating substantially as shown and described.

5,503.—*Paper-Cutting Machine.*—HERVEY LAW, Chatham, N. J. Patent No. 42,200, dated April 5, 1864. Application filed February, 3, 1873.

The knife-stock is swung above the table between vertical guides and connected, by a rod, to its actuating-lever, which passes beneath the table and is pivoted to one side of the frame. To the long arm of the lever is attached a vertical rack which connects with a pinion and shaft, by which the knife is operated.

Claim.—1. The combination of the lever F with the knife and rack and pinion, substantially in the manner and for the purpose herein shown and described, or its equivalent, constructed and operated substantially as described.

2. The arrangement of the knife-stock above the table and the actuating-lever beneath the table, the latter being hung to the knife-stock at one end by a rod and to actuating mechanism at its opposite end, both connections being outside of the frame of the machine, substantially as described.

5,504.—*Steam-Power Brake Device.*—GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa.—Patent No. 88,929, dated April 13, 1869. Application filed May 26, 1873.

Claim.—1. The combination of a brake, operating on the wheels of a railway locomotive, car, or truck, with an air-reservoir, an independent steam-pump, operated by steam from the locomotive-boiler, for charging the same, and a brake-cylinder, connected with the reservoir by suitable pipe or pipes, furnished with cocks for charging, discharging, and graduating the pressure in the brake-cylinder.

2. The combination of a brake-cylinder, operating on the wheels of a railway locomotive, car or truck, with an air-reservoir, an independent steam-pump, operated by steam from the locomotive-boiler for charging the same, a brake-cylinder, connected with the reservoir by suitable pipe or pipes, furnished with cocks for charging, discharging, and graduating the pressure in the brake-cylinder, and flexible extension pipes for connecting between cars and coupling, which, when subjected to unusual strain, are self-detaching.

3. The combination of a brake, operating on the wheels of a railway locomotive, car, or truck, with an air-reservoir, an independent steam-pump, operated by steam from the locomotive-

boiler, for charging the same, a brake-cylinder, connected with the reservoir by suitable pipe or pipes, furnished with cocks for charging, discharging, and graduating the pressure in the brake-cylinder, and a pipe or pipes extending from end to end of the car, and furnished between cars with valves which close automatically when the pipes are uncoupled.

4. Valves arranged in the adjacent ends of the coupling *f*, and guided by stems and guides, so as to open each other when the couplings *f* are united, and to close automatically when uncoupled, substantially as above set forth.

5. In atmospheric car-brake apparatus, the couplings for connecting the ends of the air-pipes between the cars, when attached to each piece by flexible connections, substantially as hereinbefore described, whereby they become automatically detached when exposed to more than the usual strain.

6. The combination of a car-brake operating on the wheels of a railroad vehicle, with an air-reservoir, a brake-cylinder, a connecting pipe or pipes from the reservoir to the brake-cylinder with flexible extensions for connecting between cars, and automatically detachable couplings on the flexible connecting-pipes, with or without valves, substantially as set forth.

7. The arrangement of the brake-lever in relation to the piston-stem of the brake-cylinder, substantially as described, whereby the brake-lever may be operated by the ordinary hand apparatus, without operating the brake-cylinder, and independently of the power-brake apparatus.

8. An auxiliary engine arranged on a locomotive, so combined with an air-pump and a feed water-pump as to operate them separately or together.

5,505.—*Steam-Power Air-Brake Device.*—GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa.—Patent No. 117,841, dated August 8, 1871. Application filed May 26, 1873.

The power actuating through the piston-rod on the short arm of the bent lever will give a rapid throw to the rod, connecting its longer arm with the brake-lever and cause the brake-shoes to rapidly approach the wheels. As the piston and brake rod come in line the power is applied more slowly and directly. By means of the peculiar arrangement of the spring the car-brakes, when released, clear the wheels quickly and entirely. By providing male and female couplings at each end of the car they will always have the same relative arrangement if any of the cars in the train be turned end for end. The flexible connections permit those of each car to be coupled together to exclude dust when not in use.

Claim.—1. A bent lever receiving power by its shorter arm from the piston-stem and communicating the same from its longer arm to the brake-lever, arranged and combined substantially as described.

2. A spring arranged in connection with the lever in a power car-brake apparatus, so that the spring will act with a continually-increasing power in causing the brake-shoes to clear the wheels, substantially as described.

3. In a power car-brake apparatus, the arrangement of male and female pipe-couplings, with flexible connections at each end of the car, substantially as described.

4. The arrangement of two pipes at each end of each car furnished with flexible connections and suitable couplings, so that the pipes at the end of any car of the train may be coupled together, thus effectually closing both pipes.

5,506.—*Steam-Power Car-Brake Apparatus.*—GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa.—Patent No. 115,667, dated June 6, 1871. Application filed May 26, 1873.

The air is exhausted from behind the piston, to assist in releasing the brakes, by means of a steam-siphon. A valve is located between the cylinder and the siphon to prevent the passage of steam into the former while a vacuum is being formed therein. By means of these devices air may be applied to one side of the piston to apply the brakes, and by exhausting the same the atmospheric pressure may be employed to relieve them.

Claim.—1. A steam or air discharging nozzle, arranged in the air-outflow pipe of a car-brake cylinder, discharging in the direction of the outflow of air from the cylinder, and in combination with such cylinder, substantially as described.

2. In combination with the subject-matter of the previous claim, a check-valve, *m*, arranged substantially as set forth.

3. In a power-brake apparatus, a brake-cylinder and piston in which air pressure is applied to one side of the piston in order to apply the brakes, and to the opposite side to release them.

5,507.—*Well-Tube.*—SAMUEL H. DICKERSON, Hudson, Mich.—Patent No. 109,699, dated March 8, 1870.—Division A. Application filed May 26, 1873.

A well-tube provided with a number of holes, around each of which is a countersink deep enough to receive a piece of wire-gauze and a cap which fits snugly in the countersinks around the holes. Each cap has a suitable opening in the center, through which the screens are seen. The wire-gauze is placed in the countersink, and the cap pressed on top and held in the countersink by friction or any other means.

Claim.—The well-tube A having countersunk holes, the screens *a a*, and caps *b b*, placed within the countersunk holes over the edges of the screens, all substantially as and for the purposes herein set forth.

5,508.—*Earth-Auger.*—SAMUEL H. DICKERSON, Hudson, Mich.—Patent No. 109,698, dated March 8, 1870.—Division B. Application filed June 24, 1872.

Claim.—The auger B, constructed as described, so as to allow the dirt to be drawn up with it, substantially as set forth.

5,509.—*Wheel for Vehicles.*—LATHROP DORMAN, Williamantic, Conn., assignor to CHARLES W. FILLMORE and JOHN R. MINER, Patent No. 64,955, dated May 21, 1867. Application filed April 19, 1873.

The shell is driven onto the wooden portion, and the spokes form arches on the outside and on the inside of the bars of the shell.

Claim.—1. The combination of the grooved wooden center A with the metal shell B, having its front and back portions connected with the single bars *f*, in the manner substantially as set forth.

2. The combination of the grooved wooden center or core A, whether with parallel or inclined sides to the groove *f*, as described; the spokes E, whether with wedges inserted as described or otherwise; and the metal-mortise shell B, said shell being constructed substantially as and for the purposes set forth.

5,510.—*Material for Distemper Painting.*—HENRY M. JOHNSTON, New York, N. Y.—Patent No. 99,967, dated February 15, 1870. Application filed July 21, 1873.

The glue or other binding material is either mixed in solution with the coloring material and then dried and pulverized, or the binding material coloring matter is prepared in separate packages. The object is to have definite and determined shades ready for use.

Claim.—The materials for distemper painting herein before described, consisting of pulverized glue or other binding substance and pigments, prepared and put up in packages, either separately or mixed, substantially as and for the purpose set forth.

5,511.—*Fence.*—ISRAEL L. LANDIS, Lancaster, Pa. Patent No. 129,837, dated July 23, 1872. Application filed June 26, 1873.

Removable panels are held between posts by pins passing through holes in end pieces of panels and the posts. By withdrawing the lower pins the lower ends of the panels will be swung out by the force of a flood of water.

Claim.—The combination of the perforated posts C, the removable fence-sections having posts B with receptacles, and the pins D passing through the perforated posts and into the receptacles, for supporting the sections and preventing the raising and lowering of the same by small animals.

5,512.—*Boat-Lowering Apparatus.*—GEORGE W. MALLORY, Mystic Bridge, Conn. Patent No. 112,930, dated March 21, 1871. Application filed July 14, 1873.

To davits arranged to and from the sides of the ship or boat hinged at its bottom for adjustment, held by lines passing through blocks connected to the deck, on the end of which the boat is suspended by block and fall, and is sustained in its position by chocks, the outside ones pivoted to the slots in the sustaining-bar, which, by dropping, the boat is released and lowered to the water by the fall and block.

Claim.—1. The davits D hinged at *e*, sufficiently inboard to allow the boat to be stowed between the hinged davits and the vessel's side, with the davits always in position on the same side of the boat, as herein specified.

2. The hinged davits D, turning on the hinges *e*, in combination with chocks F F', the outermost of which is removable, so as to avoid a necessity for hoisting the boat out of the chocks, as herein specified.

3. The guide G, secured firmly to the vessel, and combined with a hinged davit, D, arranged to transverse outboard and inboard, as herein specified.

5,513.—*Cotton-Plow.*—ZACHARIAH B. SIMS, Bonham, Tex. Patent No. 94,350, dated August 31, 1869. Application filed April 21, 1871.

The frame is nearly square in form, having a mold-board plow upon each side, and holes in the rear for the insertion of cultivator-teeth. An arched plant-protector extends from plow to plow, which can be removed at pleasure.

Claim.—1. The curved flanges K K combined with the plows G G, substantially as described.

2. The removable curved flanges K K adapted to be bolted or otherwise attached to the plows G G, substantially as set forth.

3. The plow-tooth I, in combination with the plows G G, constructed, arranged, and operating substantially as described.

4. The flanged protector *d*, in combination with the curved flanges K K, as and for the purpose specified.

5. The plows G G, in combination with the curved flanges K K and protector *d*, operating as set forth.

5,514.—*Spittoon.*—WILLIAM H. TOPHAM, Longmeadow, Mass.—Patent No. 106,094, dated August 2, 1870. Application filed January 24, 1873.

The bottom or lower part of the vessel is formed with a weight so arranged in or about said bottom that when the vessel is upset it will regain an upright position.

Claim.—1. A spittoon, or similar vessel, weighted at its bottom to insure its stability and enable it to right itself in case of being tilted, substantially as specified.

2. The arrangement of the weight between the two layers or thicknesses of material of which the bottom of the spittoon or similar vessel is composed, substantially as and for the purpose specified.

5,515.—*Car-Roof.*—JOHN C. WANDS, Nashville, Tenn.—Patent No. 136,569, dated March 4, 1873. Application filed May 3, 1873.

The rafters are made with angular upper surfaces, and are grooved to receive purline plates, the object being to lessen weight without detracting from strength.

Claim.—1. The car-roof herein described, having the wooden frame consisting of the parts A B C W, the bands E and K, the zinc sheets D, and grooved roof-boards G, the several parts being constructed and arranged substantially as and for the purpose specified.

2. In a car-roof, the central T-shaped purline F, having a depressed body and covering flanges, substantially as and for the purpose specified.

3. The combination of the purline F, roof-boards G, and frieze-boards C, constructed and arranged in a car-roof, substantially as described.

4. In a car-roof, the boards C *c*, having grooves *f* on their under sides to form drains for leakage, substantially as and for the purpose specified.

5,516.—*Paper-Folding Machine.*—ALVAH WASHBURN, Medina, Ohio.—Patent No. 133,393, dated November 26, 1872. Application filed May 1, 1873.

The folding-frames are yieldingly connected by springs to arms, vibrated by their segmental gears, engaging with levers actuated by cams on a shaft, which receives rotative movement through connection with the reciprocating bed of a printing-press.

Claim.—1. The arm P, shaft Q, and springs M V, in combination with each other and with the folding-frames, substantially as and for the purpose specified.

2. In combination with the driving or cam shaft U, the loose wheel X, pawl Y, catch Z, and rope Z', combined with the bed of a printing-press, as and for the purpose described.

3. The combination of the weighted cord X', loose wheel X, pawl Y, cam-shaft U, lever T, rack and pinions R S, catch Z, and rope Z', combined with each other, substantially as described, to operate in connection with the bed of a printing-press, as set forth.

INDEX OF INVENTIONS PATENTED JULY 29, 1873.

	Class No.	Whole No.
Alarm, burglar, M. H. Perkins	24	141,291
Alarm, fog, C. and G. M. Stevens	158	141,366
Auger bits, machine for forming, J. Swan	29	141,401
Auger, earth, S. H. Dickerson, (reissue)	29	5,508
Baggage check, J. M. Curless	146	141,285
Ball squeezer, puddler's, F. Danks	125	141,297
Balusters, machine for cutting, Frantze, Tillesen, and Gregersen	174	141,314
Barrels, machine for dressing and crozing, W. Brown	40	141,317
Bit, expansive, W. A. Clark	29	141,394
Bit stock, A. D. Goodell	29	141,345
Blind, inside, E. Metcalf	62	141,396
Boat lowering apparatus, G. W. Mallory, (reissue)	13	5,512
Boiler attachment, wash, C. P. Chapman	136	141,323
Boilers, straw burning attachment for steam, Kellogg and Coffin	140	141,350
Boilers, water regulator for, C. J. Weid	142	141,392
Bolster plates, manufacture of, W. J. Lewis	31	141,227
Bolt cutter, Fawcett and Setton	109	141,385
Boot brushing apparatus, Beck and Schneidt	23	141,196
Boots and shoes, manufacture of, J. Boyle	16	141,257
Boots and shoes, manufacture of, J. L. Joyce	16	141,357
Bottling liquids, J. Klee	1	141,360
Brake device, steam power, G. Westinghouse, Jr., (reissue)	123	5,504
Brake device, steam power air, G. Westinghouse, Jr., (reissue)	122	5,505
Bridge, iron, Bender, Latrobe, and Smith	21	141,310
Bridge truss, F. Schwatka	21	141,393
Bridle bit, V. C. Di Tergolina	72	141,334
Burner, smoke and steam, Kingman and Burgess	140	141,377
Camera stand, N. S. Bowdish	111	141,256
Can for oil, &c., M. W. House	136	141,224
Car axle box, Hill and Sargent	122	141,350
Car brake apparatus, steam power, G. Westinghouse, Jr., (reissue)	123	5,506
Car coupling, W. B. Barnes	122	141,258
Car coupling, E. Bickell	122	141,312
Car coupling, G. Koeb	121	141,278
Car coupling, E. W. Polenbet	122	141,290
Car mover, R. A. Cowell	70	141,287
Car roof, J. C. Wands, (reissue)	121	5,515
Car starter, J. Corbell	120	141,326
Cars, apparatus for heating and ventilating railroad, T. H. Mott	154	141,372
Cars, combined brake and propelling mechanism for, J. W. Hill	122	141,272
Carpet cleaner, J. Spaulding	62	141,243
Carpet lining machine, J. R. Harrington	95	141,370
Carriage seat shifting rail, H. Dressel	31	141,335
Carriage top, W. L. Peck	31	141,377
Cask, brewer's steaking, J. Jaekel	19	141,354
Caskets, composition for burial, W. H. Rose	35	141,238
Caster, table, C. B. Sheldon	34	141,389
Chain for horse powers, link of endless, A. W. Gray	150	141,288
Chair, folding, E. J. Harrison	62	141,371
Chair, reclining, G. Buchanan	62	141,319
Chair seat, J. P. Sinclair	62	141,395
Chair seat or back, R. W. Myers	62	141,374
Churn, rotary, E. A. Hewitt	45	141,349
Chlorine, manufacture of, H. Deacon	11	141,333
Copper balls, hardening, A. Welden	99	141,247
Corpse cooler, S. H. Crump	29	141,331
Cotton scraper, W. Jarrell	43	141,365
Cultivator, E. Briggs	43	141,189
Cultivator teeth, G. F. Stroud	43	141,400
Curtain fastener, J. F. A. Blatterlein	68	141,313
Disinfectant compound, J. Hilton	98	141,374
Dispatch apparatus, pneumatic, C. W. Siemens	120	141,394
Door hanger, A. K. Elder	34	141,302
Ejector, G. Hibbard	118	141,349
Electro magnetic date time printer and stamp, J. C. Hinchman	101	141,353
Engine, ammoniacal gas, W. H. and L. C. Smith and F. De Coppet	2	141,249
Engine, rotary, G. W. Cummings	150	141,261
Engine, rotary steam, E. W. and S. Jenkins	150	141,286
Engine, steam, A. Frasca	150	141,343
Engines, balanced valve for steam, W. Glen	158	141,318
Engines, oiler for steam, A. Worden	87	141,304
Eyelet setting machinery, A. B. Edmands	16	141,311
Fence, I. L. Landis, (reissue)	38	5,511
Fence, farm, W. S. McKenzie	53	141,304
Fence, portable, S. G. Burke	53	141,302
Fence post stub, G. Lakins	32	141,382
File cutting machine, A. Weed	53	141,399
Fire arm, breech loading, P. Bourdereaux	18	141,198
Fire arm, breech loading, J. Rider	18	141,383
Fire arm, breech loading, J. Rider	18	141,384
Fire escape, A. Pelham	31	141,378
Floor and ceiling, fire-proof, W. T. Butler	20	141,259
Flue for buildings, E. T. Gould	106	141,219
Fruit crate, L. Selling	63	141,392
Furnace, reverberatory, J. Morrison	85	141,371
Gas meter, De Castro and Burton	64	141,263
Gas pipe nipples, device for holding, L. W. Stockwell	64	141,244
Generator, steam, J. Ryan	148	141,239
Glass, ornamenting, S. M. Adams	54	141,285
Glove, R. D. Burr	39	141,293
Glue, manufacture of, W. Plumer	98	141,379
Harvester cutter, J. W. H. Doubler	74	141,810
Harvester cutter, F. R. and W. O. Sutton	74	141,389
Hat block, expansible, R. Eickemeyer	76	141,336
Hat stretching machine, R. Eickemeyer	76	141,337
Hats, machine for lustering, R. Eickemeyer	76	141,338
Hinge, lock, C. B. Clark	34	141,383
Hoe, J. M. Baird	141	141,308
Hoe, T. B. Lockwood	141	141,365
Hoisting apparatus, steam, J. Beggs	79	141,197
Hoisting and conveying apparatus, C. B. Stough	79	141,397
Hoop cutting machine, P. Welch	49	141,246
Horse power, Z. P. Landrum	130	141,363
Horses from crowding, device for preventing, O. C. Ross	78	141,388
Hub boring machine, Duncan and Arnold	31	141,264
Ice cream freezer, J. Dooling	58	141,269
Iron, manufacture of refined cast, C. Burgess	85	141,319
Jack, hydraulic, A. V. Ojeda	116	141,238
Kiln, brick, H. Tugby	20	141,404
Knobs to spindles, attaching, F. M. and J. B. Merriam	93	141,285
Knobs to spindles, attaching, H. J. B. Whipple	93	141,408
Lamps, shade holder for, M. W. House	90	141,223
Lamps, shade or globe holder for, L. J. Atwood	90	141,251
Lantern, L. F. Betts	90	141,311
Lasting tool, J. H. Bean	16	141,255
Latch and lock, combined, A. M. Adams	93	141,194
Lathe, D. Heer	173	141,347
Lathe chuck, W. Johnson	100	141,376
Lathe for turning tobacco pipes, C. Krapf	175	141,370
Leather folding machinery, E. B. Stimpson	92	141,396
Letter box, A. Rocentjens	146	141,237
Line, fire safety, C. A. Gregory	30	141,289
Lock, master key, A. Rankin	93	141,381
Loom, H. D. Davis	95	141,268
Marble molding machine, J. Finn	153	141,313
Meter, rotary, I. Cook	167	141,325
Millstones, machine for dressing, J. W. Parish	153	141,380
Millstones, machine for dressing, Shive and Savage	153	141,392
Nail extractor, G. J. Capewell, (reissue)	39	5,502
Nut lock, F. P. Thompson	14	141,403
Organ swell, reed, J. R. Lomas	106	141,366
Paint, compound for mixing, J. L. Newell	107	141,231
Painting, material for distemper, H. M. Johnston, (reissue)	54	5,510
Paper cutting machine, H. Law, (reissue)	109	5,503
Paper folding machine, G. W. D. Upton	109	141,405
Paper folding machine, A. Washburn, (reissue)	109	5,516
Paper making machine, N. Keely	108	141,358
Pen holder, J. S. Ornderff	146	141,287
Pessary, E. P. Banning	156	141,253
Photography, W. H. Hill	111	141,351
Piano keys, machine for shaping, N. Pratt	119	141,380
Pipe mold, cement, F. A. Sage	20	141,398
Pipes, machine for molding clay smoking, H. E. Merrill	115	141,230
Pipes in wells, apparatus for lowering, S. P. Okerland	194	141,233
Piston heads, device for centering, O. S. Howard	151	141,221
Planter, cotton, Cox and Smith	133	141,326
Plow, C. O. Mason	114	141,375
Plow, cotton, Z. B. Sims, (reissue)	43	5,513
Plow, reversible, G. W. Howe	114	141,222
Press, cotton, T. B. Smith	7	141,393
Printing and registering apparatus, ticket, J. Dyer	117	141,336

	Class No.	Whole No.
Printing press, rotary, Braidwood and Hewitt	117	141,314
Printing press, rotary, Braidwood and Hewitt	117	141,315
Propelling vessels, J. W. Evans	139	141,340
Pruning shears, H. C. Hills	44	141,273
Pump, force, O. Snell	118	141,304
Pump valve, W. Barnes	118	141 309
Railway rail chair, S. Huber	120	141,275
Railway signal, electric, D. Rousseau	50	141,387
Railway signal, musical, R. A. Filkins	120	141,266
Railway signal apparatus, electric, H. W. Spang	50	141,395
Railways, rail for street, M. L. Ghirardini	120	141,217
Rake, horse hay, J. H. Mears	77	141,370
Rice cleaner, J. L. Arms	57	141,194
Rock, blasting, I. Whitcomb	124	141,246
Roof, fire-proof mansard, Fryer and Johnson	126	141,215
Saccharine matter from cane, &c., apparatus for extracting, M. S. Bringier	166	141,316
Safe, fire proof, D. O. Paige	128	141,376
Sash balance, G. N. Joss	24	141,356
Sash fastener, A. C. Rogers	24	141,385
Saw buckle, C. W. Hubbard	130	141,225
Saw teeth, machine for dressing, J. Lucia	131	141,366
Screw cutting machine, Pease and Cox	100	141,234
Screw cutting machine, C. C. Walworth	100	141,299
Screw threading machines, device for reducing and, R. F. Fowler	14	141,342
Sewing machine, C. S. Cushman	134	141,332
Sewing machine, W. M. Whiting	134	141,303
Sewing machine, S. W. Wardwell, Jr.	134	141,345
Sewing machine caster, J. Robertson	24	141,236
Sewing machine, hat banding, J. Stewart, Jr.	134	141,397
Sewing machine meter, G. W. Manson	134	141,367
Sewing machine plaiting attachment, W. Walker	134	141,407
Sewing machine table, F. R. Wolfinger	134	141,250
Sewing machine treadle, F. Smiley	134	141,240
Shade holder, L. J. Atwood	64	141,252
Shaft coupling, J. M. Stone	67	141,296
Sheet metal, machine for bending, Cozzens and Wiggins	136	141,329
Shoe edge burnishing machine, N. C. Stow	16	141,399
Shoe soles, die for molding, S. B. Fuller	16	141,216
Shutter worker, S. R. Foster	24	141,267
Sign, W. B. Lambert	146	141,281
Sinks and cesspools, apparatus for emptying, F. J. Wildenthaler	8	141,410
Soda water apparatus, dispensing syrup in, J. Matthews	1	141,229
Spark arrester, R. Ash	94	141,195
Spittoon, W. H. Topham, (reissue)	62	5,514
Steam gage, registering, E. H. Ashcroft	148	141,307
Steam injector, R. Kerting	150	141,361
Steam whistle, O. Kromer	148	141,280
Steel, manufacture of, C. Burgess	85	141,320
Steel, adjustable, A. Doll	62	141,208
Steel, C. B. Sheldon	62	141,391
Stove polish, Chamness and Vaughn	70	141,321
Street sweeper, W. Smith	110	141,241
Stump extractor, I. Flanders	79	141,341
Submarine foundation, E. Manico	82	141,283
Sugar into blocks, machine for cutting, Brunjes and Benneckendorf	155	141,201
Teaching in schools, apparatus for, M. McVicar	146	141,368
Thread cutter, M. J. Pirnt	38	141,235
Trap, animal and insect, W. W. Hannah	143	141,346
Traps, mold for casting stench, A. H. Hook	33	141,353
Trestle, M. M. Lochy	30	141,228
Truss, E. W. Higbee	156	141,220
Ventilator, window sash, J. C. Bates	166	141,254
Vehicle wheel, L. Dorman, (reissue)	31	5,509
Vehicle wheel, H. Williams	31	141,411
Wagon bodies and seats, device for securing corners of, E. Andrews	31	141,306
Wagon seat fastener, G. Ruston	31	141,292
Walls and ceilings, coating and ornamenting, J. H. Crittenden	107	141,330
Washing fluid, N. W. Lane	35	141,364
Washing machine, I. F. Brown	91	141,200
Washing machine, J. W. Taylor	91	141,402
Watch, self winding, D. J. Mozart	36	141,373
Water elevator, J. B. Erwin	118	141,212
Water elevator, steam and vacuum, J. C. Wightman	118	141,249
Well tube, S. H. Dickerson, (reissue)	51	5,507
Wells, reamer for enlarging oil, M. Gillespie	124	141,344
Welt parer, A. V. Vreeman	16	141,406
Wheel, current, C. Weeks	168	141,301
Windows, &c., implement for washing, T. J. Mayall	62	141,368
Window sash, metallic, F. M. Campbell	30	141,204
Work box, H. E. Wilcox	38	141,409
Wood grinder, Daniels and Hubbard	174	141,206
Wrench, M. Bubeer	100	141,259
Wrench, A. Partridge	100	141,289

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JULY 29, 1873.

Adams, A. M., Combined latch and lock 141,193
Adams, S. M. Ornamenting glass 141,305
Andrews, E., Securing corners of wagon bodies and seats 141,306
Angell, M. S., assignee 141,235
Arms, J. L., Rice cleaner 141,194
Arnold and Duncan 141,264
Ash, R., Spark arrester 141,195
Ashcroft, E. H., Registering steam gage 141,307
Atwood, L. J., Shade or globe holder for lamps 141,251
Atwood, L. J., Shade holder 141,252
Baird, J. M., Hoe 141,308
Banning, E. P., Pessary 141,253
Banning Truss and Brace Company, assignee 141,253
Barnes, W., Pump valve 141,309
Barnes, W. B., Car coupling 141,256
Bates, J. C., Window sash ventilator 141,254
Bean, J. H., Lasting tool 141,255
Beck M., and C. Schneidt, Boot brushing apparatus 141,196
Beggs, J., Steam hoisting apparatus 141,197
Bender, C., C. H. Latrobe, and C. S. Smith, Iron bridge 141,310
Benneckendorf and Brunjes 141,201
Betts, L. F., Lantern 141,311
Bickell, E., Car coupling 141,312
Blake, J. W., assignee 141,303
Blatterlein, J. F. A., Curtain fastener 141,313
Bourdereaux, P., Breech loading fire arm 141,198
Bowdish, N. S., Camera stand 141,256
Boyle, J., Manufacture of boots and shoes 141,257
Bradley, E. L., assignee 141,306
Braidwood, W., and H. J. Hewitt, Rotary printing press 141,314
Braidwood, W., and H. J. Hewitt, Rotary printing press 141,315
Briggs, E., Cultivator 141,199
Bringier, M. S., Extracting saccharine matter from cane, &c 141,316
Brown, I. F., Washing machine 141,200
Brown, W., Machine for dressing and crozing barrels 141,317
Brunjes, P. O., and A. Benneckendorf, Machine for cutting sugar into blocks 141,201
Bubeer, M., Wrench 141,259
Buchanan G., Reclining chair 141,318
Burgess, C., Manufacture of refined cast iron 141,319
Burgess, C., Manufacture of steel 141,320
Burgess Steel and Iron Works, assignee 141,320
Burke, S. G., Portable fence 141,202
Burr, R. D., Glove 141,203
Burton and De Castro 141,263
Butler, W. T., Fire proof floor and ceiling 141,260
Campbell, F. M., Metallic window sash 141,204
Capewell, G. J., Nail extractor, (reissue) 5,502
Chamness, E., and J. Vaughn, Stove polish 141,321
Chapman, C. P., Wash boiler attachment 141,322
Clark, C. B., Lock hinge 141,323
Clark, W. A., Expansive bit 141,324
Clark, W. A., assignee 141,306
Coffin and Kellogg 141,359
Cook, L., Rotary meter 141,325
Corbell, J., Car starter 141,326
Cowell, R. A., Car mover 141,327
Cox, W. J., and W. T. Smith, Cotton planter 141,328
Cozzens, W. F., and W. H. Wiggin, Machine for bending sheet metal 141,329
Crittenden, J. H., Method of coating and ornamenting walls and ceilings 141,330
Crump, S. H., Corpse cooler 141,331
Cummings, G. W., Rotary engine 141,261
Curless, J. M. Baggage check 141,205
Cushman, C. S., Sewing machine 141,332
Daniels, J. F., and J. H. Hubbard, Wood grinder 141,206
Danks, F., Puddler's ball squeezer 141,207
Davis, H. D., Loom 141,262
Deacon, H., Manufacture of chlorine 141,333
De Castro, D., and R. Burton, Gas meter 141,263
De Coppet and Smith 141,242
Deere & Co., assignees 141,375
Dickerson, S. H., Well tube, (reissue) 5,507
Dickerson, S. H., Earth auger, (reissue) 5,508
Di Tergolina, V. C., Bridle bit 141,334
Dolan, W., assignee 141,273
Doll, A., Adjustable stool 141,208
Dohmstreich, F. L., assignee 141,354
Dooling J., Ice cream freezer 141,209
Dorman L., Vehicle wheel, (reissue) 5,509
Doubler, J. W. H., Harvester cutter 141,210
Dressel, H., Carriage seat shifting rail 141,335
Duncan, J., and W. H. Arnold, Hub boring machine 141,264
Dyer, J., Ticket printing and registering apparatus 141,336
Edmands, A. B., Eyelet setting machinery 141,211
Eickemeyer, R., Hat stretching machine 141,337
Eickemeyer, R., Expansible hat block 141,338
Eickemeyer, R., Machine for lustering hats 141,339
Erwin, J. B., Water elevator 141,212
Eurgens and Kingman 141,277
Evans, J. W. Propelling vessel 141,340
Fairman, S. H., assignee 141,378
Fawcett, E. W. and R., and W. E. Sefton, Belt cutter 141,265
Ferm, C., assignee 141,237
Filkins, R. A., Musical railway signal 141,266
Fillmore, C. W., (reissue) 5,500
Finn, J., Marble molding machine 141,213
Flanders, I., Stump extractor 141,341
Foster, S. R., Shutter worker 141,267
Fowler, R. F., Reducing and screw threading machinery 141,342
Frantze, P. J. M. Tilleson, and J. A. Gregersen, Machine for cutting balusters 141,214
Fraser, A., Steam engine 141,343
Fryer, W. J., and G. E. Johnson, Fire proof mansard roof 141,215
Fuller, S. B., Die for molding shoe soles 141,216
Ghirardini, M. L., Rail for street railways 141,217
Gilderaleeve, J. P., assignee 141,303
Gillespie, M., Reamer for enlarging oil wells 141,344
Glen, W., Steam engine balance valve 141,218
Goodell, A. D., Bit stock 141,345
Gould, E. T., Flue for buildings 141,219
Gowdy, J., assignee 141,339
Gray, A. W., Link of endless chain for horse power 141,268
Gregersen, Frantze, and Tilleson 141,214
Gregory, C. A., Fire safety line 141,269
Hall, L. C., assignee 141,378
Hamilton, J. A., assignee 141,365
Hannah, W. W., Animal and insect trap 141,346
Hanuan, J., assignee 141,235
Harrington, J. R., Carpet lining machine 141,270
Harrison, B. J., Folding chair 141,271
Hazeltine, D. W., assignee 141,261
Heer, D., Lathe 141,347
Henckley and Egery Iron Company, assignee 141,221
Herron, R. B., assignee 141,304
Herve, C. F., assignee 141,353
Hewitt and Braidwood 141,314 141,315
Hewitt, E. A., Rotary churn 141,348
Hibbard, G., Ejector 141,349
Higbee, E. W., Truss 141,220
Hill, H. H., and G. M. Sargent, Car axle box 141,350
Hill, J. W., Combined brake and propelling mechanism for cars 141,272
Hill, W. H., Photography 141,351
Hills, H. C., Pruning shears 141,273
Hilton, J., Disinfectant compound 141,274
Hinchman, J. C., Electro magnetic date, time printer, and stamp 141,352
Hirst, H. D., assignee 141,347
Holloway, E. S., assignee 141,265
Hook, A. H., Mold for casting stench traps 141,353
Houghton, C., assignee 141,249
House, M. W., Shade holder for lamps 141,223
House, M. W., Can for oil and other liquids 141,224
Howard, O. S., Centering piston heads 141,221
Howe, G. W., Reversible plow 141,222
Hubbard and Daniels 141,206
Hubbard, C. W., Saw buckle 141,225
Huber, S., Railway rail chair 141,275
Imperial Meter Company, assignee 141,263
Jakel, J., Brewer's stocking cask 141,354
Jarrell, W., Cotton scraper 141,355
Jenkins, E. W. and S., Rotary steam engine 141,226
Johnson and Fryer 141,215
Johnson, W., Lathe chuck 141,276
Johnston, H. M., Material for distemper painting, (reissue) 2,510
Johnston, J., assignee 141,305
Joss, G. N., Sash balance 141,356
Joyce, J. L., Manufacture of boots and shoes 141,357
Keely, N., Paper making machine 141,358
Kellogg, D. W., and B. C. Coffin, Straw burning attachment for steam boilers 141,359
Kingman, J. W., and A. Eurgens, Smoke and steam burner 141,277
Klee, J., Bottling liquids 141,360
Koeb, G., Car coupling 141,278
Korn, J. B., assignee 141,278
Korting, E., Steam injector 141,361
Krapf, C., Lathe for turning tobacco pipes 141,279
Kromer, O., Steam whistle 141,281
Lakins, G., Fence post stub 141,362
Lambert, W. B., Sign 141,281
Landis, I. L., Fence, (reissue) 5,511
Landrum, Z. P., Horse power 141,363
Lane, N. W., Washing fluid 141,364
Langdon, L. W., assignee 141,236
Latrobe, Smith, and Bender 141,310
Law, H., Paper cutting machine, (reissue) 5,503
Lewis, W. J., Manufacture of bolster plates 141,227
Lockwood, T. B., Hoe 141,365
Lomas, J. R., Reed organ swell 141,282
Lucia, J., Machine for dressing saw teeth 141,366
Lucky, M. M., Trestle 141,228
Mallory, G. W., Boat-lowering apparatus, (reissue) 5,512
Manico, E., Submarine foundation 141,283
Manson, G. W., Sewing machine motor 141,367
Martincourt, C. T., assignee 141,342
Matthews, J., Dispensing syrup in soda water apparatus 141,229
Mayall, T. J., Implement for washing windows, &c 141,368
McKenzie, W. S., Farm fence 141,284
McVicar, M., Apparatus for teaching in schools 141,369
Mears, J. H., Horse hay rake 141,370
Merriam, F. M., and J. B., Attaching knobs to spindles 141,285
Merrill, H. E., Machine for molding clay smoking pipes 141,230
Metcalf, E., Inside blinds 141,286
Miller's Falls Manufacturing Company, assignee 141,345
Mills, G., assignee 141,273
Miner, J. R., assignee, (reissue) 5,500
Morrison, J., Reverberatory furnace 141,371
Mott, T. H., Apparatus for heating and ventilating railroad cars 141,372
Mozart, D. J., Self-winding watch 141,373
Myers, E. W., Seat or back of chairs 141,374
Nason, C. O., Plow 141,375
Newall, J. L., Compound for mixing paint 141,231
Ojeda, A. V., Hydraulic jack 141,232
Okerlund, S. P., Apparatus for lowering pipes in wells 141,233
Orndorff, J. S., Pen holder 141,287
Outterson, W. P., assignee 141,358
Paige, D. O., Fire-proof safe 141,376
Parish, J. W., Machine for dressing millstones 141,288
Partridge, A., Wrench 141,289
Pease, J., and Cox, W. P., Screw cutting machine 141,234
Peck, W. L., Carriage top 141,377
Pelham, A., Fire-escape 141,378
Peloubet, E. W., Car coupling 141,290
Perkins, M. R., Burglar alarm 141,291
Pitrat, M. J., Thread cutter 141,235
Plume and Atwood Manufacturing Company, assignee 141,251
Plume and Atwood Manufacturing Company, assignee 141,252
Plumer, W., Manufacture of glue 141,379
Plummer Sewing-Machine Company, assignee 141,303
Pratt, M., Machine for shaping piano keys 141,380
Rankin, A., Master key lock 141,381
Raymond, J., assignee 141,321
Rice, W. M., assignee 141,260
Rider, A. K., Door hanger 141,382
Rider, J., Breech-loading fire arm 141,383
Rider, J., Breech-loading fire arm 141,384
Robertson, J., Sewing machine caster 141,236
Rodgers, A. C., Sash fastener 141,385
Rosenstjerna, A., Letter box 141,237
Rose, O. C., Device for preventing horses from crowding 141,386
Ross, W. H., Composition for burial caskets 141,238
Rousseau, D., Electric railway signal 141,387
Ruston, G., Wagon seat fastener 141,292
Ryan, J., Steam generator 141,239
Sage, F. L., Cement pipe mold 141,388
Sargent and Hill 141,350
Savage and Shive 141,292
Schneidt and Beck 141,196
Schwatka, F., Bridge truss 141,293
Sefton and Fawcett 141,265
Selling, L., Fruit crate 141,389
Shaw, G. W., assignee 141,245
Shaw, W. A., assignee 141,353
Sheldon, C. B., Table caster 141,390
Sheldon, C. B., Stool 141,391
Shive, S., and D. Savage, Machine for dressing millstones 141,392
Shoninger, B., assignee 141,393
Siemens, C. W., Pneumatic dispatch apparatus 141,394
Sims, Z. B., Cotton plow, (reissue) 5,513
Sinclair, J. P., Chair seat 141,395
Smiley, F., Sewing machine treadle 141,240
Smith, Bender, and Latrobe 141,310
Smith and Cox 141,328
Smith, T. S., Cotton press 141,393
Smith, W., Street sweeper 141,241
Smith, W. C., assignee 141,241
Smith, W. H. and L., and F. V. De Coppet, Ammoniacal gas engine 141,242
Snell, O., Force pump 141,304
Spang, H. W., Electric railway signal apparatus 141,395
Spaulding, J., Carpet cleaner 141,243
Stanley, R., assignee 141,303
Stevens, C. and G. M., Fog alarm 141,396
Stewart, J., Jr., Sewing machine for banding hats 141,397
Stimpson, E. B., Machinery for folding leather 141,398
Stockwell, L. W., Device for holding gas pipe nipples 141,244
Stone, J. M., Shaft coupling 141,296
Stone, J. M. and J. H., assignees 141,242
Stoops, N. D., assignee 141,333
Stough, C. B., Hoisting and conveying apparatus 141,297
Stow, N. C., Shoe edge burnishing machine 141,399
Stroud, G. F., Cultivator teeth 141,400
Sutton, F. B. and W. O., Harvester cutter 141,298
Swan, J., Machine for forming auger bits 141,401
Talbot, S., Jr., assignee 141,238
Taylor, J. W., Washing machine 141,402
Thompson, F. P., Nut lock 141,403
Tilleson, Gregersen, and Frantze 141,214
Topham, W. H., Spittoon, (reissue) 5,514
Tracy, C. C., assignee 141,233
Tugby, H., Brick kiln 141,404
Tyrrell, A. E., assignee 141,238
Upton, G. W. D., Paper folding machine 141,405
Vaughn and Chamness 141,321
Vergnes, E., assignee 141,283
Vreeman, A. V., Welt parer 141,406
Walker, W., Sewing machine plaiting attachment 141,407
Walworth, C. C., Screw cutting machine 141,299
Wands, J. C., Car roof, (reissue) 5 515
Wardwell, S. W., Jr., Sewing machine 141,245
Washburn, A., Paper folding machine, (reissue) 5,516
Weed, A., File cutting machine 141,300
Weeks, C., Current wheel 141,301
Welsh, P., Heap cutting machine 141,246
Weld, C. J., Boiler water regulator 141,302
Weldon, A., Apparatus for hardening copper balls 141,247
Westinghouse, G., Jr., Steam power brake device, (reissue) 5,504
Westinghouse, G., Jr., Steam power air brake device, (reissue) 5,505
Westinghouse, G., Jr., Steam power car brake apparatus, (reissue) 5,506
Whipple, H. J. B., Attaching knobs to spindles 141,408
Whitcomb, I., Method of blasting rock 141,248
Whiting, W. M., Sewing machine 141,303
Wiggin and Cozzens 141,329
Wightman, J. C., Steam and vacuum water elevator 141,249
Wilcox, H. E., Work box 141,409
Wildenthaler, F. J., Apparatus for emptying sinks and cess pools 141,410

Wiley, J. A., assignee 141,362
Williams, D., assignee 141,235
Williams, H., Vehicle wheel 141,411
Wolfsiger, F. R., Sewing machine table 141,250
Wooster, G. C., assignee 141,382
Wooster, G. H., assignee 141,407
Worden, A., Oiler for steam engines 141,304

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1873, by which cases are assigned for examination, governe the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of those classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks) 6,500
SEWING-MACHINES and attachments 2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes 4,000
PRINTING; including presses, type, and printers' furniture. 2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles 1,200
FELTING and HATS; including caps, bonnets, flock, &c. 1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments) 1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs 1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

The following abbreviated forms of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Aërated liquor apparatus.. 1
Air and gas engines 2
Amalgamators, ore-mills ... 3

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 6. TUESDAY, AUGUST 5, 1873. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

WOOD *vs.* MORRIS.—*Interference.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the application of Joseph Wood and the patent of William Morris, for* IMPROVEMENT IN RAILWAY FROGS.—*Decided August* 4, 1873.]

Priority awarded to an applicant who claimed a block of wood fastened between a stationary frog and the adjacent rails, and who had reduced the invention to practice, over the patentee of a special form of block to be placed between the frog and the rails, which he said incidentally in his specification might be of iron or wood, but who made no allusion to the superior qualities of wood for the purpose, and who had never used it.

Where anything is developed on an interference which renders it doubtful whether the invention is novel, the case will be remanded to the Examiner in charge, in order that, with the further light thus obtained, he may investigate the question anew.

LEGGETT, *Commissioner:*

The subject-matter in controversy is embodied in the claim of Wood, which is as follows:

"A railway frog with wood placed between the rails thereof, and fastened thereto, in the manner and for the purpose substantially as described."

The invention is applicable to that class of frogs in which the side rails and the tongue, or frog-point, are stationary. A hard-wood brace or packing, suitably molded at its edges to fit the sides of the rails, and divided so as to embrace the end of the tongue, is placed between the side rails and properly secured by vertical and lateral bolts to the bed-plate and to the side rails. The object of its employment is to give stability to the frog, and form in some measure an elastic side cushion, which enables the frog to better withstand the blows and lateral drag of the car-wheels. At the same time it diminishes the liability incident to the employment of an iron packing of breaking the flanges of the wheels.

I have no doubt there is a substantial advantage attending the use of hard wood for this purpose in a railroad frog, and that whoever first discovered the adaptation of its qualities to produce the superior results accomplished in this device, made a meritorious and patentable invention. He did not merely select the most suitable material of the kind before used, as one kind of iron rather than another, but he applied a new material, a material never before used in such connection, which may advantageously replace all kinds of iron. He has produced a new effect, and he comes within the long-settled rule that "while the properties of matter, the forces or elements of nature are common property, any man who applies them to the production of a new and useful effect in matter may claim to have been the inventor of that application" of them to produce that effect. (Curtis on Patents, p. 30.)

But the novelty of the use of wood for this purpose is denied by Morris, who does not claim it. In the brief submitted in his behalf it is stated that it may "here be understood that William Morris does not pretend to have used wood between the rails of a frog before Joseph Wood used it, but he merely claims in his patent its use in a particular way."

This, in connection with the fact that the argument is addressed mainly to the point that the alleged invention in issue is not new, and therefore not patentable, may be taken as an acquiescence in the correctness of the finding of the Examiner and the Board, that upon the evidence Wood must be held entitled to judgment of priority as to the subject-matter claimed by him.

Morris claims a combination of parts which Wood does not show, and his specification and claim contemplate the use of either wood or iron indifferently for packing. While an appeal has been formally taken upon the question of priority, the real contest now is as to whether or not wood packing was employed in railway frogs, as now claimed, prior to the date it is proven to have been adopted by the applicant. I do

not regard the evidence introduced in behalf of Morris as satisfactorily showing that it was. The rebutting testimony of Wood is sufficient to break its force as proof upon the question, so far as it might, standing alone, be regarded as having such force. The only doubt in my mind upon the question of the validity of Wood's claim is concerning the references cited in argument, but not regularly put in evidence in the case. Dempster's R. R. Eng., plate 26, and Eng. pat. No. 2,637, of 1869.

The Board did not regard these references as properly before them for consideration, and did not pass upon them. The decision of the Board awarding priority of invention to Wood is affirmed, and his application is referred to the Examiner for re-examination, in view of these references, without passing upon the question of their sufficiency further than to suggest that if Wood's claim to invention consists merely in using the ordinary means of bolts and screws to fasten the wood into the frog, it would seem to be a very thin basis on which to plant a patent.

JOHN A. MONTGOMERY.—*Extension.*

[*In the matter of the application of John A. Montgomery for the extension of Letters Patent for* IMPROVED JOURNAL AND AXLE BOXES, *granted August 2, 1859, No. 24,947.—Decided August 4, 1873.*]

LEGGETT, *Commissioner:*

The reference Resultate für Maschinenbau, plate 13, page 57, forms the only apparent objection to the grant of this extension, and the senior member of the Board regards it as fatal.

This case was referred to the Board of Examiners-in-Chief for hearing and report. The case was heard by two members of the Board, the third being absent. In their final action they fail to agree in their recommendations, making it necessary for the Commissioner in person to re-examine the testimony and arguments, which I have done carefully.

I think, however, that the Board have been somewhat misled in their investigation by attaching too much importance to the substantial forms of the boxes described in the patent and the reference. The patent is not for a spherically-formed box, nor for a movable box of spherical form, but the gist of the invention, as described and claimed in the patent, is the device which permits the spherical box to move freely in its accompanying concave bearing, yet prevent it from revolving with the shaft. The text of the principal reference makes no allusion whatever to any device for such purpose. The drawing, however, shows a device, but one substantially different and evidently impracticable. In the patent it consists of a pin on the surface of the sphere in the equatorial line, which pin plays in a slot in the concave, the slot running parallel with the shaft, allowing easy and extended motion in the direction desired, with comparatively little tendency to wear, and easily lubricated; while in the drawing of the reference the spherical surface of the box is represented as being cut away to near the shaft at the equatorial line, and the concave filled to fit. The pin to prevent the box from revolving with the shaft is in the concave, and the slot is in the box at the reduced diameter. This arrangement greatly increases the wear upon the pin and slot, as the purchase is considerably increased, yet lubrication is practically impossible, except by further invention. In the reference the motion of the box is necessarily more cramped and less satisfactory. The difference between the two is really the difference between failure and success. One is capable of use in many places where the other would evidently be impracticable.

The patent will be extended.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

THOMAS J. W. ROBERTSON *vs.* BENJAMIN B. HILL.

[*In Equity.—Before Shepley, Circuit Judge.*]

The Court will seldom hear any evidence, except on the question of infringement, upon a motion for a preliminary injunction if the patent has been sustained in three previous cases, especially if the defendant was interested in the defense of one of them.

It is no infringement of a patent for a combination which is in itself impracticable and worthless to add to the combination an element which renders it useful and valuable.

A patent for a hand-stamp is not to be impeached on the ground that the stamp cannot be made to operate successfully without an inking-ribbon, if it mentions that the stamp may be used with any suitable inking device, and such inking-ribbons were well known at the time.

This was a motion for a preliminary injunction in a suit founded on the patent of Thomas J. W. Robertson for an improvement in hand-stamps, dated September 22, 1857, extended and reissued December 12, 1871. The patent had been previously sustained in several suits. (*Robertson* vs. *Secombe Manufacturing Co.*, 3 OFF. GAZ., and others.) The motion was resisted on the ground that the invention was anticipated by a large number of English and French patents, and because the invention, as patented, was lacking in utility from the absence of any suitable device for coloring the face and type of the stamp.

[*Frederic H. Betts*, for complainant.
James B. Robb, for defendant.]

SHEPLEY, *J.:*

This is a motion for a preliminary injunction. In this case the patent has frequently been made the subject of legal investigation.

The validity of the patent has been established and confirmed in at least three cases, and under such circumstances, on a motion for a preliminary injunction, the Court very seldom hears any evidence except on the question of infringement. Under such circumstances the party, by the established rules of equity, is entitled, as a matter of course, to the preliminary injunction without a trial at law and without further trial of the cause, especially in a case like this, where the party defendant in the cause was interested in the defense of the suit and had full opportunity to test the question.

Ordinarily, therefore, in such a case, the Court, on a motion for a preliminary injunction, considers only the question of infringement, and that is the established rule of the court.

In this case, however, the Court has considered, with as much care as the time would allow, one question which has been raised by the counsel for the defendant, and which may properly be considered under the question of infringement. It is contended by the defendant that when a party has patented a combination, and that combination turns out to be useless, of no practical utility, and another party adds to that combination another element, and thereby makes the whole practically useful where there was no utility before, the party who thus adds another element to the combination, which was necessary to make the prior combination of any practical utility, is not an infringer, and that he is not entitled merely to use his improvements, requiring first a license to use the former combination, but that he may use the whole of it; and that view of the law is undoubtedly correct.

In that view of the law it is contended that there is no infringement in this case, and it is with a view to question of infringement only that the court has considered it, not deeming it necessary to go into any consideration of the question of novelty, or entertain or express any opinion on that question until the final hearing of the cause.

But considering that the right of the party depends upon the validity of the patent and the fact that that question has been adjudicated so many times, it is not the intention of the Court, in any case, upon a motion for a preliminary injunction, to express any further opinion upon the questions involved in the case, except such as are absolutely necessary to the decision of the question of infringement on the motion for a preliminary injunction.

But on an examination of the patent the court, while it believes that view of the law to be correct, cannot conceive it to be applicable to the present case.

It is contended by the defendant in this case that the combination of the plaintiff, which was the combination of a handle and a series of printing-wheels, or their equivalents, for printing dates with a fixed type-form or printing-die for dating purposes, substantially as described, had no practical utility, because without the inking-ribbon or device which the defendant has added it was of no practical use; that the wheels would clog by the ink; and it was of no practical use, and did not come into use, until the ribbon as an inking device was added to it by the defendant.

But it does not appear that Robertson, the patentee, here, has stated in his patent any combination with any inking device, but has stated that his combination could be used with any suitable inking device.

An inking device formed no part of his combination, but it could be used, he says, with any suitable inking device. Now, the testimony in the case shows very clearly that the ribbon was an inking device, which was known prior to the date of this patent—was known and in use and described in patents prior to the date of this patent. It was, therefore, one of the inking devices which the complainant had a right to use, and which he is to be considered, in the eye of the law, as having referred to as a suitable inking device in his patent.

Therefore, although it should be proved to be true, that if the plaintiff's combination were used with a common inking-pad, or by applying printers' ink with rollers in the usual way, it would so clog and interfere with the turning of the wheels that it would not be a practically useful device, still he was open to use the ribbon as a roller, which had been known and used as an inking device prior to the date of the patent.

The conclusion of the Court, therefore, is that under the present state of the proof, in view of the prior decisions in the case, the injunction must go, as prayed for.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

25,237.—Horizontal Wheels.—Granted to ABRAHAM ANDREWS and HARRISON KALBACH, August 30, 1859. Application filed May 28, 1873. Hearing August 13, 1873.

25,239.—Elastic Hose-Tubing.—Granted to JOHN C. BOYD, August 30, 1859. Application filed May 29, 1873. Hearing August 13, 1873.

25,309.—Nail-Machines.—Granted to DANIEL DODGE, August 30, 1859. Application filed May 31, 1873. Hearing August 13, 1873.

25,342.—Stoves.—Granted to EDWARD M. MANSUR, September 6, 1859. Application filed June 5, 1873. Hearing August 20, 1873.

25,344.—Machines for Wiring the Joints of Clothes-Pins.—Granted to ALVIN C. MASON, September 6, 1859. Application filed May 31, 1873. Hearing August 20, 1873.

25,364.—Watches.—Granted to CHARLES E. JACOT, September 6, 1859. Hearing August 20, 1873.

25,373.—Machines for Making Paper Boxes.—Granted to SILAS B. TERRY, September 6, 1859; reissued May 17, 1870. Application filed June 5, 1873. Hearing August 20, 1873.

25,395.—Heels for Boots and Shoes.—Granted to SIMEON DODGE, Jr., and BENJAMIN POTTER, Jr., September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,434.—Cotton-Scrapers.—Granted to JONATHAN H. MITCHELL, September 13, 1859. Application filed June 10, 1873. Hearing August 27, 1873.

25,442.—Boilers and Steamers.—Granted to DANIEL R. PRENDLE, September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,443.—Seeding-Machines.—Granted to SILAS G. RANDALL, September 13, 1859; reissued May 25, 1869. Application filed June 11, 1873. Hearing August 27, 1873.

25,473.—Scales.—Granted to ANDREW TURNBULL, September 13, 1859. Application filed May 31, 1873. Hearing August 27, 1873.

25,484.—Grain-Separators.—Granted to JONATHAN L. BOOTH, September 20, 1859; reissued September 25, 1860, and November 29, 1864. Application filed June 14, 1873. Hearing September 3, 1873.

25,488.—Hydraulic Presses.—Granted to M. H. CLARK, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,499.—Railroad-Car Seat.—Granted to ELI WHEELER, September 20, 1859. Application filed June 17, 1873. Hearing September, 3, 1873.

25,506.—Lamps.—Granted to HALVOR HALVORSON, September 20, 1859; reissued June 8 and December 5, 1871. Application filed June 6, 1873. Hearing September 3, 1873.

25,508.—Tailors' Shears.—Granted to ROCHUS HERRSCH, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,512.—Bung-Hole Borer and Reamer.—Granted to JOSIAH KIRBY, September 20, 1859. Application filed June 19, 1873. Hearing September 3, 1873.

25,544.—Try-Cocks for Steam-Boilers.—Granted to JOHN F. COOK, September 20, 1859. Application filed June 18, 1873. Hearing September 3, 1873.

25,565.—Rolling-Mills.—Granted to JOHN and GEORGE FITTS, September 27, 1859. Application filed June 27, 1873. Hearing September 10, 1873.

25,569.—Bedstead-Slats.—Granted to TYLER HOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,570.—Mode of Arranging Couches in Railroad Cars.—Granted to EDWARD C. KNIGHT, September 27, 1859. Application filed May 31, 1873. Hearing September 10, 1873.

25,572.—Molding Water-Traps.—Granted to JAMES ALLEN LOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,586.—Burglar-Alarms.—Granted to ABBOTT Q. ROSS, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,588.—Steam Punching-Machines.—Granted to JOHN SPARROW, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,640.—Steam-Boilers.—Granted to JOSEPH HARRISON, Jr. October 4, 1859. Application filed June 30, 1873. Hearing September 17, 1873.

25,662.—Construction of Prisons.—Granted to EDWIN MAY, October 4, 1859. Application filed June 23, 1873. Hearing September 17, 1873.

25,673.—Machines for Lasting Boots and Shoes.—Granted to JAMES PURINTON, October 4, 1859; reissued January 6, 1863. Application filed July 5, 1873. Hearing September 17, 1873.

25,683.—Hydrants.—Granted to CHARLES L. STACY, October 4, 1859; reissued June 6, 1865. Application filed June 28, 1873. Hearing September 17, 1873.

25,692.—Sewing-Machines.—Granted to KASIMIR VOGEL, October 4, 1859; reissued November 1, 1864. Application filed July 5, 1873. Hearing September 17, 1873.

25,701.—Skeleton Skirt.—Granted to JAMES DRAPER, October 4, 1859; reissued August 1, 1865. Application filed July 2, 1873. Hearing September 17, 1873.

25,726.—Hand-Machine for Wiring Blind-Rods.—Granted to ERAM C. DAVIS, October 11, 1859. Application filed July 12, 1873. Hearing September 24, 1873.

25,733.—Double-Friction Couplings.—Granted to JOSHUA HENDY, October 11, 1859; reissued March 25, 1873. Application filed July 7, 1873. Hearing September 24, 1873.

25,747.—Method of Combining Emery with Caoutchouc.—Granted to THOMAS J. MATALL, October 11, 1859. Application filed June 16, 1873. Hearing September 24, 1873.

25,767.—Cutting and Panning Cakes.—Granted to JOHN H. SHROTE, October 11, 1859. Application filed July 11, 1873. Hearing September 24, 1873.

25,784.—Mode of Manufacturing Barrels, &c.—Granted to GEORGE W. BARKER, October 11, 1859. Application filed July 8, 1873. Hearing September 24, 1873.

25,796.—Jacquard Machines.—Granted to AVERY BARNETT, October 18, 1859. Application filed June 30, 1873. Hearing October 1, 1873.

25,797.—Harvesters.—Granted to EPHRAIM BALL, October 18, 1859. Application filed July 18, 1873. Hearing October 1, 1873.

25,807.—Hem-Folders.—Granted to LEVERETT CLARK, October 18, 1859. Application filed July 19, 1873. Hearing October 1, 1873.

25,814.—Sleeping-Cars.—Granted to JOHN DANNER, October 18, 1859. Application filed July 12, 1873. Hearing October 1, 1873.

25,843.—Cultivators.—Granted to THOMAS MCQUISTON, October 18, 1859; reissued May 16, 1871. Application filed July 11, 1873. Hearing October 1, 1873.

25,862.—Weeding-Hoes.—Granted to JAMES M. ADAMS, October 18, 1859. Application filed July 18, 1873. Hearing October 1, 1873.

25,867.—Machines for Covering Saddle-Trees.—Granted to JOHN MACLURE, October 18, 1859. Application filed July 14, 1873. Hearing October 1, 1873.

25,874.—Bronzing-Machines.—Granted to GEORGE H. BABCOCK, October 25, 1859. Application filed July 25, 1873. Hearing October 8, 1873.

25,883.—Construction of Glass Coffins.—Granted to JOHN R. CANNON, October 25, 1859. Application filed July 23, 1873. Hearing October 8, 1873.

25,936.—Cut-Off Valves of Steam-Engines.—Granted to EDWARD R. ARNOLD, November 1, 1859. Application filed August 1, 1873. Hearing October 15, 1873.

25,978.—Tackle-Blocks.—Granted to ISAAC R. PALMER, November 1, 1859; reissued September 8, 1863, April 11, 1865, and December 8, 1868. Application filed July 26, 1873. Hearing October 15, 1873.

25,984.—Bit-Stocks.—Granted to NELSON SPOFFORD, November 1, 1859; reissued April 23, 1867. Application filed July 28, 1873. Hearing October 15, 1873.

26,003.—Telegraphic Machines.—Granted to GEORGE M. PHELPS, November 1, 1859. Application filed July 30, 1873. Hearing October 15, 1873.

26,028.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Hearing October 22, 1873.

26,030.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Hearing October 22, 1873.

26,060.—Machines for Making Box-Joints.—Granted to JAMES STIMPSON, November 8 1859. Application filed August 2, 1873. Hearing October 22, 1873.

26,069.—Sleeping-Cars.—Granted to JOHN DANNER, November 8, 1859. Application filed August 4, 1873. Hearing October 22, 1873.

26,087.—Fastening Metal Hoops on Cotton-Bales.—Granted to JOHN T. BUTLER, November 15, 1859. Application filed August 7, 1873. Hearing October 29, 1873.

26,135.—Portable Pumps.—Granted to WILLIAM T. VARE, November 15, 1859; reissued February 26, 1861. Application filed August 11, 1873. Hearing October 29, 1873.

26,145.—Cocks for Water-Closets.—Granted to DARIUS WELLINGTON, November 15, 1859. Application filed August 11, 1873. Hearing October 29, 1873.

26,243.—Water-Closet Basins.—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 10, 1873. Hearing November 12, 1873.

27,539.—Manufacture of Gun-Barrels.—Granted to JAMES H. BURTON, March 20, 1860, and antedated to September 29, 1859; reissued December 26, 1871. Application filed July 1, 1873. Hearing September 10, 1873.

30,201.—Apparatus for Freezing Liquids.—Granted to FERDINAND PHILIPPE EDOUARD CARRÉ, October 2, 1860; reissued in two divisions February 18, 1873. Patented in France August 24, 1859. Application filed May 17, 1873. Hearing August 13, 1873.

EXTENSIONS GRANTED.

25,005.—Improvement in Governor-Valves, granted to BENAIAH FITTS, August 9, 1859.

Claim.—The manner of mounting the valve substantially as herein described—that is to say, resting or supporting the valve as shown at M, and retaining it in its seat, as shown at N, for the purposes set forth.

25,014.—Improved Machine for Cutting out Wooden Ware, granted to GEORGE R. HAY, August 9, 1859.

Claim.—The rock-shaft K, in combination with the hoop-saw H, constructed and arranged as described, and operated by means of the pinion L, in the manner and for the purpose substantially as set forth.

25,036.—Improvement in Postmarking-Stamp, granted to MARCUS P. NORTON, August 9, 1859.

Claim.—The blotter J, connected or attached to the main part of any post-office postmarking-stamp for the purpose of cutting and inking, blotting, and effacing, so as to successfully cancel the frank or postage-stamp of any letter or any package at the same time and operation of marking or printing upon such letter or package the name of any post-office, the year, the month, and the day of the month, substantially as and for the purpose herein set forth.

25,070.—Improved Roof for Railway Cars, granted to A. P. WINSLOW, August 9, 1859; reissued August 8, 1865, numbered 2,050.

Claim.—1. The plates D, caps F, and grooved rafters B, when arranged substantially as herein set forth, for the purpose described.

2. Forming an air-chamber, G, between the sheeting or roof A and plates D, when arranged as herein described, for giving free circulation of air to cool the car, and at the same time allow the water, dust, &c., to pass off at the ends of said plates.

25,235.—Improvement in the Manufacture of Iron, granted to BERNARD LAUTH, August 23, 1859.

Claim.—A new article of manufacture, made by rolling iron or steel, in a cold state, for hardening and adding strength to it, without injury to its fiber, and at the same time reducing it in size, as herein set forth.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date August 5, 1873.]

6,791.—Collar-Box.—ROBERT W. BETTS, New York, N. Y., assignor to himself and O. P. DORMAN, same place. Application filed April 12, 1873.

6,792.—Nubia.—HENRY BOOT, Philadelphia, Pa., assignor to THOMAS DOLAN & Co., same place. Application filed June 26, 1873.

6,793.—Bean.—GILBERT H. PRINDLE, Philadelphia, Pa. Application filed July 25, 1873.

6,794.—Bean.—GILBERT H. PRINDLE, Philadelphia, Pa. Application filed July 25, 1873.

6,795.—Sign.—HENRY B. TITUS, Brooklyn, assignor to EDWARD TODD & Co., New York, N. Y. Application filed August 1, 1873.

6,796.—Carpet.—ALEXANDER T. WEBSTER, New Brunswick, N. J., assignor to NEW BRUNSWICK CARPET COMPANY, same place.—Case A. Application filed July 26, 1873.

6,797.—Carpet.—ALEXANDER T. WEBSTER, New Brunswick, N. J., assignor to NEW BRUNSWICK CARPET COMPANY, same place.—Case B. Application filed July 26, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date August 5, 1873.]

1,393.—Whisky.—JOHN E. CASSIDY, Boston, Mass. Application filed April 8, 1872.

1,394.—Medicine.—Mrs. SARAH DE GRATH, Jersey City, N. J. Application filed June 30, 1873.

1,395.—Guano.—B. M. RHODES & Co., Baltimore, Md. Application filed July 29, 1873.

1,396.—Agricultural Fertilizers.—O. WITTICHEN, Haymarket, Va. Application filed July 29, 1873.

1,397.—Steam-Packing for Engines.—THE SILVER LAKE COMPANY, Newtonville, Mass. Application filed July 29, 1873.

1,398.—Steam-Packing for Engines.—THE SILVER LAKE COMPANY, Newtonville, Mass. Application filed July 29, 1873.

1,399.—Steam-Packing for Engines.—THE SILVER LAKE COMPANY, Newtonville, Mass. Application filed July 29, 1873.

1,400.—Solid-Braided Cords.—THE SILVER LAKE COMPANY, Newtonville, Mass. Application filed June 29, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date August 5, 1873.]

ORIGINAL PATENTS.

141,412.—Sewer-Gas Trap.—GEORGE C. ANTHONY, New York, N. Y. Application filed June 14, 1873.

The open-top box is provided with a cover having a cylinder entering the box at sufficient depth to enter the liquid, which has its upper surface level with the top of the sewer-pipe, preventing the passage of any gas arising from the sewer back into the waste-pipe.

Claim.—A sewer-gas trap, composed of an open-topped box and a cover provided with a cylinder, as described, and having pipes for the entrance and exit of fluids, arranged substantially as set forth.

141,413.—Sand-Papering Machine.—DAVID A. ARMSTRONG, Sandwich, and SHUBAEL T. ARMSTRONG, Sycamore, Ill. Application filed October 11, 1872.

The wheel H has flanges *e e* to produce a blast of air, by which the dust is conveyed away from the machine.

Claim.—1. The wheel H, when provided with the blocks *b*, in combination with disk *d*, substantially as and for the purposes set forth.

2. The metal frames *c* for the purpose of securing the sand-paper to the blocks *b*, and the blocks to the wheel, substantially as described.

3. The wheel H, when provided with the flanges *e*, in combination with the hoods, constructed and operating substantially as and for the purposes set forth.

141,414.—Toy.—JOHN JACOB ARNAUD, Boston, Mass., assignor to THOMAS E. RIDDEL, same place, assignor of one-half his right to JOHN W. RICHARDSON, Medway, Mass. Application filed May 31, 1873.

The ball, being dropped in the hole at the top, descends in a zigzag course from one inclined way to the next until, reaching the bottom, it is cast among a series of numbered cups, in one of which it will probably rest. A substitute for the cup-board is a plane-board, on which pins, to be overturned by the ball, are set.

Claim.—1. The combination of the open frame-work, composed essentially of the standards G Gx, with two or more inclined bars and the perforated platform, when all said parts are constructed and arranged substantially as described.

2. The combination of the open frame-work, inclined bars, and the platform with one or more movable pins and the ball, when constructed and arranged to operate substantially as described.

141,415.—Gas-Burner.—JAMES W. AVERILL, Newmarket, N. H. Application filed April 14, 1873.

Claim.—The burner described, consisting of the parts A C, the former provided with air-apertures, the latter with the conical gas-nozzle D, in combination with revolving perforated register-sleeve E, held between flanges *e f* on the said parts A C, when the latter are fitted together, as shown and set forth.

141,416.—Gage-Cock.—HARRY J. BAILEY, Pittsburg, Pa., assignor to BAILEY, FARRELL & Co., same place. Application filed February 3, 1873.

By means of an eccentric upon a weighted handle, a valve, whose inner surface is faced with soft metal, is pressed to its seat—the weight serving to retain it in position when seated—both the handle and valve being removable. The valve has attached to it a twisted strip of metal, which serves to clean the bore of the gage-cock upon the removal or motion of said valve.

Claim.—1. The arrangement of a cam or eccentric, E, having on its periphery a soft-metal seat, with its face operating directly against the outer open end of the barrel or bore *a* of a gage-cock, in combination with a weighted handle, substantially as set forth.

2. The combination of a cam or eccentric, E, a spindle, D, for opening and closing the bore of the gage-cock, and, affixed thereto and moved thereby, the cleaner *c*, arranged and operated substantially as set forth.

3. The combination of the cam or eccentric E, bearings *r*, seats *d*, spindle D, cleaner *c*, and weighted handle, substantially as set forth.

141,417.—Idler for Belt-Gearing.—THOMAS BELL and JOHN F. HILLERICH, Louisville, Ky. Application filed July 3, 1873.

A stationary ring with a sleeve secured to the side of hanger, so as to be independent of the shaft on which the idle pulley works, and another ring secured to the pulley having a center hub to correspond with the friction-cone, which operates the idle pulley, when required.

Claim.—The pulley B and hanger A, with its ring and flange C C, and friction-ring D, as above described, when the pulley is made to work on a ring or flange on the side of the hanger, so that both shall be independent of the shaft, in combination with the friction-cone E and lever H, by which it is operated, when arranged, constructed, and operated substantially as and for the purpose hereinbefore set forth.

141,418.—Carpet-Stretcher.—WILLIAM A. BOLES, Shelbyville, Ind. Application filed May 9, 1873.

Two adjustable extension-bars with a cross-bar upon their ends, with points loosely attached to allow it to conform to the shape of the room, with a bar to extend its length connected by pivots, a pivoted lever to move it, thumb-screws and pawls and ratchets to move and hold it for nailing.

Claim.—The combination, in a carpet-stretcher, substantially as shown, of two adjustable extension-bars, composed of sections B C D E, secured to the ends of dental bar A, and operated by lever L, or by pawl *L'* and notched pawl P *L'*, for the purposes set forth.

141,419.—Manufacture of Manganese, Ferro-Manganese, and Spiegeleisen.—OGDEN BOLTON, Jr., Pittsburg, Pa. Application filed March 24, 1873.

This invention consists in the reduction of oxide of manganese in close boxes, at less than a melting heat, to a pure or nearly pure metallic manganese, and the utilization of such unmelted man-

gamese, either in the boxes or compressed into blooms, in the manufacture of spiegeleisen and ferro-manganese, and to counteract red-shortness in steel.

Claim.—1. The reduction of manganese in close boxes or cases in a suitable furnace at less than a melting heat, with or without introduction of iron, substantially in the manner set forth.

2. The manufacture of spiegeleisen and ferro-manganese by charging the unmelted or metallic manganese produced, as set forth, either in boxes or in blooms into pig metal previous to or after melting, substantially as in the manner set forth.

3. The charging of metallic manganese, either in cases or blooms into a bath of molten steel, substantially in the manner set forth.

141,420.—Lasting Boots and Shoes.—JOSEPH BRACKETT, Lynn, Mass. Application filed June 6, 1873.

Claim.—1. A last provided with a bottom armed with spurs or holding devices, over and upon which the edges of the upper are stretched and by which they are held whether in conjunction or not with an insole or outsole, or both, without the aid of extraneous devices, substantially as set forth.

2. The combination, with a last of otherwise ordinary or suitable construction, of a removable bottom adapted to be fitted to the bottom of the last, and provided on its outer face with a series of spurs or holding devices, substantially as and for the purposes shown and set forth.

3. In the herein-described process of lasting boots and shoes, an insole perforated with a series of small holes coinciding with the teeth or spurs on the last which confine the upper in place about such insole, substantially as and for the purposes shown and set forth.

4. For lasting purposes a plate or false bottom employed with a last, and containing a series of spurs or their equivalents for seizing hold of and retaining the upper and sole in place, substantially as and for the purposes stated.

141,421.—Water-Bowl.—BLOOMFIELD BROWER, New York, N. Y. Application filed May 9, 1873.

A water-bowl for "copying-presses" is made by dividing the cover into two parts, one raised some distance above the other, to permit the brush to come in contact with the edges and be deprived of its water.

Claim.—A water-bowl having the two parts B and D forming the cover in different planes above each other, substantially as and for the purpose set forth.

141,422.—Copying-Press Table.—BLOOMFIELD BROWER, New York, N. Y. Application filed February 7, 1873.

The slide-board, which is to hold paper or the like, is hinged so that the operator may have access to the drawer, or may extend the water-bowl without pushing in the slide. This bowl is hung in the ring of a bent-metal support, which support is pivoted to the frame of the table in such manner that it and the bowl may be moved outward when the paper is to be wetted, and then pushed under the table out of the way.

Claim.—1. The sliding board D D′, made in two parts, and hinged together, substantially as and for the purpose set forth.

2. In combination with the side frames A A, top plate B, box F, and sliding board D D′, made in two parts, the casting *m* provided with an eye, the swinging rod *n* forming a hand, and the bowl J, all substantially as and for the purposes set forth.

141,423.—Cleaning Wool on Pelts.—JAMES M. BROWN, Lynn, Mass. Application filed July 25, 1873.

Streams of water forced upon the pelt from rear to front.

Claim.—The process of washing sheep-skins by directing a stream or streams of water against the wool of the pelt, substantially as herein described.

141,424.—Clothes-Wringer Roller.—ELISHA P. H. CAPRON, Hudson, N. Y. Application filed January 30, 1873.

A wringer-roll with its journals covered with a cap, forming an outer journal of soft metal, with a flange extending to the outer surface of the roll, and projecting tenons extending from it fitted into openings in the main shaft to hold it in position, and is secured to the end of the shaft by a screw.

Claim.—The sleeve B made of Babbitt metal or similar material, provided with the tenons or projections *d*, and constructed and fitted to the roller, substantially in the manner herein shown and described, for the purposes set forth.

141,425.—Machine for Boring Hubs.—EZRA CASWELL, Lyons, N. Y., assignor of one-half his right to A. H. TOWER, same place. Application filed May 1, 1873.

A tram forms one of the devices and assists in the adjustment of the tool upon a hub.

Claim.—The tram T, hooks *h h h*, screws *s s s*, and adjusting removable plate O, in combination with the shank M, tube P, plate L, and cutter *k*, when constructed and arranged substantially as herein shown and described, and for the purposes specified.

141,426.—Stop-Gate in Water-Mains.—DEWITT C. CREGIER, Chicago, Ill. Application filed May 17, 1873.

Within the main valve a supplemental valve is provided, both operated upon the same stem, the supplemental valve rendering the operation of the main valve under pressure more feasible. A pin attached to the valve is operated by a feather, and moves an indicator showing the position of the valves.

Claim.—1. The main valve E, when provided with an interior recess or chamber, J, guides I, and impinging bar or projection K, substantially as specified.

2. The combination of the main valve E and supplemental valve F with the stem D and outer case, so as to operate both valves by a single stem, substantially as set forth.

3. The combination, in a water-gate, of the shaft H, provided with a spiral feather, with the valve E, stem D, and indicator C, substantially as specified.

4. The stuffing-box G, when attached to the case so as to form a chamber or recess, R, in combination with the stem D and ring or collar Q, substantially as and for the purposes specified.

141,427.—Removable Saw-Tooth.—JOSEPH CROOKER, St. Louis, Mo., assignor of one-half his right to JOSEPH W. BRANCH, same place. Application filed June 9, 1873.

The teeth are rounded upon the back, and the front side beveled so as to wedge tightly in the saw-plate, and are further secured by a rivet, the head of which enters a recess in the tooth.

Claim.—The combination of the tooth C beveled at C′, the slot B beveled at *b′*, and the rivet D having a flat portion or spot, *c*, all substantially as and for the purpose set forth.

141,428.—Thrashing-Machine.—JOHN CROWLEY, Sparta, Wis., assignor of one-half his right to WM. C. LEYBURN, same place. Application filed October 21, 1872.

Concave of angled grate-bars, and provided with long teeth. Picker with spiral blades for agitating straw, which is thrown onto carrier by deflecting-boards.

Claim.—1. In thrashers and separators, the concave and grate, formed of concave or angular slats B, substantially as and for the purposes set forth.

2. In combination with said concave, the peculiar arrangement of the teeth C′, as shown, and for the purposes set forth.

3. The drum G, provided with flanges L, for the purposes described.

4. In combination with said drum G, the picker-reel G′, rakes F H, and perforated floor E, arranged to operate substantially as and for the purposes specified.

5. The described thrasher and separator, wherein the cylinder A, concave C, conveying-board D, perforated floor E, rakes F H, drum G, picker-reel G′, hanging aprons I I′, and fan J, are combined and arranged to operate substantially as and for the purposes set forth, shown, and described.

141,429.—Wash-Boiler Attachment.—ENOCH DAVIS, Hanover, Ind., assignor of one-half his right to JOHN P. ARNOTT, same place. Application filed February 7, 1873.

Within a wash-boiler is placed a crate or basket formed of wire, with a wood or metal bottom, which, with its contents, may be removed.

Claim.—The crate or basket for containing the material to be washed, composed of the bottom B, rods C C, and band D, when constructed and arranged to operate substantially as shown, and for the purposes set forth.

141,430.—Reversible Knob-Latch.—BARTHEL ERNE, Pittsburg, Pa. Application filed June 12, 1873.

Claim.—The front edge-plate a^2 made in two parts, each part furnishing two adjacent sides of the bolt-hole, and one part sliding lengthwise of the bolt to permit of the reversal of the bolt, substantially in the manner and for the purposes set forth.

141,431.—Baby-Walker.—JENS ERIKSON, Madison, Wis. Application filed March 1, 1873.

Two yoke-arms adjust horizontally to circles of different diameters, and the whole yoke-frame is adjustable vertically.

Claim.—1. In a baby-walker, the combination, with the movable frame A, of the adjustable yoke-arms D, and the adjusting-screws H, substantially as set forth.

2. In combination with the yoke-arms D, adjusting-screws H, and frame A, the posts E and screws for adjusting the height of said arms, substantially as shown and described.

141,432.—Car-Coupling.—JOHN J. FRAIKIN, Fort Howard, Wis. Application filed November 4, 1872.

The coupling-hooks have projections upon which levers act to raise them, so that the cars may be coupled and uncoupled from the platform.

Claim.—The levers A, having projections E, in combination with the lever-bars C, vertical levers D and cross-bars or axles B, all constructed, arranged, and operating as described.

141,433.—Apparatus for the Manufacture of Vulcanized-Rubber Belting.—DENNIS C. GATELY, Connecticut, and JAMES B. FORSYTH, Boston, Mass. Application filed December 2, 1872.

The devices described in reissued patent No. 3,531, for vulcanizing between hollow plates heated by steam, and combined with means for stretching the belting as it is treated.

Claim.—The combination of a stretching apparatus, substantially such as described, with the two steam-chambers B B′, the whole constructed and operated substantially as described.

141,434.—Machine for Winding Bobbins.—JAMES GOODYEAR, Yonkers, N. Y. Application filed April 28, 1873.

The empty bobbins on which the sliver is wound are introduced between the disks from a receiver at the bottom of the hopper, and a supporting-pin is at the same time pushed into the bobbin from the opposite direction by the reciprocating-arms. This pin is withdrawn at the proper time by an arm, and the filled bobbin ejected into a receptacle by a vibrating ejecting-arm. The pin-operating and ejecting arms are operated from the main shaft by means of a pawl on a loose cam engaging with a ratchet on the shaft. The pawl is disengaged and the cam caused to rest by its arm coming against a stop on a slide, which supports the bobbin-pin. As the bobbin is filled it rises, and also the slide and stop, until the pawl is released from the stop and engaged by a spring with the ratchet on the shaft, which turns the cam and operates the ejecting and introducing arms.

Claim.—1. In combination, the hopper N, receiver G″, reciprocating piston I, reciprocating pin K, supporting disks or walls H H, and frictional drum E, constructed and operating together substantially in the manner described.

2. The hopper N, receiver G″, disks or walls H H, and supporting-pin K, piston I, and slides G G′, in combination with the slotted side frames, constructed and operating substantially in the manner described.

3. The cam D and arm L, combined with and operating the supporting-pin K, substantially in the manner described.

4. The mechanism for discharging the bobbin, consisting of the ejecting-arm O O′ and bar R, or the equivalents thereof, constructed and operating substantially in the manner described and specified.

5. The device for regulating the rise or filling of the bobbins, consisting of the cam-lever and pawl *c d*, ratchet *b*, and adjustable stop *a*, or equivalents, constructed and operating substantially in the manner described.

6. In combination with the hopper N, receiver G″, and disks or walls H H, the ejector O O′ for automatically discharging the filled bobbin, constructed and operating substantially in the manner described.

7. A machine for automatically winding bobbins having the following elements, namely, a hopper to receive, hold, and deliver the bobbins, a receiver to receive and hold the bobbin in position to be introduced between the supporting-disks H H, a vibrating bearing, K, to support and retain the bobbins properly during winding, a reciprocating piston or plunger, I, to deliver the bobbin on the supporting-pin, an oscillating discharger, O O′, and a vibrating lever, U T, to automatically engage the sliver with the empty bobbin, all acting together in co-operative relation, substantially in the manner described.

141,435.—Door-Check.—LEWIS GOODYEAR, Trumansberg, N. Y. Application filed May 20, 1873.

A spring-latch at top of door to prevent slamming.

Claim.—The latch A and attachments, in combination with the spring B and bent arm C, arranged as described, substantially as and for the purposes hereinbefore set forth.

141,436.—Rotary Steam-Engine.—DEXTER D. HARDY, Delavan, Ill., assignor of one-half his right to HENRY R. GREENE, same place. Application filed January 15, 1873.

Steam enters hollow shaft at one end, passes into one chamber of the drum, and thence through steam-ports into the space between the exterior of the drum and the interior of the cylinder, exerting its force upon the pistons, carrying them and the drum and exterior cylinder, with which they connect, before it, and constantly expands until it reaches the exhaust-ports. The packing-ring fits the shaft snugly, and presses against one of the cylinder-heads.

Claim.—1. The drum F having its shafts E E concentric thereto and placed eccentrically to the exterior cylinder A, and revolving in the same direction and at uniform speed.

2. The drum F, with partition *e*, cavities G H, and ports *g h*, in combination with the pistons or valves I¹ I² I³ I⁴.

3. The combination of the packing-ring J, drum F, shaft E, and cylinder A, substantially as and for the purpose set forth.

141,437.—Cemented Slate-Roofing.—AMZI G. HERRON, Buffalo, N. Y. Application filed May 3, 1873.

Upon a substratum of tarred paper or felt a coating of tar and pulverized gypsum is laid, upon which is placed a layer of roofing-slate without lapping. The joints are afterward painted.

Claim.—A roofing consisting of tarred paper or felt, tar, gypsum, or broken stone, and slabs of slate, combined and applied substantially as set forth.

141,438.—Animal-Poke.—JAMES HOPKINS, Akron, Ohio. Application filed December 6, 1872.

Claim.—The wire-spring E, coiled around the pivotal pin B, and extending back under the bolt or pin F to the stang-head D, through which it is projected by said bow-pin F, in combination with the bow A and stang C, as and for the purpose set forth.

141,439.—Oyster-Dredge.—WILLIAM C. HORNYAGER and MAURICE FITZ GIBBON, New York, N. Y. Application filed December 20, 1872.

A swival-jointed arm or crane fits into a socket in the deck, and extends to the side of the vessel. Upon the outer end is a pulley, over which is carried a rope connecting the dredge to a windlass. The dredge consists of a chain-bag attached to the peculiarly-shaped dredge-frame, the bottom of which bag opens, and is held together when closed by a belt. Withdrawal of the belt discharges the contents of the dredge.

Claim.—1. An oyster-dredge constructed substantially as herein described, and having an opening and closing device at the bottom for discharging the oysters, as and for the purposes hereinbefore described.

2. The combination of windlass A, Fig. 1, and swival-jointed arm or lever B, Fig. 1.

3. The combination of windlass A, swival-jointed lever B, and dredge C, substantially as and for the uses and purposes hereinbefore set forth.

141,440.—Spindle-Bolster for Spinning-Machines.—BARTON H. JENKS, Bridesburg, Pa.—Case A. Application filed May 2, 1873.

The spring holds the bolster with an elastic pressure, allowing it to move in its socket following the spindle, while the latter finds its center of gravity. The screw regulates the pressure of the spring.

Claim.—1. The spring *g*, in combination with the necked bolster, which is supported upon, and is laterally movable in, its rail, substantially as described.

2. The adjusting-screw C, combined with the spring *g* and the loose-necked bolster A, substantially as described.

141,441.—Spindle-Bolster for Spinning-Machines.—BARTON H. JENKS, Bridesburg, Pa.—Case C. Application filed May 2, 1873.

The bushing or sleeve is made loose in the bolster-shell, and prevented from turning by a pin in the latter entering a groove in the former.

Claim.—The sleeve B for encircling the spindle, constructed and applied within the cylindric bolster-shell, so that it shall form a close-fitting upper guide and bearing for the spindle, and yet have sufficient lateral movement in any direction within the bolster-shell to permit the spindle to find its center of gravity, and at the same time shall be positively restrained from revolving with said spindle, all as herein described and set forth.

141,442.—Apparatus for the Manufacture of Starch.—THOMSON KINGSFORD, Oswego, N. Y. Application filed July 15, 1873.

Claim.—The starch-drying apparatus, consisting of an absorbent slab or table, which receives the starch to be dried and abstracts its moisture by absorption, said slab or table being itself dried by artificial heat applied to its lower surface, in the manner set forth.

141,443.—Bee-Hive.—DAVID LATCHAW, Barkeyville, Pa. Application filed November 6, 1872.

Pivoted strips at the bee-entrance are set to guide the bees in and out, and moths to a prison at one end of the hive, where are removable supplemental frames. Woven-wire cylinders form avenues from the outer entrance to the prison, and decoy-apertures serve to lead marauding bees from the hive to said prison.

Claim.—1. In a bee-hive, a comb-frame provided with a supplemental removable comb-guide, substantially as herein before described.

2. In a bee-hive, the combination of the guide-strips *a a′* pivoted in the bee-entrance, a prison-box arranged at one side of the comb-frames and provided with apertures in its under side, and a passage-way leading thereto, all as shown and described.

3. The prison-box provided with wire cylinders, forming continuations of its entrance-apertures, as and for the purpose specified.

4. The combination, with the guide-strips and prison-box, of the front frame provided with the aperture in the bottom, whereby robbers seeking to escape from the brood-chamber may be led into the prison-box, as set forth.

5. The entrance-blocks S provided with wings, as specified, in combination with the guide-strips, as and for the purpose specified.

141,444.—Organ-Coupler.—RAPHAEL E. LETTON, Quincy, Ill., assignor of one-half his right to LUCIUS M. LOCKE, same place. Application filed May 7, 1873.

Organ with coupler for doubling the notes, to operate by means of a knee-swell or by stops.

Claim.—1. The hinged platform A A′ provided with the pins *n*, and wires B having the arms *b d* arranged as shown, in combination with the inclines *m*, feet *i*, standards A, rods *g* secured to the stops P and R, when said parts are constructed and arranged to operate substantially as shown and described.

2. The hinged platforms A A′ provided with the pins *o*, and wires B having the arms *b d* arranged as shown, in combination with the slide E having the inclines N, the lever I, rod L, and knee-swell M, when said parts are constructed and arranged to operate substantially as shown and described.

141,445.—Car-Coupling.—IRA B. LEWIS, Albion, Mich., assignor to himself and CORNELIUS VAN WYCK, same place. Application filed March 17, 1873.

The draw-bar has devices for automatically connecting, which are secured to it by means of the coupling-pin, and may be easily removed.

Claim.—The frame C, adapted to fit an ordinary draw-head, and be secured thereto by the coupling-pin B, the frame having the shaft *a*, spring *b*, hook D, bell-crank E, lever F, quadrant G, and fillet *c*, substantially as and for the purpose set forth.

141,446.—Carpet-Stretcher.—JAMES LINDSAY, New York, N. Y. Application filed May 7, 1873.

Two elongated griping-jaws having shanks pivoted together and combined with a guide-stud and lever, so that the jaws will automatically open and close. A bearing is also so arranged that the jaws may be forcibly closed to grasp the carpet by the outward movement of the lever.

Claim.—1. The combination, with the elongated griping-jaws A B, of the shanks D C, pivoted together as described, of the

toggle-joint, the lever F having a sliding movement, and its inner end forming a part of the toggle-joint, and the steel or transverse pin g, substantially as and for the purpose specified.

2. The combination, with the shanks, pivoted together and carrying the elongated jaws, of the toggle-joint, the lever F having a sliding movement, and its inner end forming a part of the toggle-joint, and the bearing f, the whole arranged substantially as and for the purpose specified.

141,447.—Bale-Band Stretcher.—FRANCIS M. LOGUE, Sartaria, Miss. Application filed July 17, 1873.

Claim.—The lever A and arm C, when forked and notched, as shown, and combined with the crank B, as herein described, and for the purpose specified.

141,448.—Machine for Rossing Bark.—LEANDER BAKER, (administrator of JAMES MARTIN, deceased,) and GEORGE W. WILSON, Merced, Mich. Application filed May 17, 1873.

A rotating cutter removes the inner portion of the bark, which is carried from the machine by a traveling apron, while another similar apron carries off the outer and coarser portion.

Claim.—The machine described, having the press-roller I, connecting-rod L, and weighted lever K, in combination with the cutter C and traveling belts M P, as described.

141,449.—Apparatus for Pitching Casks, Barrels, &c.—GUSTAVUS MEYER and JOCHN DICK, Quincy, Ill. Application filed June 19, 1873.

Two concave rollers, one divided at its center and capable of reverse motion, are mounted upon parallel shafts, one of which is provided with movable eccentric bearings for regulating the distance between the shafts. One section of the compound roller is provided with clutches at each end and mounted loosely upon the shaft. The barrel is placed endwise upon the concavities of the roller, which being disengaged and rotated the barrel is revolved upon its longitudinal axis, and upon the sections being engaged an end-over-end motion is given to the cask.

Claim.—1. The section O having clutches at each end mounted loosely upon a shaft and having an endwise movement, as and for the purposes shown and described.

2. The section O, in combination with the section P, substantially as shown and described.

3. The roller composed of the sections O and P, in combination with the roller r for the purpose of rotating a cask or similar vessel in the plane of its vertical axis, substantially as shown and described.

4. The combination of the sections O and P, capable of reverse motion, and roller r for the purpose of rotating a cask or similar vessel upon the axis of its cylinder, substantially as shown and described.

5. The combination of the sections O and P and roller r operating horizontally, substantially as shown and described.

6. The combination of the sections O and P, rollers B and r, substantially as shown and described.

7. The milled eccentric-bearings A, substantially as shown and described.

8. The elongated slot l, in combination with the box e, substantially as shown and described.

9. The combination of the eccentric-bearings A, slot l, and box e, substantially as shown and described.

10. The shaft r, screw s, in combination with the draw-rods t and shaft Z, substantially as shown and described.

11. The combination of the pulley-wheel b, bar c, lever f, slotted standard d, and movable shaft Z, for the uses and purposes substantially as shown and described.

12. Two or more rollers, either concave or cylindrical, working in a horizontal position for rotating a cask, substantially as shown and described.

141,450.—Printer's Furniture.—HARLAN P. MONTAGUE, Belchertown, Mass. Application filed December 21, 1872.

Claim.—The pieces C having a solid middle equal to the shortest side of the smallest form and slotted from said middle outward to each end, as and for the purpose described.

141,451.—Apparatus for Sausage-Stuffing and other Purposes.—JAMES A. MOORE, Bethlehem, Pa., assignor of one-half his right to ALFRED J. MOORE, same place. Application filed March 8, 1873.

Piston tilts out of the way of cylinder when withdrawn therefrom.

Claim.—1. The tilting piston-rod h, arranged and operating substantially as and for the purpose herein specified.

2. A sausage-stuffer and lard-press, composed substantially of a bench, A, cylinders D G H, piston C with its rack i and tilting-rod h, and driving-gearing, substantially as herein specified.

141,452.—Coal-Stove Grate.—SAMUEL G. MORRISON, Williamsport, Pa. Application filed June 7, 1873.

Claim.—The movable flanged collar or ring c, in combination with the horizontally-rotating grate A, substantially as and for the purpose described.

141,453.—Folding-Table.—PATRICK MUNDS, East Hampton, Mass. Application filed February 3, 1873.

At each end of the table-top are hinged the leg-frames. Said frames are made adjustable in height by means of operating-sleeves, screws, and nuts arranged in the standards of said frames. A hinged brace hooks into the nuts on each standard, and keeps the nuts from turning and the leg-frames from folding together.

Claim.—The relative arrangement, with a table-top, of the legs, when constructed substantially as shown and described, and of operating sleeves T T, screws W W, and nuts V V, for the purpose of enabling the height of the top to be altered at will, and having, in connection with them, the removable brace K, for the purpose of locking the nuts V V when in place.

141,454.—Check-Valve.—JOHN H. NAYLOR, Buffalo, N. Y. Application filed March 28, 1873.

The valve, seat, and cage are held in place by a screw-lid on the chamber. The stop-cock shuts off communication with the boiler, allowing the valve to be removed.

Claim.—1. The combination and arrangement of the cylinder A, screw-cover B, removable valve-seat C, cage D, and valve E, for the purpose and substantially as herein set forth.

2. The combination and arrangement of the cylinder A, screw-cover B, removable valve-seat C, cage D, and valve E with the stop-cock G, for the purpose and substantially as herein described.

141,455.—Explosive Compound.—ALFRED NOBEL, Hamburg, Germany, assignor to THE GIANT-POWDER COMPANY and THE ATLANTIC GIANT-POWDER COMPANY, San Francisco, Cal. Application filed June 4, 1873.

Claim.—The composition of matter hereinbefore set forth, consisting of nitrate of soda and resin, or their equivalents, with or without sulphur, mixed with nitro-glycerine, as a new explosive compound, substantially as hereinbefore described.

141,456.—Folding-Chair.—PATRICK W. NOLAN, New York, N. Y., assignor of one-half his right to J. H. CAMPBELL, Willimantic, Conn. Application filed April 8, 1873.

To a base-plate are secured two uprights or frame pieces, having vertical and angular slots to receive the pivots connected to the sliding back, folding arms, or folding seat. When the seat is in position for use the arms are extended and the back is inclined, but when the seat is folded the arms are also folded, and the back assumes a vertical position and slides down in the grooved uprights.

Claim.—1. The pivoted sliding back D, in combination with the slotted upright side standards B, substantially as and for the purpose described.

2. The folding seat, provided with angular or curved straps, in combination with the sliding pivoted back, substantially as described.

3. The folding arms, in combination with the pivoted sliding back, substantially as described.

4. The combination of the pivoted seat C, folding arms E, and pivoted sliding back D, substantially as and for the purpose described.

5. The standards or uprights B, provided with the vertical and angular slots b b^1, in combination with the folding seat C and pivoted back D, substantially as and for the purpose described.

6. The shields or guards G, in combination with the standards B, for covering the projecting curved or angular ends of the seat-straps C', as described.

141,457.—Folding-Chair.—PATRICK W. NOLAN, New York, N. Y., assignor of one-half his right to J. H. CAMPBELL, Willimantic, Conn. Application filed June 25, 1873.

A single pivoted arm is arranged between two pivoted seats, so that while either of the seats is unfolded the arm remains unfolded also. The seats are also connected with the backs by means of curved slotted straps on the seats and pins on the backs, and when the seat is folded up the back is brought to a perpendicular position. When the seat is unfolded the back is inclined to the proper position.

Claim.—1. A single pivoted or folding arm between two adjoining seats, in combination with independent cams, or an equivalent device, on the adjacent sides or straps of said seats for operating said arm, substantially as described.

2. The combination of the pivoted back with the pivoted seat, provided with curved slotted straps or plates, whereby a positive movement is imparted to the back in both directions by the movement of the seat, and also to the seat by the movement of the back, substantially as described.

3. The slotted cam-shaped straps B', in combination with the pivoted back and arm for operating said back and arm, substantially as described.

141,458.—Iron Bridge.—JACOB D. PIERCE, Columbia, Mo. Application filed June 17, 1872.

The bridge is sustained by cables anchored to the foundation and passing over trestle-supports. The central suspensory space is thus diminished in width, and the road-way is carried over this portion upon raised trestle-work. The bridge thus has a wave-line contour.

Claim.—1. The arrangement of one of the chords of a bridge in three reversed curves to act alternately as a top and bottom chord, and the extension of the same in full line at tangent to anchorage, as the of the main or primary features of seating or upholding the bridge.

2. The application of cables to the support of the center of bridges by passing them over arches combined with trusses in place of upright towers.

3. The combination of upright and suspended arches with three trusses in the organization of one span of a bridge, and all without the aid of towers, substantially as and for the purpose described.

141,459.—Manufacture of Leather.—GEORGE RAWLE, Bristol, and WILLIAM N. EVANS, Bedminster, England. Application filed April 16, 1873.

Claim.—Coating the grain side of skins or hides with a protecting coating of grease and oil, or other coating capable of protecting such grain side from the action of tannin liquor, and subsequently submitting the skins so prepared to the action of tannin liquor in a tan-pit, substantially as herein described.

141,460.—Screw-Cutting Machine.—HENRY O. REED, Boston, Mass. Application filed May 16, 1873.

The face-plate carries two circular die-holders, in the periphery of which the screw-cutting dies are fastened. The bolt is advanced by means of a lever pivoted to the rear of the clamp, in the end of which a spring-pawl is fitted to operate against a rack on the side of the bed.

Claim.—1. The castings F and G, in combination with the small steel pieces, the set-screws, the pins a a, and the die-plate D, as above described.

2. The lever K having for its fulcrum the sliding spring-pawl L, bearing in a rack in the bed A, in combination with the head I and jaws H H mounted in ways in the bed A, and with the die-plate D bearing a cutting-tool, so that the screw or nut held in the jaws may be forced against the cutting-tool by the lever, all substantially as described.

141,461.—Device for Locking Drawers.—LOUIS RENKER, Hoboken, N. J. Application filed May 19, 1873.

A rod which, by a series of cams, locks or unlocks all the drawers in a bureau or desk at one operation.

Claim.—The slide-rods C C', provided with the cam-projections E, lock-projections D D, and springs w w, in combination with a lock-drawer, B, and notched drawers B' B', to be fastened thereby, arranged and operating substantially as and for the purpose herein specified.

141,462.—Cultivator.—RICHARD B. ROBBINS, Adrian, Mich. Application filed December 30, 1872.

Anchor-shaped hooks are provided pendent from the axle-tree for holding the cultivator-beams from the ground, and securing them by automatic action.

Claim.—The anchor-shaped pendent hooks e, in combination with the staples f, when used in a lateral-moving cultivator, substantially as described.

141,463.—Running-Gear of Vehicles.—LUCIUS R. ROSEBROOK, Harmon, Ill. Application filed April 19, 1873.

Mode of connecting the head-blocks of vehicles to their front axles, whereby a free ball-and-socket movement is allowed, and fifth-wheels and king-bolts dispensed with.

Claim.—The double-jointed brace E, connected to an eye-piece, A, on the reach-plate, and to a pivot-screw, a', on a plate, a, in combination with the ball e and socket-plates g g, substantially as described.

141,464.—Sugar-Cane Coverer.—FREDERIC ROY, Parish of St. Bernard, La. Application filed April 5, 1873.

Two pairs of scrapers are secured to the frame, by which the earth from each side is thrown into the trench and a ridge formed, which is made uniform and pressed by a following plow and roller, the latter being adjustable in height. By means of a bent axle and lever the covering devices are raised from the ground at will.

Claim.—1. The combination of the frame A with the mold-boards E E, regulator or leveler F, together with its vertically-adjustable frame F', its roller F'', standards g g, and vertical screws G G G G, substantially as described and shown, and for the purpose set forth.

2. The combination of the wheels and axle B', lever C', handle D, runners H H', screws J J, oscillating cross-piece I with fore-wheels B B with their mountings, all constructed and operating together substantially as described and shown, and for the purposes set forth.

141,465.—Vent-Gimlet.—HIRAM S. RUMSEY, Binghamton, N. Y. Application filed March 8, 1873.

Claim.—The vent-gimlet described, consisting essentially of a single tube, A, of equal diameter throughout, provided with a stop-cock, D, gimlet-point B, and tapering screw-thread c, as described, for the purpose set forth.

141,466.—Corn-Harvester.—ALEXANDER SCOTT, Rochester, N. Y. Application filed May 14, 1873.

Shear-cutters are opened by star-shaped or cam-wheels to receive the standing stalks, and closed for cutting by springs.

Claim.—1. The receiving-platform C operated by the point g, latch d, and cord n, or its equivalent, in the manner shown and described, for the purposes set forth.

2. The movable cutters D and D', connected as described, and arranged so as to be opened by a cord or its equivalent, and closed by a spring or otherwise instantaneously, for the purposes set forth.

141,467.—Frame for Vertical Engines.—GEORGE B. SIMSON, Buffalo, N. Y. Application filed March 22, 1873.

Claim.—The vertical engine-frame, cast in two pieces or halves, each half comprising the standards A A', bed-plate B, permanent tubes C C, and having the yoke F connected therewith, the whole arranged and constructed substantially as hereinbefore specified.

141,468.—Reed-Organ.—JOHN A. SMITH, Erie, Pa. Application filed October 23, 1872.

Claim.—1. In combination, with the stops of a reed-organ, a series of stop-actuating devices, arranged to be severally operated by a movement of the knee, substantially as and for the purposes described.

2. The front rail D, in combination with the plunger E, as shown, and for the purposes mentioned.

3. The combination of the plunger E, knee-piece A, and lever B, constructed and operating together, substantially as and for the purposes mentioned.

4. The plunger E, constructed as described, in combination with the lever B and spring c, as and for the purposes mentioned.

5. The register F, in combination with the plunger E, and front rail D, as shown and described.

141,469.—Organ-Stop Action.—JOHN A. SMITH, Erie, Pa. Application filed October 29, 1872.

Finger-stop handles or push-knobs are arranged with a pawl, notch, and springs, in connection with an alternate on-and-off indicator by consecutive pressures of the same finger-knob.

Claim.—1. The stop-keys D D' D'', connected with the stops of the organ by plungers, pawls, springs, levers, to cause like movements on the said stop-keys to produce opposite results upon the stops, substantially as set forth.

2. The plunger E, in combination with the plunger F, as shown and described.

3. The plunger E and pawl m, in combination with the plunger F and catch-pawl c, as shown and described.

4. The plunger E and pawl m, in combination with the spring g and catch-pawl c, as shown and described.

5. The stop-key D, D', or D'', in combination with the plunger E, as shown and described.

6. The movable tablet P, covering and displaying alternately the fixed tablet O, said device being in conjunction with the name of the stop, substantially as shown and described.

141,470.—Beat-Detaching Apparatus.—SAMUEL SHEDEN, Brooklyn, N. Y. Application filed July 9, 1873.

To the upright standard is firmly attached a plate provided with a slot, through which the end of the operating-lever passes, so that, should the bolt upon which the lever is fulcrumed break, the lever would still be retained in position.

Claim.—The standard 1, eye 2, plate 4 having the slot 5, in combination with the operating-lever 6 and plug 7, substantially as shown and described.

141,471.—Stop-Cock.—E. FRANK SPAULDING, Cambridgeport, Mass. Application filed April 26, 1873.

When the first disk has reached its lowest point the farther descent of the other operates a cam, which forces the disks in place.

Claim.—In a valve, substantially as described, the combination of the disks G G', the wedge c', and ribs A A, constructed and arranged for conjoint operation, as specified.

141,472.—Seeding-Machine.—HENRY CHARLES STEPHENS, Glenville, Ohio. Application filed June 9, 1873.

The frame is supported upon a center wheel, which acts through a series of pins, to move the agitator in the seed-box situated upon the front end of the frame. A hollow tooth conveys the seed to the furrow, which it opens, and the seed is covered by scrapers on the rear of the opener.

Claim.—1. The combination of the frame A, roller B, seed-box D, hollow standard E, point or share F, and scraper G, in the manner as and for the purpose set forth.

2. The agitator, consisting of the frame I and cord H, in combination with the seed-box D, arm J, spring K, and pins c of the roller B, substantially in the manner as and for the purpose specified.

141,473.—Bushing for Faucet-Holes.—SAMUEL R. THOMPSON, Portsmouth, N. H. Application filed April 15, 1873.

The neck of the faucet is held in position by the angular projection of a wooden plug screwed within the ordinary metallic bushing, admitting of the ready insertion and withdrawal of the faucet.

Claim.—1. A bushing, c, constructed and arranged, as described, so as to hold and allow the yielding in any direction and permit the ready release of a faucet, substantially as specified.

2. The combination of a bushing, c, and a casing, b, constructed and arranged as described, and for the purposes specified.

141,474.—Car-Starter for Street-Railways.—MORTON TOULMIN, New Orleans, La., assignor of one-fourth his right to O. F. CAWTHON, Mobile, Ala. Application filed May 27, 1873.

Within the segmental wheel is eccentrically journaled a smaller friction-wheel, which is forced against and turns the axle, power being applied to turn the segmental wheel.

Claim.—1. The combination of the segmental wheel F, which is greater than a quadrant, with the eccentric-wheel I, spring E, pin O, and wheel K, substantially as and for the purpose set forth.

2. The combination of the sleeve having the wheel K, journals S S, lugs G G, with the segmental wheel F, substantially as and for the purpose set forth.

3. The combination of the spring E, to operate on the pin O and eccentric I, with the wheel K, substantially in the manner and for the purposes set forth.

141,475.—Carpenter's Gage.—JUSTUS A. TRAUT, New Britain, Conn., assignor to THE STANLEY RULE AND LEVEL COMPANY, same place. Application filed November 16, 1872.

The scribe-pin is inserted in holes in the slit, which is clamped by a screw.

Claim.—As an article of manufacture, the carpenter's gage herein described, composed of the bar *a*, head *b*, slit *c*, gage pin or pins *c'*, and fastening-screw *f*, all arranged as and for the purpose set forth.

141,476.—Window-Mirror.—HERMANN VOSS and HERMANN P. BRANDT, Davenport, Iowa. Application filed June 23, 1873.

Claim.—The window-mirror, consisting of the box or frame A and the mirrors *a a a' a'*, the mirrors *a a* diverging outwardly or toward the outer end *b*, and being in vertical planes, while the mirrors *a' a'* diverge upwardly and outwardly at angles which will reflect objects directly beneath the window in which the mirror is placed into the room, all substantially as herein described.

141,477.—Wrench.—SAMUEL W. WAKEFIELD, Keokuk, Iowa. Application filed May 16, 1873.

Claim.—The wrench A B having tapered slot C, with the large end of the slot toward the handle and the other end D, closed, and the side *d* serrated, substantially as shown and described.

141,478.—Chimney or Globe Holder.—RUFUS WRIGHT and JAMES H. RACE, Brooklyn, N. Y. Application filed May 13, 1873.

Claim.—The lamp-chimney or globe securer, consisting of a single metallic clip embracing the gallery-frame, so constructed, substantially as described, that without alteration of the parts it may be attached to any open-ring gallery.

141,479.—Sawing-Machine.—PETER M. ANDRIOT, Oxford, Ohio. Application filed April 21, 1873.

Locking devices are provided for the wheels upon which the machine rests, which prevent their rotation when the machine is in use.

Claim.—The bars 7, constructed as described, and used for locking the wheels, substantially as set forth.

141,480.—Churn.—ESAU ARCHER, Davisville, W. Va. Application filed April 12, 1873.

Claim.—The combination of the crank fly-wheel G, short horizontal shaft F, bevel gear-wheels H I, short vertical shaft J, sleeve K, stationary bevel-gear wheel M, lug-plate N, shaft O, cranks P, bow or stirrup Q, and bevel-gear wheel R, with each other, to give a rotary movement and an up-and-down movement to the dasher-shaft, substantially as herein shown and described.

141,481.—Insect-Powder Gun.—WILLIAM HENRY BALL, Brooklyn, N. Y. Application filed April 19, 1873.

By compressing the flexible box the powder is ejected.

Claim.—A combined package and gun for insect-powder, composed of a hollow cylinder, A, of paper, wood, or other material, and a flexible tube, E, the box A having a hopper or other perforated bottom, C, and the flexible tube E having an ejecting-nozzle, substantially as specified.

141,482.—Water-Closet for Vessels.—WILLIAM BISHOP, Brooklyn, N. Y. Application filed July 19, 1873.

The supply-water pump and soil-pump are connected to and operated by the same lever, washing the closet simultaneously with the withdrawing of the contents previous to projecting the same out through the vessel.

Claim.—The water-pump *b* operated by the lever *c*, in combination with the pump *d* that removes the contents of the closet and discharges the same, substantially as set forth.

141,483.—Manufacture of Friction-Matches.—CHARLES F. BONHACK, New York, N. Y. Application filed June 28, 1873.

Stirrers in a paste-chamber, which is inclosed within a water-chamber, convey the paste to a roller, from whence it is transferred by contact to a bundle of matches resting on a guide-roller. A gage determines the thickness of paste on the roller and scrapes waste paste from the ends of the roller. A scraper for removing paste from the transfer-roller is provided with pins to arrest the stray pieces of broken matches.

Claim.—1. The combination of paste-receptacle A, water-bath B, covers C, transferring-roller D, stirrer E E', gage H, scraper I, and guide-roller F, forming the match-dipping machine, substantially as and for the purpose described.

2. The adjustable gage H, having side extensions *f* for scraping paste-drippings on the roller ends, as described.

3. The scraper I, having upright pins or teeth *g* for taking the pieces of broken matches and passing the paste between them into receptacles A, as set forth.

141,484.—Shirt-Collar Fastener.—GEORGE W. BRIENTNALL, Lancaster, Pa. Application filed August 8, 1872.

Claim.—As a new article of manufacture, the fastener for paper or other removable collars, consisting of an elastic band or cord provided with a button at each end, substantially as and for the purpose set forth.

141,485.—Coal-Hod.—JOHN H. BROWN, Lynn, Mass. Application filed April 1, 1873.

The spout or front slides in slots or otherwise, and is operated by the handles so as to be raised or lowered.

Claim.—The combination of the extension-spout B with the hod A, operating as described, and for the purpose set forth.

141,486.—Packing-Box for Paper-Folding Machines.—CYRUS CHAMBERS, Jr., Philadelphia, Pa. Application filed May 10, 1873.

One side is adjustable so that it may accommodate differently-sized folded sheets and be set longitudinally at such an angle as to cause a diminution of frictional bearing of the springs of the back board. This back board and the plunger are adjustable, to meet the size of the trough. The folded sheet drops into the vertical slot I, is fed forward by the plunger, and the bends given its edges in passing the cleats are straightened by being forced against the angular rear edges of the cleats as the plunger retreats, being returned by the elasticity of the accumulated pile.

Claim.—1. The adjustable side B', united to the bottom board A of the packing-box of a folding-machine by means of set-screws passing through the slots *s* in the bottom board, substantially in the manner and for the purpose specified.

2. The plunger D, made adjustable as to its width by means of the slats *d d* united to the side bars *e f*, and sliding upon one another in the manner substantially as set forth.

3. The sliding back board C, made adjustable as to its width by the sliding slats *k m*, and provided with the frictional springs S S, as and for the purpose stated.

4. The inclined faces of the cleats K K, forming the acute angles *a a*, for the purpose of straightening out the folded sheet in the manner described.

141,487.—Machine for Folding, Cutting, and Trimming Paper.—CYRUS CHAMBERS, Jr., Philadelphia, Pa. Application filed May 8, 1873.

Circular cutters with angular teeth attached to one of each pair of folding-rollers run in grooves in the other. They are clamped between rings of rubber which, bearing against the periphery of the rollers, receive motion therefrom and hold the paper distended over the grooves. The teeth are beveled on one side, and cutting on both their angles, and from one side only, insure clean cuts on the binding edges. The waste is cleared from the grooves by fingers. The cutters slide freely on their shafts, and, together with the clearers and rollers, adjust simultaneously longitudinally.

Claim.—1. The combination, with the cutter G, of the rubber-actuating disks H H', arranged and operating in the manner and for the purpose described.

2. The angular or inclined arrangement of the cutter-teeth as distinguished from teeth radially arranged, as and for the purpose set forth.

3. The cutter G, whether having inclined, angular, or radial teeth, dressed on a bevel on one side of the cutter-plate, as described and represented, for the purpose specified.

4. The arrangement of the cutter loosely on a stud projecting from the frame, as described, for the purpose of enabling it to accommodate itself to the longitudinal adjustments of the folding-rollers, as stated.

5. The arrangement, in combination with the grooves in which the circular cutters work, of adjustable clearing-fingers to keep said grooves free from chips or shreds of paper, as set forth.

141,488.—Machine for Folding, Pasting, and Inserting Paper.—CYRUS CHAMBERS, Jr., Philadelphia, Pa. Application filed June 11, 1873.

The "outsect" sheet (sixteen pages) has a line of paste deposited on the line of its back fold which is parallel with that of its first fold, (by mechanism of a kindred application.) The sheet is then folded in its center by the first folding-blade, guided to the second folder by tapes, folded and given a line of paste inside on the line of its last fold from a paste-box, S, and carried by tapes under the last folding-rolls, where it rests. The "insect" sheet (eight pages) is folded on a table at right angles to the other, where, as its first fold is made, a paste-roller, C', deposits paste on its back folding-line. As it is carried forward to a position under the last folding-rollers 4 4 it receives paste from box S' on its last folding-line. This insect thus lies under the outsect, both receiving the last fold by the upwardly-rising blade D, the folded being guided by curved rods up over one roll, 4, and down between it and a roll, 5, and delivered.

Claim.—1. The supplemental attachment, consisting of the folding-blade B' with its paste-cup C', the grooved rollers 3 3, and paste-box S', arranged and operated as described, in combination with a two-sheet folding and pasting machine, for the purpose of folding and pasting the inset ready to be delivered to the last folding device and folded within and pasted to the outset, all substantially in the manner set forth.

2. The paste-cup C', constructed as described, and attached to the folding-blade by means of the adjustable spindle, in the manner and for the purpose specified.

3. The combination of the spindle, slide, screw, and arm with the folding-blade of a paper-folding machine, in the manner and for the purpose described.

141,489.—Paper-Folding Machine.—CYRUS CHAMBERS, Jr., and WILLIAM MENDHAM, Philadelphia, Pa., assignors to EDWIN CHAMBERS and CYRUS CHAMBERS, Jr., same place.—Case A. Application filed May 13, 1873.

One from a bank of sheets on feed-table is adjusted with its side against gages and its front edge on stops which vibrate into recesses in griping-roller as the drop-roll falls upon it. It passes between rolls, being creased by a blade of one into the bite of grippers upon the other, and, thus held, is guided around by rods. The forward end is directed out between rods *s* and *t* by fingers V, vibrated from out of recesses in F into its path, and retracted in time to allow its griped crease to pass upward into the bite of rolls F and I to form the first fold, when the gripers release it. The doubled sheet is carried on tapes under rods *r* to the second and succeeding folders.

Claim.—1. In combination with the hinged feed-table B', the divided adjustable guide C C', constructed and operating as described.

2. The spring-gripers *f*, constructed as set forth, and attached to the cylinder F in the manner and for the purpose stated.

3. The compound cam Q, consisting of two disks having independent and combined adjustments, in combination with the drop-roller and the guide-fingers V and the mechanism for operating them, as and for the purposes described.

4. The guide-fingers V, operating as and for the purpose specified.

5. The elastic creasing-blade *g*, in combination with the recess in roller F for creasing the paper while on the run, as set forth.

6. The cylinder F, composed of separate disks or rollers placed on a common shaft, E, at suitable distances apart, in combination with the vibrating fingers V, arranged and operating in the manner described.

7. The wires Z Z placed above a pair of folding-rollers and on either side of the folding-blade, as and for the purpose specified.

141,490.—Paper-Folding Machine.—CYRUS CHAMBERS, Jr., and WILLIAM MENDHAM, Philadelphia, Pa., assignors to EDWIN CHAMBERS and CYRUS CHAMBERS, Jr., same place.—Case B. Application filed May 13, 1873.

As the sheet with duplicate printed matter receives its first fold it is divided centrally by circular knives, the two halves being delivered, supported by rods, to overlie the rollers D D' and E E', through which they are simultaneously forced to form their second folds. The folded sheet from rolls D is carried by the usual tapes over rolls I I', receives its last fold, is delivered and packed. The folded sheet from rolls E is carried by tapes over and between rolls D to the last folding-rolls I, thus following the first to the packing-box. When the sheet receives but two folds it is delivered into a receiving-box standing parallel with the packing-trough, which receives the sheet, swings into a plane at right angles to the trough, and drops it from off a fixed supporting-bed into the trough, where it is packed. A rearward continuation of this fixed bed is a hinged plate, which may be depressed at will to eject the sheet and permit its being packed.

Claim.—1. In a folding-machine by which the printed sheet is cut in two parts, as described, the combination and arrangement for correlated action of the rollers E E' with their blade F, the rollers D D' with their blade C, the rollers I I' with their blade K, the carrying-tapes *t*, and the guide-bars G, all constructed, timed, and operated substantially in the manner and for the purpose specified.

2. The turning-frame Q, constructed as described, and operated by the reciprocation of the plunger to receive the folded sheet from the rolls, and deliver it in proper position for packing into the packing-trough, as set forth.

3. The drop *h*, constructed and located as described, and operated by the treadle Z, for the purpose of throwing out an imperfect sheet before it reaches the packing-trough, as specified.

141,491.—Packing Device for Paper-Folding Machines.—COOPER CLARK, New York, N. Y., assignor to CYRUS CHAMBERS, Jr., and EDWIN CHAMBERS, Philadelphia, Pa. Application filed May 10, 1873.

The limp and damp folded sheet, dropping into the vertical slots *s*, is forced forward, by the inclined plunger C, against the spring-seated inclined retiring head B, while the front of the pile is supported against the inclined stops K.

Claim.—1. In combination with the packing-box of a folding-machine, the inclined reciprocating plunger C, constructed and operating as described.

2. The inclined back board B, made as described, for conjoint operation with the plunger C in the packing-box of a folding-machine, in the manner and for the purpose specified.

3. The inclined catches K, having the same inclination to the packing-trough as the plunger and back board, and operating to hold the packed sheets at that angle, as specified.

141,492.—Passenger-Register.—SYLVESTER L. COOPER, Lewistown, Pa., assignor of two-thirds his right to JOHN LOCK and ROBERT N. WILLIAMS, same place. Application filed May 19, 1873.

A passenger-register for full and half fares connected with a step mechanism by which the weights of the different kinds of fares are regulated.

Claim.—1. The step *b*, in combination with the triangular blocks *c*, substantially as set forth, compelling the passengers to place their weight upon the center of the steps, the legs *d*, and levers *e*, as described.

2. In combination with the movable step of a passenger-register, the levers *e* and adjustable weight *f*, for the purpose set forth.

3. A passenger-register for fares and half-fares, in combination with a step mechanism, by which the relative weight of fares may be regulated, substantially as shown.

141,493.—Stamp for Crushing Ores.—GEORGE D. CROCKER, San Francisco, Cal. Application filed April 14, 1873.

The stamp-rods, having flexible connection, operate through guide-rollers which allow the rebound of the stamp.

Claim.—The combination of the flexible spring connections D with the friction-wheel guides *b b*, in a quartz-mill, when the several parts are constructed and arranged substantially as and for the purpose set forth.

141,494.—Cotton-Bale Tie.—WILLIAM CROSS, Galveston, Tex. Application filed May 24, 1873.

S-shaped bar, through the bent parts of which the band, with projections thereon, passes.

Claim.—The S-shaped bar A B B, and the cross-bars E, combined with the band D in the manner and for the purpose described.

141,495.—Fly-Trap.—ANDREW J. DAVIS, Hartford, Mich. Application filed June 21, 1873.

A trap constructed with a cylindrical cage with a cover, a bottom within a basin having openings for the insects covered with a conical formed cap, and an opening at its top for the insects to pass into the cylinder, which is separated at this point by another basin through which the cone passes, which serves to form another apartment, and is hinged to the base, for clearing the trap of the insects caught, and has no other means of egress for them.

Claim.—1. The double fly-trap, consisting of cage A, with cover C, handle D, entrance-cones *c*, and basin E, connected to the lower chamber B, having cone F and basin E', substantially as specified.

2. The basin E, having central aperture for lower cone F resting on the rim *f* of the lower chamber B, and secured thereto by sliding bolts *g* and eyes *g'*, as shown and described.

141,496.—Loom-Picking Stick-Check.—ROBERT DAVIS, Lawrence, Mass., assignor to himself and PARKER C. KIRK, same place. Application filed June 25, 1873.

To hold the picking-stick in its outer position, so as to prevent its rebounding when struck by the shuttle, a spring friction-bar is pivoted to the bottom of the lay under the shuttle-box and so placed as to bear against the side of the stick in its outward movement, and on the opposite side of the lay-bottom, and parallel with the slot in which the stick moves, is placed a fixed friction-bar, adjustable laterally that it may be moved inwardly from time to time as it becomes worn.

Claim.—In combination with the picker-staff B, the race-beam A provided with the adjustable bar F, and the friction-brake D with its spring E, all operating together as specified.

141,497.—Farm-Gate.—EDWARD B. DECKER, Carrollton, Ill. Application filed January 18, 1873.

This is hinged and latched as other gates. One or more of the lower rails are pivoted at the hinge-end, and, being plural, connected by a link near the latch-end, at which end these bars rest in a slot out of which they pass in a curved movement to be held up by a link held by the same pivot that holds a gravitating-latch which prevents animals from lifting the bars.

Claim.—In combination with the vertical cross-bar D, rigidly connected with the upper bars of the gate, the pivoted latch H, and the lower bars (one or more) pivoted to the cross-bar C and resting at their front ends in slots of the said bar D, as shown and described.

141,498.—Scaffold-Support.—RICHARD A. EDMONSTON, Georgetown, D. C. Application filed January 28, 1873.

The "putlogs" rest transversely upon the curved projecting portion of the support, and by their weight constrict the scaffold-pole, at the same time pressing the beveled edges *b b* into its substance, rendering slipping impossible.

Claim.—A scaffold-crab, constructed for use and operation substantially as shown and described.

141,499.—Fence-Post.—HOSEA O. ELMER, Sand Bank, N. Y. Application filed February 21, 1873.

A post of angle-iron, (crucial,) having an expanded iron plate near its base, and socketed into a wooden block, said block having an iron band around its upper end, and being thoroughly incased in cement or artificial stone, said plate serving as a cap.

Claim.—A fence-post having its upper part of iron, its lower of iron, wood, and cement of artificial stone, and provided with the intermediate cap F, as and for the purpose described.

141,500.—Manufacture of Illuminating-Gas.—WILLIAM ELMER, New York, N. Y. Application filed November 22, 1872.

Claim.—The process herein described of manufacturing illuminating-gas by first distilling the gas-stock in one retort at a comparatively low heat, then decomposing the resulting distillates into hydrogen and carbonic oxide in a separate retort at a high heat—not less than 2,000° Fahrenheit—and then causing the resulting gases, immediately before leaving the said highly-heated retort, to pass over or through crude coal, or its equivalent, deposited for the purpose therein and near the point of exit of the gas, whereby the inflammable but non-illuminating gases generated under the said high heat take up and combine with themselves, while under the action of such heat, a portion of carbon, thereby converting them into useful illuminating-gas, substantially as described.

141,501.—Packing and Carrying Device for Paper-Folding Machines.—WASHINGTON FARRINGTON, Brooklyn, N. Y., assignor to CYRUS CHAMBERS, Jr., and EDWIN CHAMBERS, Philadelphia, Pa. Application filed May 7, 1873.

The packing-trough has a supplemental bottom which may be lifted with the accumulated folded sheets upon it to remove them to the finishing-table.

Claim.—In combination with the packing-trough of a paper-folding machine, a removable slatted tray or false bottom, made substantially as described, for the purpose specified.

141,502.—Terret and Martingale Ring.—JOHN GERAGHTY, Jersey City, N. J. Application filed April 19, 1873.

Claim.—An improved harness-trimming for martingale and terret rings, consisting of the frame B, ratchet A, and pawl C, combined and arranged as and for the purpose specified.

141,503.—Treating Cotton-Seed Oil to Render it Drying.—HENRY GOLDMAN, New York, N. Y. Application filed May 17, 1873.

Dissolve five pounds of bichromate of potassa in water, twenty gallons; heat to boiling and add one hundred gallons cotton-seed oil and agitate; then draw off into another vessel and add, under agitation, five pounds aqua regia diluted with twenty gallons of water, continuing the agitation; then allow to settle, draw off, and mix with five pounds oil of vitriol diluted with ten gallons of water under agitation.

Claim.—The process for converting cotton-seed oil into a drying-oil, substantially as herein described.

141,504.—Silvered-Glass Door-Knob.—JOHN W. HAINES, Cambridgeport, Mass. Application filed March 18, 1873.

Claim.—The within-described process of silvering and backing up the silver lining of glass door-knobs by filling the shell with cement, so as to exclude the air and protect the silver from oxidation, substantially as shown and described.

141,505.—Window-Fastener.—WILLIAM A. HAWTHORN and EDGAR E. SCOTT, Carson City, Nev. Application filed June 6, 1873.

Claim.—In combination with the rod D, notched as shown, the bar H, with its thumb-piece and shoulder, and the spring I, for the purpose of locking the sash at any point, substantially as herein described.

141,506.—Casting Steel Ingots.—JAMES A. HOLMES, Philadelphia, Pa. Application filed December 10, 1872.

Claim.—1. The production of ingots of cast-steel by the process described, namely, melting the steel in a crucible which is hermetically sealed, and then permitting the steel to cool in the crucible, from which the ingot is removed, as set forth.

2. A crucible made with one side detachable, substantially as and for the purpose set forth.

3. A crucible made with detachable linings, substantially as and for the purpose specified.

141,507.—Grain-Binder.—ALBERT S. HOYT, Winona, Minn. Application filed October 10, 1872.

A segmental gear-wheel, provided with eccentric cams on each of its faces, serves to operate at the proper moment the devices for holding and cutting the cord, and for tying the knot.

Claim.—1. In a grain-binder, the bevel-wheel h provided with segmental gear adapted to the pinion i to operate the spindle B, in combination with the cam g, rod I, nippers D, and the cam f and rods a b and carriers c, all arranged to operate substantially in the manner and for the purpose described.

2. In a grain-binder, the gear-wheel k provided with a cam or cams, l, in combination with the pin H, rod y, and holding and cutting device G, all arranged to operate in the manner herein described.

3. In a grain-binder, the hollow spindle B, its plug F and nippers D, and rod I and its pin m, with or without the reacting spring w, all constructed, arranged, and operated substantially as and for the purpose set forth.

141,508.—Cooking-Stove.—WILLIAM W. KARSHNER, Aubrey, Kan. Application filed May 10, 1873.

Dampers and flues are so arranged that heat may be directed to the top or bottom of the stove without heating the opposite part, or it may be directed to both parts at the same time, or to the chimney, without heating either the top or bottom.

Claim.—The arrangement of the dampers E F I in connection with the opening in the rear end of the lined fire-chamber, the openings in the top of said lined fire-chamber, the space between the top of the stove and the top of the fire-chamber, the flue J, and flue H, substantially as herein shown and described.

141,509.—Horseshoe.—ALBERT LEACH, Lynn, Mass. Application filed May 15, 1873.

A shoe provided with detachable calks. The calk is made in two parts and recessed to fit a tenon on the shoe, the two-part calk being secured together by a screw.

Claim.—1. A horseshoe having tenons b provided with sockets A, adapted to receive and hold the correspondingly tongued and recessed divided calks E, substantially as described.

2. The calk E constructed of two parts, e e, connected by the screw f, and provided with the recess f and tongues g, in combination with the tenon b having the sockets A, substantially as and for the purpose specified.

141,510.—Reed-Organ.—RAPHAEL E. LETTON, Quincy, Ill. Application filed May 8, 1873.

By placing the valve-opening nearer one set of reeds than the other the quality of tone of one set is varied, increasing the resources of the instrument.

Claim.—The reed-board A C provided with the slots D and F, the valve e, and reeds N and N', when said parts are constructed, combined, and arranged substantially as and for the purpose described.

141,511.—Tool for Seating Bung-Bushes.—LOMAX LITTLEJOHN, New York, N. Y. Application filed July 12, 1873.

This implement bevels the bung-hole and countersinks it for the reception of the bush.

Claim.—The tapering hollow body A, having a recess and slot to receive the knife B, the flange C provided with projections c^1 c^2 to receive the cutters D E, the rigid ball F, and handle G, said parts being constructed and operating, in connection with each other, as herein fully described.

141,512.—Compound for Destroying Insects, &c.—JOHN B. LUNBECK, Leon, Iowa. Application filed June 28, 1873.

Pine tar, soft soap, tobacco juice, strong alkali, unslaked lime, dry ashes, oil of tansy.

Claim.—The above-described compound for destroying insects, worms, and grubs, and protecting fruit and other trees, composed and applied substantially as set forth.

141,513.—Elevator for Passengers and Freight.—SAMUEL NASH, Cambridge, Mass. Application filed May 29, 1873.

Power is applied by a geared crank-shaft, the gearing meshing into gearing on a drum, which in turn meshes into the gearing of a drum above it, all arranged in a stationary frame, and each drum having secured to it one end of a cord, which passes around four pulleys in the upper part of the main frame and around one pulley attached to the cross-piece of the cage or car moving between upright posts in the said frame, so that as it unwinds upon one drum it winds on the other.

Claim.—1. The drums d and e provided with gear-wheels d' and e', and the shaft f having gear f', as arranged and combined with the cord g, the pulleys b b, b' b', and c, substantially as shown and described.

2. The frame A provided with the pulleys b b b' b', and the movable frame a a, &c., having a pulley, c, in combination with the frame B, provided with drums d and e having gear-wheels d' and e', and the shaft f with its gear f', and the cord g, the whole being arranged, combined, and constructed substantially as herein shown and described.

141,514.—Pump.—JOHN WOLFORD and ROBERT CONNER, Knightsville, Ind. Application filed January 9, 1873.

The cylinder of the pump is attached to the curb by bifurcated adjustable braces, by means of which the height of the cylinder in the well may be varied.

Claim.—The bifurcated detachable and adjustable braces P P' in combination with the cylinder A and curb N, all constructed and arranged as set forth.

141,515.—Railway Rail.—WILLIAM PECKHAM, Middletown, R. I. Application filed May 7, 1873.

A dovetailed groove is formed in the base of the rail throughout its entire length, into which a bar of corresponding form is inserted, with the object of maintaining the parts in position in case the rail should be broken across.

Claim.—The rail A provided with the dovetailed groove a and protection-bar B arranged in it, as and for the purpose specified.

141,516.—Toy Money-Box.—HENRY W. PROUTY, Boston, Mass. Application filed May 26, 1873.

The door rotates upon vertical central bearings. The toy-cashier is arranged to be at the window when the door is open, but to disappear when the money has been received and the door sprung to again. The money is, by the same movement, deposited in the vault to the rear.

Claim.—1. In a toy savings-bank, constructed substantially as described, the combination, with the case A, of the door D, when hinged or pivoted thereto, in manner as set forth.

2. In a toy savings-bank, the combination, with the case A, of the door D, window E, and counter F, substantially as described.

3. In a toy savings-bank, the combination of the counter F and door D with the case A, when the door is hung as described and provided with means for actuating it, substantially as and for the purpose set forth.

4. The combination of the door, hung as described, and its actuating-spring, the counter F, and vault B provided with an opening, b, the whole being arranged to operate together in manner as set forth.

5. In combination with the pivoted door D, the counter F, provided with the flanges c c, as and for the purpose set forth.

6. In combination with the door, hung as described, and provided with a window and means of reversal, as specified, mechanism, substantially as stated, for bringing the cashier at his post at the window when the bank is open, and away therefrom when the bank is closed.

141,517.—Feed-Water Heater and Purifier.—SAMUEL J. SADLER and HENRY VOLMAR, Cleveland, Ohio. Application filed February 21, 1873.

The lower part of the case is divided into two parts by a diagonal plate. The upper one is designed to receive the sediment which the water, in passing over the corrugated plates, has parted with, which is blown off through cork, the water passing through the vertical pipe into the lower part, from which it is taken by the pump.

Claim.—The reservoir divided in two compartments by the diagonal dividing-plate I and connected by the communicating-pipe K, arranged substantially as specified.

141,518.—Composition Filling for Painters.—RICHARD SHARP, Pittsburg, Pa. Application filed June 14, 1873.

Claim.—A rough-stuff compound to follow paint, formed of pumice-stone, applied in connection with white lead, japan, and varnish, as described.

141,519.—Seal-Lock.—THOMAS SLAIGHT, Newark, N. J. Application filed November 13, 1872.

The seal-holding device is locked in position by means of an arm on the dog or bolt that secures the hasp.

Claim.—In a seal-padlock, a combination of devices consisting of a front plate, G, provided with a recess, A, an escutcheon, B, having a hook-clutch, d, a seal-holding device, D c c, and a lug, O, attached thereto, substantially as described, and an arm, E, of a lock-hook, F, whereby, through the medium of said hook-clutch d, the escutcheon B is securely locked, in the manner substantially as described, for the purposes set forth.

141,520.—Brick-Yard Shed.—ROBERT A. SMITH, Newburyport, Mass. Application filed June 25, 1873.

The sheds are composed of the end frames, the clap-boarding, and the roof-doors, which cover the spaces in which the bricks are stacked while drying. The doors are to be opened in good weather and closed in bad weather.

Claim.—The protection-shed composed of the two frames H H, the clapboardings I, and the roof-doors K, constructed and arranged substantially as represented and described.

141,521.—Valve-Register.—JESSE W. STARR, Camden, N. J. Application filed April 10, 1873.

Claim.—1. The combination, with a valve moving longitudinally in a casing or frame and a threaded stem operating said valve, of a spur-wheel fast upon the valve-stem, a spur-wheel of different pitch attached to an index-plate and loose on said stem, and a spur-pinion meshing into both the spur-wheels, these members being combined for joint operation, substantially as and for the purpose set forth.

2. The combination of a valve-stem, a hand-wheel pointer fast thereon, and an index-plate loose thereon, and differential gearing to operate the index-plate, substantially as and for the purpose set forth.

141,522.—Paint-Brush.—AMASA S. THOMPSON, Little Falls, Minn., assignor to himself and LOUIS VASALY, same place. Application filed January 25, 1873.

A paint-brush with its handle constructed with an opening, into which is introduced an India-rubber egg-shaped reservoir for the paint, which is drawn, by the aid of its valves, through a connecting India-rubber pipe, and by the pressure of the hand in using it the brush is supplied with paint through a pipe extending downward from it.

Claim.—The combination of a brush, B, pump or syringe, E, a handle, C, and tube F, substantially as shown and described.

141,523.—Buffing-Mandrel.—NATHANIEL S. THOMPSON, Augusta, Me. Application filed April 1, 1873.

A wooden roller having an abrasive covering is divided longitudinally. The shaft is made in sections, and the device when closed is secured by the nuts, as shown.

Claim.—The combination of the sectional shaft C D C' D' with the blocks E E' and nuts N N, substantially as described, and for the purpose set forth.

141,524.—Separator for Cleaning Grain.—GRANT B. TURNER, Cuyahoga Falls, Ohio. Application filed April 30, 1873.

Grain passed over screens falls into a chute, through which it is drawn, and thence into a rotating screen, through which a blast is also drawn.

Claim.—1. The rolling screen G, composed of an exterior imperforate, except as at f, and interior perforated jacket, with space between, and perforate and imperforate ribs w h, for agitating and scouring grain, substantially as and for the purposes set forth.

2. In combination with the series of shaking-riddles and the rolling-screen, the suction-fan and the air-passages C D, the air to supply the fan and form the blast being drawn through the rolling-screen, as and for the purpose described.

141,525.—Composition for Water-Proofing Wall-Paper.—CORNELIUS VAN HERWERDEN, Williamsburg, N. Y., assignor to himself and CORNELIUS JANSEN, same place. Application filed May 31, 1873.

White soap dissolved in warm water, and add, when dissolved, white wax and isinglass.

Claim.—The composition formed of the ingredients in the proportions and manner substantially as herein set forth and described.

141,526.—Threshing-Machine.—WILLARD VERRILL, Elwood, N. J. Application filed April 12, 1873.

Vibrating beater-shaft carrying two sets of flails.

Claim.—The vibratory beaters J J pivoted intermediately across the endless carrying-belt C, as and for the purpose described.

141,527.—Straw-Cutter.—THOMAS WEBB, Elyria, Ohio. Application filed November 9, 1872.

The lower stationary and upper vibrating roller are covered by a concave-convex frame, slender arms from which descend into slots and bear upon the gudgeons of the upper wheel, and are held by extensible latches, the rear end of said frame forming a guide under which the straw enters, the other end descending lower and folding inwardly, so as to make a spring-pressure upon the straw near to the cutter. A horizontal bar, pivoted at the cutter-end, carries a cogged connecting gear-wheel under the control of the left hand of the operator, by which the feed may be stopped without stopping the cutting-wheel.

Claim.—1. The cover K, having arms working in vertical guide-slots of the trough, and engaging with the straps i i, so that it may move with the roller F, and provided at its front end with a convex yielding or spring-bearing plate, as described, for the purpose specified.

2. The combination, with the feed-rollers and their train of gear-wheels g, and with the driving-shaft E and its gear-wheel l, of the wheel j and the lever H, all as shown and described, for the purpose specified.

141,528.—Flooring-Clamp.—SYLVANUS B. WOOD, WILLIAM S. TERRY, ROBERT Y. H. TERRY, and ALONZO W. TERRY, Hamburg, Ark. Application filed April 26, 1873.

The block B, with a tongue or groove to correspond with the edge of the board, is adjusted to the proper height. The cruciform and variable clamp E combines with the set-brace F to sustain the instrument in position on the joist.

Claim.—An improved flooring-clamp, composed of the lever A, block B, arm C, flanged nut E, pointed arm F, strengthening-brace G, slotted flange or disk H, and stop-pin I, said parts being constructed, arranged, and operating substantially as herein shown and described, and for the purpose set forth.

141,529.—Alloy.—HOWELL W. WRIGHT, Glastenbury, Conn., assignor to ALBERT CHAPMAN, same place. Application filed December 30, 1872.

One part of copper to three or four of zinc. The zinc is melted in a crucible covered with pulverised charcoal to exclude the air, raised to the temperature at which copper melts, and the copper then added in thin sheets. The copper may be previously treated by melting and the addition of soda-ash.

Claim.—The process of producing an alloy of zinc with copper, or other metal or metals, which melt at a higher temperature than zinc, by first melting the zinc and then carrying it under a carbonaceous flux to the melting-point of the more infusible metal or metals, and then adding such other metal or metals, the whole being done substantially in the manner and for the purpose described.

141,530.—Alloy of Nickel, Zinc, and Copper.—HOWELL W. WRIGHT, Glastenbury, Conn., assignor to ALBERT CHAPMAN, same place. Application filed February 25, 1873.

Produced by melting the zinc while covered with powdered charcoal. When heated a trifle above the melting-point of copper nickel is added in small strips or pieces, and heat continued till the whole is melted, when the alloy is cast into ingots, the charcoal forming a coating.

Claim.—An alloy of copper, nickel, and zinc in about the proportions specified.

141,531.—Spark-Arrester.—MICHAEL ZECH, Pittsburg, Pa. Application filed May 17, 1873.

Claim.—A spark-arrester, consisting of the contracted top B, inverted dome F, perforated flange H, annular partition I, disk K, and flange M, arranged substantially as shown and described.

141,532.—Fence.—GEORGE ALBRO, Columbus, Pa. Application filed March 18, 1873.

A flat iron post has its upper end bent over to support a cap-rail, and at its base a transverse sill of same material set edgewise. Panels are secured to the posts by bolts passing through side strips, and can be swung down upon the ground between the posts and top rail by releasing top bolt.

Claim.—1. A fence-post constructed of flat or band iron, having its top bent over to form a horizontal flange, and its sill-piece arranged edgewise to the ground and transversely to the fence, substantially as described, for the purpose specified.

2. In combination with the fence-posts A and fixed cap or top rail D, the fence-panel E F, arranged to swing down upon the pivots a', as herein described, for the purpose specified.

141,533.—Plow.—THOMAS G. ANDREWS and ANDREWS RIVERS, Barnesville, Ga. Application filed May 17, 1873.

Plow-plate detachably secured to standard by shouldered lever pivoted in the slotted standard, and secured to the beam by sliding clasp.

Claim.—The lever-brace D, pivoted at its rear end to the slotted lower end of the standard C, secured at its forward end detachably to the beam A, and provided with a shoulder or pin for securing the plow-plate F detachably to said standard C, substantially as herein shown and described.

141,534.—Yarn Take-Up and Tension Device for Knitting-Machines.—HORACE L. ARNOLD, Ottawa, Ill. Application filed January 28, 1873.

The buckle-finger is a loosely-swinging piece that bears upon and grips the yarn between the bobbin and the spring take-up lever, on the rear side of which are cam surfaces, one of which

acts against and raises the fingers so as to allow yarn to be drawn from the bobbin when the tension thereon depresses the lever, and the other of which performs the same function when the lever is at its highest point, so that threading up may be facilitated.

Claim.—1. The combination of the take-up lever, segment-gear, and spring-rack, substantially as described.

2. The combination of the take-up lever provided with the cam-surface *a* and the buckle-finger, connected substantially as described, whereby the depression of the lever will remove the finger from the yarn and result in an even and regular delivery from the bobbin, as and for the purposes specified.

3. The combination of the spring take-up lever, provided with the cam-surface *f*, with the buckle-finger, arranged substantially as described, whereby the elevation of the take-up lever will throw the finger from the yarn, as and for the purposes specified.

4. The combination of a buckle-finger having an independent griping action, and arranged to bear upon the yarn on its way from the bobbin, with a spring take-up lever arranged to control the finger, substantially as described, whereby a desirable degree of tension on the yarn between the needles and the finger may be regularly and evenly maintained, as and for the purposes specified.

5. The combination of the graduating-screw with the take-up lever, segment-gear, rack, and actuating-spring, whereby the spring force of the take-up lever may be varied, as and for the purpose specified.

141,535.—Metallic Plane.—JOHN A. RAINES, New York, N. Y., assignor of one-half his right to JAMES BARKER, same place. Application filed July 2, 1873.

By interchange of various devices and substitution of different bits, several planes are formed with the same foundation of stock, handles, and gages.

Claim.—The herein-before-described plane, when constructed in the manner and for the purpose substantially as specified.

141,536.—Sleeve or Patch for Stopping Leaks in Hose.—JOHN F. BELLEMERE and FRANCIS R. FLEER, Reading, Pa. Application filed July 7, 1873.

Claim.—1. The sleeve or patch B having the internal lips or flaps C so arranged that when the patch is applied to a hose said flaps shall encircle the same and make a water-tight joint when subjected to a pressure from the inside, substantially as described.

2. The hose-patch, consisting of the tube B, made of leather or other flexible material, and provided with the internal lips or flaps C, arranged substantially as shown and described.

141,537.—Self-Operating Switch.—ADOLPH BOUCHARD, New Orleans, La. Application filed April 5, 1873.

Claim.—The T-shaped arms F and G rigidly secured to the front and rear platforms of the car at angles to the line of motion, in combination with the movable frog-point, so that the switch may be opened for the passage of the car and automatically replaced after said passage, substantially in the manner specified.

141,538.—Planting-Machine.—JOHN M. BRIGHT and ELIAS STANDT, Berryville, Pa. Application filed March 15, 1873.

A grain-drill with double hopper, for drilling or sowing wheat or large grain and timothy or grass seed at the same time.

Claim.—1. The compound receptacle E, consisting of two sets of hoppers, *b d*, of equal length, communicating through a series of openings, *e*, each provided with a valve, *f*, as set forth.

2. The combination of the reciprocating arms *j* and fixed rods K, arranged and operating so as to distribute the grain, as set forth.

3. The combination, with the slotted plates M M′, placed one above the other, of the double crank-shaft *h*, operating both plates, as set forth.

4. The receptacle F provided with a series of rods or plungers, *l*, adapted to the openings *m* in the bottom of the said receptacle, and connected to the hinged lid of the latter so as to be simultaneously operated by the reciprocation of the same, substantially as herein described.

141,539.—Billiard-Table.—GEORGE BUNTIN, Boston, Mass. Application filed May 21, 1873.

The metal bed-plates, preferably three to a table, are numerously perforated, and the holes countersunk underneath. Plastic cement is then applied to the plate and forced down to form heads upon the plaster projected through the plate-holes, and the top beveled off as usual. There is also special construction of the frame, legs, and top plates.

Claim.—1. A billiard-table, the bed of which is composed of a cast-iron plate or plates, combined with cement or plaster, substantially in the manner described.

2. The within-described billiard-table bed, composed of cast-iron plates having cells on its upper surface and countersunk holes at the bottom for retaining the cement packed in the cells, all as set forth.

3. A billiard-table frame, consisting of the side-beams A and A′, end beams B and B′, constructed for receiving detachable legs and intermediate beams, all as described.

4. The cast-iron cement-packed beds of a billiard-table, combined with and secured to a cast frame, substantially in the manner described.

5. The combination, substantially as described, of leveling-screws *s* and *t* with the bed and frame of the table.

141,540.—Steam Vacuum-Pump.—WILLIAM BURDON, Brooklyn, N. Y.—*Ante*. Application filed December 9, 1872.

The exhaust steam is admitted into successive water-chambers by rotating valves, which are operated by a shaft having a series of wipers that open and close the valves in succession. The steam, after forcing the water of the chambers, is condensed by a spray-jet, and thereby a vacuum is created, by which the water again fills the chambers.

Claim.—The combination, with the exhaust-pipe of a steam-engine, of three or more steam vacuum-pumps, each having a separate steam-inlet valve, and a valve-operating shaft, organized substantially as herein described, to operate the several valves in succession, as and for the purpose herein set forth.

141,541.—Chimney-Cowl.—JOHN BURGT, Powhatan Point, Ohio. Application filed May 1, 1873.

Claim.—As a new article of manufacture, the within-described chimney-cap, consisting of pipes A and cover B, having a smoke-escape passage between them, the openings D and radial wings G, and having hinged thereto the coupled doors E, the whole constructed and combined as set forth.

141,542.—Machine for Painting Barrels, Casks, &c.—WILLIAM BURNET and GEORGE B. FISHER, Chicago, Ill. Application filed July 21, 1873.

Consists in an automatic barrel-painting machine, to be operated by steam or otherwise, whereby an indefinite number of barrels, being introduced into the machine, will be each held until ready to be fed to the painting device, and will then, by its own weight, roll to its place, be then arrested and revolved on its imaginary axis until painted, and then automatically discharged from the machine.

Claim.—1. A cloth-covered or flexible-surfaced roller having an appropriate configuration for and as a means for applying a coat of paint or other material directly to the periphery of a barrel or cask.

2. In combination with a cloth-covered or flexible-surfaced roller adapted for applying a coat of paint or other material to the surface of a barrel or similar article, one or more cloth-covered or flexible-surfaced rollers dipping into a vessel, and conveying the paint or other material therefrom to such painting-roller.

3. In a barrel-painting or surfacing-machine, a roller having a concave surface adapted to fit the periphery of a barrel, substantially as described, and as shown at E.

4. The combination of one or more barrel-shaped rollers, C, for taking up the paint or other liquid or semi-liquid with a concaved roller for receiving the material from it, and depositing it directly upon the surface of a barrel or cask.

5. In a machine for painting or surfacing barrels or casks, inclined feed and guide rails, substantially as described, whereby the article shall, by the mere force of gravity, be fed into and discharged from the machine.

6. The inclined guiding and feed rails provided with movable stops to hold back a barrel prior to feeding it to the painting roller, substantially as and for the purpose described.

7. In combination with the inclined discharging-rails, a swing-frame operating to prevent the advance of the barrel while being painted or coated, but permitting it to be freely revolved while so held back.

8. The swing-frames provided with a stop or stops to limit its descent so as to hold the barrel to proper position, substantially as and for the purpose described.

9. In combination with the swing-frame, friction disks or wheels, substantially as and for the purpose described.

10. The combination, with the lever-stops H, of the described link-and-lever connections or their equivalents, whereby both stops may be simultaneously withdrawn from the tracks of the rails.

11. The described means or their equivalent for automatically lifting the swing-frame at the desired period of time.

12. The described means or their equivalent for automatically operating the lever-stops H.

13. The combination of the means for operating the swing-frame with the means for operating the lever-stops, the combination being substantially as described.

14. The mode of operation or method herein described, of surface covering or painting a cask or barrel, the same consisting in retaining it over and upon the surfacing-roller, upon which it loosely rests by means of a device in front, which checks its advance and yet permits it to be revolved by the frictional contact of such surfacing-roller.

15. The combination, in a machine for applying paint or other liquid or semi-liquid material to a barrel or cask, of a paint-delivering roller, inclined feed and delivery rails, and a swing-frame to hold back the article till painted.

16. The combination, with a paint-delivering or surfacing-roller, of the inclined rails and stops and the swing-frame.

17. The combination of the trough, the lower and upper covered rollers, the inclined rails, stops to hold back an unpainted barrel, and a swing-frame to hold back a barrel while being painted, substantially as and for the purpose described.

141,543.—Condenser for the Manufacture of Illuminating-Gas.—PETER T. BURTIS, Chicago, Ill., assignor of one-half his right to ELIAS T. WATKINS, same place. Application filed July 3, 1873.

The tarry deposits fall into the trough in the bottom of the condenser and are carried by the traveling scraper into one or other of the wells, from whence they can be removed without interrupting the work. The wells are filled with water to a point above where they communicate with the condenser, to prevent the escape of gas.

Claim.—1. The washer B or condenser having the trough A, substantially as and for the purpose specified.

2. The well I, in combination with the washer B or condenser, and communicating directly therewith by means of the opening *a*, substantially as and for the purpose specified.

3. The combination of the washer B or condenser, the well I, and scraper C, all constructed and operating substantially as and for the purposes specified.

141,544.—Paint Compound.—CHARLES CAMPBELL, New York, N. Y. Application filed July 19, 1873.

Bicarbonate of soda, borax, and water, mixed with oxide of zinc, linseed-oil, benzine.

Claim.—A paint compound which is produced by combining the solution described with the pigment, oil, and benzine, in the proportions and manner as and for the purpose set forth.

141,545.—Machine for Boring Blind-Stiles.—ANDREW B. CARLIN, Camden, N. J. Application filed June 4, 1873.

Two stiles are bored at the same time, being automatically fed forward.

Claim.—1. The swivel-bars K K, in combination with the center rib *d* of the carriage H and the gage-bars J J, for the adjustment of the latter to the width of the stiles to be bored, substantially as described.

2. The combination of the sliding bar E, carrying the pawl F, with the carriage H having a toothed rack G, pitman D, and the crank-shaft C for giving the forward movement to the carriage, substantially as set forth.

3. The combination of the pawl F having a shoulder, *e*, sliding bar E, spring-bolt V, and rack G with the carriage H having a tripping-pin *c*, substantially as and for the purpose specified.

4. The combination of the lever X, spring-bolt V, pawl F, and rack G, substantially and for the purpose set forth.

5. The combination of the cam *b*, weight *g*′, sliding bar S having a stop, *o*, levers R R, sliding plates Q Q with the bit-shafts P P for giving a reciprocating movement to the latter, substantially as set forth.

6. The sliding bar T, spring *v*, hinged lever U having a shoulder, *t*, and sliding bar S with the carriage H, for throwing the stop *o* out of line with the cam *b* to arrest the sliding movement of the bit-shafts P P, substantially as described.

141,546.—Disinfecting-Powder.—HENRY G. DAYTON, Maysville, Ky. Application filed July 11, 1873.

Claim.—The combination of powdered marble and white sand, as described, to form a base for the distillate of coal-tar, substantially as and for the purpose specified.

141,547.—Canvas Stretching and Protecting Frame.—ALBERT DICKERMAN, Boston, Mass. Application filed December 12, 1872.

Claim.—1. The combination of the teeth B with the movable bar C and hooks E, for stretching the canvas, substantially as set forth.

2. The combination of the slots *o o*, pins *b b*, and spring-catch *g*, for adjusting the protecting curtains F and I, as set forth and described.

141,548.—Sectional Adjustable Slotted Cam.—FREDERICK D. ELDERFIELD, St. Louis, Mo. Application filed May 13, 1873.

Claim.—1. The combination of two sections of a cam, B B, the screw-bolts E E E, and the bolt-nuts K K K, substantially as described.

2. The check-disks C C, as described.

3. The combination of the check-screws F F F with the bolt-nuts K K K, substantially as specified.

4. The combination of set-screws *i i*, acting upon the loose key D, as specified.

5. The combination of the cap H, the shoulder L, and the shaft-nut G, substantially as specified.

141,549.—Box-Scraper.—CHARLES ELLIS, GEORGE W. ELLIS, and JOHN D. ELLIS, Philadelphia, Pa. Application filed June 20, 1873.

The blade A is fastened by bolts, which screw into the blade, having a threaded jam-nut, D, to prevent working loose.

Claim.—An improved box-scraper, consisting of the stock B having shanks *b b* projecting therefrom at, or nearly at, a right angle thereto, with a scraper-blade, A, having laterally-extended ends *a a* secured to the inner side of a projection, *b*², of the stock by screws C fitting screw-threaded holes in the scraper-blade, as and for the purpose specified.

141,550.—Boot and Shoe Tree and Stretcher.—THOMAS R. EVANS, Philadelphia, Pa. Application filed June 19, 1873.

Improvement on Patent No. 119,131.

Claim.—1. The tree or last, consisting of a fixed and a movable section arranged to revolve, as described, in combination with the swiveled screw-rod E, wedge-bar D, and operating-nut, and hand-wheel *d* F, as set forth.

2. The combination, substantially as described, of a scale and pointer with the operating screw-rod E of a boot and shoe stretcher, for the purpose specified.

141,551.—Hoisting Apparatus.—FRANKLIN FARRELL, Ansonia, Conn. Application filed January 22, 1873.

Claim.—The combination of a chain having alternate long and short links and a chain-wheel, A, adapted to said chain, and having radial teeth *c*, which enter the spaces between the short links, as set forth.

141,552.—Machine for Bending Shafts.—ALLEN J. FRIEMER, Toledo, Ohio. Application filed January 14, 1873.

The shaft is bent on the former D, which, with its strap R retaining the shaft, is removed by slipping the hinge-joint at Q.

Claim.—The described arrangement of double strap H I K, extension R S, separable hinge Q *g*, upsetting device L M N, convex block D *d d*′ *d*″, and suitable clamp-loops with screws or wedges, the whole constituting a combined bending and setting apparatus, as set forth.

141,553.—Ice-Shaving Machine.—JAMES D. FREEMAN, Abbeville, Ala., assignor to himself and JAMES GILLESPIE, same place. Application filed June 28, 1873.

A lever with a plate on its under surface is attached to an adjustable plate, and is used to press the ice down onto a cylinder provided with blades and operated by a crank.

Claim.—The combination of the hoppers A, base-plate B, knife-cylinder C D, crank J, holding-plate E, lever F, adjusting-plate G, and clamp H-I with each other, substantially as herein shown and described.

141,554.—Apparatus for Treating and Aging Spirituous Liquors.—GEORGE GOEWEY, Philadelphia, Pa. Application filed June 14, 1872.

Improvement on patent No. 91,840, June 29, 1869. The vapors escaping from the several closed vessels are condensed in the globes, the condensation falling back, the uncondensed vapor escaping. The supplemental pipe from the air-conduit to the first closed vessel equalizes the pressure throughout the apparatus.

Claim.—1. The spirit-condensing apparatus composed of an interior vessel, *w*, an inclosing or exterior vessel, *y*, and an intervening air-space, A, between said vessels, in combination with means for the ingress and egress to and from said space of a forced current of air, substantially as set forth.

2. Pipe *t* or equivalent means for connecting the air-conduit A with the liquor-pan *a*, to facilitate the flow of the liquor from the said pan into the pan *a*¹, substantially as set forth.

141,555.—Glove-Fastening.—CHARLES H. HALL, Trenton, N. J., and ROBERT KNOTT, Brooklyn, N. Y. Application filed March 15, 1873.

The notches upon the bar afford means for properly adjusting the fastening.

Claim.—A glove-fastening, comprising the notched bar A hinged to a clip, C, fastened to the part D of the glove, and the notched hook B in a clip, H, fastened to the part I of the glove, all combined and arranged substantially as specified.

141,556.—Weighing-Scales.—SANDY HARRIS, Philadelphia, Pa. Application filed May 13, 1873.

A series of pins, projecting laterally from the scale-beam, is arranged to be in line with a similar series of stationary pins secured to the frame. A set of perforated weights, sliding on the said pins, can be transferred to and from the scale-beam pins only when the beam is at an exact balance.

Claim.—1. The beam C, having the lateral pins *d* projecting at intervals of different distances in a direct line from the fulcrum, in combination with the fixed rack D, having the corresponding pins and the sliding weights *d*′, substantially as shown and described.

2. Laterally-shifting balancing-weights, in combination with weight-scales having a fulcrum-beam adapted to receive said weights at different intervals of its length, substantially as and for the purpose specified.

141,557.—Middlings-Purifier.—AUSTIN HERR, Georgetown, D. C. Application filed June 16, 1873.

A rotating fan traveling back and forth under the screens keeps the meshes clear and loosens the mass of middlings, throwing the light particles of bran and dust to the upper surface, from which they are drawn off through the air-passages and flue by a suction-blast. The middlings, falling through the screens on endless partitions, are discharged respectively on the heads of the screens below, while the tailings pass off the ends of the screens into suitable discharge-spouts. The endless partitions also keep the air from passing up through the series of screens.

Claim.—1. The combination, with a purifying or separating screen, of a rotating fan having a reciprocating motion, in contact or nearly so with the under side of said screen, substantially as specified.

2. The combination, in a middlings purifier or separator, of the screens E E′ E″, arranged one above another, with the endless-partition bands H, substantially as shown and described, and for the purpose specified.

3. The combination, with the screens E E′ E″, arranged one above another, and the endless-partition bands H, of the series of alternate hoppers F and flat draft-boards G transversely arranged, as specified.

4. The combination, with a shaker or screen, of the reciprocating frame carrying an open fan, the stud *c*, pivoted arm *d*, endless cord *g*, pulleys *f*, and slide-ways A, substantially as specified.

5. In a middlings-purifier, the combination, with the draft-case A and the series of alternate hoppers F and draft-boards G, of the flue Z and draft-passages *m m* and partitions H between the screens, substantially as specified.

6. The combination, with the pulleys *k* and endless cord *m*′, of the pulleys *a* and traveling fan K, substantially as specified.

141,558.—Means of Elevating and Depressing Propellers.—SAMUEL G. HILL, Muscatine, Iowa, assignor of one-half his right to PATRICK YORK, St. Louis, Mo. Application filed March 18, 1873.

By this arrangement wheels, which are attached to one end of a frame pivoted near its center, are counterbalanced, or nearly so, by the weight of the steam-cylinders located on the other end. Thus less power is required to raise or lower the wheels according to depth of immersion required.

Claim.—The arrangement of the steam cylinder or cylinders B and stern paddle-wheel D on opposite ends of the rocking beams C, which are pivoted intermediately of their length, so as to vibrate as described, for the purpose set forth.

141,559.—Corn-Sheller.—EDWIN L. HUTCHINSON, Auburn, N. Y. Application filed March 18, 1873.

Cone with alternating teeth revolves the ears underneath a plate held down by a spring.

Claim.—1. The guide-bar C having the standard *g*, for the purposes herein set forth.

2. The combination, with the spring R arranged to control the concave or plate B, of the central supporting-piece S, piece T, and adjusting-screw *x*, substantially as set forth.

141,560.—Brick-Machine.—DONALD J. IRWIN and HENRY S. LANGDON, Noble, Ill. Application filed June 14, 1873.

A brick-machine in which the plunger is connected by curved arms to a horizontal bar operated by an eccentric; horizontally-reciprocating knife provided with supports fitting into clutches, the knife secured to and moving in slide-bars.

Claim.—1. In combination with the horizontal bar *k*, to which the plunger is connected, the vertical slides L and eccentrics M, substantially as and for the purposes herein set forth.

2. The knife or trimmer A provided with arms *i i*, substantially as and for the purposes herein set forth.

3. In combination with the arms *i i* on the knife A, the clutches *m m*, for the purposes herein set forth.

4. The cut-off bar *n* and knockers or bumpers *o o* operating in combination with the knife A and its arms *i i*, substantially as and for the purposes herein set forth.

5. The combination, with the knife A and its supporting-bar *k*, of the horizontal slide-bars N N and eccentrics M M, substantially as and for the purposes herein set forth.

141,561.—Cover for Sewing-Machine Tables.—HENRY JESSEN, Long Island City, N. Y. Application filed July 1, 1873.

The flexible top of the cover is fastened at one end to a cross-bar extending from one of the circular ends to the other. The opposite end of the flexible top is connected to the under side of the table-top by an elastic cord or spring. The circular ends of the cover are provided with slots, in which work pins projecting from the ends of the table-top, and on these pins the cover revolves; a pin also projects from the inner side of the circular ends and engages in a groove on the end of the table-top. On one side of the table-top is hinged a narrow shelf, which locks the extension-leaves in position when the cover is turned down to the side of the table.

Claim.—1. In combination with the flexible cover C, connected to and operated by pivoted end pieces, as described, the locking-leaf O, substantially as set forth.

2. A flexible cover for sewing-machines and other tables operated by a cam-motion, substantially as herein described, and for the purposes set forth.

3. In combination with the flexible cover C connected to and operated by pivoted end pieces, as described, the cam-groove D and pin I, and the guide-slot *i* and pin *e*, substantially as set forth.

141,562.—Machine for Manufacturing Plug-Tobacco.—JOHN L. JONES, Oxford, N. C. Application filed January 27, 1873.

The tobacco-leaves are laid in a trough, which is placed between two adjustable guide-bars, the leaves resting upon a plate having slots, and beneath another plate having knives, which sink through the layer of tobacco into the said slots, dividing it into plugs. A traversing roller, having shoulders to rest upon the sides of the box, gives the desired pressure, being placed in vertically-movable bearings in a horizontally-moving carriage.

Claim.—1. The combination of the trough C, slotted plate *a*, and the plate *b* with knives *d*, substantially as and for the purposes herein set forth.

2. The wheel D provided with shoulders or flanges *f f*, and placed in up-and-down movable boxes in a horizontally moving frame or carriage, for the purposes herein set forth.

141,563.—Machine for Cleaning and Repairing Tobacco-Leaves.—JOHN L. JONES, Oxford, N. C. Application filed January 27, 1873.

The leaves are passed between rollers having alternate flat and concave surfaces to crush the stems; then between another pair of rollers having knives and brushes, whereby the flattened stems are cut into narrow strips, and the leaf is brushed. Guides prevent the leaf from adhering to the pressing-rollers, and scrapers clean the cutting-rollers.

Claim.—1. The rollers C C', constructed, as described, with alternate flat surfaces *f f* and concave surfaces *h h*, for the purposes herein set forth.

2. The rollers G G, constructed, as described, with brushes *k k*, knives *m m*, and grooves *i i*, substantially as and for the purposes herein set forth.

3. A machine for preparing tobacco-leaves in which the stem is crushed or flattened in the leaf and split, and the leaf brushed, all in one operation, substantially as herein set forth.

4. The combination of the rollers C C', pockets or boxes *n n'*, rollers G G with brushes and knives, guides *p p*, scrapers *s s*, and combs *t t*, all substantially as and for the purposes herein set forth.

141,564.—Sheave.—PATRICK KAVANAGH, Canarsie, N. Y. Application filed May 22, 1873.

Claim.—The improved sheave herein described, constructed with the perforated plates B B, pivot-pins *a*, rollers *c*, flanged sleeve C, and sheave-block A, said pins respectively passing through the rollers, and rigidly attached to one plate only, and said rollers being held and operated between the flanges of said sleeve or collar, as shown and described.

141,565.—Trace-Buckle.—JOHN KENNEDY, Osage Mission, Kans., assignor to himself and JOHN MOFFIT, same place. Application filed March 22, 1873.

The rear end of the tongue-plate is slotted to allow of limited movement longitudinally, and is pivoted through the slots to lugs on the buckle-frame. The lugs are recessed angularly to correspond with coincident angles on the tongue-plate, thus forming a lock when the strap is engaged.

Claim.—A trace-buckle, consisting of the looped plate A provided with lugs C C, and the tongue-plate B provided at one end with tongue D and at the other end with a slot and angular projections, the slot to receive the pivot-pin and the projections to fit correspondingly-shaped recesses in the lugs, as and for the purpose specified.

141,566.—Railway Cattle-Guard.—THEODORE D. KLINE, Opelika, Ala. Application filed June 28, 1873.

A grating of boards placed shutterwise between the tracks of a railway to prevent cattle from passing up the track.

Claim.—The cattle-guard, consisting of the longitudinal beams C and the stationary horizontal parallel inclined boards D D' transversely arranged thereon in such a manner that they incline downward from both ends toward the center, substantially as specified.

141,567.—Washing-Machine.—JOHN H. KOOKER, Pekin, Ill. Application filed March 8, 1873.

Claim.—In a washing-machine, the combination of the shaft B provided with the arms C and pinion D, the rack-bar E provided with the slotted stud *b*, and the hand-lever, having its lower end arranged to work in the slotted stud, as shown.

141,568.—Thimble-Skein for Vehicle-Wheels.—JOHN LAHMAN, Panora, Iowa. Application filed May 17, 1873.

Claim.—The thimble-skein A having at each end a number of semi-tubular recesses running lengthwise of the skein, and extending around the bottom and sides only, leaving the top smooth at both ends, and having inserted in the recesses the tapering rollers *a a*, substantially as shown and described.

141,569.—Hemp-Brake.—WILLIAM S. LAWRENCE, Winchester, Ky. Application filed April 26, 1873.

Improvement on patent of April 9, 1872, in which two pitmen connected with one crank operate two alternately-operating brakes, the same mechanism operating reels at the sides of the frame.

Claim.—1. The combination of the double crank G, the pitman *i*, the walking-beam I, the pitman *i'*, the brake K, the crank-plate H, the wrist-pin *h*, the pitman *l*, the walking-beam L, the pitman *l'*, and the brake M, substantially as specified.

2. The reels O O and P P, in combination with the operating mechanism of a hemp-brake, substantially as herein specified, and for the purpose mentioned.

141,570.—Securing Wheels to Axles.—ROBERT J. LESSOR and JOHN B. SHAMBO, Brandon, Vt. Application filed March 15, 1873.

To hold the wheel on the axle, and to permit of its ready removal, and to exclude sand from the box.

Claim.—1. The hook-lever H, in combination with the axle D, hub A, and grooved projecting end of the axle-box B, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the sand band or cap J with the axle D, hub A, hook-lever H, and grooved projecting end of the axle-box B, substantially as herein shown and described, and for the purpose set forth.

141,571.—Apparatus for Charging Liquids with Carbonic Acid.—JOHN MATTHEWS, New York, N. Y. Application filed July 17, 1873.

The agitator has non-metallic beaters and a shaft of stiff metal incased in a sleeve of tin or other innocuous metal which will resist wear and prevent it being ground off. A step having a bushing of rubber, in which the incased lower end of the shaft revolves, is secured to the lower end of the fountain.

Claim.—1. The improved apparatus herein described for mixing carbonic acid with liquids, consisting of an agitator having non-metallic beaters and shaft incased, substantially as set forth.

2. The shaft-casing, composed of the sleeves, beaters, and washers, combined and arranged as set forth.

3. The step D and bushing *d*, in combination with the shaft B, provided with the foot *m*, so as to protect the lower bearing-surfaces, as described.

141,572.—Saw-Swage.—ANDREW J. MCCOLLUM and GEORGE D. EMERY, Indianapolis, Ind. Application filed March 8, 1873.

A bifurcated arm pivoted to the stock and a binding-screw for drawing the arm sections against the sides of the saw.

Claim.—1. The guide-arms C connected at their upper ends by a back, D, and pivoted to the stock A of the swage A B, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the set-screw E with the guide C D pivoted to the stock A of the swage A B, substantially as herein shown and described, and for the purpose set forth.

141,573.—Sponge-Cup.—WILLIAM MCCONNELL, Philadelphia, Pa. Application filed July 11, 1873.

The sponge is passed through a rigid band which rests upon the water-cup, and may thus be handled without soiling the fingers.

Claim.—A pen-wiper in which a reversible sponge-holding band, A, is adapted to and combined with a water-vessel, B, substantially as and for the purpose described.

141,574.—Smoke-Burning Furnace.—CORNELIUS MCGINNIS and WILLIAM NAYLOR, Chicago, Ill. Application filed April 21, 1873.

An adjustable door through which air passes over the fire, impinging against an inclined deflector which directs it against the fire. Hot air is supplied from a close chamber under the fire-grate through a perforated bridge above the level of the fire, which commingles with the product of combustion and consumes the smoke.

Claim.—The combination of the adjustable door and draft-flue, constructed and arranged as set forth, and combined with the deflector C and bridge-wall M, substantially as described, and for the purpose set forth.

141,575.—Bobbin.—THOMAS G. MCLAUGHLIN, Glen Riddle, Pa. Application filed May 28, 1873.

Claim.—The ring cast in the driving-head of a bobbin, and provided with projections for consolidating said ring with the wood of the bobbin, as specified.

141,576.—Hemmer for Sewing-Machines.—ALFRED MCMILLAN, Cincinnati, Ohio. Application filed June 21, 1873.

The slide is connected with the large scroll, and adjustable laterally thereon. For wide hems it occupies a position at the right of the small edge-turning scroll, and for narrow ones it is moved to the left out of the way, and the small scroll is moved toward the right.

Claim.—The hemmer herein described, consisting of the slotted plate A, slotted scroll B, arm D, scroll C, and adjustable guide G, attached to scroll B, all constructed and operating as described.

141,577.—Door-Check.—JOHN A. MCNAIR, Olathe, Kans. Application filed June 26, 1873.

Claim.—The combination of gravitating metallic bolt C, the metallic case A firmly attached to the door, and the metallic bracket-catch F G attached to a wall or partition, and provided with an India-rubber bumper fastened into the end of said bracket under the catch, all constructed and arranged substantially in the manner and for the purposes hereinbefore shown and described.

141,578.—Steam-Generator.—THOMAS E. MCNEILL and RUFUS N. PRATT, New York, N. Y. Application filed September 21, 1872.

Claim.—The jacket E, having its outer flue or chimney communication at or near its bottom, in combination with the bent tubes D, the fire-box, and the cylinder A, substantially as herein shown and described.

141,579.—Metallic Rope-Clamp.—AIMÉ MÉHU, Paris, France. Application filed March 15, 1873.

Claim.—1. A metallic lashing, consisting of a clamp composed of two sections, A A', having slotted or bent arms to receive keys C C, and adapted to be readily applied to and removed from the overlaid portion of a loop, substantially as specified.

2. The combination of the clamps B, keys *c c*, and wires *b*, as specified.

141,580.—Glove-Fastener.—LOUIS MEYERS, New York, N. Y., assignor to himself and JACOB ADLER, same place. Application filed June 16, 1873.

Claim.—The glove-fastener, consisting of a cord, B, which is fastened with both ends to one flap of the glove and drawn through holes in the other flap to operate in combination with the button or holder *c*, as set forth.

141,581.—Match-Box.—ADOLPH MEYERSTEIN, New York City, assignor to E. B. FITCH & SON, Peekskill, N. Y. Application filed June 25, 1873.

The match-box is secured to a back, which has projections adapted to receive a lamp-bracket.

Claim.—The arrangement, in relation to each other, substantially as described, on the same bracket-back, of the lamp bracket socket or sockets B B, and the match-safe C.

141,582.—Cider-Mill.—NATHANIEL R. MILLER, Canaan Center, Ohio. Application filed April 30, 1873.

Claim.—1. The hopper T, provided with the vibrating partition W, in combination with the feed-box U, having the grinding-cylinder *b* therein, substantially as and for the purpose specified.

2. The press-block 10, in combination with the turning table Q, substantially as and for the purpose specified.

3. The herein-described pressing mechanism, consisting of the swinging plunger K, walking-beam A hung in pivot-clasp I, connecting-rod J, with rounded end bearing on lever-seats P, and hand-lever L, in combination with the frame A B, the whole being arranged to act on the grindings in the straining-tube supported from the sill-pieces A A, substantially for the purpose specified.

4. A cider-mill combining in its construction the following essential features, viz., a feed-box with grinding-cylinder, hopper with vibrating partition, turning table for the support of the straining-tube, stationary table with outer rim and press-block, and two pressing devices, each consisting of a swinging plunger, walking-beam, and hand-lever, the several parts being so combined as to allow of the continuous operation of the grinding and pressing processes, substantially as and for the purpose specified.

141,583.—Shovel-Plow.—JOHN J. MITCHELL, Livingston, Ala. Application filed April 12, 1873.

The two sections of the plow are connected by loose joints or links, so that one shovel may be lifted over an obstruction without disturbing the other.

Claim.—The double-shovel-plow-frame, consisting of the standard A, the adjustable angular braces *c*, the handles K adjustable on said braces by means of the clamp *w v*, and the adjustable link connections *k k'*, substantially as specified.

141,584.—Portable Fence.—ALANSON MOSHER, Canton, Mo. Application filed April 2, 1873.

Claim.—The fence-panels A A, provided at their adjacent ends with inclined braces *a* and united and supported by the notched stakes *d d* and key *f*, as shown and described.

141,585.—Explosive Compound.—JOHAN H. NORRBIN and JOHAN OHLSON, Stockholm, Sweden, assignors to ALARIK LINDBECK, same place. Application filed October 4, 1872.

Claim.—An explosive compound, consisting of nitrate or nitrite of ammonia and a fulminate, as set forth.

141,586.—Magazine for Stoves.—JOHN R. PAINTER, Reading, Pa., assignor to ORR, PAINTER & CO. Application filed May 15, 1873.

The rib *a* coincides with the notch *n*, and locks the parts A and B together.

Claim.—The combination described of the upper portion B of the magazine, its lugs *b b*, and rib *a*, with the lower portion A and its notched flange *a*.

141,587.—Pump-Valve.—WILLIAM PAINTER, Baltimore, Md., assignor of one-half his right to LEWIS R. KEIZER, same place. Application filed June 23, 1873.

Solid matter of less area than the bearing surfaces or of less area than the opening of the valve, but of indefinite length, can be pumped from the cesspool. The braces prevent the flaps from being drawn through the valve-port.

Claim.—1. A valve provided with a flexible valve-flap, having an extensive superficial area, and arranged so that its face will engage in close contact with a coincident face of a corresponding area, in a plane practically at right angles to the plane of the valve-opening, substantially as and for the purposes specified.

2. A valve composed of flexible valve-flaps provided with extensive superficial areas and with coincident faces, which are arranged to engage in close contact with each other, in a plane practically at right angles to the plane of the valve-opening, substantially as and for the purposes specified.

3. In combination with a flap-valve, the stiffeners or braces F F, arranged at the base to prevent collapsing, substantially as described.

141,588.—Fish-Trap.—SAMUEL PAVONARIUS and CHARLES C. MICHTLER, Philadelphia, Pa. Application filed May 17, 1873.

A shallow cylinder has its bottom covered with netting. A hoop covered also with netting forms the top of the trap. This hoop has a hinge upon two opposite sides of the center, so that half the hoop can be opened to allow entrance of the fish. This movable half hoop is held open by a hook on its rim engaging with a spring inside the cylinder. To a bait-line attached to this spring and arranged across the opening, the bait is affixed, disturbing which the fish disengages the spring, and the half hoop is sprung over to inclose it.

Claim.—The fish-trap, consisting of the cylindrical frame A, the rod B, the springs *b b*, the semicircular trap-door C, the hook *c*, the spring D, bait-strings *d*, and suitable net-work, substantially as specified.

141,589.—Loom-Shedding Mechanism.—EDWARD REDFEARN, Philadelphia, Pa. Application filed June 3, 1873.

To lessen the friction between the warp-thread on the shedding movement, the heddles are raised consecutively instead of simultaneously, by means of compound eccentric pulleys, to which the leaves of heddles are suspended.

Claim.—The combination, substantially as described, of compound eccentric pulleys E E', with leaves of heddles suspended from and controlled in their movements by the said pulleys, substantially as and for the purpose specified.

141,590.—Magazine Fire-Arm.—JOSEPH RIDER, Newark, Ohio. Application filed April 14, 1873.

The magazine-tube is pivoted to the under side of the barrel, and swings bodily away therefrom to facilitate charging.

Claim.—1. A magazine-gun having its magazine or cartridge-holder B hinged or pivoted to the arm, substantially as described, whereby the magazine is opened by swinging it bodily away from the arm so as to expose its open end, as set forth.

2. The magazine B, pivoted to the slide *c*, the latter being fitted in a dovetailed groove, and the stop *d*, all arranged to operate substantially as described.

141,591.—Trunk-Lid Supports.—ANTONY V. ROMADKA, Milwaukee, Wis., assignor to ROMADKA BROTHERS, same place. Application filed January 21, 1873.

Claim.—The combination of the rod C attached to the trunk-cover with the rod E attached to the body, the two being hinged together so as to leave a projecting arm to act as a stop, substantially as described.

141,592.—Feed-Water Regulator.—JOHN B. ROOT, New York, N. Y. Application filed January 4, 1873.

Upon the falling of the water in the boiler below the ordinary level, steam enters the drum and forces the water therein through pipe into the case, below the flexible diaphragm, and by raising the latter, through its stem, the valve of water-supply pipe is operated.

Claim.—The combination of the drum and case with connecting-pipes opening at the top and bottom of the drum and case, respectively, and the diaphragm and its spindle, substantially as described.

141,593.—Machine for Chucking and Revolving Tubes, &c.—JOHN B. ROOT, New York, N. Y. Application filed January 4, 1873.

In the end of a hollow revolving cylinder are pivoted three toggle-jaws, held forward by springs, to hold the rod or pipe while revolving. An inner cylinder, through which the rod is introduced, has on its end a beveled ring that operates, when thrown forward against lugs on the side of the clamping-jaws, to throw them open and release the rod.

Claim.—1. The combination of the revolving axis B, pulley A, clutch mechanism, and sliding cylinder H, when operating in connection with a screw-thread or other cutter in such manner that the tube or bar can be adjusted longitudinally without stopping the machine, as herein shown and described.

2. The combination of the sliding cylinder H provided with a beveled head, J, with the clutch mechanism described, as and for the purpose set forth.

141,594.—Boiler-Furnace.—JOHN B. ROOT, New York, N. Y. Application filed January 15, 1873.

Has a retort perforated on its upper side, cylindrical or other form, placed within the fire-box and over the fire, whereby the carbon and other gases are extracted. The coke is pushed down upon a grate to burn.

Claim.—1. A boiler or other furnace, provided with retorts having internal outlets for the gas and coke, for containing bituminous coal, from which gases are freed and ignited to increase the heat in the furnace, and the coke from which is consumed in said furnace, as herein described.

2. A perforated retort having both ends open, in which bituminous coal is burned, as described, in combination with a boiler or other furnace, as and for the purpose set forth.

3. A retort constructed with a portion of its under side cut away, and with perforations and gate and plate, in the manner and for the purpose described.

4. The combination of the hereinbefore-described retort, with a furnace provided with inclined grate-bars, as and for the purpose described.

141,595.—Spice-Box.—JOSEPH SEARS, Chicago, Ill. Application filed February 1, 1873.

The top and cap plate are made with corresponding corrugations or ribs and depressions, so as to keep them in close contact, and the cap-plate has a longitudinal movement upon or beneath the box-top.

Claim.—The combination of a box-top and cap-plate, swaged or stamped together with corresponding corrugations, or ribs and depressions, to keep them in close contact, the cap-plate having a sliding movement upon or beneath the box-top, substantially as herein set forth.

141,596.—Veneer-Cutter.—JOHN N. SEIB, Boston, Mass. Application filed May 10, 1873.

The knife-carriage is moved back and the knife carried clear of the log, when the stay-log begins its return-stroke. When it begins its forward stroke the carriage is moved forward faster to enable the knife to cut the veneer. A steadying-roller is held in contact with the log by the action of the knife-carriage, and is always held firmly up to it, and imparts motion likewise to the cut-off knife to sever the sheets.

Claim.—1. In combination with the knife-carriage and the reciprocating stay-leg of a veneer-cutting machine, a feed mechanism which carries the knife-carriage back when the stay-log recedes and forward when the stay-log advances, substantially as shown and described.

2. The combination of the adjusting-disk r^1 and stop-pawls r^{10} with the feed-wheel r^9, feed-pawl r^{10}, screw-rods s^1, and knife-carriage E of a veneer-cutter, substantially as set forth.

3. The combination of slides n^3, cords p^3, and said adjusting-screws p^2 with the knife-carriage E and roller m^2, substantially as shown and described.

141,597.—Harvester.—JOSEPH H. SHERMAN, York, Pa., assignor of one-half his right to Adam R. REESE, Phillipsburg, N. J. Application filed November 23, 1872.

The operator, by a hand-lever, simultaneously lifts and rocks the finger-bar and platform.

Claim.—1. In a harvesting-machine having a hinged grain-platform, which is free to rise and fall at its outer end independently of the main frame, and which is supported at its outer or grain side by carrying-wheels, a lever connected with the platform, substantially as described, for enabling the operator to simultaneously lift the inner or stubble side of the platform, and to rock or tilt it upon the outer carrying or grain-wheel.

2. In combination with the drag-bar D, the rear brace D^2 connecting the standard D^1 with the heel end of the drag-bar, substantially as and for the purpose described.

3. The pivoted seat-support N′, in combination with the swivel-block O for adjusting the seat, substantially as described.

141,598.—Steering Apparatus for Vessels.—AMIE SIBENTHAL, Vevay, Ind., assignor to himself and F. R. DUFOUR, same place. Application filed June 21, 1873.

The tiller is pivoted at its rear end to the rudder-post, and at its forward end it is connected to a rope which traverses over a vertical arch, and is attached to the drum of the steering-wheel. Thus the tiller has the horizontal and lateral motion of the rudder-post, but is regulated in its speed by its relative position on the arch, and by this means a differential compensating movement is attained by which the greatest rapidity is given to the tiller when the least power is required, and vice versa.

Claim.—In combination with wheel A, rope B, and arch D, or its equivalent, the tiller E, arm G, hinge connection *g* *i*, and rudder-post F, constituting the steering apparatus, substantially as set forth, for the purposes described.

141,599.—Valve for Steam and Vacuum Pumps.—ALONZO J. SIMMONS, Indianapolis, Ind. Application filed May 10, 1873.

When used as a steam-valve with double cylinders it is moved by the pressure in one cylinder, the water in the other having been forced out by the steam. When employed as a hydraulic or discharging-valve an aperture is made through its center to permit a quantity of water to enter the cylinder from which the water has just been expelled to condense the steam therein.

Claim.—The cylindrical casing A having end ports B B and side port D, and the cylindrical valve G having ports *b b*, and enlarged central head E in chamber C, with or without the aperture, constructed substantially as and for the purposes herein set forth.

141,600.—Combined Fountain and Pump.—JOSEPH J. SINK, Philadelphia, Pa. Application filed November 16, 1872.

Claim.—1. A combined fountain and pump in which a hollow rod, G, is made to serve the twofold purpose of a piston-rod and a pipe for conveying fluid under pressure from the supply-reservoir to to the discharge-nozzle, substantially as described.

2. The combination of the piston, its valve *b* opening downward, the hollow tube G, and openings furnishing a continuous communication of the tube with the space below the piston.

3. The reservoir A, barrel D, and valve *a*, in combination with the piston F and its valve *b*, so arranged as to open downward and to strike and operate the valve *a*, as set forth.

4. The barrel D, communicating with a reservoir for containing water and air under pressure, and provided with a flange, *f*, in combination with a piston-rod and its pin *e*, arranged as set forth.

141,601.—Damper and Ventilator.—JOHN L. SKINNER, Amboy, Ill. Application filed May 31, 1873.

A pipe, having circular opening to correspond with that of the vertical flue, fits within the horizontal flue. It may be used as a damper and a cleaner, and by withdrawing it partially the stove-pipe is converted into a ventilating flue.

Claim.—The pipe B, constructed as described, with the knob C and circular opening *b*, in combination with the pipe A *a*, arranged and operated substantially as and for the purpose set forth.

141,602.—End-Gate for Wagons.—ROBERT SMILLIE and CHARLES H. BROOKS, Virden, Ill. Application filed May 7, 1873.

The hinged section of the side of the body is unfastened by unscrewing the fastening-rod, and the pressure of the load in the wagon forces outward the end-gate.

Claim.—1. The wagon-body A having the rear end *d* of its side hinged to swing outward, and provided with the fixed cleat *a*, so that the pressure of the gate tends to turn it outward, as set forth.

2. In combination with the wagon-body, having its side *d* hinged and provided with the cleat *a*, the rod C passing through and holding the hinged portion, as shown.

141,603.—Breech-Loading Fire-Arm.—DEXTER SMITH and JOSEPH C. MARSHALL, Springfield, Mass.; said MARSHALL assignor to said SMITH. Application filed August 30, 1872.

Claim.—1. The combination of the locking-brace *c*′, having the projection *m* thereon, with the trigger A and tumbler *x*, all substantially as and for the purpose herein described.

2. The locking-brace *c*′, provided with the projection *m*, whereby the said brace is secured in position beneath the breech-block by the nose of the trigger, substantially as described.

141,604.—Railway Telegraph.—JAMES G. SMITH, Boston, Mass., assignor to himself and JAMES W. BROWN, same place. Application filed March 28, 1873.

Two wires in sections, one having battery connections at terminals. Sections end in a circuit-changer through which corresponding wires in adjacent sections are normally connected. Third wire controls circuit-changer by current from battery in train. Arm carrying three fingers insulated from each other, one for each wire, projects from car. Train entering section operates circuit-changer so that a circuit is formed from one wire through one finger to instrument on train, thence by another finger to second wire. All the trains and stations on a line may be included in one circuit.

Claim.—1. A railway telegraph, substantially as described, or a telegraph system for railways, in which, by means of an arm projecting from a car of each moving (or stationary) train, and connected with a telegraph instrument upon said car, connection is or may be made between said instrument and the wire or wires of a line parallel with the railway, and with all of the trains upon the track.

2. A line having the sections of wires *d c* connected to transmit the electric current substantially as described, the wires being normally connected, and having their direct connections changed for connection with the instrument upon the train.

3. In combination with the wires *d c*, the third wire *n*, bars *p q*, and instruments *u*, arranged substantially as shown and described.

4. The battery *g*, finger *j*, wires *n*, and bars *p q* for effecting the change of the armature *v*, substantially as described.

5. The wires *d c*, fingers *l m*, instrument A, battery *g*, finger *j*, wires *n*, bars *p q*, instruments *u*, and their various connections, arranged and operating substantially as described.

6. In combination with a line formed in sections, an instrument connected with each section to change the circuit, substantially as or for the purpose described.

7. In combination with the instrument A and battery *g*, an arm, *i*, having extended from it the respective branches or fingers *l m j*, which fingers are insulated from each other, and are respectively connected with the instrument and battery, substantially as shown and described.

141,605.—Package for Fruit.—DAVID SNEDEKER, New York, N. Y. Application filed June 25, 1873.

The ordinary box for receiving the fruit is inclosed in an outer ornamental package, made of willow or other light material. The top of the package is cut through on three sides to form a hinged lid. A slotted handle is attached to the ends of the box, so that it can be used as a handle, or as a fastening to hold the lid down.

Claim.—The package B for holding and carrying fruit or other articles provided with a lid, G, and sliding handle E combined together, substantially as described, and adapted to the box A, as set forth.

141,606.—Fertilizing Attachment to Seed-Sowers.—HENRY SPRINGER, Brady, Mich. Application filed October 11, 1872.

The frame of the machine and single bearing-wheel are similar to those of a common wheelbarrow. The seed and fertilizing boxes are mounted upon the frame, and the reciprocating motion of the feeding devices are communicated from the bearing-wheel by means of a band passing over a pulley on said wheel, and bell-crank with connecting-rods.

Claim.—The fertilizer-distributing attachment to seed-sowing machines herein described, consisting of the V-shaped box K, serrated bar L, connecting-bar N, and bell-crank E, arranged upon the frame in front of the seed-sowing-box, and operated by the power that actuates the sower, all constructed and arranged substantially as specified.

141,607.—Fire-Extinguisher.—DANIEL J. TAPLEY, Danvers, Mass. Application filed March 29, 1873.

A pump in connection with a siphon empties the acid-receptacle of its contents and mixes it with the solution in the cylinder by a propeller-screw revolving in a vertical perforated cylinder in the bottom of the extinguisher, also preventing the undissolved alkali from settling and clogging the pipe. An alarm-bell is operated by the pumping mechanism. By suitable pipes in connection with a three-way cock, gas or the solution may be used.

Claim.—1. The combination, with the tank and acid-chamber I, of the siphon D and air-pump H arranged in the tank and operated from the outside, in the manner and for the purpose described.

2. The combination, with the pump-operating mechanism, of the spring-bold lever that strikes the gong, and causes the latter to be sounded whenever acid is admitted to the tank.

3. The pump and siphon D fixed to the chamber I, as described, so that the latter may be removed by simply drawing out the piston-rod and detaching its fastening-bolts.

4. The combination, with the acid-chamber I and the acid-discharging apparatus, essentially as herein described, of the connecting-rod G, substantially as and for the purpose set forth.

5. The removable acid-chamber I having the pipe E and siphon-pump attached thereto, and arranged as described.

6. The hollow cylinder Q, in combination with the propeller-screw F and tank X for giving direction to the current, substantially as herein shown and described.

7. The combination of the branch pipe M opening into the gas-space of the tank X with the main pipe C E S, substantially as herein shown and described.

141,608.—Car-Brake.—JAMES TEMPLE, Mooresburg, Pa., assignor, by mesne assignments, to himself and DANL. J. ROTE, same place. Application filed May 9, 1873.

The brake-shoes of the rear wheels are tightened by the downward or forward movement of the front shoes by means of the brake mechanism.

Claim.—1. A longitudinally-sliding bar arranged, in relation to the wheels, as shown, and carrying arc-shaped brake or friction shoes applied to correspondingly-shaped portions of the bar, the bar being fitted to slide in hanger E at one end, and connected to the arm *f* or crank-shaft F at the other, the various parts being combined and arranged to operate in the manner set forth.

2. The sliding shoe-bar fitted in a slotted guide-hanger, to enable the same to be vertically adjusted, to counteract the effects of wear upon the shoes and wheels, as herein set forth.

141,609.—Life-Boat.—WILLIAM A. VAIL, Clinton, Conn. Application filed July 9, 1873.

Attaching to the outside of the hull of a life-boat a sheet-metal extension, flaring outward toward the top, which, by heightening the boat, lessens its liability to upset, and also prevents the waves breaking from over its sides.

Claim.—The detachable beam-extension for life-boats, made in the form and applied in the manner herein shown and described.

141,610.—Plaiting Attachment for Sewing-Machines.—WILLIAM WALKER, Brooklyn, assignor to GEORGE H. WOOSTER, New York, N. Y.—Case A. Application filed May 15, 1873.

The nippers are closed against the fabric when they move forward to form the plait; and as the nippers are opened the blade rises and the nippers move forward, and bend the fabric upward to insure correct formation of the plait.

Claim.—1. The reciprocating or vibrating nippers I, arranged in combination with the work-plate A of a sewing-machine and with the vertically-movable blade J, to form the plaits in the fabric before the same arrives on top of said plate A, as set forth.

2. The jaw *g* of the nippers, hinged to the holder H of the lower jaw *f*, and provided with the projecting arm A *j* to receive, by means of the rotary cam *d* bearing against the arm *j*, the independent oscillating movement above such lower jaw, as specified.

3. The vertically-movable wedge or blade J, interposed between the reciprocating nippers I and the plate A of the sewing-machine, substantially as and for the purpose herein shown and described.

141,611.—Sewing-Machine.—WILLIAM V. WALKER, Dresserville, N. Y. Application filed July 15, 1873.

Two cutters, placed one upon the other, have pitmen, connected by a pivoted lever, and operated by a zigzag groove on the inner periphery of the drive-wheel.

Claim.—The combination, with the two knives or cutter-bars G G, of the rods *b b*, lever H, rollers *i i*, and the zigzag groove *a* formed on the inside of a projecting rim on the driving-wheel D, all substantially as and for the purposes herein set forth.

141,612.—Chuck for Holding Pipe-Fittings.—MATHIAS WALTY, Buffalo, N. Y. Application filed May 14, 1873.

The chuck-bearing D is pivoted in one of the arms, and has on its under surface grooves formed at right angles, into one of which a lever, situated in a recess in the arm, and pressed up by a spring, is forced, to retain the chuck in position.

Claim.—1. The combination, with the supporting-arm B and spring-locking lever F *h*, of the recessed and pivoted chuck-bearing D and removable chucks C C, substantially as and the purpose hereinbefore set forth.

2. The combination, with the supporting-arm B and pivoted chuck-bearing D, provided with locking-grooves *f* on its under side, of the spring-locking lever F *h*, arranged in a recess in the face of the arm B contiguous to the chuck-bearing, substantially as hereinbefore set forth.

141,613.—Millstone-Pick.—THOMAS R. WAY, Springfield, Ohio. Application filed April 5, 1873.

A right-angled body so constructed that one arm receives the cutting-blade and the other the handle, which is attached to the upper end of this body so that the weight may be below. The outer face of the upper arm is flat, and provided with side flanges or lips, extending beyond the edges of the blade to prevent lateral motion. Between these flanges is pivoted a cam-lever, under which is mounted an arched spring-plate provided at its upper end with ears which fit into notches in the flanges and hold the plate in place. There is a stud on the flat face of the upper arm, under the upper end of the spring-plate, which fits into the blade and keeps it from moving endwise.

Claim.—1. The head or body A provided with the stud F, in combination with the blade B and cam-lever D, or equivalent fastening device.

2. The head A provided with the stud F and cam-lever D, in combination with the blade B and spring-plate E, substantially as shown and described.

3. A millstone-pick having its handle attached at or near the upper end of the head or body, in order that the weight may be below the handle, as and for the purpose described.

4. In combination with the body or holder, constructed as described, the double-ended reversible blade provided with a series of holes or recesses to receive the fastening-stud.

141,614.—Oscillating Berth for Vessels.—BERNHARD WINKEN, New York, N. Y. Application filed May 15, 1873.

Claim.—The rock-shaft *f*, lever *e*, and rod *d*, in combination with the balance-pendulum D, swinging berth C, and oscillating frame B, substantially as set forth.

141,615.—Can for Oils.—F. CORTEZ WILSON, Chicago, Ill., assignor to himself and JOHN G. EVENDEN, same place. Application filed June 27, 1873.

The stationary half of the cover is soldered to the inside of the can a little below its upper edge, and an inclined flange continues in the same line around the other half of the can, forming a groove for the revolving half of the cover. The revolving cover is held between a collar and a beveled washer at the apex of the dome, and may be made in two parts.

Claim.—1. In an oil-tank having a conical top or dome, a vertical guard or track around the upper edge of the body or cover to receive the sliding portion of the top or dome, substantially as described, for the purpose specified.

2. The vertical guard, strengthened by the top wire, and formed by soldering the dome to the inside of the tank or cover rim, a suitable distance below the edge, substantially as described.

3. The tank A, having a groove around its upper edge formed by the projecting edge D, the stationary portion B of the dome, and the flange H, substantially as described, for the purpose specified.

4. The sliding door or cover C, for the top or dome, pivoted to the apex of the latter by the beveled washer F, collar E, and the screw and knob, substantially as described.

141,616.—Water-Wheel.—ABRAHAM N. WOLF, Allentown, Pa. Application filed June 17, 1873.

The gates and water-guides are placed between the two horizontal parallel rings, the guides swinging on bolts or pins. There are also double water-guards, forming tapering water-passages, and provided with joints, of rubber or other suitable elastic material, at the point where the water-guides strike them when the gates are closed, thereby forming a water-tight joint.

Claim.—1. The gates G G and water-guides J J, placed between the two horizontal parallel rings H H, and the guides swinging on bolts or pins *a a*, substantially as and for the purposes herein set forth.

2. The double water-guards E E, forming tapering water-passages D D, and provided with joints *b*, of rubber or other suitable elastic material, substantially as and for the purposes herein set forth.

3. The combination, with the wheel A, of the water-guards E with joints *b*, rings H, gates G, and swinging water-guides J, substantially as and for the purposes herein set forth.

REISSUE PATENTS.

5,517.—Machine for Making Glass Buttons.—HENRY BOCK, New York city, assignor to WILLIAM W. MCFARLAN, Brooklyn, N. Y.—Patent No. 46,330, dated February 14, 1865. Application filed May 15, 1873.

Slot in presser to receive and hold metallic eye of button; gas flame under mold to keep mold at a high temperature.

Claim.—1. In a press for making buttons of plastic material, a plunger or presser having a slot or recess, *n*, for the purposes specified.

2. The combination of a die for giving shape to a button with a presser having a slot or recess, *n*, for the purposes specified.

3. A die and presser for molding plastic material, in combination with the heating devices, substantially and for the purposes described.

5,518.—Pen and Pencil Case.—CHARLES H. DOWNES, Hudson City, N. J.—Patent No. 107,672, dated September 27, 1870. Application filed June 24, 1873.

The extension-tube is so arranged that the handle may be extended without moving the pencil-holder when the pen is to be used; or, by turning the extension-tube to the right before withdrawing it the pencil-holder will be extended.

Claim.—1. The combination of a spindle or pencil-holder, A B, and a revolving spirally-slotted barrel, C, with a short slotted fixed guiding-tube, G, and a slotted extension-tube, Q, substantially as described, for the purpose specified.

2. The combination of a spindle or pencil-holder, A B, and a revolving spirally-slotted base, C, constructed and arranged, substantially as specified, with the short slotted fixed guiding-tube G, as described.

3. The spindle A B having stud D thereon, tube C having spiral slots E F, short slotted tube G, slotted extension-tube Q combined with case P, tube M having slot N, slide K, and pin L, all constructed and arranged with respect to each other, as specified.

5,519.—Printing-Telegraph.—THOMAS A. EDISON, Newark, N. J., assignor, by mesne assignments, to THE GOLD AND STOCK TELEGRAPH COMPANY, New York city.—Patent No. 91,547, dated June 22, 1869; reissue No. 4,166, dated October 25, 1870. Application filed June 19, 1873.

Printing and type-wheel magnets arranged in same circuit with a polarized electro-magnet acting to shunt either, the circuits being so arranged, however, that if the switch-magnet fails to act the continuity of the circuit is preserved.

Claim.—1. A printing-telegraph instrument with the printing and type-wheel magnets in the metallic circuit forming part of the main line, and a shunt-switch operated by electro-magnetism to divert the current from the type-wheel magnet while the printing is effected, substantially as set forth.

2. A separate magnet in the main line to cut out, by a switch and shunt connection, either the printing or the type-wheel magnets, substantially as set forth.

3. In a printing-telegraph instrument, three electro-magnets within the metallic circuit forming part of the main line, and a shunt-switch operated by magnetism, whereby the current is diverted or short-circuited from one magnet by the movement of the switch, substantially as set forth.

4. Two or more printing-telegraph instruments placed in one main circuit, and operated simultaneously by pulsations of electricity, the type-wheel being set by pulsations of one polarity, and the printing being effected by pulsations of the opposite polarity, substantially as set forth.

5. Two or more printing-telegraph instruments placed in one main circuit, with all the electro-magnets in metallic connection with that circuit, so that the entire circuits remain unbroken, in combination with shunts and switches actuated by magnetism to direct the current principally through the printing-magnets when the impression is to be made, substantially as set forth.

5,520.—Hominy-Mill.—THEODORE HUDNUT, Terre Haute, Ind.—Patent No. 122,172, dated December 26, 1871. Application filed March 22, 1873.

Curved blades, secured between curved arms, attached to shaft.

Claim.—1. The combination of the shaft B, plates E, lugs F, arms I, blades G, and the collars D, all substantially as specified.

2. The combination of the blades G, lugs F, and arms I, for securing the blades to the shaft and plates, substantially as specified.

3. The holders I for the blades G, having the curved form described.

4. Cutters for a hominy-mill, consisting of curved holders I and blades G, combined and arranged relatively to the shaft, as specified.

5,521.—Spindle for Spinning-Machines.—BARTON H. JENKS, Bridesburg, Pa.—Patent No. 134,067, dated December 17, 1872. Application filed July 5, 1873.

An improvement in that class of spindles which have flat or reduced parts to be engaged by check-pieces extending across the lower part of the bore of the bobbin, and consists in forming such flat or reduced parts on a button made separate from and applied to the spindle, and so as to be embraced entirely within the lower end of the bobbin when applied.

Claim.—A tubular button with an engaging-surface, substantially as described, and made separate from and so applied to a spindle of a spinning-frame that it occupies a position and interlocks with a corresponding surface within the lower end of the bobbin, substantially as and for the purpose set forth.

5,522.—Billiard-Cue.—HERVEY PLATTS, Ithaca, N. Y.—Patent No. 139,519, dated June 3, 1873. Application filed July 26, 1873.

A ferrule, flush with the end of the wood portion of the cue, is used, and is made of lead, zinc, or some non-elastic material. The tip is fastened to the cue by driving it forcibly onto the rough projecting points, which prevent rotary motion of the tip upon the stick.

Claim.—1. A billiard-cue having several rough or barbed projecting from its end, adapted to hold the tip, and for the purpose substantially as specified.

2. The combination, with a billiard-cue, of the soft-metal or non-elastic tip-band *c*, substantially as specified.

5,523.—Printing-Telegraph.—FRANK L. POPE, Elizabeth, and THOMAS A. EDISON, Newark, N. J., assignors, by mesne assignments, to THE GOLD AND STOCK TELEGRAPH COMPANY, New York city.—Patent No. 103,924, dated June 7, 1870. Application filed June 19, 1873.

Type and printing magnets in same circuit. Type-wheel revolving, printing-magnet is shunted by A and *z*. Wheel set-shunt is broken by *x*, and printing-magnet becomes active. Unison-magnet in same circuit, thrown into action by reverse current, shunts both type and printing magnets. All circuits arranged so that if either unison-magnet or shunt *w x* fail to act the continuity of the circuit is still preserved.

Claim.—1. In a printing-telegraph instrument, the arrangement of two electro-magnets in the same electrical circuit, one being employed to rotate the type-wheel and the other to actuate the printing mechanism, when the action of the latter is controlled by that of the former by means of a branch or short circuit and a mechanical cut-off, or its equivalent, constructed and operated substantially as described.

2. An improved cut-off, termed an electrical-unison cut-off, whereby, at a given point in the revolution of a ratchet or type wheel, a shunt or branch circuit may be brought into action, and the electrical current diverted from the electro-magnet controlling the movement of the said ratchet or type wheel, so that the said movement may be arrested at each given point, the same being constructed and operated substantially as specified.

3. The electro-magnet R R′ and soft-iron bar T, in combination with a polarized-steel bar, *n s*, so arranged that said steel bar will be in magnetic contact with the said soft-iron bar, substantially as herein specified.

4. The bar M, feeder N or N′, spurs *q* or *q*′, bed-plates O or O′, combined, arranged, and operating substantially as described, and for the purposes specified.

5. The combination of the lever E, pawls F and F′, stops S and J, and ratchet-wheel G, arranged and operating substantially as described.

6. The combination of the pawl F, stop S, and ratchet-wheel G, substantially as and for the purposes specified.

7. The electro-magnet R R′, soft-iron bar T, and polarized-steel bar *n s*, in combination with the spring *t*, insulated collar *v*, and pin or stud *w*, in the manner described, and for the purposes specified.

8. The combination, with an electro-magnet in a telegraphic-printing apparatus, of a type-wheel whose periphery is provided with integral numbers, so arranged upon said type-wheel that fractions of numbers may be printed upon the paper, thereby decreasing the number of characters upon the type-wheel and insuring great rapidity in recording, substantially as herein shown and described.

9. In a printing-telegraph, a type-wheel provided with letters, figures, or characters, which are arranged in two different lines around the periphery of said wheel, and in such manner that the said letters, figures, or characters in the one line shall be opposite blank spaces in the other line, substantially as herein specified.

10. A printing-telegraph instrument with the metallic circuit of the main line passing through both the type-wheel and the printing electro-magnets, in combination with a shunt circuit or switch that operates to energize the printing-magnet during a pause after the type-wheel has been set.

5,524.—Steam-Generator.—JOHN B. ROOT, New York, N. Y., assignor, by mesne assignments, of one-third interest to THOMAS C. M. PATON.—Patent No. 74,146, dated February 4, 1868; reissue No. 4,062, dated July 26, 1870; reissue No. 4,690, dated January 2, 1872. Application filed May 20, 1873.

Each tube acts as an independent small boiler, which, being set in an inclined position, permits the steam generated to pass freely to its upper end. To prevent foaming, the passages leading from the tubes into the head connecting any two of them are made of less transverse area than the transverse area of the hollow space or chamber in the head connecting them.

Claim.—1. The combination and arrangement of a series of inclined boiler-tubes of uniform diameter, a corresponding set of perforated heads for the lower ends of said tubes, and a corresponding set of perforated heads for the upper ends of said tubes, in such manner that a connected conduit for water is formed at the lower ends of the set of boiler-tubes, and a connected obstructed conduit composed of a series of alternate chambers and passages of less transverse area than the said chambers, is formed at the upper ends of the said tubes for the passage of the steam from their interiors to the upper part of the boiler.

2. A water-tube boiler constructed of a series of inclined water-tubes which are of uniform diameter throughout their length, and are provided with a series of heads, and are combined in such manner that the upper ends of said tubes and the connections between them form an obstructed passage of alternate constructions and enlargements.

5,525.—Pump for Oil-Wells.—JOHN B. ROOT, New York, N. Y., assignor, by mesne assignments, to ALEXANDER S. HILL, HARRISON H. NOYES, and HARVEY M. HASKELL, Pleasantville, Pa.—Patent No. 47,224, dated April 11, 1865. Application filed May 17, 1873.

The tube is composed of staves bound around with iron bands. The pump-rod passes through a yoke firmly secured to the pump-cylinder, which fits snugly within the lower length of the tube. To draw up the cylinder without disturbing the tube, the pump-rod is raised until the piston is brought in contact with the yoke, when the cylinder is dislodged and all brought up together.

Claim.—1. The pump-tube A, composed of wooden staves and surrounding bands of metal, constructed and arranged substantially as described.

2. In combination with a tube for oil-wells, the detachable pump-cylinder, arranged to operate substantially as described, whereby the latter can be withdrawn and replaced without removing the tubing of the well, as and for the purposes set forth.

3. The combination of the tube A, cylinder B, and packing-rings *d*, substantially as described.

4. The piston or valve rod D, connected to the pump-cylinder B, substantially as described, whereby the rod has sufficient motion to operate the pump, and when drawn up will remove the cylinder with it, as herein set forth.

5,526.—Thread Show-Case.—AURELIUS STEWART, Chicago, Ill.—Patent No. 79,033, dated June 16, 1868. Application filed May 17, 1873.

The case is provided with parallel rows of apartments having inclined bottoms, and open in front, and provided with a stop thereat. The fronts of the partitions and ends are cut out in the arc-form to allow the individual spools to be easily removed.

Claim.—1. A spool-case, provided with parallel rows of apartments for each kind of thread or silk, having inclined bottoms, and open in front and provided with a stop thereat, so that the different kinds of article shall be exhibited to the eye, in the manner described.

2. The parallel apartments of a spool show-case, bottom inclined, to enable the successive spools to be fed forward by gravity, in the manner set forth.

3. The combination, in a spool-case, of partitions and ends, pared away in the arc-form to allow the individual spools to be removed, in the manner specified.

5,527.—Window Screen and Shutters.—BENJAMIN J. WILLIAMS, Philadelphia, Pa.—Patent No. 103,900, dated May 10, 1870.—Division A. Application filed July 8, 1873.

A combined screen and shutter having an overlapping bead all around the opening for excluding all light when the shutter-slats are closed.

Claim.—In an inside blind or door having movable slats, wire screens attached in rabbets made in the stiles and rails of the blind, in combination with beads or moldings made wider than the rabbets, substantially as and for the purposes set forth.

5,528.—Blind-Slat Operator.—BENJAMIN J. WILLIAMS, Philadelphia, Pa.—Patent No. 103,900, dated May 10, 1870.—Division B. Application filed July 5, 1873.

Claim.—In combination with the movable slats of a blind or slat-door, the center lever C, movable parallel slides B B, and pivotal guide-rods *d*, all arranged upon the rail and inclosed by plate D, the slot *c* being left between the plate and rail for the lever to work in, substantially as set forth.

5,529.—Seed-Dropper.—FRANK W. YOUNG, Holden, Mo.—Patent No. 135,743, dated February 11, 1873. Application filed June 25, 1873.

Beneath a hopper, and upon a board containing a single escape-hole, revolves, intermittingly, by means of a pair of spring-pawls, an annular disk, in the inner edge of which semicircular seed-cups are formed, into the open sides of which project the concave ends of radial piston-arms, slotted at their inner ends and pivoted loosely through the cam-slots to a centrally-pivoted adjusting-disk. By turning slightly the central disk, the pivots, working in the cam-slots, move the radial piston-arms outwardly or inwardly, to vary the size of the seed-cups, which stop successively over the seed-escape hole at each stroke of the pawl.

Claim.—1. The slotted and pivoted arms D D, when used in connection with a rotating dropping-wheel, substantially as and for the purpose set forth.

2. The combination of the slotted pivoted arms D D with disk E, substantially as and for the purpose set forth.

3. The slotted pivoted arms D D and pivoted disk E, in combination with the pivoted wheel C, provided with dropping-holes *c*¹, substantially as described, and for the purpose set forth.

4. The reciprocating slide F, pawls G H, dropping-wheel C, disk E, and arms D D, all constructed and combined to operate substantially in the manner and for the purpose herein described.

INDEX OF INVENTIONS PATENTED AUGUST 5, 1873.

	Class No.	Whole No.
Alloy, H. W. Wright	99	141,529
Alloy of nickel, zinc, and copper, H. W. Wright	99	141,530
Animal poke, J. Hopkins	144	141,536
Axles, securing wheels to, Lessor and Shambo	31	141,570
Baby walker, J. Erikson	143	141,631
Bale band stretcher, F. M. Logue	7	141,447
Bale tie, cotton, W. Crone	7	141,694
Bark, machine for reeling, Martin and Wilson	98	141,448
Barrels, casks, &c., machine for painting, Burnet and Fisher	19	141,542
Bee hive, D. Latchaw	9	141,443
Belt gearing, idler for, Bell and Hillerick	87	141,617
Belting, apparatus for the manufacture of vulcanized rubber, Gately and Forsyth	81	141,639
Billiard cue, H. Platts, (reissue)	143	5,522
Billiard table, G. Buntin	143	141,539
Blind slat operator, B. J. Williams, (reissue)	30	5,528
Blind stiles, machine for boring, A. B. Carlin	30	141,545
Boat detaching apparatus, S. Smeden	13	141,470
Boat, life, W. A. Vail	13	141,669
Bobbin, T. G. McLaughlin	148	141,575
Bobbins, machine for winding, J. Goodyear	142	141,434
Boiler attachment, wash, E. Davis	126	141,689
Boot and shoe, lasting, J. Brackett	16	141,490
Boot and shoe tree and stretcher, T. R. Evans	16	141,550
Box, match, A. Meyerberg	62	141,521
Box scraper, C., G. W., and J. D. Ellis	29	141,549
Box, spice, J. Sears	66	141,585
Brick machine, Irwin and Langdon	20	141,560
Bridge, iron, J. D. Pierce	21	141,458
Brush, paint, A. S. Thompson	22	141,582
Buckle, trace, J. Kennedy	73	141,585
Bung bushes, tool for seating, L. Littlejohn	29	141,511
Burner, gas, J. W. Averill	66	141,415
Bushing for faucet holes, S. R. Thompson	40	141,473
Buttons, machine for making glass, H. Bock, (reissue)	66	5,517
Cam, sectional adjustable slotted, F. D. Elderfield	67	141,548
Can, oil, F. C. Wilson	107	141,615
Canvas stretching and protecting frame, A. Dickerman	54	141,547
Car brake, J. Temple	122	141,668
Car coupling, J. J. Fralkin	122	141,438
Car coupling, L. B. Lewis	122	141,445
Car starter for street railways, M. Toulmin	122	141,474
Carbonic acid, apparatus for charging liquids with, J. Matthews	1	141,571

	Class No.	Whole No.
Carpet stretcher, W. A. Boles	62	141,418
Carpet stretcher, J. Lindsay	62	141,446
Casks, barrels, &c., apparatus for pitching, Meyer and Dick	40	141,449
Chair, folding, P. W. Nolan	62	141,456
Chair, folding, P. W. Nolan	62	141,457
Chimney cowl, J. Burgy	166	141,541
Chimney or globe holder, Wright and Race	90	141,478
Chucking and revolving tubes, &c., machine for, J. B. Root	100	141,593
Churn, E. Archer	45	141,460
Clothes wringer roller, E. P. H. Capron	91	141,424
Coal hod, J. H. Brown	154	141,485
Cock, stop, E. F. Spaulding	152	141,471
Copying press table, B. Brower	146	141,422
Corn sheller, E. L. Hutchinson	50	141,559
Cultivator, R. B. Robbins	43	141,462
Damper and ventilator, J. L. Skinner	154	141,601
Disinfecting powder, H. G. Dayton	98	141,546
Door check, L. Goodyear	24	141,435
Door check, J. A. McNabb	24	141,577
Drawer locking device, L. Ranker	62	141,461
Elevator for passengers and freight, S. Nash	79	141,513
Engine, rotary steam, D. D. Hardy	150	141,436
Engines, frame for vertical, G. B. Sisson	150	141,467
Explosive compound, A. Nobel	71	141,455
Explosive compound, Norrbin and Ohlsson	71	141,565
Fence, G. Albro	52	141,532
Fence, portable, A. Mosher	52	141,584
Fence post, H. O. Elmer	52	141,499
Fire arm, breech loading, Smith and Marshall	18	141,603
Fire arm, magazine, J. Rider	18	141,590
Fire extinguisher, D. J. Tapley	35	141,607
Flooring clamp, Wood and Terry	29	141,598
Fountain and pump, combined, J. J. Sink	118	141,600
Fruit, package for, D. Snedeker	63	141,605
Furnace, boiler, J. B. Root	149	141,594
Furnace, smoke burning, McGinnis and Naylor	149	141,574
Gage, carpenter's, J. A. Traut	29	141,475
Gage cock, H. J. Bailey	148	141,416
Gas, condenser for the manufacture of illuminating, P. T. Bartlis	66	141,543
Gas, manufacture of illuminating, W. Elmer	66	141,500
Gate, farm, E. B. Decker	72	141,497
Generator, steam, McNeill and Pratt	148	141,578
Generator, steam, J. S. Root, (reissue)	148	5,524
Glove fastening, Hall and Knott	23	141,555
Glove fastening, L. Meyers	23	141,580
Grain binder, A. S. Hoyt	74	141,507
Grain, separator for cleaning, G. B. Turner	159	141,524
Harvester, J. H. Shireman	74	141,597
Harvester, corn, A. Scott	75	141,466
Heater and purifier, feed water, Sadler and Volmar	148	141,517
Hemp brake, W. S. Lawrence	78	141,509
Holding apparatus, F. Farrel	79	141,551
Horseshoe, A. Leach	60	141,509
Hose, sleeve or patch for stopping leaks in, Bellesmre and Fleer	81	141,536
Hub boring machine, E. Caswell	31	141,425
Ice shaving machine, J. D. Freeman	58	141,553
Insect powder gun, W. H. Ball	63	141,481
Insects, &c., compound for destroying, J. B. Lunbeck	63	141,512
Knitting machines, yarn take up and tension device for, H. L. Arnold	89	141,534
Knob, silvered glass door, J. W. Haines	68	141,504
Latch, reversible knob, B. Erbe	93	141,430
Leather, manufacture of, Rawle and Evans	92	141,459
Lock, seal, T. Sleight	93	141,519
Loom picking stick check, R. Davis	95	141,496
Loom shedding mechanism, E. Redfearn	95	141,589
Mandrel, buffing, N. S. Thompson	79	141,523
Manganese, ferro-manganese, and spiegeleisen, manufacture of, O. Bolton, Jr	85	141,419
Matches, manufacture of friction, C. F. Bonhack	71	141,483
Mill, cider, N. E. Miller	19	141,582
Mill, hominy, T. Hudnut, (reissue)	57	5,520
Millstone pick, T. R. Way	57	141,613
Mirror, window, Voss and Brandt	62	141,476
Mowing machine, W. V. Walker	74	141,611
Ore crushing stamp, G. D. Crocker	3	141,493
Organ coupler, R. E. Letton	106	141,444
Organs, reed, R. E. Letton	106	141,510
Organs, reed, J. A. Smith	106	141,468
Organ stop action, J. A. Smith	106	141,469
Oil to render it drying, treating cotton seed, H. Goldman	107	141,503
Oyster dredge, Herafager and Fitzgibbons	143	141,439
Paint compound, C. Campbell	107	141,544
Painters, composition filling for, R. Sharp	107	141,518
Paper, composition for water-proofing wall, C. Van Herwerden	109	141,585
Paper folding machine, Chambers and Mendham	15	141,489
Paper folding machine, Chambers and Mendham	15	141,490
Paper folding machines, packing box for, C. Chambers, Jr	15	141,486
Paper folding machines, packing device for, C. Clark	15	141,491
Paper folding machines, packing and carrying devices for, W. Farrington	15	141,501
Paper, machine for folding, cutting, and trimming, C. Chambers, Jr	15	141,487
Paper, machine for folding, pasting, and inserting, C. Chambers, Jr	15	141,488
Pen and pencil case, C. H. Downes, (reissue)	146	5,518
Pipe fittings, chuck for holding, M. Walty	64	141,612
Plane, metallic, J. A. Baines	39	141,535
Planting machine, Bright and Barrett	133	141,538
Plow, Andrews and Riviere	114	141,533
Plow, shovel, J. J. Mitchell	114	141,583
Printers' furniture, H. P. Montague	117	141,450
Propellers, elevating and depressing, S. G. Hill	139	141,558
Pump, Welford and Conner	118	141,514
Pump for oil wells, J. B. Root, (reissue)	118	5,525
Pump, steam vacuum, W. Burdon	118	141,540
Pump valve, W. Painter	118	141,587
Pumps, valve for steam and vacuum, A. J. Simmons	118	141,599
Purifier, middlings, A. Herr	57	141,557
Railway cattle guard, T. D. Kline	121	141,566
Railway rail, W. Peckham	120	141,515
Register, passenger, S. L. Cooper	42	141,492
Regulator, feed water, J. B. Root	148	141,592
Roofing, cemented slate, A. G. Hennion	126	141,437
Rope clamp, metallic, A. Mehn	138	141,579
Sand papering machine, D. and S. T. Armstrong	70	141,413
Sausage stuffing &c., apparatus for, J. A. Moore	25	141,451
Saw swage, McCollum and Emery	131	141,572
Saw teeth, removable, J. Crookes	131	141,497
Sawing machine, P. M. Andriot	130	141,479
Scaffold support, R. A. Edmonston	30	141,498
Scales, weighing, S. Harris	132	141,556
Screw cutting machine, H. O. Reed	14	141,460
Seed dropper, F. W. Young, (reissue)	133	5,522
Seed sowers, fertilizing attachment to, H. Springer	133	141,606
Seeding machine, H. C. Stephens	133	141,473
Sewing machine hemmer, A. McMillan	134	141,576
Sewing machine plaiting attachment, W. Walker	134	141,613
Sewing machine tables, cover for, H. Jenson	134	141,561
Shaft bending machine, A. J. Fraser	126	141,552
Sheave, P. Kavanagh	79	141,564
Shed, brick yard, R. A. Smith	30	141,598
Shirt collar fastener, G. W. Brientnall	38	141,484
Show case, thread, A. Steward, (reissue)	54	5,526
Spark arrester, M. Zeck	94	141,531
Spinning machines, spindle for, B. H. Jenks, (reissue)	142	5,521
Spinning machines, spindle bolster for, B. H. Jenks	142	141,440
Spinning machines, spindle bolster for, B. H. Jenks	142	141,441
Spirituous liquors, apparatus for treating and aging, G. Goewey	19	141,554
Sponge cup, W. McConnell	146	141,573
Starch, apparatus for the manufacture of, T. Kingsford	145	141,442
Steel ingots, casting, J. A. Holmes	85	141,506
Steering apparatus for vessels, A. Siebenthal	137	141,598
Stove, cooking, W. W. Karshner	154	141,508
Stove grate, coal, S. G. Morrison	154	141,452
Stoves, magazine for, J. R. Painter	154	141,586
Straw cutter, T. Webb	59	141,527
Sugar cane coverer, F. Roy	43	141,464
Switch, self-operating, A. Bouchard	160	141,537
Table, folding, P. Munde	69	141,453
Telegraph, printing, T. A. Edison, (reissue)	50	5,519
Telegraph, printing, Pope and Edison, (reissue)	50	5,523
Telegraph, railway, J. G. Smith	50	141,604
Terret and martingale ring, J. Geraghty	72	141,502
Thrashing machine, J. Crowley	159	141,498
Thrashing machine, W. Verill	159	141,526
Tobacco leaves, machine for cleaning and preparing, J. L. Jones	160	141,563
Tobacco, machine for manufacturing plug, J. L. Jones	160	141,562
Toy, J. J. Arnaud	143	141,414
Toy money box, H. W. Prouty	143	141,516
Trap, fish, Pavonarius and Michtle	143	141,588
Trap, fly, A. J. Davis	143	141,495
Trap, sewer gas, G. C. Anthon	6	141,413
Trunk lid support, A. V. Romadka	162	141,591
Valve, check, J. H. Naylor	152	141,454
Valve register, J. W. Starr	154	141,521
Vehicle wheels, thimble skein for, J. Lahman	31	141,566
Vehicles, running gear of, L. R. Rosebrook	31	141,463
Veneer cutter, J. M. Seib	174	141,596
Vent gimlet, H. S. Rammer	40	141,465
Vessels, oscillating berth for, R. Weisker	137	141,614
Wagons, end gate for, Smillie and Brooks	31	141,602
Washing machine, J. H. Keener	91	141,567
Water bowl, B. Brower	8	141,421
Water closet for vessels, W. Bishop	9	141,482
Water mains, stop gate for, D. C. Cregier	167	141,495
Water wheel, A. E. Wolf	166	141,616
Window fastener, Hawthorn and Scott	94	141,505
Window screen and shutter, B. J. Williams, (reissue)	30	5,527
Wool on belts, cleaning, J. M. Brown	92	141,423
Wrench, S. W. Wakefield	160	141,477

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED AUGUST 5, 1873.

Albro, G., Fence	141,532
Adler, J., assignee	141,580
Andrews, T. G., and A. Riviere, Plow	141,533
Andriot, P. M., Sawing machine	141,479
Anthon, G. C., Sewer gas trap	141,413
Archer, E., Churn	141,460
Armstrong, D. A. and S. T., Sand papering machine	141,413
Arnaud, J. J., Toy	141,414
Arnold, H. L., Yarn take up and tension device for knitting machines	141,534
Arnott, J. P., assignee	141,499
Atlantic Giant Powder Company, assignee	141,455
Averill, J. W., Gas burner	141,415
Bailey, Farrell & Co., assignees	141,416
Bailey, H. J., Gage cock	141,416
Baines, J. A., Metallic plane	141,535
Baker, L., assignee	141,448
Ball, W. H., Insect powder gun	141,481
Barker, J., assignee	141,535
Barrett and Bright	141,538
Ball, T., and J. F. Hillerick, Idler for belt gearing	141,417
Bellesmre, J. F., and F. R. Fleer, Sleeve or patch for stopping leaks in hose	141,536
Bishop, W., Water closet for vessels	141,482
Bock, H., Machine for making glass buttons, (reissue)	5,517
Boles, W. A., Carpet stretcher	141,418
Bolton, O. Jr., Manufacture of manganese, ferro-manganese, and spiegeleisen	141,419
Bonhack, C. F., Manufacture of friction matches	141,483
Bouchard, A., Self-operating switch	141,537
Brackett, J., Lasting boot and shoe	141,420
Branch, J. W., assignee	141,427
Brandt and Voss	141,476
Brientnall, G. W., Shirt collar fastener	141,484
Bright, J. M., and E. Barrett, Planting machine	141,538
Brooks and Smillie	141,602
Brower, B., Water bowl	141,421
Brower, B., Copying press table	141,422
Brown, J. H., Coal hod	141,485
Brown, J. M., Cleaning wool on pelts	141,423
Brown, J. W., assignee	141,604
Buntin, G., Billiard table	141,539
Burdon, W., Steam vacuum pump	141,540
Burgy, J., Chimney cowl	141,541
Burnet, W., and G. B. Fisher, Machine for painting barrels, casks, &c	141,543
Burtis, P. T., Condenser for the manufacture of illuminating gas	141,543
Campbell, C., Paint compound	141,544
Campbell, J. H., assignee	141,456, 141,457
Capron, E. P. H., Clothes wringer roller	141,424
Carlin, A. B., Machine for boring blind slats	141,545
Caswell, E., Machine for boring hubs	141,425
Cawthon, O. F., assignee	141,474
Chambers, C., Jr., Packing box for paper folding machines	141,486
Chambers, C., Jr., Machine for folding, cutting, and trimming paper	141,487
Chambers, C., Jr., Machine for folding, pasting, and inserting paper	141,488
Chambers, C., Jr., and W. Mendham, Paper folding machine	141,489
Chambers, C., Jr., and W. Mendham, Paper folding machine	141,490
Chambers, C., Jr., and E., assignees	141,491, 141,501
Chapman, A., assignee	141,529, 141,530
Clark, C., Packing device for paper folding machines	141,491
Conner and Wolford	141,514
Cooper, S. L., Passenger register	141,492
Cregier, D. C., Stop gate in water mains	141,495
Crocker, G. D., Stamp for crushing ore	141,493
Crone, Cotton bale tie	141,494
Crookes, J., Removable saw teeth	141,497
Crowley, J., Thrashing machine	141,498
Davidson, J. H., assignee	141,544
Davis, A. J., Fly trap	141,495
Davis, E., Wash boiler attachment	141,499
Davis, R., Loom picking stick check	141,496
Dayton, H. G., Disinfecting powder	141,546
Decker, E. B., Farm gate	141,497
Dick and Meyer	141,449
Dickerman, A., Canvas stretching and protecting frame	141,547
Downes, C. H., Pen and pencil case, (reissue)	5,518
Dufour, F. R., assignee	141,206
Edison and Pope, (reissue)	5,523
Edison, T. A., Printing telegraph, (reissue)	5,519
Edmonston, R. A., Scaffold support	141,498
Elderfield, F. D., Sectional adjustable slotted cam	141,548
Ellis, C., G. W., and J. D., Box scraper	141,549
Elmer, H. O., Fence post	141,499
Elmer, W., Manufacture of illuminating gas	141,500
Emery and McCollum	141,572
Erbe, B., Reversible knob latch	141,430
Eriksen, J., Baby walker	141,431
Evans and Rawle	141,459
Evans, T. R., Boot and shoe tree and stretcher	141,550
Evenden, J. G., assignee	141,615
Farrel, F., Hoisting apparatus	141,551
Farrington, W., Packing and carrying device for paper folding machines	141,501
Fisch, E. B., & Son, assignees	141,561
Fisher and Burnet	141,542
Fitzgibbons and Herafager	141,439
Fleer and Bellesmre	141,536
Forsyth and Gaealy	141,503
Franklin, J. J., Car-coupling	141,438
Fraser, A. J., Machine for bending shafts	141,552
Freeman, J. D., Ice shaving machine	141,553
Gately, D. C., and J. R. Forsyth, Apparatus for the manufacture of vulcanized rubber belting	141,433
Geraghty, J., Terret and martingale rings	141,502
Giant Powder Company, assignee	141,455
Gillespie, J., assignee	141,553
Gold and Stock Telegraph Company, assignee, (reissue)	5,519
Gold and Stock Telegraph Company, assignee, (reissue)	5,523
Goodyear, J., Machine for winding bobbins	141,434
Goodyear, L., Door check	141,435
Goewey, G., Apparatus for treating and aging spirituous liquors	141,554
Goldman, H., Treating cotton seed oil to render it drying	141,503
Green, H. R., assignee	141,436
Haines, J. W., Silvered glass door knobs	141,504
Hall, C. H., and R. Knott, Glove fastening	141,555
Hardy, D. D., Rotary steam engine	141,436
Harris, S., Weighing scale	141,556
Haskell, H. M., assignee, (reissue)	5,525
Hawthorn, W. A., and E. E. Scott, Window fastener	141,505
Hennion, A. G., Cemented slate roofing	141,437
Herr, A., Middlings purifier	141,557
Hill, A. S., assignee, (reissue)	5,525
Hill, S. G., Elevating and depressing propellers	141,558
Hillerick and Bell	141,417
Holmes, J. A., Casting steel ingots	141,506
Hopkins, J., Animal puke	141,438
Herafager, W. C., and M. Fitzgibbons, Oyster dredge	141,439
Hoyt, A. S., Grain binder	141,507
Hudnut, T., Hominy mill, (reissue)	5,520
Hutchinson, E. L., Corn sheller	141,559
Irwin, D. J., and H. S. Langdon, Brick machine	141,560
Jenks, B. H., Spindle for spinning machines, (reissue)	5,521
Jenks, B. H., Spindle bolster for spinning machines	141,440
Jenks, B. H., Spindle bolster for spinning machines	141,441
Jenson, H., Cover for sewing machine tables	141,561
Jones, J. L., Machine for manufacturing plug tobacco	141,562
Jones, J. L., Machine for cleaning and preparing tobacco leaves	141,563
Karshner, W. W., Cooking stove	141,508
Kavanagh, P., Sheave	141,564
Keiser, L. R., assignee	141,567
Kennedy, J., Trace buckle	141,565
Kingsford, T., Apparatus for the manufacture of starch	141,442
Kirk, P. C., assignee	141,496
Kline, T. D., Railway cattle guard	141,566
Knott and Hall	141,555
Koeser, J. H., Washing machine	141,567
Lahman, J., Thimble skein for vehicle wheels	141,566
Langdon and Irwin	141,560
Lanchaw, D., Bee hive	141,443
Lawrence, W. S., Hemp brake	141,509
Leach, A., Horseshoe	141,509
Lessor, R. J., and J. B. Shambo, Securing wheels to axles	141,570
Letton, R. E., Reed organ	141,510
Letton, R. E., Organ coupler	141,444
Lewis, I. E., Car coupling	141,445
Leyburn, W. C., assignee	141,568
Liedbeck, A., assignee	141,565
Lindsay, J., Carpet stretcher	141,446
Littlejohn, L., Tool for seating bung bushes	141,511
Lock, J., assignee	141,492
Locke, L. M., assignee	141,444
Logue, F. M., Bale band stretcher	141,447
Lunbeck, J. B., Compound for destroying insects, &c	141,512
Marshall and Smith	141,604
Martin, J., and Wilson, G. W., Machine for rossing bark	141,448
Matthews, J., Apparatus for charging liquids with carbonic acid	141,571
McCollum, A. J., and G. D. Emery, Saw swage	141,572
McConnell, W., Sponge cup	141,573
McFarlan, W. W., assignees, (reissue)	5,517
McGinnis, C., and W. Naylor, Smoke burning furnace	141,574
McLaughlin, T. G., Bobbin	141,575
McMillan, A., Sewing machine hemmer	141,576
McNabb, J. A., Door check	141,577
McNeill, T. R., and R. N. Pratt, Steam generator	141,578
Mehn, A., Metallic rope clamp	141,579
Mendham and Chambers	141,489, 141,490
Meyer, G., and J. Dick, Apparatus for pitching casks, &c.	141,449
Meyers, L., Glove fastener	141,580
Meyersberg, A., Match box	141,581
Michtle and Pavonarius	141,588
Miller, N. E., Cider mill	141,582
Mitchell, J. J., Shovel plow	141,583
Mofit, J., assignee	141,585
Montague, H. P., Printer's furniture	141,450
Moore, J. A., Apparatus for sausage stuffing, &c	141,451
Morrison, S. G., Coal stove grate	141,452
Mosher, A., Portable fence	141,584
Munde, P., Folding table	141,453
Nash, S., Elevator for passengers and freight	141,513
Naylor, J. H., Check valve	141,454
Naylor and McGinnis	141,574
Nobel, A., Explosive compound	141,455
Nolan, P. W., Folding chair	141,456
Nolan, P. W., Folding chair	141,457
Norrbin, J. H., and J. Ohlsson, Explosive compound	141,565
Noyes, H. H., assignee, (reissue)	5,525
Ohlsson and Norrbin	141,565

Painter, J. R., Magazine for stoves 141,586
Painter, O., & Co., assignees 141,586
Painter, W., Pump valve 141,587
Paine, T. C. M., assignee, (reissue) 5,524
Pavesarics, S., and C. C. Michtle, Fish trap 141,588
Peckham, W., Railway rail 141,515
Pierce, J. D., Iron bridge 141,458
Plate, H., Billiard cue, (reissue) 5,522
Pope, F. L., and T. A. Edison, Printing telegraph, (reissue) 5,523
Pratt and McNeill 141,578
Prouty, H. W., Toy money box 141,516
Race and Wright 141,478
Rawle, G., and W. N. Evans, Manufacture of leather 141,459
Redfern, E., Loom shedding mechanism 141,589
Reed, H. O., Screw cutting machine 141,460
Reese, A. R., assignee 141,597
Remker, L., Device for locking drawers 141,461
Richardson, J. W., assignee 141,414
Riddel, T. E., assignee 141,414
Rider, J., Magazine fire arm 141,590
Riviere and Andrews 141,533
Robbins, R. B., Cultivator 141,462
Remadka, A. V., Trunk lid support 141,591
Remadka Brothers, assignees 141,591
Root, J. R., Steam generator, (reissue) 5,524
Root, J. R., Pump for oil wells, (reissue) 5,5 5
Root, J. R., Feed water regulator 141,592
Root, J. R., Machine for chucking and revolving tubes, &c. 141,593
Root, J. R., Boiler furnace 141,594
Rosebrook, L. R., Vehicle running gear 141,463
Rote, D. J., assignee 141,608
Roy, F., Sugar cane coverer 141,464
Rummer, H. S, Vent gimlet 141,465
Sadler, S. J., and H. Volmar, Feed water heater and purifier 141,517
Scott, A., Corn harvester 141,466
Scott and Hawthorn 141,595
Sears, J., Spice box 141,595
Seib, J. F., Veneer cutter 141,596
Shambo and Lesser 141,570
Sharp, R., Composition filling for painters 141,518
Shireman, J. H., Harvester 141,597
Siebenthal, A., Steering apparatus for vessels 141,598
Simmons, A. J., Valve for steam and vacuum pumps 141,599
Sink, J. J., Combined fountain and pump 141,600
Sisson, G. B., Frame for vertical engines 141,467
Skinner, J. L., Damper and ventilator 141,601
Sleight, T., Seal lock 141,519
Smillie, R., and C. H. Brooks, End gate for wagons 141,602
Smith, D., and J. C. Marshall, Breech loading fire arm 141,603
Smith, J. A., Reed organ 141,468
Smith, J. A., Organ stop action 141,469
Smith, J. G., Railway telegraph 141,604
Smith, R. A., Brick yard shed 141,520
Snedeker, D., Fruit package 141,605
Sneden, S., Boat detaching apparatus 141,470
Spaulding, E. F., Stop cock 141,471
Springer, H., Fertilizing attachment to seed sowers 141,606
Stanley Rule and Level Company, assignee 141,475
Starr, J. W., Valve register 141,521
Stephens, H. C., Seeding machine 141,472
Steward, A., Thread show case, (reissue) 5,526
Tapley, D. J., Fire extinguisher 141,607
Temple, J., Car brake 141,608
Terry and Weed 141,522
Thompson, A. S., Paint brush 141,523
Thompson, N. S., Buffing mandrel 141,523
Thompson, S. R., Bushing for faucet holes 141,473
Toulmin, M., Car starter for street railways 141,474
Tower, A. H., assignee 141,425
Trust, J. A., Carpenter's gage 141,475
Turner, G. B., Grain cleaning separator 141,524
Vail, W. A., Life boat 141,609
Van Horwerden, C., Composition for water-proofing wall paper 141,525
Van Wyck, C., assignee 141,445
Vanaly, L., assignee 141,522
Verill, W., Threshing machine 141,596
Volmar and Sadler 141,517
Vose, H., and E. P. Brandt, Window mirror 141,476
Wakefield, S. W., Wrench 141,477
Walker, W., Sewing machine plaiting attachment 141,610
Walker, W. Y., Mowing machine 141,611
Waltz, M., Chuck for holding pipe fittings 141,612
Watkins, E. T., assignee 141,543
Way, T. R., Milestone plok 141,613
Welch, T., Straw cutter 141,527
Weisker, B., Oscillating berth for vessels 141,614
Williams, E. J., Window screen and shutter, (reissue) 5,527
Williams, E. J., Blind slat operator, (reissue) 5,528
Williams, E. N., assignee 141,492
Wilson and Martin 141,448
Wilson, F. C., Oil can 141,615
Wolf, A. N., Water wheel 141,616
Wolford, J., and R. Conner, Pump 141,514
Wood, S. R., W. S., and R. T. H., and A. W. Terry, Flooring clamp 141,528
Wooster, G. H., assignee 141,610
Wright, H. W., Alloy 141,529
Wright, H. W., Alloy of nickel, zinc, and copper 141,530
Wright, R., and J. M. Rose, Chimney or globe holder 141,478
Yore, F., assignee 141,558
Young, P. W., Seed dropper, (reissue) 5,529
Zeah, E., Spark arrester 141,531

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks) 6,500
SEWING-MACHINES and attachments 2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes 4,000
PRINTING; including presses, type, and printers' furniture. 2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles 1,200
FELTING and HATS; including caps, bonnets, flock, &c. 1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments) 1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs 1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 200 of drawings; total of each volume about 1,000 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,000 pages per month: 9,000 pages of specifications, 3,120 pages of drawings—12,720 pages.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited and the invention therein described will become public property, as against the applicant thereafter, unless he shall make a new application within two years from the date of notice of the original allowance.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 7. TUESDAY, AUGUST 12, 1873. PRICE { $5,00 per year—single. $4,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

JOHN B. WICKERSHAM.—*Extension.*

[*In the matter of the application of John B. Wickersham for the extension of Letters Patent No. 25,166, dated August 16, 1859, granted to him and Henry Jenkins, since deceased, as joint inventors of* IRON FENCE.—*Decided August* 11, 1873.]

The extension of a patent issued to two joint inventors will be denied if one of them has since deceased, and his representative not only refuses to join in the application, but protests against its being allowed.

A patent issued to two joint inventors cannot, it seems, be extended upon the several application of one of them.

LEGGETT, *Commissioner:*

This is a case where one of the joint inventors petitions for the extension of a patent, while the representative of the other not only refuses to join in the petition, but protests against the extension.

As to the right of the survivor to make this petition alone and receive the extension, the two members of the Board of Appeals are divided; consequently it becomes the duty of the Commissioner, notwithstanding the case has been referred to the Board for report, to examine this question himself.

Section 63 of the patent act provides that the patentee, meaning the inventor, shall petition for extension when the same is desired. The attorney for the applicant rests upon the use of the singular here as authority for one joint inventor appearing in the application without the other. I cannot see the force of this argument. In a case taken to the courts, as reported in Law's Digest, page 453, the judge used this language: "One of two or more joint inventors is not *the* inventor according to the statute." In legal signification, John B. Wickersham is no more the patentee or inventor than would be John Doe or Richard Roe, and I cannot see how he has any more right to make an application for an extension in this case than any other person would have.

It may be a hardship in Mr. Wickersham's case, but it is one of those hardships to which joint ownership is liable, and from which it is not always the province of the law to grant full relief.

Mrs. Jenkins, administratrix of Henry Jenkins, evidently regards it as her interest to object to this extension. She has a reason, it seems, for so doing. Her husband was the sole inventor of an analogous invention which probably is deemed by her as sufficiently covering the matter of this patent to make it for her interest that this patent should be out of the way. She has a right in this case, as elsewhere, to consult her own interest, and certainly, in the absence of a law providing for the extension of a patent upon the application of one joint inventor, the Government would not be warranted in forcing upon her an extension which she does not desire.

For these reasons, if there were no others, the extension must be refused.

BARKER AND MACK.—*Appeal.*

[*Appeal from the decision of the Primary Examiner in the matter of the application of George E. Barker and Stephen F. Mack for* FIRE EXTINGUISHER.—*Decided August* 7, 1873.]

PRACTICE UNDER RULE 44.

There is no legitimate combination between the reservoir of a fire-extinguisher and the fluid it is intended to contain, unless they are especially adapted to each other.

Unless the Examiner in charge has acted upon an amendment, no appeal can be taken from him to the Commissioner under the 44th rule.

Upon an application for the reissue of a patent for a fire-extinguisher no amendment should be allowed which introduces the formulas for preparing the fluid to be used when there was no indication of the formulas in the original.

A claim for a peculiar fluid to be used in a fire-extinguisher cannot be embraced in a patent for the instrument, but it must be covered by a separate patent.

LEGGETT, *Commissioner:*

This matter comes up irregularly, as it purports to be an appeal under rule 44, and at the same time it contains an amendment.

As the Commissioner cannot act upon the amendments until they have been acted upon and rejected by

the Examiner, it is difficult to see how he can act upon the appeal at all.

The applicant should first submit his amendments to the Examiner for action, and after he has become satisfied himself with the form of his claims, he may take an interlocutory appeal to the Commissioner in person if the Examiner, for any reason, declines to examine the case upon its merits.

As he has not refused to examine the claims set forth in the amendment of July 29, no appeal could properly lie. I have, however, looked into the substance and form of the claims in this amendment, and I find that the same objections which the Examiner raised to the previous claims would be equally valid against these. I have no doubt whatever that the Examiner was correct in refusing to admit the amendment which introduced the formulas for making the fluid, as no indication of such formulas was in the original application. It is certainly new matter, and should be stricken out. If, however, these formulas had been found in the original application, yet as they are entirely distinct from the mechanism claimed, the Examiner should have required their erasure from the application. If they were new the applicant should have been required to divide and claim them separately.

In reference to the combination claims, the Examiner is correct. There is not the remotest quality of patentable combination between the fluid in this case and the reservoir in which it is placed. The fact that two things may come in contact and be used together does not necessarily constitute a patentable combination. This has been decided over and over again so often by commissioners and courts that discussion upon it is not necessary. The machine for throwing a fluid upon a fire, if new, would be patentable, but to make a combination between the mechanism and some particular kind of fluid would be impossible, unless the machine was especially adapted to that special fluid and the fluid to the machine, and even then the propriety of a combination claim would be very doubtful.

The action of the Examiner is fully sustained. Instead of being open to criticism, as made by the applicant's attorney, his action in the case indicates thorough intelligence upon the subject-matter of the application, a very just and appreciative examination of the case, a fair treatment of the application in all its stages, and a very commendable amount of patience with the applicant's attorney.

B. S. BAKER.—*Appeal.*

[*Appeal from the Primary Examiner in the matter of the application of B. S. Baker for a patent for* WEINGERS.—*Decided August* 14, 1873.]

A claim should not be allowed for a combination of elements, no one of which is novel in itself or produces any new effect upon the action of either of the others.

To render a combination legitimate the constituent parts must produce some new operation in consequence of their being so arranged together, or some one of them must be novel in itself, and render the whole capable of producing a new result.

HODGES, *Acting Commissioner:*

Some confusion has arisen in this case in consequence of not keeping in view the distinction between the two classes of combinations which are now sanctioned by law. In the one long recognized the elements may be every one of them old and well known, but as they are joined together they operate mutually upon one another, and each one modifies the action of the rest so that a result is produced which was unknown before. To render this combination legitimate, it is essential that each constituent part should perform some new function of which it was previously incapable.

The other combination is where several devices are brought together, but produces no new operation by that means, yet the combination embraces some element which is new in itself and gives the whole a new effect, and it is thereby rendered patentable. The patentability of such a combination has only become recognized within a few years, but now seems well established. (*Lee* vs. *Blandy*, 2 Fish., 89, 93; *Sugar Refinery* vs. *Mathieson*, Id. 600, 605; *Gallahue* vs. *Butterfield*, 2 OFF. GAZ., 645, 647.)

There is no such co-operation or mutual effect of the several mechanisms specified in the several claims in this case as renders any combination of them legitimate. There is none between the roller-frame and its parts on the one hand, and the table and its parts on the other. The table would operate with any other frame just as it does with this, and the roller-frame with any other table as with this. The same remark will apply to the drip-board which is embraced in several claims, and which will serve just as well in any other roller-frame or on any other table. If these several devices are old, not one of the claims covers a patentable combination.

If any of the elements are new, however, that will require a different consideration. From the correspondence it may be inferred that the Examiner in charge was disposed, for instance, to concede the novelty of the roller-frame. If indeed he finds that to be new, then all the claims but the fourth are patentable, since they all embrace it. They are needlessly multiplied, and some of them should be stricken out. The fourth claim is entirely indefensible, unless the drip-board or table is new, since the peculiar roller-frame described is not included.

As the ultimate disposition of the several claims depends on the novelty of the elements enumerated, which has not been determined, the case is remanded to the Primary Examiner, who will be governed by the principles herein asserted. He will allow no claims which do not embrace some new feature, since the combinations possess no merit as such, and he will restrict them in number at his discretion. As there is not probably more than one new feature in the machine, no occasion can well arise for requiring a division of the application.

MARCUS P. NORTON.—*Extension.*

[*In the matter of the application of Marcus P. Norton for the extension of Letters Patent No.* 25,036, *granted to him August* 2, 1859, *for a* POSTMARKING-STAMP.—*Decided August* 7, 1873.]

If an invention is an obvious one and sure to be devised in a short time, the first one to produce it does not seem to be entitled to the same remuneration for it, however great the benefits resulting from it, as the inventor of an improvement less likely to be discovered.

An applicant for an extension will not be required to erase from his specification the description of an invention which he uses but does not claim, at the demand of a remonstrant who has a patent for the invention, and who apprehends that the applicant may set up a title to it on a reissue. The applicant has a right to have the question tried on an interference.

REPORT OF THE BOARD OF EXAMINERS-IN-CHIEF—PRACTICE UNDER SECTION 10, ACT OF 1871.

"*To the Hon. Commissioner of Patents:*

"We respectfully report as follows, viz.:

"The report of the Examiner establishes the novelty of the invention satisfactorily, and the references which have been given by the contestants on this point entirely fail of impeaching it.

"It consists merely in so attaching a canceling-stamp to a hand post-office stamp that the operator can with a single stroke deface the stamp by which the postage is paid, and mark the letter with the name of the office and date. Both the canceling-stamp and marking-stamp are old, and it would seem to be an achievement of very slight merit to unite them. From the correspondence it appears, nevertheless, that the Government officials had been for some time engaged in finding some instrument that would effect such a result, and did not succeed until the one in question was produced. It was immediately adopted and put in extensive use in the post-offices throughout the country. So great a diminution of labor was thereby effected that the saving to the Government is estimated by its officers at several hundred thousand dollars. Its value and importance are fully made out as abundantly sufficient to warrant the extension. Perhaps one consideration should be brought to notice in this connection. The invention is so obvious a one, and was so sure to come to light soon, that the one who first happened to produce it should not have the same credit or receive the same reward as if it had been more difficult to devise. This point is not deemed very material in this case after all, as the applicant has been insufficiently remunerated, even on the supposition that his discovery does not involve much ingenuity.

"There can be no question as to his diligence. The Government was his only customer. They took it up, and the extent to which it was introduced was entirely at the control of the officers, who in fact employed it largely.

"The opposition made by T. J. W. Robertson is founded entirely upon the apprehension that as Norton's specification describes quite nearly a marking-stamp for which he has a patent, Norton may hereafter endeavor to claim it upon a reissue of the extended patent and involve him in litigation. If that part of the specification were erased, he is willing to withdraw his opposition. We apprehend that this is not the proper occasion to try the question who is the inventor of the stamp, neither should Norton be required to surrender his claim without such a trial. Even if the amendment he proposes were made, it would not give the remonstrant effectual relief. Nothing which can be done now can prevent Norton from seeking a reissue upon the model or drawings of his case, or even the specification as originally presented. The extension should not be refused upon this ground.

"The interest of the applicant in his invention has been assigned and reassigned a number of times, and to what extent the renewed term is embraced is not easy to settle, nor in whom the title now is. But at the hearing an assignment from Ransfords and Low of one-half their interest in the renewed term to the petitioner was filed and recorded. If the former assignments embraced the renewed term, they were the undoubted owners of one-half of it, so that the applicant's interest in it becomes clear. There are other conveyances of an interest in it for the benefit of his family, but the effect of these depends on circumstances which are not known, and they are therefore passed over.

"Upon a consideration of the entire case we recommend the extension.

"S. H. HODGES,
"R. L. B. CLARKE,
"*Examiners-in-Chief.*"

The foregoing report is approved, and the patent will be extended.

M. D. LEGGETT,
Commissioner of Patents.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

25,395.—Heels for Boots and Shoes.—Granted to SIMEON DODGE, Jr., and BENJAMIN POTTER, Jr., September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,434.—Cotton-Scrapers.—Granted to JONATHAN H. MITCHELL, September 13, 1859. Application filed June 10, 1873. Hearing August 27, 1873.

25,442.—Boilers and Steamers.—Granted to DANIEL R. PRENDLE, September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,443.—Seeding-Machines.—Granted to SILAS G. RANDALL, September 13, 1859; reissued May 25, 1869. Application filed June 11, 1873. Hearing August 27, 1873.

25,473.—Scales.—Granted to ANDREW TURNBULL, September 13, 1859. Application filed May 31, 1873. Hearing August 27, 1873.

25,484.—Grain-Separators.—Granted to JONATHAN L. BOOTH, September 20, 1859; reissued September 25, 1860, and November 29, 1864. Application filed June 14, 1873. Hearing September 3, 1873.

25,488.—Hydraulic Presses.—Granted to M. H. CLARK, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,499.—Railroad-Car Seat.—Granted to ELI WHEELER, September 20, 1859. Application filed June 17, 1873. Hearing September, 3, 1873.

25,506.—Lamps.—Granted to HALVOR HALVORSON, September 20, 1859; reissued June 6 and December 5, 1871. Application filed June 6, 1873. Hearing September 3, 1873.

25,508.—Tailors' Shears.—Granted to ROCHUS HERRICH, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,519.—Bung-Hole Borer and Reamer.—Granted to JOSIAH KIRBY, September 20, 1859. Application filed June 19, 1873. Hearing September 3, 1873.

25,544.—Try-Cocks for Steam-Boilers.—Granted to JOHN F. COOK, September 20, 1859. Application filed June 10, 1873. Hearing September 3, 1873.

25,565.—Rolling-Mills.—Granted to JOHN and GEORGE WHITE, September 27, 1859. Application filed June 27, 1873. Hearing September 10, 1873.

25,569.—Bedstead-Slats.—Granted to TYLER HOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,570.—Mode of Arranging Couches in Railroad Cars.—Granted to EDWARD C. KNIGHT, September 27, 1859. Application filed May 31, 1873. Hearing September 10, 1873.

25,572.—Holding Water-Traps.—Granted to JAMES ALLEN LOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,593.—Burglar-Alarms.—Granted to ABBOTT Q. ROSS, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,668.—Steam Punching-Machines.—Granted to JOHN STARROW, September 27, 1859. Application filed June 26, 1873. Hearing September 16, 1873.

25,649.—Steam-Boilers.—Granted to JOSEPH HARRISON, Jr. October 4, 1859. Application filed June 30, 1873. Hearing September 17, 1873.

25,662.—Construction of Prisms.—Granted to EDWIN MAY, October 4, 1859. Application filed June 23, 1873. Hearing September 17, 1873.

25,673.—Machines for Lasting Boots and Shoes.—Granted to JAMES PUMERTON, October 4, 1859; reissued January 6, 1863. Application filed July 5, 1873. Hearing September 17, 1873.

25,683.—Hydrants.—Granted to CHARLES L. STACY, October 4, 1859; reissued June 6, 1865. Application filed June 28, 1873. Hearing September 17, 1873.

25,692.—Sewing-Machines.—Granted to KASIMIR VOGEL, October 4, 1859; reissued November 1, 1864. Application filed July 5, 1873. Hearing September 17, 1873.

25,701.—Skeleton Skirt.—Granted to JAMES DRAPER, October 4, 1859; reissued August 1, 1865. Application filed July 2, 1873. Hearing September 17, 1873.

25,726.—Hand-Machine for Wiring Blind-Rods.—Granted to BIRAM C. DAVIS, October 11, 1859. Application filed July 12, 1873. Hearing September 24, 1873.

25,733.—Double-Friction Couplings.—Granted to JOSHUA HENDY, October 11, 1859; reissued March 25, 1873. Application filed July 7, 1873. Hearing September 24, 1873.

25,747.—Method of Combining Emery with Caoutchouc.—Granted to THOMAS J. MAYALL, October 11, 1859. Application filed June 16, 1873. Hearing September 24, 1873.

25,767.—Cutting and Panning Cakes.—Granted to JOHN H. SHROTS, October 11, 1859. Application filed July 11, 1873. Hearing September 24, 1873.

25,784.—Mode of Manufacturing Barrels, &c.—Granted to GEORGE W. BARKER, October 11, 1859. Application filed July 8, 1873. Hearing September 24, 1873.

25,796.—Jacquard Machines.—Granted to AVERY BARRETT, October 18, 1859. Application filed June 30, 1873. Hearing October 1, 1873.

25,797.—Harvesters.—Granted to EPHRAIM BALL, October 18, 1859. Application filed July 18, 1873. Hearing October 1, 1873.

25,807.—Hem-Folders.—Granted to LEVERETT CLARK, October 18, 1859. Application filed July 19, 1873. Hearing October 1, 1873.

25,814.—Sleeping-Cars.—Granted to JOHN DANNER, October 18, 1859. Application filed July 12, 1873. Hearing October 1, 1873.

25,843.—Cultivators.—Granted to THOMAS MCQUISTON, October 18, 1859; reissued May 16, 1871. Application filed July 11, 1873. Hearing October 1, 1873.

25,869.—Weeding-Hoes.—Granted to JAMES M. ADAMS, October 18, 1859. Application filed July 18, 1873. Hearing October 1, 1873.

25,867.—Machines for Covering Saddle-Trees.—Granted to JOHN MACLURE, October 18, 1859. Application filed July 14, 1873. Hearing October 1, 1873.

25,874.—Browning-Machines.—Granted to GEORGE H. BABCOCK, October 25, 1859. Application filed July 25, 1873. Hearing October 8, 1873.

25,883.—Construction of Glass Coffins.—Granted to JOHN R. CARSON, October 25, 1859. Application filed July 23, 1873. Hearing October 8, 1873.

25,936.—Cut-Off Valves of Steam-Engines.—Granted to EDWARD R. ARNOLD, November 1, 1859. Application filed August 1, 1873. Hearing October 15, 1873.

25,978.—Tackle-Blocks.—Granted to ISAAC E. PALMER, November 1, 1859; reissued September 8, 1863, April 11, 1865, and December 8, 1868. Application filed July 26, 1873. Hearing October 15, 1873.

25,984.—Bit-Stocks.—Granted to NELSON SPOFFORD, November 1, 1859; reissued April 23, 1867. Application filed July 28, 1873. Hearing October 15, 1873.

26,003.—Telegraphic Machines.—Granted to GEORGE M. PHELPS, November 1, 1859. Application filed July 30, 1873. Hearing October 15, 1873.

26,028.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Hearing October 22, 1873.

26,030.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Hearing October 22, 1873.

26,060.—Machines for Making Box-Joints.—Granted to JAMES STIMPSON, November 8, 1859. Application filed August 2, 1873. Hearing October 22, 1873.

26,069.—Sleeping-Cars.—Granted to JOHN DANNER, November 8, 1859. Application filed August 4, 1873. Hearing October 22, 1873.

26,087.—Fastening Metal Hoops on Cotton-Bales.—Granted to JOHN T. BUTLER, November 15, 1859. Application filed August 7, 1873. Hearing October 29, 1873.

26,090.—Machines for Folding Paper.—Granted to CYRUS CHAMBERS, Jr., November 15, 1859; and reissued August 12, 1873. Application filed August 14, 1873. Hearing October 29, 1873.

26,097.—Electro-Magnetic Telegraphs.—Granted to MOSES G. FARMER, November 15, 1859; and reissued December 10, 1872. Application filed August 16, 1873. Hearing October 29, 1873.

26,128.—Billiard-Table Cushions.—Granted to GEORGE D. SHARP, November 15, 1859; and reissued April 8, 1873. Application filed August 16, 1873. Hearing October 29, 1873.

26,135.—Portable Pumps.—Granted to WILLIAM T. VAIL, November 15, 1859; reissued February 25, 1861. Application filed August 11, 1873. Hearing October 29, 1873.

26,136.—Mode of Advertising.—Granted to EDWARD WEBB, November 15, 1859. Application filed August 18, 1873. Hearing October 29, 1873.

26,139.—Pumps.—Granted to WILLIAM WRIGHT, November 15, 1859. Application filed August 14, 1873. Hearing October 29, 1873.

26,145.—Cocks for Water-Closets.—Granted to DARIUS WELLINGTON, November 15, 1859. Application filed August 11, 1873. Hearing October 29, 1873.

26,147.—Machine for Bundling Kindling-Wood.—Granted to WILLIAM L. WILLIAMS, November 15, 1859; and reissued October 4, 1870. Application filed August 14, 1873. Hearing October 29, 1873.

26,177.—Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 18, 1873. Hearing November 5, 1873.

26,178.—Making Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 18, 1873. Hearing November 5, 1873.

26,243.—Water-Closet Basins.—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 10, 1873. Hearing November 12, 1873.

26,276.—Manufacture of Rubber Hose.—Granted to THOMAS J. MAYALL, November 29, 1859; and reissued October 22, 1872. Application filed August 19, 1873. Hearing November 12, 1873.

26,321.—Molding for Metal Casting.—Granted to JOHN P. BROADMEADOW, November 29, 1859. Application filed August 15, 1873. Hearing November 12, 1873.

27,339.—Manufacture of Gun-Barrels.—Granted to JAMES H. BURTON, March 29, 1860, and antedated to September 29, 1859; reissued December 26, 1871. Application filed July 1, 1873. Hearing September 16, 1873.

EXTENSIONS GRANTED.

25,115.—Improvement in Self-Acting Wagon-Brakes, granted to BENJAMIN S. HEALEY, August 16, 1859.

Claim.—1. The combination of a forked pole, arranged substantially as described, with the hounds, whereby the pole is free to slide in its forks and operate the brakes without moving the forks backward in the hounds.

2. In combination with brakes pivoted to a fixed bar, as described, the brake-blocks, arranged and connected with the brakes, as set forth, whereby the friction of the wheels on the blocks draws the brakes toward and causes them to press with greater force against the wheels.

25,143.—Improvement in Weighing-Scales, granted to FRANCIS M. STRONG and THOMAS ROSS, August 16, 1859.

Claim.—1. The arrangement of the bars C D of the larger platform E, as shown, to wit, one lever crossing the other at about right angles, so that the knife-edged bearings *b* of the foot-pieces *c* of one lever will be at right angles to those of the other, and the lateral movement of the foot-pieces on the bearings prevented.

2. Attaching the arms E E of the levers C D, either separately or when connected, direct to the beam G, and having the bar I of the scoop or smaller platform H rest on knife-edged bearings *h h* on the beam, substantially as and for the purpose set forth.

25,149.—Improvement in Blanks for Shoe-Pegs, granted to B. F. STUYVESANT, August 16, 1859.

Claim.—A blank or strip of shoe-pegs cut around the log, substantially as described.

25,167.—Improved Mode of Lighting Gas by Electricity, granted to ARCHELAUS WILSON, August 16, 1859, (JULIA H. WILSON, administratrix.)

Claim.—1. Combining with a gas or other burner metallic points approaching but not coming in contact with each other, substantially as described, in combination with the inductive apparatus, substantially as described, for the purpose of effecting ignition by means of the electric discharge or spark, as specified.

2. Combining with the galvanic battery an inductive apparatus or coil metallic points and an electro-magnet, for the purposes specified, and substantially as herein described.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date August 12, 1873.]

6,798.—Stamp Pad and Rack.—GEORGE K. COOK, New York, N. Y. Application filed June 17, 1873.

6,799.—Cake-Holders.—GEORGE GILL, Taunton, Mass., assignor to REED and BARTON, same place. Application filed June 25, 1873.

6,800.—Clock-Cases.—JOHN F. MANN and HENRY MANN, Brooklyn, E. D., N. Y. Application filed July 17, 1873.

6,801.—Advertising-Desk.—CHARLES W. ARMSTRONG, Detroit, Mich. Application filed June 27, 1873.

6,802.—Tea-Service.—GEORGE GILL, Taunton, Mass., assignor to REED & BARTON, same place. Application filed June 25, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date August 12, 1873.]

1,401.—Patterns of Paper, Cloth, &c.—THE DOMESTIC SEWING-MACHINE COMPANY, New York, N. Y. Application filed July 29, 1873.

"'Domestic,' in conjunction with the words 'Paper Patterns,' or 'Patterns.'"

1,403.—Dress-Patterns.—THE DOMESTIC SEWING-MACHINE COMPANY, New York, N. Y. Application filed July 29, 1873.

"'Paper Fashions.'"

1,403.—Medicine.—T. S. FELLOWS and J. R. SMITH, Wells, Minn. Application filed July 5, 1873.

"'Gopher State Oil.'"

1,404.—Paints and Colors.—MCCLOSKEY, BRO. & Co., Philadelphia, Pa. Application filed July 31, 1873.

"a human arm, the hand of which grasps a brush."

1,405.—Alpacas and Mohairs.—MOORE, TINGUE & Co., New York, N. Y. Application filed March 8, 1873.

"three crows perched on the branches of a tree, printed in black ink."

1,406.—Metallic Paint.—PRINCE'S METALLIC PAINT COMPANY, New York, N. Y. Application filed July 28, 1873.

"an eagle standing on a stump inclosed by a triangle of wide bars, whereon the words 'Eagle Metallic Paint' are printed; also, three stars, one near the apex of each angle."

1,407.—Shoes.—GEORGE A. REYNOLDS, Utica, N. Y. Application filed June 30, 1873.

"the letters 'G. A. R.' and the word 'Best,' below such monogram."

1,408.—Hams, Shoulders, Bacon, &c.—WILLIAM J. RIEMAN & SON, Baltimore, Md. Application filed June 16, 1873.

"an orange, with a short stem and leaves attached."

1,409.—Medicated Liquor.—MICHEL VERGNOLE, New Orleans, La. Application filed April 14, 1873.

"'Bitter des Arabes. Perfectionné de sidi Mahomet, (Ulttes,) Breveté, S. G. D. G. Fleurat, Proprietor. Transferred to M. Vergnole.'"

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date August 12, 1873.]

ORIGINAL PATENTS.

141,617.—Ventilating Railroad Cars.—JOSHUA G. ALLEN, Philadelphia, Pa. Application filed October 11, 1872.

Claim.—1. The exhaust-flue A extending horizontally along the side of the car, above the floor, and provided with an upright portion extending through the roof, when provided with the series of openings opposite or between the seats, as shown and described.

2. In combination with the horizontal exhaust-flue A, arranged as shown and described, the lateral branches *c* extending lengthwise against the under side of the seats, and opening into the central aisle near the floor, as shown and described.

3. The combination of the exhaust-flue A and the hot-air flue B, when arranged parallel with each other along the side of the car, above the floor, and provided with the series of openings, as and for the purposes set forth.

4. The combination of the exhaust flues *c* extending lengthwise under the car-seats with the inverted troughs *d* secured to their under sides or immediately below them, to receive the incoming heated air.

141,618.—Trussed-Spring Bolster for Railroad Cars. JAMES ANDERSON, Wilmington, N. C., assignor of one-half his right to W. J. CALAIS and WM. H. JAMES, same place. Application filed May 1, 1873.

The body-bolster yields vertically beneath the car-frame.

Claim.—In combination with the trussed-spring car-body bolster B, the springs A, or their equivalents, the spring-seats *g*, and stirrups *f*, as and for the purpose set forth.

141,619.—Oil-Can.—JAMES E. AULD, Buffalo, N. Y. Application filed January 22, 1873.

Claim.—The combination of the oiler A having the movable spout B, the lamp C, and cover D, constructed substantially as hereinbefore set forth.

141,620.—Distributing Apparatus for Garden-Hose, Syringes, &c.—SAMUEL BARTON, Jr., London, England. Application filed September 6, 1872.

Claim.—A revolving socket or circular box fitted with different jets and arranged so as to turn partially on a fixed conical or other plug on the end of the hand-pipe, substantially as hereinbefore described.

141,621.—Heating-Drum.—JOSEPH R. BARTLETT, Boston, Mass. Application filed May 3, 1873.

Claim.—In combination with a range or its equivalent, the air-chamber *d*, with its cold-air inlet *e*, hot-air pipe *f*, and the bent pipe *g g g* leading from the smoke-stack *a* to the chimney *h*, and provided with the dampers *i*, *k*, and *l*, as and for the purpose set forth.

141,622.—Baling-Press.—HENRY W. BAUMANN, Memphis, Tenn. Application filed August 10, 1872.

Claim.—1. The combination, in a baling-press, of a follower, toggle-levers, a right-and-left-hand screw, the cross-head, and a platform suspended from the cross-head so that the operator can travel up or down with the screw and operate it with greater facility, substantially as described.

2. The combination, in a baling-press, of a right-and-left-hand screw, the double toggle-levers, the follower, and the slotted guide attached at its base rigidly to the follower, and guided trim by an elongated pivot of the toggle-levers, which it straddles, all these parts being constructed and combined to operate substantially as described.

141,623.—Tucker for Sewing-Machines.—JOSEPH H. BEAN, Cincinnati, Ohio. Application filed March 25, 1873.

The tuck last sewn is received and guided in the vertical space formed by bending the end of the gage-plate. This plate is adjustable on the base-plate, provided with two slots to adapt it to various machines.

Claim.—The tucker described, consisting of the plate A with slots *a a*, flange a^2, and extension a^3, and gage-plate B with bent portion *b*, combined as described, for the purpose set forth.

141,624.—Magazine Fire-Arm.—Joseph H. Bean, Cincinnati, Ohio. Application filed December 27, 1872.

Cartridge-carrier block drawn down by slotted link, sliding bar and finger-piece thrown up in the act of cocking by the tumbler, acting as a cam, against the sliding bar and securely held in place by a vertical stud or brace.

1. The combination of the cartridge carrier-block, constructed substantially as described, with the intermediate mechanism for drawing it down and the independent mechanism for moving it up, substantially as described.

2. The combination of the block C, the slotted lever *c*, connecting-rod c^2, and supporting-block D, as described.

141,625.—Mode of Making Axle-Clips.—Henry M. Bercher, West Meriden, Conn. Application filed March 3, 1873.

Dies successively reduce a short section of a flat rectangular bar of metal to the form of a finished clip.

Claim.—The process herein described for forging coach-axle clips, which consists in reducing the metal in the manner described into the succession of forms herein set forth.

141,626.—Tucker for Sewing-Machines.—Francis W. Brown, Cincinnati, Ohio. Application filed July 19, 1873.

Improvement on patent No. 132,235. The folding hook that receives and guides the edge of the tuck being stitched is formed and projects from near the center of the adjustable plate. The upper plate with hook at outer end guides the tuck previously sewn, and both plates are sustained above the cloth-plate by the tucker-plate.

Claim.—1. The main tucker-plate A, composed of the elevated plate *a'* and holding-plate *a* provided with slot *a a'*, and constructed as and for the purpose herein set forth.

2. The adjustable plate C C′ provided with the folding hook *c*, and constructed substantially as herein set forth.

3. The plate C C′ *c*, in combination with the main slotted plate A, substantially as herein set forth.

4. The combination of plate A with the plates B and C C′ *c*, constructed substantially as herein set forth.

141,627.—Platform-Scale.—Joseph Betson, Quincy, Ill. Application filed April 11, 1873.

The double arms of a transmitting-lever beneath the platform are made adjustable with reference to each other by means of a slot and screw-bolts.

Claim.—The transmitting-lever F, constructed substantially as described, in combination with the arm F′, when adjustable with relation to each other, by means of the slot f^1 and bolts f^2, substantially as and for the purpose specified.

141,628.—Stopper for Bottles Containing Inflammable Liquids, &c.—Louis G. Chaput, New York, N. Y., assignor to R. Howe & Co., same place. Application filed June 11, 1873.

Claim.—The vessel A having a screw-neck to receive the nipple B having a conical mouth-piece, the upper thread or terminus of the screw-neck forming a seat for the spring D, as shown, in combination with each other and with the valve C having the seat B and nipple *c*, all constructed and arranged as herein shown, for the purpose specified.

141,629.—Machine for Punching Metal.—John Clark, Haverstraw, N. Y. Application filed March 28, 1873.

Claim.—1. In a machine for punching or perforating, the combination of the device C for holding the punches, the punches *p*, and the wedge-shaped raising and lowering apparatus described.

2. The improved machine described for punching or perforating, having a frame, A, die-plate E, punch-guide D, punch-lifter C, punches *p*, and the wedge-shaped raising and lowering device with its handle, substantially as described, and for the purposes set forth.

141,630.—Self-Closing Cock.—Mifford S. Clark, New York, N. Y., assignor to Charles Harrison, same place. Application filed April 24, 1873.

Water flows into the inner chamber through depressions in the plug. As the plug enters said chamber again the egress is stopped, and the water is forced out of the chamber through a small opening which allows the valve to close slowly.

Claim.—1. In a self-closing cock, the inner cylinder *a*, provided with the lateral aperture *f* and with the reciprocating piston or plunger *c*, and arranged in relation to the valve-shell X, substantially in the manner described, and for the purpose set forth.

2. The combination of the lateral opening *f*, the annular groove f^1, and the outlet f^2 with the cylinder *a*, the reciprocating piston or plug *c*, and the packing-ring *b*, substantially as described.

3. The partly tapered or corrugated plug *c*, in combination with the variable chamber of a self-closing cock, substantially as described.

141,631.—Life-Preserving Garment.—Elizabeth R. Cogswell, New York, N. Y. Application filed June 11, 1873.

The flaps *d*, stuffed with cork or its equivalent, are flexibly connected to the garment, as that when not in use as a life-preserver they will depend from the waist; but when the wearer springs into the water they will automatically rise and form floats under the arms.

Claim.—The combination, with the cork-stuffed jacket, made as described, of the floats *d*, having flexible connection therewith, and arranged to operate in the manner set forth, for the purpose specified.

141,632.—Lawn or Garden Sprinkler.—Henry E. Cooke, Cleveland, Ohio. Application filed July 2, 1873.

The hose-pipe is supported by a staff or rod set perpendicularly in the ground. The flexible hose on the end of the hose-pipe is smaller than the leading-hose, and is caused to straighten out by the force of the water passing through it, and flops over from one side to the other, whereby the water is thrown about in various directions and distributed over the ground.

Claim.—The combination and arrangement of the small hose C, tip E, staff F, and ring G, (either with or without the pipe B,) with the hose A, as and for the purpose set forth.

141,633.—Hog-Trap.—Thomas Darby, Duncan, Ill. Application filed May 23, 1873.

Two bars, pivoted at their lower ends, are acted upon by a lever having pins which engage with the upper inclined or cam-shaped portions of the bars, shutting or opening them simultaneously for holding or releasing the animal.

Claim.—The cam-shaped or inclined boards A and T, lever H, and guide-boards C, D, and E, in combination with the timbers B, F, G, and I, substantially as and for the purpose hereinbefore set forth.

141,634.—Smoke-Bell for Gasaliers.—Charles Deave, New York, N. Y., assignor to Archer and Pancoast Manufacturing Company, same place. Application filed July 19, 1873.

A smoke-bell has openings in its side and perpendicular to the circumference of its base. Above each opening and projecting from its highest side is a deflecting-plate which diverts heat and smoke from the gasalier. Deflecting-disks, more or less conical, are suspended above the smoke-bell.

Claim.—1. A concavo-convex smoke-bell for gas-burners, consisting of the body A, apertures B B, and deflecting-shutters C C, one or more, substantially as herein specified.

2. The combination, with the smoke-bell A provided with the apertures B and plates C, one or more, of the deflecting-disks D D, substantially as herein specified.

3. The combination, with the smoke-bell A provided with the apertures D D and plates C C, one or more, of the conical deflector E, substantially as herein specified.

141,635.—Car-Coupling.—Phillip H. Decker and Nelson Lee, Chicago, Ill. Application filed May 5, 1873.

The links are held by horizontal bolts and are capable of being "set" vertical, so that the concussion caused by the meeting of the draw-heads will tilt them over into place in the opposite draw-head. The pins are operated by an upright lever and a spring.

Claim.—The buffers E having open mortises G G, and links I arranged to set vertically and horizontally, in combination with levers B, rack L, pins J H, and spring C, as set forth.

141,636.—Device for Baling Hay.—Levi Doty, Frankfort, Ill. Application filed June 25, 1873.

The hoop is held in position upon the bale in order to facilitate the nailing or securing the end thereto.

Claim.—The combination of the levers *s* and *v*, pawl *s*, and forked point *i*, constructed, operating, and arranged, as and for the purpose set forth.

141,637.—Sieve for Grain-Separators.—Elihu Doud, Oshkosh, Wis. Application filed July 1, 1873.

Sieve adjusted in shoe to vary force of blast thereon.

Claim.—The step-shaped sieve or sieve-frame D, combined with and adjustably secured in the shoe C, substantially as and for the purposes described.

141,638.—Blacking-Brush.—William S. Fickett, Rochester, N. Y. Application filed November 30, 1872.

A blacking-brush with a holder or clamp on its back, and a slot and set-screw, that boxes of various sizes may be held upon it for use.

Claim.—The adjustable clamping-standard D in this class of brushes, in combination with the brush A and blacking-box C, as and for the purposes set forth.

141,639.—Ironing-Table.—James H. Frank, of Ilion, N. Y., assignor to Sceva S. Phillips and Alonzo E. Vosburgh, same place. Application filed March 12, 1873.

Claim.—The ironing-table, consisting of the legs K L, brace G, and hinged or pivoted top A provided with the cleats E and F, constructed and arranged as shown and described.

141,640.—Fastener for the Meeting-Rails of Sashes.—Myron Gee, Oakland, Cal. Application filed June 13, 1873.

Claim.—1. The bolt B having the concentric grooves E and O, and the slot G operating in connection with the pin P, when constructed and arranged substantially in the manner and for the purposes set forth.

2. The combination and arrangement of the bolt B having the grooves E and O, and slot G operating in connection with the pin P, the thumb-piece C, the case A, and catch K covering the mullion of a window-sash, the whole being constructed and operated substantially in the manner and for the purposes set forth.

141,641.—Roll for Rolling Wagon-Hub Bands.—John Glass, Pittsburg, Pa., assignor to Wilson, Glass & Company, same place. Application filed May 19, 1873.

Claim.—A pair of rolls, *a*, one of which is plain and the other is provided with a groove, *b*, of the shape shown, for producing the blank *c*, substantially as described.

141,642.—Machinery for Goring Shoe-Uppers.—Asahel J. Goodwin, Brookline, Mass. Application filed April 11, 1873.

Improvement on patent No. 133,703. The guide-pattern is so constructed that it may be increased or diminished in width at either end, so as to vary the angular position of its opposite edges; is also provided with grooves at opposite edges to receive what is termed size slips. The table is furnished with adjustable slides and elastic lever gages for determining the position of the gore; also a lining-gage holder.

Claim.—1. The guide-pattern E, having its parts *b c* connected by slotted arms *f f* and clamp-screws *e e*, arranged as and for the purpose substantially as specified.

2. The guide-pattern E, provided with the size slip-receiving grooves *d d*, arranged in it as set forth.

3. The table A, provided with the slides C C and the elastic lever-gages D D, all constructed, arranged, and applied together substantially as specified.

4. The combination of the lining gage and holder F with the table A, of a machine for goring shoes.

5. The combination of the lever L, the draft-line *u*, and carrier G of the lining gage and holder F.

6. The combination of the lever-clamp K, the carrier G, the lining gage and holder F, the lever L, and the draft-line *u*.

7. The combination of the lever H, (supported and provided with adjustments, as described,) the gage-carrier G, the lever L, and the clamp K, the said carrier being or to be furnished with the draft-line *u* and retraction-spring *t*, and the whole being arranged substantially in manner and to operate as explained.

8. The combination of the adjustable stop or collar *s* with the arm *s* and gage-carrier G.

9. The combination of the lap-holder N with the lining gage and holder F.

10. The combination of the adjustable stop *b'*, the stud *d'*, and the movable dog P with the lap-holder N, combined with the lining gage and holder F, as set forth.

11. The combination and arrangement of the screw *s'* and the rail *z* with the lever H, combined with the lining-gage carrier G.

141,643.—Dish-Drainer.—Warren H. Gould, Manchester, N. H. Application filed June 14, 1873.

Claim.—A dish-drainer attachment for wash-pans, consisting of a wire frame bent so as to be adapted to the vessel and extending over a part thereof, and which will permit the water to drip from the dishes when placed therein, substantially as and for the purpose described.

141,644.—Music-Leaf Turner.—Norman P. Hall, Janesville, Wis. Application filed May 13, 1873.

Claim.—1. The combination of the compound latch F, to allow the arms to pass in going down and to hold them until released, with the combination-lever attachment and key G, substantially as and for the purpose hereinbefore set forth.

2. In combination with the revolving arms B, the horizontal springs E, attached as described, adjustable fingers C, rests H, guides I, compound latch E, and combination lever and key G, all constructed and arranged substantially as and for the purpose hereinbefore set forth.

141,645.—Pattern for Pipe-Elbows.—John King Home, Almonte, Canada. Application filed January 24, 1873.

Claim.—1. An adjustable elbow-pattern to describe the required sweep or miter previous to being formed into sections, and which, when united at the miter-joints, form a pipe-elbow of any required bevel.

2. The pivot C, so placed as to give the exact sweep or curve of the edges C C to scribe the large and small end of the elbow to be made.

3. The sector-plates A B, having a series of scales, as set forth, pivoted together at the point C, and provided with a slot, D, and screw E, or other suitable fastenings, substantially as and for that purpose set forth.

141,646.—Brick-Machine.—Dav. J. Hunter, Boston, Mass., assignor to Isaac Ames, same place. Application filed June 26, 1873.

Carriage elevated to top plane of mold receives the brick. Pulling lever C lowers carriage, advances mold, embracing bricks, and throws forward plunger, pressing brick against back piece. At same time carriage is carried forward over oil-reservoir. Reversing motion of lever brings forward carriage, withdraws mold and plunger, and elevates carriage and brick.

Claim.—1. In combination with the reciprocating mold, reciprocating plunger received and partly supported in said mold, and stationary mold-bottom, toward and away from which said mold and plunger move, as set forth, a carrier, reciprocating vertically, to take the brick from or deliver it to the mold, in accordance with the direction of its movement, and horizontally reciprocated in its lowest position to allow the mold to close upon the stationary bottom, said movements being timed with relation to those of the mold and plunger, substantially as shown and set forth.

2. The combination of a mold, reciprocating in a horizontal plane, and a carrier reciprocating in a vertical and horizontal plane, to lower a brick to the mouth of the mold, and subsequently receive and elevate the brick therefrom, substantially as and for the purposes stated.

3. The mold-bottom, composed of the two wedge-shaped pieces X Y, united by a connecting and tightening rod, A, and nut B, and adjustable one on the other, substantially as and for the purposes set forth.

4. The combination of the vertically-reciprocating carrier with the lubricating-chamber and devices whereby, during the movement of said carrier, the lubricant may be taken from said chamber and delivered to those parts with which the carrier is brought in contact, substantially as shown and set forth.

5. The rollers D′ D′, as combined with the carriage Q and chamber C″, substantially as and for the purposes stated.

6. The combination of the jointed levers K and T, crank O, and bar C, with carrier Q and mold H, said parts being constructed and arranged together for joint operation, substantially as and for the purposes stated.

7. The combination of crank O, pawl G, levers K T, and rod R, with plunger E, mold H, and carrier Q, under the arrangement and for operation as shown and set forth.

141,647.—Sash-Lifter.—Hiram Kingsbury, Rochester, N. Y. Application filed March 31, 1873.

A circular conical socket, with turned-down flanges, cast or struck up from sheet metal, a single screw through the center serving to attach it to the stiles or vertical bars of a window-sash.

Claim.—As a new article of manufacture, the circular sash-lifter C constructed, with flanges turned down as shown and described, to be applied to the stiles or vertical bars of the sash, and used substantially in the manner and for the purposes set forth.

141,648.—Car-Coupling.—Antoin Langhellier, Concord, N. H. Application filed October 2, 1872.

The link B has attached to it on one side a pawl, *a'*, which, when the link is raised, is caught by a spring-catch, D, and held until the draw-head is struck by the draw-head of the approaching car, when it carries the pawl back of said spring-catch, and the link is allowed to fall.

Claim.—The combination of the link B, having the pawl *a'*, spring D, spring A′, chain H, lever C, and cross-bar E, with a draw-head, A, all arranged to operate in the manner and for the purpose specified.

141,649.—Cherry-Stoner.—John S. Lash, Philadelphia, Pa. Application filed January 31, 1873.

Claim.—1. The vibrating plate D operated upon by a spring, in combination with the cylinder A, constructed substantially as and for the purpose set forth.

2. The cylinder A having spiral ribs or worms and longitudinal serrations or indentations on part of its surface, constructed substantially as described, and for the purpose designated.

3. The construction of the plates I, P, R, U, and M, and manner of attaching them together by means of the screw-bolt G to form the casing B, substantially as shown and described, and for the purpose shown and described.

4. The cam C, in combination with the cylinder A, plate M, vibrating plate D, and spring E, constructed and operated substantially as described, and for the purposes set forth.

141,650.—Apparatus for Feeding Fuel to Furnaces.—Charles P. Leavitt, Newark, N. J. Application filed September 14, 1872.

Claim.—1. The plug C, in combination with the pipe P, the piston *p*, the vessel A, and piece B, substantially as described, and for the purpose set forth.

2. Combination of the piece B with the vessel A, substantially as described, and for the purpose set forth.

141,651.—Horseshoer's Rest.—Joshua Legg, Rushville, N. Y. Application filed August 19, 1871.

Claim.—A horseshoer's rest, made with three legs united at their upper ends, forming a rest on their top smaller than the inner circle of the horseshoe, substantially as specified.

141,652.—Wheel for Vehicles.—Obed Look, Bridgeport, Conn. Application filed August 12, 1872.

The hub is metallic, and the recesses, re-enforce, and thimble are eccentric to the axle-box.

Claim.—1. The combination of the recessed hub B, the axle-box A having re-enforce D cast on it, the adjustable thimble D′, the center of the circumference of the re-enforce and the thimble being eccentric to that of the box A, all substantially as set forth.

2. The combination and arrangement of the recessed open hub B, the box A having re-enforce D, the adjustable thimble D′, and securing-nut C, all substantially as described, and for the purpose specified.

141,653.—Truck for Carrying Safes, &c.—Frederick Luehmann and Carl Rohbl, Chicago, Ill. Application filed June 2, 1873.

The truck has two rollers, one of which has a spur-gear, which engages with a toothed track when it is desired to carry a load up a steep incline. The front roller is arranged to turn on a turn-table which has friction-rollers around its outer edge, and also a segmental rack, into which meshes a worm-gear of a rod, actuated by a crank situated at one end of the truck.

Claim.—1. The combination of the platform A, roller B, worm-gear *b* to travel on the sectional rack platform C, shaft *d*, worm *e*, crank *f*, shafts D D^1 D^2, gears and pinions 1 2 3 4, roller E, frame

F, turn-table G having the toothed segment c and rollers A, the shaft b, crank i, and worm f, arranged to operate substantially as and for the purposes set forth.

2. The combination of the shaft m, pinions n, yokes r r, shaft o, worm o', crank p, levers H H, racks s, and tie-rods I with the platform A, substantially as and for the purposes set forth.

141,654.—Manufacture of Gun-Cotton.—SAMUEL JOSEPH MACKIE, Westminster, England. Application filed May 29, 1873.

Claim.—1. The improvement in the art of manufacturing gun-cotton, consisting of the following operations, viz: The treatment of vegetable fiber with acids, so as to transform it into gun-cotton, the crushing of the fiber so as to destroy its capillary structure and reduce it to an impalpable mass, and the granulation of the said mass, all substantially as before set forth.

2. The improvement in the art of manufacturing dry gun-cotton, consisting of the following operations, viz: The production of the gun-cotton in a moist condition, and the drying of it in vacuo, all substantially as before set forth.

141,655.—Thill-Coupling.—PAUL L. MALTHIE, Ramapo, N. Y. Application filed July 25, 1872.

Claim.—1. The combination of the cap or cover E, composed of a leather or equivalent strip, f, and metallic ears g, with the socket B, substantially as shown and described.

2. The combination of the thill-irons A, having T or cross shaped ends, with the socket B, bearing D, and cap E having ears g, substantially as shown and described.

141,656.—Vertical Steam-Boiler.—CASSIUS M. MILLER, Phelps, N. Y. Application filed March 31, 1873.

By dropping the central portion of the boiler the tubes are constantly covered with water, thus preventing their burning out; an unbroken fire-surface is produced by means of annular space, and an annular deflection of the current by means of combustion-tubes.

Claim.—1. In combination with the central water-space C and annular combustion-chamber G, and water-space N, the water-circulation tubes D, for the purposes set forth.

2. The combustion-tubes F, in combination with the annular steam-dome B and annular water-space N, substantially as and for the purposes set forth.

3. The arrangement of the annular steam-dome B and combustion-flues F with relation to the annular water-space N and central water-chamber C, with its combustion-flues E, substantially in the manner and for the purposes set forth.

141,657.—Boring-Machine.—ROBERT O. MOORHOUSE and S. LLOYD WIEGAND, Philadelphia, Pa.; said WIEGAND assignor to said MOORHOUSE. Application filed April 11, 1873.

A screw operates a worm-wheel on the boring-bar. The feed-wheel crank may be adjusted to give a quick feed by fastening it to the wheel on the feed-screw by a sliding pin or bolt, dispensing with intermediate gear-wheel. The device is centered in the rear end of a closed cylinder by means of a step with sliding extension arms.

Claim.—1. The combination of the internal gear and pinion with the feeding-screw, as shown and described.

2. The frame E', worm-wheel and screw, and plate D combined, as shown and described.

3. The step F with the sliding bars, oblique bars, and nuts for simultaneously expanding the same, as described and shown.

141,658.—Machine for Washing Photographs.—LUTHER V. MOULTON, Beaver Dam, Wis. Application filed February 10, 1873.

Claim.—1. The combination of the pipe c with the cylinder e and case a, substantially as and for the purpose specified.

2. The combination of the wheels c c with the bars e e e e and notting f, substantially as and for the purpose specified.

141,659.—Hub for Carriage-Wheels.—PATRICK MURPHY, South Amesbury, Mass. Application filed March 18, 1872.

The bands are intended to protect the hub from splitting while being mortised, as well as afterward, and the enlargement at the middle of the hub is to afford support to the spokes.

Claim.—The combination of the shells A A', having projections a' a', with the wood B, constructed as set forth.

141,660.—Steering Apparatus.—JOHN MYERS, Jersey City, N. J. Application filed April 23, 1873.

A double screw, operated by an ordinary steering-wheel, acts simultaneously upon two nut-bars, D and D', which bars have upon their under surfaces lugs which play into slots formed in the S-shaped cam-levers on the rudder-head. The bars, by approaching and receding from each other, act upon the cam-levers, and, through the medium of the lugs and slots, give a reciprocating rotary motion to the rudder-head.

Claim.—1. A double screw, N N, acting simultaneously upon two nuts, D D', (with their ends supported and guided by rods K K,) in combination with the bolts n n n n and cam-levers I I', as substantially described and set forth in the specification.

2. A cast-iron rudder-head, with its recess f f, in combination with its cam I', for the purpose herein specified.

3. The lugs J J, in combination with the cast-iron rudder-head F, braces and rod a a, as substantially described, and for the purpose herein specified.

4. The casting g g g g, with its end recesses, in combination with its elastic substance x, bolt-heads o o o o, as described, and for the purpose specified.

141,661.—Carriage-Bolt.—ISAAC NEWTON, Cleveland, Ohio. Application filed May 22, 1873.

To increase the binding effect of the bolt when inserted, projections are formed on the face of the square portion, immediately under the head.

Claim.—The herein-described bolt, having projections or feathers a on the sides thereof, directly under the head, in the manner as described, and for the purpose specified.

141,662.—Reclining-Chair.—GEORGE C. PAINE, Boston, Mass. Application filed January 9, 1873.

The seat is pivoted to the legs at its back edge and connected to the legs at its front by link-joints. The back of the chair extends below the seat, and is connected to the pivot of the legs by slotted bars. The arms are slotted, and are connected with the leg-rest, and have a connection with the front part of the legs by means of notched bars. The bars of the leg-rest connecting with the slotted arms are pivoted to the front of the seat, and have a foot-rest hinged at their lower ends, held in position by slotted bars engaging with a catch on the bars of the leg-frame.

Claim.—1. Combination of the seat, supported by the legs A A, the back, constructed as shown, having its frame extended below the seat and connected to the pivot of the legs by the slotted bars z, and the leg-rest, constructed and arranged as shown, the whole being arranged to fold together for transportation, substantially as set forth.

2. In combination with the above, the slotted arm G, notched bar H, and leg w, arranged substantially as set forth.

3. The foot-rest M, provided with the slotted bar S, arranged to retain and support the foot-rest, in combination with the catch s, or its equivalent, substantially as set forth.

141,663.—Bobbin-Winder for Sewing-Machines.—THOMAS PEDDEN, Middletown, Conn. Application filed February 28, 1873.

The axle of the thread guide is provided with spring-arms that sustain a segmental rack, which is moved in opposite directions by a pinion on a shaft moved from the bobbin-shaft. When the pinion reaches an end tooth of the rack one of the spring-arms strikes a second spring, which holds the last pin of the rack in contact with this pinion, thus moving the rack to the opposite side of the pinion, when the motion of the rack is reversed.

Claim.—1. The combination of the section-gear d^3, provided with spring-arms d^5 attached to the shaft e, and the pinion d, when constructed and operating substantially as set forth.

2. The combination of the section-gear d^3, having spring-arms d^5 running to the shaft e, the pinion d, and the spring f, when constructed, arranged, and designed to operate substantially as set forth.

3. The combination of the bobbin-shaft b^1, having the pinion c, the gear c^1 fast upon the shaft c^2, the pinion d, the section gear d^3 set upon the shaft e, and the guide-arm e^2, all constructed, arranged, and designed to operate substantially as and for the purpose set forth.

141,664.—Earth-Auger.—CHARLES D. PIERCE, Lawrence, Kan. Application filed June 30, 1873.

Claim.—The earth-auger, consisting of the open-sided, tapered, twisted pods A A provided with the inclined knives or cutters C C having the inner corners e e the lowest and in advance, and having the outer corners f f farther from the center than any other portion of the auger, substantially as specified.

141,665.—Metallic Column.—JOHN L. PIPER, Pittsburg, Pa. Application filed July 15, 1873.

A panel of the hollow column is made removable to afford access to the interior for painting and repairs, and when in place contributes to the strength of the column.

Claim.—A hollow metallic post, column, strut, or girder having a removable panel or section, constructed substantially as set forth.

141,666.—Glass-Furnace.—ANTOINE POCHERON, Paris, France, assignor to EDWIN CANNINGTON. Application filed May 29, 1873.

Sides and bottom of tank and sides of fire-places have tubes which deliver air heated therein under grates. False arch thrown over fire-places to protect arch. Chimney surmounts tank.

Claim.—1. The combination, in glass-furnaces, of the following parts, viz.: The tank for holding the glass, the fire-places arranged externally to the said tank, the air-passages in the walls of the tank, the arch surmounting the tank, and perforated with working-holes, and the chimney inclosing the said arch and receiving the products of combustion from the working-holes, all substantially as before set forth.

2. The combination of the following parts, viz.: The tank for holding the glass, the fire-places arranged externally to said tank, the air-passages in the walls of the said fire-places, the internal arches of the said fire-places, the arch surmounting the said tank, and perforated with working-holes, and the chimney inclosing the said arch, all substantially as before set forth.

141,667.—Steam-Hammer.—DAVID R. QUICK and GEORGE A. GARDNER, New York, N. Y. Application filed August 31, 1872.

The piston, which is attached to the hammer, slides in the working-cylinder, operated in an outer cylinder by suitable parts above and below. Steam being admitted moves the working-cylinder, in which are arranged parts that admit air through the upper open end of said cylinder, which forms a cushion for the piston.

Claim.—1. The combination, substantially as herein shown and described, of the external motor-cylinder D, the contained working-cylinder B, forming the piston of the said cylinder D, and the internal striking-piston A, for the purpose specified.

2. The arrangement, substantially as herein shown and set forth, of the ports or passages b of the working-cylinder B, with reference to the piston A and external cylinder D, for the purpose specified.

141,668.—Harvester-Rake.—AMOS RANK, Salem, Ohio. Application filed May 4, 1871.

An adjustable stop slides on the coupling-arm, and by striking against the rake-standard limits its inward movement as the outer end of the finger-bar is lifted.

Claim.—The combination of the shoe, the rake-standard, the coupling-arm, and the adjustable stop thereon, all these members operating in combination, as set forth, to prevent the rake from striking the driving-wheel and to make the joint rigid in one direction.

141,669.—Wagon-Bed Lifter.—DAVID ROOD, Mount Eric, Ill., assignor of one-half his right to FLETCHER EMLEY, Franklin, Ohio. Application filed May 19, 1873.

The main frame supports a roller, around which are wound ropes for raising and lowering by means of ratchet and lever. A spring and pawl engage with the ratchet, successively operated by motion of the lever backward and forward. The pawl may be thrown out of gear by raising a small rod attached to the main frame, and the spring may be prevented from engaging with the ratchet by a small lever attached to the main lever.

Claim.—In the device for raising and lowering a wagon bed or frame or other bodies, the combination of frame, roller, ratchet and pawl, spring, lever, and ropes, substantially as herein set forth, and for the purpose specified.

141,670.—Process of Gilding on Glass.—VALENTIN SCHWARZENBACH, Berne, Switzerland. Application filed March 3, 1873.

Dissolve pure gold in nitro-muriatic acid and evaporate in salt-water bath till it crystallizes. After filtration the solution is ready for use. The solution is then rendered alkaline by soda-lye of mean strength. The glass to be gilded is disposed horizontally on another surface of glass separate from it about three millimeters; then alcohol is added to the solution. The liquid is then poured between the two glasses and left to stand two or three hours. The upper gilt plate is then removed, washed, and varnished.

Claim.—The process of gilding on glass, in the manner and for the purposes substantially as described.

141,671.—Gimlet-Handle.—HENRY S. SHEPARDSON, Shelburne, Mass. Application filed May 22, 1873.

The handle is flattened so as to afford a larger surface for the action of the finger and thumb of the operator.

Claim.—A flattened metallic gimlet-handle, A, constructed substantially as shown and described.

141,672.—Circular-Saw Mill.—EDWARD H. STEARNS, Erie, Pa. Application filed March 26, 1873.

The reversing-gear is so arranged that the same movement which disengages the friction-wheels applies a brake to retard further motion.

Claim.—1. The rocking-shaft d, attached to the frame A of the machine, with a crank d^2, and rod d^1, connected directly to and in combination with the swinging arm c, which carries the end of the rag-shaft B, substantially as set forth.

2. The combination of rocking-shaft d with crank and rod connections, both to the swinging arm c and to the cam-shaft e, whereby the rag-wheel is shifted and the brake applied to it simultaneously by a single throw of the shaft d, substantially as described.

3. The brake S, made with a series of boxes of suitable form for receiving a series of wooden blocks, such blocks constituting the rubber, and being adjustable by set-screws r^2, substantially as set forth.

4. The combination of the spring g^1, the cam-shaft e carrying the bead e^2, and the brake S carrying the bead s^1, constructed substantially as described, with reference to Figs. 4 and 5.

5. The combination of the sliding carriage w, adjustable guides n n^1, and detachable rubber blocks q^1 q^2, substantially as set forth.

141,673.—Wick-Raiser.—JOHN STRASZER, St. Louis, Mo. Application filed June 30, 1873.

The wick is raised by the revolution of a cylindrical collar placed within the wick-tube on either side of the wick, having one or more spiral and flanged sections free at one end and acting as springs to clutch the wick, and attached by arms from its inner side to a rod within it and parallel to its axis, to which the hand-wheel is applied.

Claim.—1. The collar E F, provided with spring sections or wings e, having spiral ribs or flanges e', which act directly on the wick, substantially as set forth.

2. The combination of the collar E F, wings e, and spiral ribs e' with the barrels A B, collar G, arms f, and rod H, as and for the purpose set forth.

141,674.—Bell for Sleigh-Shafts.—AUGUSTUS E. TAYLOR, New Britain, Conn. Application filed March 24, 1873.

Claim.—1. The metallic shaft-strap A, recessed crosswise, for attaching bells to sleigh-shafts, substantially as described.

2. The eyes e d, formed of a single piece of metal and passing through the bell at two points, thereby encircling the tongue, a portion of the bell, and the strap, substantially as described.

141,675.—Colter-Clasp.—CHARLES H. THOMAS, Coeyville, N. Y. Application filed March 17, 1873.

The colter-clasp is pivoted loosely on the bolt, which is kept in rigid position by a partial thread which screws firmly into the beam. The angle of the clasp may be changed by moving the wedge-blocks.

Claim.—In connection with a plow-beam, the combination of the bend a, partial thread-bolt b, blocks f f, and perforated colter g, all constructed and operating as and for the purposes set forth.

141,676.—Grain-Separator.—WILL E. TURNER, Neosho Falls, Kans. Application filed March 15, 1873.

A vertical cylinder with openings arranged to produce a whirling blast of air, for the purpose of more thoroughly separating the wheat from the chaff.

Claim.—The hollow cylinder P, having spirally-arranged slots in the lower part, combined with spout O, to produce a whirling blast, in the manner and for the purpose described.

141,677.—Nursery-Gate.—EDWARD A. TUTTLE, Brooklyn, N. Y. Application filed December 30, 1872.

Claim.—A nursery-gate, made adjustable by means of slats and screws with inclined surfaces on the uprights H H, in combination with slides I I having inclines, so that when the gate is forced down it will be tightened, substantially as and for the purpose described.

141,678.—Machinery for Burnishing the Heels of Boots and Shoes.—ISAAC VAN NOUHUIS, Albany, N. Y. Application filed January 28, 1873.

A worm, mounted upon the shaft which gives intermittent reciprocating motion to the burnisher, meshes into a worm-wheel, and, by means of a pitman-rod and intermediate gearing, gives corresponding movement to the heel of the boot or shoe.

Claim.—1. The combination of the worm O and worm-wheel P with the bevel-wheel M and pinion K, having an arm, A, when used for giving motion to the shoe during the operation of burnishing the heel, as and for the purpose herein set forth.

2. The combination of the sliding block E and burnisher F, having a lip, f^2, with the rocker f^1 and springs f^6 and f^7, when arranged to operate as herein specified.

3. The combination of the automatic reciprocating burnisher F, having a lip, f^2, with the rocker f^1 and spring f^7, when arranged to operate as herein described.

4. The combination of the sliding block E with the burnisher F and rocker f^1, as herein described, and for the purpose set forth.

141,679.—Die for Making Blanks for King-Bolts.—FREDERICK VAN PATTEN, Auburn, N. Y., assignor, by mesne assignments, to himself and E. D. CLAFF, same place.—C. Application filed February 28, 1873.

The dies leave pins along the line of parting and a web between the horns.

Claim.—The dies 3 and 4, constructed and applied for producing the blank, Fig. 5, from which, by trimming, the king-bolt blank, Figs. 6 and 7, is produced, all substantially as set forth.

141,680.—Die for the Manufacture of Clip King-Bolts.—FREDERICK VAN PATTEN, Auburn, N. Y., assignor, by mesne assignments, to himself and E. D. CLAFF, same place.—D. Application filed February 28, 1873.

A series of dies in die-block A, for drawing out and molding the stem, the shoulder, neck, and other parts having been formed by other dies, and other dies C to spread out the limbs of the clip and to mold the wings at the junction of the limbs.

Claim.—1. The die for centering and reducing the stems of clip king-bolts, recessed and constructed as represented by Fig. 1.

2. The combination of the die sections C C and C' with the centering and truing die A, substantially as and for the purposes described.

141,681.—Die for Swaging Clip King-Bolt Blanks.—FREDERICK VAN PATTEN, Auburn, N. Y., assignor, by mesne assignments, to himself and E. D. CLAFF, same place.—E. Application filed February 28, 1873.

The dies are intended to swage a blank to a shape suited to other dies and operations, (described in other patents,) which ultimately fashion it into a king-bolt. The part designed for the horns of the bolt is made trough-like, in order that, when compressed into the other die, it shall with certainty fill out the corners and insure equality of mass in the two horns in which it is to be divided.

Claim.—1. A die, F 4 y, for forging a bar of metal into a blank for a clip king-bolt, substantially as described.

2. A die, E E', for holding and bulging the part C of the blank, substantially as described.

3. The combination of the die F 4 with the die E E', substantially as described.

4. The adaptation of part C of the blank to dies in which it is to be subsequently struck up, and so as to insure the filling out of the corners, with the least possible surplus of metal, by reducing it to the concavo-convex or bulging form described and shown.

141,680.—Die for the Manufacture of Fifth-Wheel Blanks.—FREDERICK VAN PATTEN, Auburn, N. Y., assignor, by mesne assignments, to himself and E. D. CLAFF, same place.—F. Application filed February 28, 1873.

The first pair of dies swages a rectangular bar into a blank of particular shape; the second pair molds this blank into the body and limbs of the wheel-head, leaving surplus metal as fins; and the third pair bends the limbs to the proper shape.

Claim.—1. The die-sections A, recessed as described, to produce the blank of Fig. 3 with fins *a*, as specified.

2. The dies shown by Figs. 8 and 9, for producing the primary blank Fig. 2, from which the blank Fig. 3 is produced, as set forth.

3. The combination of the dies shown by Figs. 1, 5, 6, 8, and 9, as and for the purpose herein described.

141,683.—Machine for Milling Fifth-Wheels of Vehicles.—FREDERICK VAN PATTEN, Auburn, N. Y., assignor, by mesne assignments, to himself and E. D. CLAFF, same place. Application filed March 17, 1873.

A blank fifth-wheel is clamped upon a sliding table, with the projections for the flanges at its ends standing upward and in line with the rotating milling-tools. The article is carried under the mills, which cut the projections, leaving each with two finished flanges in true line with each other.

Claim.—1. The adjustable wheel-rest E, provided with internal supports and external supports and a central pivot, which latter coincides with the axis of the wheel when confined in place, in combination with a movable carriage, F, and a milling-wheel, *b'*, substantially as and for the purposes described.

2. The combination, with the fifth-wheel rest E, carriage F, and milling-tool *b'*, of the milling-tools *c'*, substantially as described.

141,684.—Horse Hay-Rake.—JOSEPH H. WALKER, Grand Rapids, Mich. Application filed January 13, 1873.

An L-shaped hand-lever, having a moving fulcrum, is used to lock the rake in its raking and also in its elevated position.

Claim.—1. The hand-lever L, with flexure O, movable fulcrum *g*, link *i*, stationary link and stop S, guide D, and link F, in combination with head A and arm E, all constructed and operating substantially as set forth.

2. The hand-lever L, with its flexure O and movable fulcrum *g*, link *i*, and stationary link and stop S.

141,685.—Valve Device for Fluid-Brakes.—GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Application filed May 24, 1873.

Air entering above the piston depresses the same, which, through pin and cross-bar, opens the lower valve, permitting the air from the cylinder to escape, while the middle valve is closed and the air above the piston passes through grooves and ports into the central chamber, and thence to supplementary tank. As soon as it attains a pressure in the tank equal to that above the piston a spring raises the latter, the lower valve is closed and the middle valve raised, which permits the air to enter the cylinder and put on the brake.

Claim.—1. The piston *c c'*, having separate and independently-operating connections to, and in combination with, a charging-valve *a*, and discharging-valve A^1, whereby the discharging-valve shall be closed at or before the opening of the charging-valve, substantially as set forth.

2. The pin *c'*, cross-bar *e*, and stem *g*, in combination with the piston *c c'*, valves *a* and A^1, and plug *o*, arranged substantially as set forth.

141,686.—Feed-Bag for Horses.—THOMAS ADAMS, Jersey City, N. J. Application filed February 11, 1873.

The feed-bag, so constructed that it can be adjusted to fit any horse.

Claim.—1. A feed-bag, with a hopper at the back part separated from the forward portion of the feed-bag by the partition *c*, at the bottom of which is an opening for the feed, substantially as set forth.

2. A feed-bag with an opening at the front, and with the sides *b b* connected together, substantially as and for the purposes set forth.

141,687.—Fire-Upsetting Machine.—DURBIN L. BADLEY, Afton, Iowa. Application filed June 14, 1873.

The upsetting force is imparted by an eccentric on shaft *b*, revolving in a stirrup that projects downward from plate C.

Claim.—The improved tire-shrinker, consisting of frame A, base-block B, sliding plate C, and stationary plate D, which carry blocks G and segmental blocks G' with arms *m*, lever *n*, disk H, shaft *b*, eccentric *d*, and lever E, substantially as and for the purpose described.

141,688.—Milk and Cream Cooler.—HENRY C. BALDWIN, North Walcott, Vt. Application filed July 19, 1873.

Water circulates around a vessel having a flange on its bottom that fits into an annular perforated flange on the bottom of the outer vessel. The inner vessel is held stationary by the flange on its bottom and by hooks reaching from the outer vessel, and it has a conical-shaped top provided with ventilators to allow a free circulation of air.

Claim.—The combination of the outer vessel A, provided with a spout, E, pipes C and D, perforated ring-flange F, and hooks J, the inner vessel G provided with the ring-flange H and ball J, and the cover K provided with two or more ventilators, L, with each other, substantially as herein shown and described.

141,689.—Making Artificial Marble.—CHARLES F. BARKER, Boston, Mass. Application filed July 17, 1873.

Claim.—1. In a process for making artificial stone, the combination of salt, gum Arabic, and gum Senegal, for tempering gypsum, substantially as and for the purposes set forth.

2. An artificial stone made of calcined gypsum, alum, and copperas, substantially as described.

141,690.—Name-Fastener.—THOMAS L. BOOKER, Shady Grove, Va., assignor to himself and E. H. BOOKER, Donaldsonville, S. C. Application filed May 31, 1873.

Claim.—A fastening for hames formed by the combination of clips B, band C, and bolts D D', substantially as shown and described.

141,691.—Combined Hook and Hasp.—BENJAMIN H. BROOKS, New Haven, Conn. Application filed July 16, 1873.

Claim.—The hasp A, having a tongue, *a*, formed upon one or both sides of the slot, C, substantially as and for the purpose described.

141,692.—Rotary Churn.—WILLIAM H. BUNCH, Windsor, N. C. Application filed May 24, 1873.

A vertical revolving dasher-staff carries a flat perforated dasher in the lower part of the churn. From the under side of the lid descend stationary concave plates to nearly touch the dasher.

Claim.—The perforated wings or dashers E E curved upon one side and suspended vertically from the removable cover D, in combination with the dasher F arranged to rotate in the space below them, all as and for the purpose specified.

141,693.—Channeling-Machine for Boots and Shoes.—ALVIN E. CHICKERING and HENRY B. TUTTLE, Albany, N. Y. Application filed March 24, 1873.

Claim.—1. For starting up and turning over the flap of the channels of the soles of boots and shoes, the combination of the plow *c* and molding curved surfaces *s* with the plate A, substantially as shown and set forth.

2. For starting up, turning over, and pressing down the flap of the channels of the soles of boots and shoes, the combination of the plow *c* and molding-carving surface *s* with the pressing-roller B, substantially as shown and set forth.

141,694.—Drill-Rod Coupling.—ROBERT A. CLARK, Petrolia City, Pa. Application filed February 1, 1873.

When the sleeve is passed over the point of junction of the outer screw-thread in the two rods the contrary pitch of the inner thread prevents the rods from turning and becoming disengaged.

Claim.—The sections A B connected together by a part of one screwing into a socket of the other, and a sleeve on both screwing against a collar on one, the threads being reversed as to the pitch, substantially as specified.

141,695.—Harvester-Rake.—SAMUEL CLEVENGER, Vibbard, Mo. Application filed July 5, 1873.

Cog-sectors on the two faces of a supporting-wheel, by means of rack and pinions, operate the rake periodically.

Claim.—The slide D, the toothed bar E, the slide-rod F, the guide I, the rake-head G *g' g''*, the bar H, the pin J, the two shafts K, the four gear-wheels L M, and the two segments of gear-wheels N, in combination with each other and with the frame, platform, and drive-wheel of a harvester, substantially as herein shown and described.

141,696.—Fire-Proof Shutter.—JOHN B. CORNELL, New York, N. Y. Application filed July 5, 1873.

Claim.—The two plane-faced plates *a b*, combined with one intermediate zigzag plate, *c*, presenting alternately to each of them a small plane surface, against which they rest, and by which they admit of being conveniently fastened together, in the manner described.

141,697.—Screw-Valve.—PHILIP CORRIGAN, New York, N. Y. Application filed July 5, 1873.

By removing an internal nut, made in sections, the valve may be ground to its seat, which being accomplished the parts are replaced.

Claim.—The nut F made in sections and provided with lugs *f'* having screw-threads cut in their outer surfaces, in combination with the screw *e'* of the valve-stem C, the cap-nut D, and the body of the valve, substantially as herein shown and described.

141,698.—Harness.—ENOCH COVERT, Farmer Village, N. Y. Application filed November 14, 1872.

Claim.—The combination of the semi-tubular metal plate C with ears *a a*, screws *d d*, and under plate D, all substantially as and for the purposes herein set forth.

141,699.—Axle-Box and Sleeve for Vehicle-Wheels.—WILLIAM H. COWELL, Columbus, Ohio. Application filed April 19, 1873.

The interior of the pipe-box is chambered for the lubricant. The box is cast on a chill.

Claim.—The recessed sleeve D E and the rabbeted collar F combined with the pipe-box H, adapted to revolve on the sleeve,

while the sleeve itself is adapted to revolve on the axle, as and for the purpose described.

141,700.—Wagon-Jack.—NELSON CRANDALL, Wooster, Ohio. Application filed June 26, 1873.

Claim.—1. A lifting-jack composed of a stand, A, slotted lifting-bar E, lever H, and roller and pin, as shown and described.

2. In combination with the bar E beveled on its lower end, as shown, the lever H pivoted at I, and co-operating therewith, as shown and described.

141,701.—Rolling-Mill for Sheet Metal.—EVAN H. DAVIS, Pittsburg, Pa. Application filed May 14, 1873.

The lower rolls are driven by power applied to them severally, and the upper and intermediate rolls are driven by frictional contact with them or with the sheet of metal. The guides are so constructed as to pass the sheet underneath the intermediate rolls, and the shearing-rolls at the extremity of the series trim the edges of the sheet as it emerges.

Claim.—1. The combination of a series of pairs of rollers, arranged with gradually-increasing pressure, and intermediate rollers E, arranged between the pairs of rollers and resting upon the bottom rollers of the adjoining pairs, substantially as and for the purposes herein set forth.

2. The stationary guides *f f* and the yielding guides *h h*, arranged in connection with the intermediate rollers E E, substantially as and for the purposes herein set forth.

3. The combination of a series of pairs of rollers, C D, intermediate rollers E E, stationary guides *f*, yielding guides *h*, shafts *m*, and cutters or shears H, all constructed and arranged as described, to roll a single sheet of metal complete and trim the edges by once passing through the mill, as herein set forth.

141,702.—Circular-Saw Guard.—OSCAR A. DEAN, Bethel, Vt. Application filed June 21, 1873.

The saw-guard is adjustably attached to the gage upon the saw-table.

Claim.—1. In combination with a circular saw, a guard consisting of the slotted guard-bar G and the slotted guard J, arranged substantially as shown and described, for the purposes set forth.

2. The guard formed as above described, in combination with the gage D.

3. The vertical plate M, in combination with the guard-bars G and J, substantially as shown and described.

141,703.—Pneumatic Oiler.—CHARLES E. DECKER, Chicago, Ill. Application filed November 29, 1872.

Claim.—1. In combination with a self-feeding oiler, a valve device for admitting a regulated quantity of air to the oil to govern the flow, substantially as specified.

2. The air-supplying tube K, so arranged that the air will pass up through the oil, thereby indicating the flow of oil, in combination with the glass-chambered self-oiler, substantially as specified.

3. The combination of the valve-seat F, tube E, air-pipe K, rod L, ball M, and tube B *m*, substantially as and for the purpose specified.

4. The passage-way H, having aperture A, in connection with the channel *g* entering the air-valve, substantially as and for the purpose specified.

141,704.—Carriage.—HENRI E. DELESSERT, Paris, France. Application filed March 21, 1873.

Claim.—1. The combination and arrangement of a brougham or carriage, substantially as before described, the body of which extends down in the rear of the rear axle, and with the door opening at the rear, the principal seat being directly over the said rear axle.

2. The arrangement of the springs, the lower sweeps of which resting on the hind axle, one on each side of the carriage, and the upper sweeps being suspended to a transverse-kneed bar which passes under the seat of the carriage, as described.

141,705.—Plow.—WILLIAM DONNELLY, Calverton, N. Y. Application filed July 19, 1873.

An adjustable plate is attached to the rear end of the mold-board of a plow, which opens a trench for planting. In a subsequent furrow the plate-crank is replaced by another having several plates for covering.

Claim.—The crank E, provided with one or more plates, G, and secured adjustably by a set-screw, F, to a bar, D, attached to the mold-board of a plow, substantially as herein shown and described.

141,706.—Rope-Clamp.—WILLIAM H. DOWNING, Shamburg, Pa., assignor of one-half his right to BENJAMIN MARSHALL, same place. Application filed June 19, 1873.

The arrangement of the open nut and set-screw admits of the vertical adjustment of the screw *b*, while, by means of the adjustable rope-clamp attached to the screw by the swivel attachment, the rope can be taken up or let out.

Claim.—The described arrangement and combination of the fixed open nut *a*, screw *b*, hand-wheel *c*, or its equivalent, and swivel *d*, the hand-wheel being fixed upon the screw below the nut, and the swivel below the hand-wheel, substantially as set forth.

2. The described cable-clamp, consisting of the jaw *e* with its lugs or pins *f f*, the jaw *e'* with its lugs or pins *f' f'*, and the slotted hook-clasp *g* with its hooked ends *h h* and set-screw *k*, said clasp being arranged upon and embracing the jaw *e* and hooking over the lugs or pins upon the jaw *e'*, the whole constructed and operating substantially as and for the purposes set forth.

141,707.—Cultivator.—RUFUS A. FISH, Worcester, Mass. Application filed January 3, 1873.

The teeth are secured to the frame by means of metallic sockets bolted to the side of the beams, the teeth being held in the sockets by keys and pins. The beams are adjusted in regard to width by means of notched segments and held in place by a tapering pin passing through flanges.

Claim.—1. In combination with the cultivator-frame, the independent metallic socket C, tooth D, and wedge for holding the tooth in said socket, as set forth.

2. The socket C and pin or key F, in combination with the tooth D, formed with a slot to engage said key, and the wedge, or its equivalent, substantially as shown and set forth.

3. The combination, with the notched expanding-beam, of the holder G and pin H, substantially as shown and set forth.

141,708.—Valve for Artesian Wells, &c.—JOSEPH FLEMING, Shamburg, Pa. Application filed July 12, 1873.

The case in which the ball-valve is arranged is screwed to the pipes for elevating the water, oil, &c., and is provided with right-angled transverse openings below the valve-seat to clear out the sand, &c., and prevent the valve from clogging.

Claim.—1. The combination of the cylinder A having the screw P, tubes T T, hollow screw S for the reception of the valve-case and valve V, and the receptacle R attached by the screw Q, all constructed and arranged substantially as shown and described.

2. The cylinder A, provided with the tubes T T and screw P, in combination with the hollow screw S, forming the valve-case for valve V, constructed and arranged substantially as shown and described.

141,709.—Churn.—ANDREW W. FUQUA, Sandford, Ind. Application filed May 24, 1873.

The dash-rod within the churn is broad and flat. Upon its lower end it carries a broader hollow cylinder closed at top and open at bottom. This cylinder has flaps cut from its side and bent outward, but concave in front.

Claim.—A churn-dash consisting of the rod *a*, hollow cylinder *c* provided with beaters *d*, and openings *e*, operating together as described.

141,710.—Rotary Steam-Engine.—SAMUEL GIBSON, York, Pa., assignor of his right to HIRAM YOUNG, same place. Application filed June 20, 1873.

In one side of the valve is a recess, from which a passage leads to a semicircular groove in the cylinder-head, which admits steam. The steam forces the valve out before it escapes into the cylinder and operates the wheel.

Claim.—1. The valves D D, provided each with a recess, *f*, and passage *e*, and placed in slots in the wheel C, as described, and operated by the live steam through the passage *b*, substantially as and for the purposes herein set forth.

2. The combination, in a rotary engine, of the steam-inlet passage *a* and the curved passage or cut-off *b* in the cylinder-head A with the wheel C and its valves D D, whereby the steam is caused to operate upon the valves before it enters the casing, substantially as set forth.

3. The combination of the casing A with inlet B, passage *a*, groove *b*, and exhaust A, slotted wheel C, and valves D D, having recesses *f* and passages *e*, all constructed and arranged, substantially as and for the purposes herein set forth.

141,711.—Machine for Heading Bolts.—CHARLES HALL, New York, N. Y. Application filed February 7, 1873.

Claim.—1. In a bolt-heading machine, the combination, substantially as herein set forth, of a pair of jaws provided with dies, an upsetting-header, and the side hammers, arranged in such manner that they are moved toward and from the face of the dies in a longitudinal direction, to form the bolt-head, and then to allow it to drop, as set forth.

2. In a bolt-heading machine, the combination, substantially as herein set forth, of a pair of jaws, a cutting-shear, and a detaining-lever, arranged to operate substantially as set forth.

3. In a bolt-heading machine, the combination, substantially as herein set forth, of a pair of holding-dies, the cutting-shear, and the detaining-lever, with the non-revolving upsetting-shaft and side hammers, all arranged to operate substantially as set forth.

4. In a bolt-heading machine, the combination, substantially as herein set forth, of a pair of holding-dies and a cut-off shear with the side hammers, arranged to shape the head of the bolt by blows at right angles to its axis, and also to reciprocate longitudinally toward and from the face of said dies, for the purposes set forth.

141,712.—Machinery for Burnishing the Heels of Boots and Shoes.—LORENZO P. HAWKINS, Lynn, Mass., assignor to MORGAN & DORR, same place. Application filed June 7, 1873.

Claim.—A reducing or abrading wheel for heel-covering machines, provided with a tire or exterior annular band of vulcanized rubber having an exterior surface or periphery of a contour adapted to the shape of the heel to be scoured, and covered by a webbing or fibrous jacket to receive the coating of abrading material, substantially as and for the purposes shown and set forth.

141,713.—Feeder for Printing-Presses.—FREDERICK L. HEUGHES, Rochester, N. Y. Application filed June 24, 1872.

Grippers, mounted in a metallic apron, take the sheet from the feed-table and carry it before two vertically-arranged platens, where it is printed. The intermittent motion is from a reciprocating rack through a loose rachet-pinion and its pawl.

Claim.—The combination, in a printing-press, of two or more platens, H H', arranged in the same vertical, or nearly vertical, line, and the revolving griper-bands B, operating substantially as described.

141,714.—Knob-Latch.—AUGUST HEYER, Terre Haute, Ind. Application filed April 12, 1873.

The knob-spindle is provided with two wedge-shaped projections, which act upon the extension-piece of the latch-bolt in such manner that, by pushing or pulling the knob, the bolt will be withdrawn.

Claim.—The rectangular guide-piece *d*, and the extension piece K of the bolt embracing the spindle E, and the straight guide-piece *b* in combination therewith, all as shown and described.

141,715.—Wheel for Vehicles.—PHILANDER C. HOUSE, West Randolph, Vt. Application filed March 15, 1873.

A double set of spokes with separate hubs, arranged so that a spoke can be taken out and renewed without disturbing the others.

Claim.—The combination of the axle-nut K, the hub-ring B having the peculiarly-shaped mortise, and the thimble tee or clip G having the socket I, for the purpose of easily applying and removing the spoke, all as set forth.

141,716.—Tree-Protector.—GEORGE H. HUME, Paola, Kansas, assignor to L. C. CHITTENDEN, GEO. H. HUME, and CHAS. W. CARR, same place. Application filed June 14, 1873.

Claim.—The tree-protector, provided with the downwardly-projecting tongues or spurs *d*, formed by being cut from the sheet-metal plate *c*, as shown and described.

141,717.—Feeding-Elevator for Corn-Shellers.—PETER KAUFMAN, Hudson, Ill. Application filed April 5, 1873.

Elevator-chain composed of alternate wire and plate links, the plate-links provided with forks for carrying the ears of corn to the machine.

Claim.—A link for endless elevator-chains made of a single metallic plate, E, turned outward to form the fork H H, as and for the purpose described.

141,718.—Hose-Coupling.—JOSIAH W. KENNEDY, St. Louis, Mo. Application filed July 16, 1873.

The tube section is first introduced inside the hose; the sleeve is then slipped over the hose and the nut screwed on the end of the tube-section, clamping the hose firmly against its raised rim by forcing the sleeve forward.

Claim.—1. The internal tube section A, having raised A-shaped rim *a* and screw-threaded portion *a'*, in combination with the nut A, and sleeve C having flaring end *c*, as and for the purpose set forth.

2. The combination and arrangement of the tube section A, having raised rim *a* and screw-threaded portion *a'*, with the nut A', collar C *c*, friction-ring *d*, and coupling-sleeve D, as and for the purpose set forth.

141,719.—Advertising-Lantern.—SOL. KUH, Jefferson, Iowa. Application filed February 8, 1873.

Claim.—An advertising-lantern shaped as a prism, the sides of which are composed of two or more rows of changeable glass plates, of the same height, and of a width the multiple of which constitutes the exact width of one of the sides, the said glass plates being separately provided with the letters of the alphabet or other advertising mediums, substantially as shown and described.

141,720.—Loom Let-off Mechanism.—JOHN M. LINSCOTT, Buxton, Me. Application filed June 26, 1873.

The friction-bands at each end of the warp-beam are attached each to a horizontal lever, carrying a supplemental lever pivoted to it and held in position by an adjustable loop. The inner ends of the supplemental levers are connected by links to the short arm of a blade-spring lever, the long arm of said lever embracing in its forked end a screw-nut on a vertical screw-rod. By means of a cog-wheel on the warp-beam, a tripping-lever, actuated by the cogs or teppets, and operating a ratchet on the top of the screw-rod, the said rod is rotated with the warp-beam, which rotation carries the nut downward, thereby gradually lessening the tension on the spring-lever, and, consequently, the tension of the friction-straps on the warp-beam.

Claim.—1. The combination of the yarn-beam *b*, having the rolls *c*, with the friction-bands *d*, the levers *f* A, links *i q*, spring *t*, nut *n*, and the rotating screw-rod *o*, as set forth.

2. In combination with the beam *b*, rolls *c*, friction-bands *d*, levers *f* A, spring *t*, vertical rotating screw-rod *o*, and nut *n*, the tipping-lever *u*, cog-wheel *l*, vertical bar *v'*, ratchet-wheel *x*, ratchet *z*, frame *y*, piece *a'*, frame *d'*, and spring *g'*, as herein set forth.

141,721.—Whiffletree-Hook.—MAGNUS MATSON, Quincy, Ill., assignor of one-half his right to JNO. H. SUNDERMANN, same place. Application filed April 4, 1873.

Claim.—The combination of the hook G, ferrule B, and C-shaped spring H, the hook being seated in the slot E and having its inner end connected with the spring, substantially as and for the purpose specified.

141,722.—Adjustable Treadle for Sewing-Machines, &c.—JOSEPH MCEVOY, Brooklyn, N. Y. Application filed March 15, 1873.

Claim.—1. The treadle-pivot C, mounted in the slots D, curved upon the arc of a circle, described from the axis of the crank-shaft, as shown and described, for the purpose specified.

2. The treadle pivot-rod, cranked so as to adjust the treadle as to height, and provided with binding-nuts for clamping it to the frame, substantially as specified.

3. The combination of a notched rest, M, with the cranked treadle pivot-rod C, substantially as specified.

141,723.—Corn-Planter.—WILLIAM MULL, Rantoul, Ill. Application filed April 19, 1873.

A revolving geared driving-axle is universally jointed at a short distance from the wheels, to enable the wheels to be lifted by levers while turning, to stop the dropping of seed, or to accommodate themselves to uneven surfaces; the loose ends of the axle are braced by rods to the front part of the frame, and the weight of the machine is supported by runners, which open the ground for the seed; a gear upon the axle drives a shaft and a disk, which has an eccentric slot to receive a pivot upon the link-rod, which works the seed-slide; a jerking motion is thus imparted by a spring at each revolution.

Claim.—1. The combination of the revolving axle J, universally jointed at L L, with the pivoted braces M M, to enable the wheels to be raised or to accommodate themselves to uneven ground, without allowing the end sections to get out of alignment with the middle section, in the manner described.

2. The lever P, levers O O, and rods N N, combined with the end sections of a jointed revolving axle, as described, to allow the wheels to be raised for turning, or to cause the dropping of seed to cease.

3. The combination, with the link-rod E and dropper-slide C, of the slotted disk or crank-wheel F and the slide-spring D, to drop the seed in the manner specified.

141,724.—Door-Fastener.—HENRY ORCUTT, Amherst, Wis. Application filed June 14, 1873.

Claim.—The combination of the semicircular notched or perforated bar and a weighted latch, B, with a door, substantially as described.

141,725.—Machinery for Beetling Woven Fabrics.—JOHN PATTERSON, Belfast, Ireland. Application filed January 15, 1873.

Three beams have their bearings in two disks, which, with their axis, may be rotated, to bring either beam adjacent to the stampers, and at the same time place a beam, containing cloth previously beetled, in position for the unwinding of the cloth. The beam containing the cloth which is being beetled receives both an endwise and rotary motion from the shaft that operates the stampers, by means of the devices enumerated in the second clause of claim.

Claim.—1. The shaft C, box B, vertical screws D, eccentrics C^1 C^1, sliding blocks C^2, springs F, stampers E, beams G G^1 G^2, and disks H H keyed to the trunnion I, combined as described.

2. The worm-wheels J and K, shafts C and L, pinion M, wheel N, shaft O, bevel-wheel P, wheel Q, shaft R, grooved boss U, flanged pinion S, and wheel T keyed to the axle of the beam G, all combined and operating together as and for the purposes described.

141,726.—Spring Bed-Bottom.—JAMES POLLITT, Edon, Ohio. Application filed December 21, 1872.

Side rows of springs have loops that fit through the cross-slats and are held by straps, while a central row of springs has loops which clasp the slat in the center.

Claim.—1. The springs C, provided at their upper ends with loops *a* that fit mortises in the cross-slats B, in combination with said cross-slats B, strap D, and head and foot pieces, arranged as and for the purpose specified.

2. The combination of the central row of springs having loop *b* to receive and hold the cross-slats B at the center with the side row of springs C, the cross-slats B, and straps D, all arranged as and for the purpose specified.

141,727.—Hat-Tip Lining.—WILLIAM H. M. PYE, Brooklyn, N. Y. Application filed May 6, 1873.

Claim.—1. A hat-tip lining made of two or more sections of fabric united at the edges by a strip of material and fusible adhesive substance, substantially as set forth.

2. A hat-tip lining ornamented by a strip of paper affixed by fusible adhesive material, substantially as set forth.

141,728.—Balance Slide-Valve.—SAMUEL REID, Chicago, Ill. Application filed May 26, 1873.

A hollow ring is placed in a recess between the saddle-plate and the valve, the expansion of the steam within the ring holding it firmly against the adjacent parts.

Claim.—The hollow ring C, having a slot, *d*, extending around it, in combination with the valve A and saddle-plate D, all constructed substantially as and for the purposes specified.

141,729.—Buckle.—AI B. SHAW, Medford, assignor to MARTIN W. CARR, Somerville, and HIRAM W. BROOKS, Cambridge, Mass. Application filed July 21, 1873.

Claim.—The above-described buckle, consisting of the crimped frame *a a'*, and the blunt tongue *b b'*, constructed and arranged substantially as and for the purpose hereinbefore set forth.

141,730.—Grain and Seed Drill.—JACOB H. SHERMER, Wilmington, Del. Application filed June 6, 1873.

Claim.—1. The triangular-shaped shovel B and cutter D, cast in one piece with the boot A, substantially for the purposes herein set forth.

2. The curved screw-rod *a*, cast in the boot A, and having the bell-shaped seed-distributer G adjustably fixed to its lower end, substantially as herein set forth.

141,731.—Meat-Chopper.—ALBERT R. SILVER, Salem, Ohio, assignor of one-half his right to JOHN DEMING, same place. Application filed May 21, 1873.

A cylindrical block and surrounding hopper are revolved by a suitable gear-connection beneath, in which train of gearing a sprocket-wheel serves to arrest the revolving movement intermittingly, so that a pause shall occur simultaneously with the fall of the knives, the knives or choppers ascending and descending by direct connection with the beat main shaft.

Claim.—1. The combination of the block 7, provided with circular rack 6, sprocket and side sprocket-wheels 4 and 2, and crank-shaft *d*, arranged and operating so as to give the hopper an intermittent motion.

2. The screw-nut 9 upon the top of the knife-shaft, having a loose sleeve extending beneath over the thread and following the knife down, substantially as set forth.

3. The combination of the crank-shaft *d*, pitman *c*, knife-shaft *g* provided with knives, and block 7 operated by suitable gearing, substantially as shown and described.

141,732.—Manufacture of Illuminating-Gas from Petroleum, &c.—ROLAND H. SMITH, Pittsburg, Pa. Application filed June 4, 1873.

The stove is hinged together, and contains a retort having a central aperture communicating with the stove-pipe, which is provided with a sliding sleeve to permit adjustment of the pipe. A scraper for cleaning out one of the pipes that carries gas to the washer passes through a plug at the junction of the two pipes.

Claim.—1. The retort D D', constructed as described, with central aperture *d*, and having its two parts connected by means of a lead seal, substantially as and for the purposes herein set forth.

2. The stove A B, hinged together at *a*, and containing within it the retort D D', in combination with the stove-pipe C, having movable sleeve C', all substantially as and for the purposes herein set forth.

3. In combination with the connection P, the plug O, rod N, and scraper M, constructed and arranged substantially as and for the purposes herein set forth.

141,733.—Mode of Opening and Closing the Doors of Vehicles.—SAMUEL SMITH, Halesworth, Great Britain. Application filed January 16, 1873.

By means of levers or handles, cords, wires, or rods are operated to open or close the door.

Claim.—The combination of the various parts described, when used for the purpose of making communication between the door and driving-seats of carriages, as herein set forth.

141,734.—Machine for Making Chains.—LOUIS SOUTHER, Springfield, Ill. Application filed July 12, 1873.

Two pivoted arms, operated vertically by cams and toward each other by sliding over a ring, receive the blank on their upper ends and press it upward around the mandrel, in which position it is seized by two lips (which are pressed together by two horizontally-sliding heads, also acting as supports to the mandrel,) and held in position to receive the action of the upper die, which bends it over the top of the mandrel. The upper die, in welding, presses the joint on the mandrel, and the lips, pressed together by the sliding heads, give the lateral pressure. The lips, after the welding is performed, are turned one-quarter of a revolution by means of a spiral groove in a head or sleeve to which they are attached, and hold the finished link in position to receive another blank.

Claim.—1. The four gear-wheels C, the cams D L M W W B', and arms E K O V V A', constructed and combined with the large driving gear-wheel B, for giving motion to the operating mechanism, substantially as herein shown and described.

2. The fingers F, operated by the guide-ring I and the former H, in combination with the arms E and A', the cams D B', and gear-wheels C B, for bending the bar to form the link, substantially as herein shown and described.

3. The die J, lips S, and heads U, in combination with the former H, the arms K V V, cams L W W, and gear-wheels C B, for welding the open end of the link, substantially as herein shown and described.

4. The locking-bar T, spirally slotted or grooved sleeve R, arm O, and cam N, in combination with the lips S, to cause said lips to hold the completed link and turn it into position to receive the bar for the next link, substantially as herein shown and described.

141,735.—Heel-Breasting Machinery.—VIVIAN K. SPEAR, Lynn, Mass. Application filed June 24, 1873.

Claim.—1. In a heel-breasting machine, the combination with the vertical breasting-knife, placed over the jack in the plane of the heel to be operated on, of a jack arranged to support the shoe with its sole uppermost, and in substantially a horizontal plane, and an upright jack bar or support adapted to rise and fall, to carry the jack to and from the knife, and to move in a horizontal plane to vary the position of the work with respect to the knife, substantially as shown and set forth.

2. In heel-breasting machinery, the combination of a jack capable of vertical and horizontal play, and a knife-carrier capable of horizontal swiveling movements, substantially as and for the purposes stated.

3. The combination, with the knife-stock and its swinging or pivoted carrier or crane, of the vertically-yielding knife gage or guard, carried by said crane, and arranged and operating in connection with the knife, substantially as shown and set forth.

4. In combination, a jack susceptible of vertical and horizontal play, a knife stock or carrier susceptible of horizontal swiveling movements, and a gage or guard applied adjustably to said carrier and with respect to the knife, substantially as and for the purposes stated.

141,736.—Log-Turner.—ESAU TARRANT, Muskegon, Mich. Application filed May 10, 1873.

The segment of a toothed wheel is so arranged that when rotated in one direction it shall roll a log from the log-deck of a saw-mill onto the saw-carriage, and when the motion is reversed will turn the log upon the carriage.

Claim.—1. The segment D, cog-toothed at F, and supported in the side pieces of the log-deck A, in combination with the said log-deck and the pinion G, as and for the purpose specified.

2. The segment D, cog-toothed and spiked at F 3, respectively, and journaled in the upper ends of bars I, with the outer ends of the axle of the segment resting in curved slots in the side pieces of the log-deck, in combination with said slots, the log-deck A, the bars I, and pinion G, as and for the purpose specified.

141,737.—Coal-Sifter.—LEWIS TIBBETTS, Augusta, Me., assignor of one-half his right to JOSEPH H. CLARK, same place. Application filed May 15, 1873.

Claim.—The coal-sifter herein shown and described, composed of an ash-box, A, mounted on rockers *c c*, and provided with removable slats *c c*, sprung into angular recesses *b* near the top of the box, and having a removable sieve, B, made of such size as to be placed within the box A when not in use by removing the slats *c c*, so that the sifter shall occupy less space, as specified.

141,738.—Ice-Cream Freezer.—ELIJAH B. TILDEN, Prairie City, Iowa. Application filed February 15, 1873.

Consists in combining, arranging, and co-operating an ice-holder, cream-holder, scraper, and beater in such a manner that during the operation the beater will be locked to the cream-holder and move therewith, while the scraper is at the same time held stationary in the revolving cream-holder.

Claim.—1. The locking-bar C, in combination with the ice-holder A and cream-holder B, substantially as described, and for the purpose specified.

2. The locking-bar C, in combination with the tube-key *b* and scraper *a*, substantially as described, and for the purpose specified.

3. The locking-bar C, tube-key *b*, and scraper *a*, in combination with the beater *c d*, having a series of cutters, 1, 2, 3, and 4, substantially as described, and for the purpose specified.

4. The coupling device *f* and *g* and pivot A, in combination with the beater *c d*, substantially as described, and for the purpose specified.

141,739.—Log-Turner.—JOHN TORRENT, Muskegon, Mich. Application filed January 29, 1873.

The toothed bar, which rolls the logs, is jointed in the middle, which allows the upper portion to oscillate and follow the log as it rolls, while the lower part reciprocates perpendicularly.

Claim.—1. The toothed bar, the bottom of which is pivoted to an upright reciprocating shaft, as described.

2. The combination of the inclined ways provided with a stop, A, the toothed bar, the upright shaft, and the chain led through a sheave and operated by a cylindrical shaft, as described.

141,740.—Clothes-Pin.—VINCENT D. URSO and BENJAMIN CHARLES, Evansville, Ind. Application filed May 7, 1873.

Claim.—1. In combination with a clothes-pin having two jaws forced together by a single spring, a rubber tooth inserted in one jaw, and fitting in a recess in the other, substantially for the purposes herein set forth.

2. The within-described clothes-pin, consisting of the jaws A A with handles B B, the spring C, hole *d*, rubber tooth A, and recess *i*, all constructed and arranged substantially as and for the purposes herein set forth.

141,741.—Mechanical Power.—CORNELIUS VAN DERZEE, Albany, N. Y., assignor of two-thirds his right to DAVID DORRHUS and DAVID H. MATHIAS, same place. Application filed July 23, 1873.

A rocking-chair has its rockers extended, and a vertical frame attached to their ends. Said frame is connected with the chair by levers operated by the weight of the operator and hand levers. With the rise and fall of the chair reciprocatory motion is communicated to any device requiring such motion.

Claim.—1. The combination of the extended ends B of the rocker, vertical standards or gallows E, and foot-lever C with the chair A, substantially as and for the purpose set forth.

2. The handled lever F and pitman G, in combination with the supporting-bar D and foot-lever F, substantially as and for the purpose set forth.

3. The connecting-bar H, in combination with the lever F, chair A, and the gallows E, substantially as and for the purpose set forth.

4. The combination of the rollers a with the supporting-bar D, foot-lever C, and chair A, substantially as and for the purpose set forth.

5. The combination of the spring I with the lever F and the rocker B, substantially as and for the purpose set forth.

141,742.—Paper-Folding Machine.—ALVAH WASHBURN, Medina, Ohio. Application filed May 1, 1873.

A sliding bent plate forms a continuation of the folding rib on the fly, being moved backward to clear its hinge and forward to insure a complete fold. The carrying-arm of the fly is a spring, to compensate for an excess of motion.

Claim.—The sliding creasing-blade H, combined with the stationary creasing-rib and folding fly or flies of a paper-folding machine, as and for the purpose specified.

141,743.—Button-Fastening.—ELONZO S. WHEELER, Westport, Conn., assignor to himself and JONATHAN E. WHEELER, same place. Application filed April 10, 1873.

Claim.—In combination with a tubular rivet, substantially such as described, the head D, formed from two disks, n r, when the said disk n is formed with teeth t more or less in number, substantially as and for the purpose specified.

141,744.—Cutter-Head.—DANIEL C. ALLEN, Concord, N. H. Application filed July 31, 1873.

The cutters are placed upon spindles and secured between collars upon the arbor by means of a fixed shoulder formed thereon, and a screw-thread and corresponding nut.

Claim.—The combination of the adjustable cutters with the holding-collars, nut, and spindle, all the parts being constructed, arranged, and operating as specified.

141,745.—Hollow Auger.—GEORGE F. ALMY, Delphos, assignor to himself and H. M. CLARK, Toledo, Ohio. Application filed July 10, 1872.

Claim.—A hollow auger cut in a series of spring-sections A A, each section having a suitable knife or cutter, in combination with a ring, D, placed around the outside of the sections, and its inner edge made in oval form, all substantially as and for the purposes herein set forth.

141,746.—Steam-Generator and Apparatus for Rendering Fats.—VALERIUS D. ANDERSON, Springfield, Ohio. Application filed May 14, 1873.

A steam-generator is provided with two sets of heads and two sets of tubes, one of the series of tubes ending in a manifold, while the other series end separately in a neck, both of which combine to form a steam-space. Slides are provided to vary the course of the products of combustion. A kettle for rendering animal-fat is arranged above the boiler, under which is a superheating steam-chamber, the products of combustion passing around the kettle without impinging on it.

Claim.—1. The upright cylindrical body a, provided with the two necks b, in combination with the heads c, each provided with several tubes, d, and the vertical tube or manifold e, having the outer ends of all the tubes d connected thereto, as shown.

2. The combination of a steam-generator, a kettle heated by steam therefrom, and a jacketing or flue arranged to conduct the waste products of combustion from the generator around or through the kettle in such manner as to superheat the steam while in the kettle.

3. In combination with the steam-generator, the hollow-walled kettle G, surrounded by the casing p, through which the waste products of combustion are conducted from the generator, as shown.

4. In combination with the generator having the heads c, tubes d, and tubes or manifolds e, the sections consisting of tubes f, long tube or manifold g, and short tubes or manifolds h, constructed and arranged as shown.

5. In combination with the steam-generator, constructed as shown and described, the plates o, arranged as and for the purpose set forth.

141,747.—Outlet-Valve for Water-Tanks.—JASPER ARMSTRONG, St. Joseph, and DANFORTH CHENEY, Brookfield, Mo. Application filed July 7, 1873.

The valve is provided upon its upper surface with a slotted boss, through which the operating-lever passes and is pivoted. The valve-seat consists of a ring of rubber adapted to fit into rabbets in a holder, and held in position by a covering-plate, which last is firmly secured to the bottom of the tank by bolts.

Claim.—1. The holder A, provided with the central opening B and rabbets C and D, and the valve-seat E when fitted to or within said rabbet D, when said parts are combined with each other and with the covering-plate G, substantially as and for the purpose specified.

2. The valve L, provided with the boss M and slot m, in combination with the operating-lever N and pivoted bearing-pin Q, substantially as and for the purpose shown.

141,748.—Sheet-Metal Bucket.—WILLIAM AUSTIN, Philadelphia, Pa. Application filed February 17, 1873.

A sheet-metal bucket supported on an open flange so that the bottom may freeze equally with the sides, and corrugated to allow it to expand when the contents are frozen.

Claim.—A bucket having its body composed of corrugated sheet metal, and having an open flange or support below the bottom, substantially as described.

141,749.—Machine for Making Buttons.—JEAN FELIX BAPTEROSSES, Paris, France. Application filed September 25, 1872.

Dies for corresponding faces are affixed to upper and lower die-plates. Material is introduced into holes of a central plate. Die-plates are then brought together, molding buttons in holes of central plate, which is lifted with upper die-plate, and a sheet-metal tray, having chambers corresponding to perforations in central plate, is introduced beneath it to receive the formed buttons for the kiln. Suitable devices are used intermediately to pierce buttons or prepare them for shanks.

Claim.—1. The combination, substantially as described, of the sliding piece G carrying the upper dies P, the movable middle piece I, and the fixed lower dies P'.

2. The middle plate I and the lower dies P', combined and arranged, in respect to each other, to permit the introduction between them of a receiver or receivers for the buttons, as described.

3. The combination of the standards T with the sliding piece G, its spring-boxes R, and the movable middle plate I, all substantially as specified.

4. The combination of the punches of the upper die with rods f, to which an independent sliding movement, through the said punches, is imparted, substantially as and for the purpose specified.

5. The combination of the punches of the upper die with screw-rods Y, to which a combined rotary and longitudinal movement, through the said punches, is imparted, substantially as and for the purpose specified.

141,750.—Portable Fence.—GUSTAV F. BECHER, Brooklyn, N. Y. Application filed June 6, 1873.

Eyebolts are pivoted to the sides of a lazy-tong fence, through which stakes are inserted which enter the ground.

Claim.—The pivoted eye-bolts a c, secured to the side of a series of lazy-tongs, A, in combination with the stakes B, substantially as and for the purpose specified.

141,751.—Spindle-Bolster for Spinning-Machines.—JOHN BRIERNHEAD, Mansfield, Mass. Application filed May 7, 1873.

The bolster has lateral play in its sockets. The screws of the first clause of claim prevent it being raised, and the set-screw of the second clause prevents it turning.

Claim.—1. The spindle-bolster, having its shank constructed with a diameter less than that of its rail-socket, and the two provided with connection-screws b d, all being arranged substantially as specified.

2. The spindle-bolster, having its shank provided with the recess c, and constructed with a diameter less than that of its rail-socket, and connected therewith by male and female screws, as described, and having a screw, f, applied to such recess and the rail, in the manner and for the purpose specified.

141,752.—Dredging-Machine.—ALBERT BOSCHKE, San Francisco, Cal. Application filed March 11, 1872.

A rotary floating wheel is attached, by means of a pivoted frame, to a barge, the frame and wheel being counterbalanced by weights attached to a rope which passes over suitable pulleys and is secured to the frame. Buckets armed with rotary cutters are arranged in a spiral line around the face of the wheel, and the wheel is adjusted to the proper depth for dredging by admitting water to water-tight compartments within it. The bottoms of the buckets are provided with gratings and water-reservoirs beneath to prevent the adhesion of the earth to the buckets. The earth is deposited on an inclined chute and slides down into the barge, from whence it is taken, by a transverse carrying-wheel, to a lateral chute having a bottom composed of trap-doors, by means of which the soil can be deposited as desired to form a levee on the bank.

Claim.—1. The floating wheel W, adjustable in its immersion by water-ballast admitted through the opening C, provided with dredging-buckets G G, arranged around its face in a spiral form, in combination with the counterbalance-weights Q Q, engine E, and connecting-gearing M M, s c, g g i t, and X, substantially as and for the purpose hereinbefore set forth.

2. The elevator-wheel D, furnished with buckets L L for cutting the soil, in combination with the chute S', distributing drop-doors T T, engine E, forward and reversing gear M', h h, l l, v, and X X', substantially as and for the purpose hereinbefore set forth.

3. The projections s s on the floating wheel W, which actuate the spokes of the wheel K K, drum J, and chains C C, for the automatic movement of the barge B, substantially as and for the purpose hereinbefore set forth.

4. The dredging-buckets G G, provided with grate-bottoms inclosing water-reservoirs, arranged around the floating-wheel W, in the manner described, substantially as and for the purpose hereinbefore set forth.

141,753.—Cotton-Planter.—ROBERT E. BOWEN, George's Creek, S. C. Application filed June 17, 1873.

A seed-hopper having a shaker-spout suspended from the bottom by means of flexible connection and arms, which give the spout an up-and-down shaking motion by coming in contact with pegs secured near the periphery of a front wheel. To the shaker is attached a rod for adjusting the arms in and out of gear.

Claim.—The combination, with the spout D, suspended from the hopper A, and provided with arms e, of the cross-bar e', arranged between said spout and the toothed wheel, and the adjusting-rod extending back to the handles F, all as shown and described, to operate as specified.

141,754.—Spike-Machine.—WILLIAM A. D. BOWMAN, Poughkeepsie, N. Y. Application filed January 29, 1873.

Connected to the griping-lever is a stirrup in which the fulcrum-pin of the bending-lever is adjustable by a screw.

Claim.—In a spike-machine of the character specified, a bender, G, which is adjusted vertically with reference to the griping-die C, substantially as and for the purpose set forth.

141,755.—Electric Apparatus for Signaling Between Railway Trains.—ROBERT K. BOYLE, New York, N. Y. Application filed July 1, 1873.

Line-wire divided into sections; polarized switches normally breaking circuit at ends of sections; battery and alarm on train. Train closes circuit to switch, causing switch to close circuit at one end; a train approaching causes switch at other end to close circuit; alarm then sounds on both trains.

Claim.—The polarized switch D, situated between the poles of two electro-magnets, C C', in combination with insulated anvils f f' on the side of a railroad track, and with an audible or visible signal and keys g h h', or their equivalents, attached to a locomotive, the whole constructed and operating substantially as shown and described.

141,756.—Car-Coupling.—RICHARD B. BUCKNER, Gilroy, Cal. Application filed March 21, 1873.

One bumper has a flaring mouth, the lower portion of which is cut away. The draw-bar is pivoted on a crank-rod in the other bumper, and is weighted at its rear end so as to be held horizontally. When the two bumpers come together the front end of the draw-bar is depressed until it passes beneath the cavity of the opposite bumper, when it rises and is held therein until its rear end is elevated, by means of a crank, to uncouple.

Claim.—1. The bumper B with its suspended draw-bar D, having the engaging head i and weight j, in combination with the bumper B' with its semicircular slotted mouth having inclined slides and slot o, the reverse side of which has a cavity or socket, s, for holding the hook or head i of the draw-bar, substantially as and for the purpose above described.

2. The draw-bar D, suspended upon the crank-shaft g, and having the overbalancing weight j to be operated by the crank-shaft f and lever n, substantially as and for the purpose above described.

141,757.—Elevated Wire-Way.—CARLOS E. W. BURNETT, Valparaiso, Chili. Application filed June 6, 1873.

The rope is supported by hubs placed in pairs, with interlocking arms which permit the suspensory-bar to pass without impediment. The rope is grasped by a griping device composed of toggle-levers, which release their hold when the load is slightly lifted by impinging on an inclined plane.

Claim.—1. The arrangement of the frames A A B with their horizontally-revolving rope-supports G f, substantially as and for the purpose above described.

2. The revolving hubs G G, with their interlocking angularly-attached arms f f, substantially as and for the purpose above described.

3. The bolts C C, with their heads d, in combination with the hub G and cap-plate h, substantially as and for the purpose above described.

4. The pendent rod or bar p, with its crossed lever-arms r r and gripers s s, by which the cars are attached to the rope, substantially as above described.

5. The bar p, with its crossed lever-arms r r and gripers s s, in combination with an inclined plane, whereby I am enabled to automatically detach the cars, substantially as above described.

141,758.—Dash-Board.—JOHN S. CAMPBELL, Bridgeport, Conn. Application filed February 17, 1873.

Claim.—The dash-board consisting of the metal frame or plate A and the India-rubber filling B, which is secured to the frame by vulcanization, all as set forth.

141,759.—Turbine Water-Wheel.—ELISHA P. H. CAPRON, Hudson, N. Y., assignor to THE CAPRON WATER-WHEEL COMPANY, same place. Application filed December 17, 1872.

Means are provided for attaching and securing the buckets to the disks, so that while the said buckets are detachable, and may be separately removed and replaced, they are firmly secured in position when in use.

Claim.—1. A detachable bucket or float of a turbine water-wheel, constructed as described and shown, being provided with the recess a, groove b, and slots d, for the purposes herein set forth.

2. The bucket B, constructed as shown and described, in combination with the bolt c and disks A A, the latter being provided with the fillets f f f and projections, as and for the purposes set forth.

141,760.—Machine for Filling Twist-Drills.—SIMON W. CARD, Mansfield, Mass., assignor to himself and JOHN BRIERNHEAD, same place. Application filed April 30, 1873.

A sliding bolt on the frame may be made to look either of the wheels B C. The former wheel being held to the spiral groove and the latter to the straight groove, with wheel C locked, spindle A will move forward when screw G is turned, but will not rotate, while if wheel B be locked, both rotary and longitudinal motion will be imparted to spindle A.

Claim.—1. The combination of the shaft or spindle A, the straight and helical grooves a b, the notched wheels B C, the studs f g, and the slide-bolt E, all constructed, arranged, and applied together, and to the bracket D, substantially in the manner and to operate as set forth.

2. In combination with the shaft or spindle A, helical grooves a b, the notched wheels B C, the stud f g, and the slide-bolt E, the work-supporter K, applied to the support-rail F, as set forth.

3. In combination with the shaft or spindle A, the straight and helical grooves a b, the notched wheels B C, the stud f g, and slide-bolt E, the feeding-screw G, the support-rail F, and work-supporter K, all arranged essentially in manner and to operate as specified.

141,761.—Sawing-Machine.—THOMAS H. CARROLL, Erie, Pa. Application filed July 12, 1873.

The gage and movable saws are adjusted by means of levers attached to sliding bearings.

Claim.—1. The sliding sleeve and collar c', having grooves l l, in combination with the box e e''', having the lining of metal e'', when constructed to operate in the manner described.

2. The combination of the revolving and sliding sleeve and collar c' carrying saw C', box e e''' having arm e' and eye D', and hand-lever E, with the guide-rod D, substantially as and for the purposes described.

3. The pivoted and slotted sliding sleeve f, having arm f' and gage-rod F, in combination with the transverse guide-rod g, substantially as and for the purposes described.

4. In a machine for sawing planks or boards into strips, the sliding saw C', the fixed saw C, the horizontally-adjustable gage F, and single carrying-rollers G, when constructed and arranged with relation to each other, and operating in the manner substantially as described.

141,762.—Air-Compressor or Blower.—LORENZO CHASE, Portland, Me., assignor of one-half his right to CHARLES W. CAHOON, same place. Application filed July 16, 1873.

The air being forced from one of the compartments by the direct action of steam, the steam is condensed by a jet of water, and a vacuum is formed which is instantly filled, through a valve opening inward, by outside air. This action is repeated alternately in each compartment, the steam and water valves operating, through suitable connections, by the piston-rod of the pump, which supplies the condensing-jet.

Claim.—1. The combination of two or more air-chambers, provided with suitable openings and apparatus for the automatic and alternate admission of steam and water, and for the admission and emission of air, substantially as and for the purpose specified.

2. The construction and relative arrangement of the air-chambers A and B, air-ports H and K, steam-ports d, and water-pipes O and e, substantially as and for the purpose shown.

3. The hereinbefore-described apparatus, as a whole, when its several parts are constructed and combined to operate substantially as and for the purpose set forth.

141,763.—Lamp.—ROBERT CHRISTY, Mansfield Valley, Pa. Application filed June 27, 1873.

The oil-reservoir is formed of several vertical hollow cylinders arranged around a similar central cylinder containing the burner, all of the cylinders communicating at their extremities with an upper and a lower oil-chamber.

Claim.—A lamp for burning hydrocarbon and other oils, composed of an upper and lower chamber, a central vertical tube provided with openings i i at its upper and lower ends, and a series of exterior tubes, whereby the oil is separated into a number of small columns surrounded by atmospheric air, substantially as described, for the purpose specified.

141,764.—Coating Canvas to Form Tarpaulins.—CYRUS COBB, Charlestown, Mass. Application filed May 13, 1873.

Black paint mixed with linseed oil, red lead, litharge, beeswax, boiled; black paint, red lead, litharge, spirits turpentine, boiled.

Claim.—The preparation of burlaps or canvas, or other suitable fabric, substantially as herein described, for the purpose specified.

141,765.—Heating-Stove.—LEVI R. COMSTOCK, Baltimore, Md. Application filed January 18, 1873.

The inner hot-air chamber being brought in contact with the outer cylinder at two points forms with it the two crescent-shaped flues E F. The flues K pass through the hot-air chamber from top to bottom.

Claim.—1. The arrangement of the elliptical inner hot-air chamber E within the outer casing D, so that its sides shall touch the inner wall of said casing, dividing the space between into the crescent-shaped flues E and F, substantially as specified.

2. The combination, with the broad flues E F G L, of the dipping-flues K, the hot-air chamber, and the exterior case, substantially as specified.

141,766.—Solar Compass.—HENRY O. COOK, New York, N. Y., assignor to MARINE VARIOMETER COMPANY, same place. Application filed June 23, 1870.

An adjustable compass-card, suspended in gimbals and heavily loaded, is provided with an inclined index or gnomon for determining the solar meridian by the shadow-mark.

Claim.—The weighted box A, hung as described, the dial-plate B, and gnomon C, combined, when constructed and arranged as shown and set forth.

141,767.—Wrench.—MOSES G. CRANE, Newton, Mass. Application filed March 24, 1873.

Claim.—The wrench constructed as described—that is, with its two bars a b curved in the arc of a circle and arranged to slide

upon each other throughout their entire inner curves, each having a right-angled and an obtuse-angled jaw, the two being held together by straps and operated by a screw-thread in the inner face of one and by screw pivoted in the body of the other.

141,768.—Loom-Shedding Mechanism.—GEORGE CROMPTON, Worcester, Mass. Application filed November 11, 1872.

The lifter and depresser bar and the evener-bar are pivoted to rocking arms, which are actuated by a reciprocating slide-rod through an intermediate link and bell-crank lever. To enable the lifter and depresser bar to yield, it is arranged to slide under spring-levers. To enable all the warps to be raised at once, the lifter and depresser bar is raised out of engagement with the lower jacks by means of a shaft carrying eccentrics and provided with a handle. The shaft which operates the pattern-cylinder is in two parts, connected by a sliding clutch and wheel, by which means the cylinder can be disconnected from the driving-gear, and this operation also removes the detainer-roll from the notches of the wheel on the cylinder-shaft.

Claim.—1. The link A, in combination with the rockers i^1 and bell-crank lever g, and reciprocating slide-rod f, substantially as shown and described.

2. The arms or levers p^2 and springs r^2, substantially as shown and described, in combination with the lifter and depresser bar t^2.

3. The shaft s^2, eccentrics t^2, and arms u^2, or their equivalents, for raising the lifter and depresser bar, substantially as shown and described.

4. The shaft p provided with the clutch q^1 and crown-wheel, combined with the sliding clutch, its shaft and gear-wheel, the pattern-cylinder, and the two-armed shaft u v, the arm v acting against the wheel x of the pattern-cylinder, and all operating as described.

141,769.—Locomotive Ash-Pan Cleaner.—ASA O. DENIO, Wilmington, Del. Application filed April 26, 1873.

A jet of water is employed to extinguish the fire in the ash-pan and expel accumulation of ashes therein.

Claim.—The combination described, with a locomotive ash-pan, of a nozzle directed to the pan, attached to the boiler and to a cock communicating with the water-space of the boiler, all substantially as and for the purpose set forth.

141,770.—Base-Burning Stove.—WILLIAM DOYLE, Albany, N. Y. Application filed May 28, 1873.

Claim.—1. A faucet or revolving valve, A, suspended within the lower part G of a fuel-reservoir, B, and having solid or imperforate walls, so as to form a flue-space, *b*, as herein shown and set forth.

2. A fuel-reservoir, B, provided with one or more descending gas-flues, *a a*, communicating, near the lower part of said reservoir, with cold-air-induction flues *c c*, flue *b*, and valve A.

141,771.—Stove.—BERNARD DÜRRSTOCK, Cincinnati, Ohio. Application filed June 7, 1873.

When the grate rests upon the upper lugs the fire is in more immediate contact with the top of the stove and can be used for cooking. When it rests upon the lower lugs the stove is better adapted for heating the room, and by means of the vertically-sliding door and the removable blower may be used either as an open or closed stove.

Claim.—In the stove A, B, C, D, and F, the combination of the lugs f f', vertically-shiftable grate I, sliding door J, detachable blower K, guides L l' l, and retaining device M f', whereby the apparatus is rendered capable of being used either as an open-front or closed stove, or as a cook-stove, substantially as herein described and set forth.

141,772.—Circuit for Automatic or Chemical Telegraphs.—THOMAS A. EDISON, Newark, N. J. Application filed November 9, 1872.

Part of main current shunted through branch circuit. Effect of extra line current neutralized by extra current from local battery A, regulated by rheostat *l*.

Claim.—The rheostat *l* applied to the battery A in the local circuit to regulate the action thereof, in combination with the rheostat f in the branch circuit, and the receiving instrument in the main circuit, substantially as and for the purposes set forth.

141,773.—Circuit for Automatic Telegraphs.—THOMAS A. EDISON, Newark, N. J., assignor to himself and GEORGE HARRINGTON, Washington, D. C. Application filed January 15, 1873.

Line kept statically charged by the main battery, whose circuit is made and broken with immense rapidity by a pulsator, resistance being such that these currents do not affect receiver; transmitter in shunt around the resistance. Receiver has two or more pens in circuits having shunts containing magnets of varying size. Water resistance used to divide current passing to a looped-in station.

Claim.—1. The resistance *b* and transmitting-instrument *d*, arranged in connection with the line, the battery *a*, and the rapid circuit-breaker *c*, as and for the purposes set forth.

2. Two or more styluses or pens connected with the main line and with shunt-circuits, in which are differing magnets for operation upon the chemical-receiving paper, as set forth.

3. The vessel of liquid receiving the two ends of the shunt-circuit and the two ends of the main line to vary the strength of the shunt-circuit according to the relative positions of such circuit ends, as set forth.

141,774.—Chemical Telegraph.—THOMAS A. EDISON, Newark, N. J., assignor to himself and GEORGE HARRINGTON, Washington, D. C. Application filed March 13, 1873.

Paper wet by chemical solution, by siphon just before reaching electrodes, which are both upon the surface of the paper; current passing across instead of through it.

Claim.—The circuit-points or electrodes *c c*, connected with the wires *l l* and applied at each side of the line of chemical solution upon the surface of the paper, substantially as set forth.

141,775.—Perforator for Automatic Telegraphs.—THOMAS A. EDISON, Newark, N. J., assignor to himself and GEORGE HARRINGTON, Washington, D. C. Application filed March 13, 1873.

Each punch actuated by an electro-magnet. Key closes circuit to electro-magnets necessary to perforate any character at once.

Claim.—A group of punches for perforating telegraphic paper, actuated by a separate electro-magnet to each punch, in combination with the circuit-bars *l* and a range of finger-keys, for selecting the circuits that are to be closed to perforate the paper in accordance with the character upon the key, substantially as set forth.

141,776.—Circuit for Automatic Telegraphs.—THOMAS A. EDISON, Newark, N. J., assignor to himself and GEORGE HARRINGTON, Washington, D. C. Application filed January 15, 1873.

Claim.—The use of an opposition or secondary battery of weak power at one or more points, to act in the main line in opposition to the pulsations from the transmitting instrument, to free the main line of surplus or static electricity, substantially as set forth.

141,777.—Relay-Magnet.—THOMAS A. EDISON, Newark, N. J., assignor to himself and GEORGE HARRINGTON, Washington, D. C. Application filed March 13, 1873.

Relay contact-points close circuit in a liquid. As these points are withdrawn an increasing tension is thrown into circuit by resistance of liquid, thus avoiding spark and oxidation.

Claim.—The adjustable contact-points acting within a liquid, in combination with the helix, armature, and spring of a sounder or relay, as set forth.

141,778.—Coking-Furnace.—HENRY ENGELMANN, Salt Lake City, Utah Ter.—A. Application filed December 6, 1872.

Claim.—1. The peculiar shape of the coking-ovens A, combining small width and great height with considerable length, as specified.

2. The combination, with the narrow and high ovens A, of the vertical heating-flues C, provided in the walls between these ovens, constituting, in fact, as many different heating-furnaces, substantially as and for the purpose specified.

3. The combination, with the narrow, high, and long ovens A, heated in the specified manner, of a valve or equivalent means of throttling or stopping the outflow of gases from the material subjected to coking, whereby the retention of the gases long enough to secure the most efficient deposition of carbon therefrom is provided for, substantially as herein described.

4. The arrangement, with reference to the heating-flues C in the intervening walls of the coking-ovens A, of the openings C of the gas-passages E, and the openings *f* of the air-conduits G, substantially as and for the purpose specified.

5. The arrangement, with reference to the vertical heating-flues C provided in the walls B of the coking-ovens A, of the outlet-flues I and the outlets J, the outlet-flues being divided centrally at *m''*, and the outlets provided at opposite ends of the furnace, substantially as and for the purpose herein set forth.

141,779.—Coking-Furnace.—HENRY ENGELMANN, Salt Lake City, Utah Ter.—B. Application filed December 6, 1872.

Claim.—1. The conduits H, of constantly-diminishing transverse area in proportion as the number of flues E diminishes, whereby the supply of gaseous fuel, flame, or hot products of combustion, as the case may be, is uniformly distributed to the flues to heat the coking-ovens, substantially as herein set forth.

2. The combination, with the conduits H leading to the flues E, of the air-inlets *c*, air-passages *d*, and openings *a'*, substantially as and for the purpose specified.

3. The combination of the canal J with the conduits H, constructed as described, and leading to the flues E, substantially as and for the purpose specified.

4. The combination, with the flues E of the coking-ovens, of the draft-passages G increasing in transverse area as they approach the centrally-located uptake I, substantially as and for the purpose specified.

5. The combination, with the coking-ovens, constructed and proportioned as described, of the openings *m'*, substantially as and for the purpose specified.

141,780.—Fire-Grate.—WILLIAM H. FARRIS, Cairo, Ill. Application filed May 31, 1873.

Each bar is hollow and made in one piece, the back being turned up. A bolt, having a conical nut at each end, passes through all the bars and holds them together. A rubber and soft metal packing is used between the bars.

Claim.—1. The grate-bars A, constructed as shown, provided with plane horizontal upper surfaces and having at the rear end of each a bearing-lug, *a'*, substantially as and for the purpose specified.

2. In combination with the bearing-faces F and G, the rubber gasket H and soft-metal gasket A, substantially as and for the purpose shown.

3. The means employed for securing together the grate-bars, consisting of the rods I passing through openings *b* and *c* and through the pipes K and K', and provided upon their threaded ends with conical nuts *i*, which fit into corresponding seats in said pipes, substantially as specified.

4. The grate-bars A and A, constructed as shown, provided with the bearing-faces F and G combined to form a whole by means of the rods I and nuts *i*, and connected to or with a boiler by the pipes K and K', substantially as and for the purpose set forth.

141,781.—Refrigerator.—SIMON M. FORT, Syracuse, N. Y. Application filed June 28, 1873.

Two drawers are placed in the center of the refrigerator, one above the other, each provided with an overflow-pipe and a faucet. The lower drawer receives drippings from ice and overflow water from the upper drawer.

Claim.—1. The drawers G and G', constructed and arranged as described, and adapted for the uses set forth.

2. The lower drawer G', constructed as described, and provided with outlet-pipe H and faucet g^1, and so placed in the refrigerator as to receive and contain the cold water from the melting ice, in the manner set forth.

3. The refrigerator A B C D, provided with ice-box, cooling-closet and drawers, chambers or water-boxes G and G', substantially as set forth.

4. In a refrigerator, one or more drawers or compartments, G and G', each provided with an overflow-pipe and faucet, substantially as and for the purposes set forth.

141,782.—Ornamental Window-Glass.—CARL FREDERICI, New York, N. Y., assignor of one-half his right to EDWARD B. GRANT, same place. Application filed February 21, 1873.

Claim.—As a new article of manufacture, a pane of glass composed of two plates united, each of a different color, having etched or cut upon their inner sides similar designs that register with each other, the design on one plate being a cameo, *c*, and that on the other an intaglio, *b*, substantially as and for the purpose described.

141,783.—Thrashing-Machine.—PETER GEISER, Waynesborough, Pa. Application filed June 26, 1872.

Fan-arms beveled so as not to interfere with blast. Stirring-rods attached to reciprocating-shaft to keep throat and shoe clean.

Claim.—1. In combination with the shoe and reciprocating rod E^1, rods E^2, arranged to operate substantially as set forth.

2. The twisted or beveled arms which carry the fan-blades, arranged to operate substantially as set forth.

3. In combination with the tailing-shoe, constructed substantially as set forth, the additional dividing-shelf D'.

4. In combination with the trunk-bottom and rakes, stirring-rods E, substantially as set forth.

5. In combination with the shoe H and tailing-shoe D and knockers, the set-screw F for regulating the action of the former, substantially as set forth.

141,784.—Folding-Chair.—KASPAR GEISLER, New York, N. Y., assignor to himself and JOHN LEATORA, same place. Application July 14, 1873.

Claim.—A folding-chair having a pivoted seat, A, connected by a hinge, *b*, with the back D, from which pins *d d* project into the grooves *e* of the side supports B, substantially as herein shown and described.

141,785.—Apparatus for Navigating the Air.—THOMAS GREEN, New York, N. Y. Application filed July 15, 1873.

Hollow bars form frame-work of machine. Outside the frame are bearings for propeller-shaft, which crosses frame at right angles and carries feathering blades at each end.

Claim.—1. The shaft F, the pivoted rods G, the frames H and A, and the floats or vanes I, when constructed and combined to operate in the manner and for the purpose substantially as specified.

2. In combination with the vane-rods G, provided with the pins *g*, the disk or collar K, secured upon the shaft F, and the segmental disk L, attached to or upon the bearing D, substantially as and for the purpose shown.

3. The main or supporting frame, when its parts are constructed and combined in the manner and for the purpose substantially as set forth.

4. In combination with the main or supporting frame, the pivoted wheel-frame M M and ss, provided with the rollers R and the bar S, pivoted to or upon the rear end of said frame, substantially as and for the purpose shown and described.

141,786.—Cultivator.—JONATHAN M. GUSTIN, Wilmington, Ohio. Application filed January 26, 1873.

The axle-tree has two crank-arms, which carry a shaft to which the plow-beams are attached. Pairs of corrugated plates admit of the shifting of this bar or shaft to a higher or lower position.

Claim.—1. The yielding beam-supporters, consisting of the bent plates M, swiveled to the beam E, and holding the adjustable screw-rods N and springs O, substantially as and for the purpose specified.

2. The yielding beam-supporter, consisting of the bent plate M', hinged to a swiveled horizontal shank, and holding the adjustable screw-rod N and spring O, substantially as and for the purpose specified.

3. The adjustable arched or bent brace H, constructed and arranged as shown and described, in combination with the axle A, axle-arms C, and clutch-plates B B', substantially as and for the purpose specified.

4. The adjustable and removable cast G G^1, loop G^2, and rack G^3 combined, substantially as and for the purpose set forth.

5. The axle A and axle-arms C, in combination with the clutch-plates B B', bolts b^2, and the combined walking and riding cultivator herein described.

141,787.—Hose-Pipe Nozzle.—FRANK E. HALL, Boston, Mass. Application filed July 16, 1873.

The three-way cock has its outlets arranged in the same circumferential line in relation to the passage in the eduction-pipe, thus enabling the water to be thrown at the same time both from the sprinkler and tube, or from either.

Claim.—The described hose-pipe nozzle, having, in combination with the nozzle-pipe C, perforated chamber D E and eduction-pipe G, the three-way cock F, having its outlets all arranged in the same annular or circumferential line, and in relation to passages leading to the pipe G and chamber D E, as set forth, whereby the water may be thrown at the same time both from the sprinkler and from the tube, as well as from either alone.

141,788.—Sign.—JAMES HARRISON, New York, N. Y. Application filed July 1, 1873.

Transparent material with raised letters or figures, the body or ground-work rendered opaque upon its rear side, while the letters or figures remain transparent and are ornamented upon their faces with buttons of same material.

Claim.—The letters or figures of a sign made of a transparent material, with the protuberances *a a*, with or without the shoulder C, the ground portion of said letters or figures being covered with the material *b*, substantially as herein shown, for the purpose specified.

141,789.—Coffee-Roaster.—THEODORE HERRMANN, Mattoon, Ill. Application filed May 26, 1873.

Claim.—1. The combination, in a coffee-roaster, of the heating-cylinder E, the inner wire or perforated cylinder F, and the stirring or shifting wings J, substantially as described.

2. The wire cylinder F, supported and braced within the outer cylinder by the annular flanges H and the tie-plates I, as described.

3. The annular guards or shield flanges K of the open base A, in combination with a revolving cylinder, as and for the purpose set forth.

4. The elevated ends P of the case, in combination with the removable cylinder and the removable chute Q, as and for the purpose set forth.

141,790.—Hydraulic Railroad-Car Brake.—WILLIAM M. HENDERSON, Philadelphia, Pa. Application filed April 4, 1873.

Water of condensation returned to tank before cooling. Springs between piston and brake moderate shock of sudden motion.

Claim.—1. The three-branched cock or valve A, combined with a water-tank, a steam-boiler, and hydraulic brake-operating cylinders, so that in one adjustment of the cock A the brake-cylinders B may fill or empty from the tank, and in the other adjustment of said cock the pressure within the boiler is transmitted to the fluid operating the brake-pistons, substantially in the manner set forth and described.

3. The three-branched cock or valve A, combined with a water-tank, a steam-boiler, and hydraulic brake-operating cylinders, with the springs E interposed between the brake-shoes, and the pistons operating the same by pressure of an inelastic fluid, substantially as herein described and set forth.

141,791.—Sewing-Machine.—WILLIAM HIBBINS and JAMES D. MOORE, Grinnell, Iowa. Application filed May 24, 1873.

The feed is produced by a four-motioned serrated presser supported in a cylindrical head arranged to turn about the needle-bar. The adjustable end lever attached to the lifting-lever that operates the cone is adapted to regulate the length of the feed.

1. The feed-bar H, with the serrated presser-foot A, the handle A^1, the controlling-arm A^2, the projection A^3, in combination with the cone E^1 with the flanged head e^1, the levers E^2 I, and the springs h^1, e^2, P, and A^4, substantially as described.

2. The combination, with the feeding-foot, of the lifting-lever E^2 and the pivoted adjustable end lever E^3, having the slot e^3 and set-screw e^4, substantially as specified.

3. The tension device fastened to the needle-arm C, consisting of the movable spring-case T, having the diametrical guide-eyes *t'*, spring R, set-screw *t*, and pressure-plate S S', arranged and operating substantially as shown and described.

141,792.—Organ Free Reed.—HERBERT E. HODGSON, Knoxville, Tenn. Application filed May 3, 1873.

To furnish, in connection with reed-sets of the ordinary material, a different quality of tone.

Claim.—In cabinet organs and other musical instruments similar in character, the free reed herein described, the same being made of wood or other elastic non-metallic material, substantially as set forth, for the purpose specified.

141,793.—Match-Box.—JOHN HOLTZ, Baltimore, Md., assignor of one-half his right to EDWIN HIGGINS, same place. Application filed June 11, 1873.

The match-stubs are placed on an inclined slat affixed to the side of the base, and pass, through corresponding horizontal slots in the side of the base and end of the drawer, into the drawer.

Claim.—1. In combination with the slotted base of the match-safe, the slotted sliding drawer C, into which the stubs may be placed without opening the said drawer, as set forth.

2. The plate *c'*, in combination with the entrance-slot of the base of the match-safe and the inclosed slotted drawer, as shown.

141,794.—Wrench.—WILLIAM JOHNSON, Milwaukee, Wis. Application filed November 16, 1872.

Plug for bung-hole of a cask is made tapering, and a pivoted eccentric arranged in a longitudinal groove. This eccentric is brought in contact with the interior portion of the bushing and presses tightly when the wrench is turned.

Claim.—The combination of the tapering plug A, eccentric B, and its shaft C, substantially as described.

141,795.—Corn-Sheller.—JOHN B. JOHNSON, Alma, Ill. Application filed June 21, 1873.

A spring guide and holder for the corn-ears, and a revolving and self-feeding corn-sheller.

Claim.—1. A corn-sheller composed of the revolving paring and feeding springs H and the stationary clamping-springs I, constructed and arranged substantially as specified.

2. In a corn-sheller, the combination of the paring and feeding springs H, the lugs *f*, and the plate F, constructed and arranged substantially as specified.

3. In a corn-sheller, the springs H with the paring-knife A and twisted heel *h'*, substantially as specified.

141,796.—Knitting-Holder.—HANNAH P. JOY, South Berwick Junction, Me. Application filed May 24, 1873.

Claim.—A knitting-holder, consisting of the tube 1 provided with slot 2 through which the work projects, and a suitable cap or holding device, 4, substantially as shown and described.

141,797.—Manufacture of Boots and Shoes.—CHARLES A. KEITH, Danvers, assignor to GORDON MCKAY, trustee, Boston, Mass. Application filed June 23, 1873.

The upper is lasted to the insole at the toe and crimped over the remaining perimeter. The outsole is tacked on, the last removed, and the unlasted portion of the upper withdrawn from between the insole and outsole. The shoe is then sewed upon a straight-post sewing-machine, being bent at the toe under the needle, and the crimped and unlasted portion fed into position as the work progresses.

Claim.—The improvement in the manufacture of boots and shoes, consisting in the method of lasting and uniting together the inner and outer soles and upper, substantially as described.

141,798.—Steam-Generator.—WILLIAM E. KELLY, New Brunswick, N. J. Application filed May 2, 1873.

Water carried into main chamber below the plates in tubes is collected by pockets and carried back above them. Construction permits expansion and contraction.

Claim.—1. The combination of the pockets E extending across the chamber A, the partition-plates D, and the tubes B, substantially as shown and described.

2. The partition-plates D, constructed with shoulders *f* at their forward ends, in front of the tubes B, within which said plates fit, in combination with the recesses *e* in the back edges of the pockets, essentially as specified.

141,799.—Sectional Steam-Generator.—WILLIAM E. KELLY, New Brunswick, N. J. Application filed May 2, 1873.

Circulation is maintained by passing the water from the front portion of the vertically-divided chamber through secondary tubes to the return-chamber, and them through main tubes to the rear portion of the divided chamber. The division of the return-chamber permits the easy removal from the tubes.

Claim.—1. The chamber A A', constructed with partitions B *d* and tubular connections *e e*, in combination with the tubes C D, substantially as and for the purpose herein specified.

2. The independent hook connections to the several couplets of tubes, composed of half or partial boxes E F, provided with passages *g*, and secured at their meeting faces by an outside clamp, essentially as described.

141,800.—Mechanical Movement.—LEDYARD V. LOWIS, Sun Prairie, Wis. Application filed July 18, 1873.

A two-throw cranked axle, connected by two connecting-rods to double toggle-jointed levers, one end of the levers being stationary, while the other is attached to a slide to which the pitman is secured.

Claim.—1. The combination of the double-cranked axle, connecting-rods, toggle-levers, and slide, when combined substantially as set forth.

2. A mechanical movement in which the parts are combined and arranged to operate substantially as shown and described.

141,801.—Lamp-Extinguisher.—WILLIAM D. LINDSLEY, Waltham, Mass., assignor to himself and EZRA V. SHIVELY, same place, and L. E. HEDGES, Frederick, Md. Application filed May 20, 1873.

The arms by which the snuffers are operated pass through a staple on the back, then bend at right angles and pass through both snuffer-cup and spring, and are riveted down upon the inside.

Claim.—The arm D, having the end turned at right angles, passed through both spring and extinguisher, and riveted down in front, as and for the purpose set forth.

141,802.—Paint.—JOHN LUCAS, Gibbsborough, N. J., assignor to himself and WILLIAM HENRY LUCAS, Philadelphia, Pa. Application filed November 29, 1872.

Claim.—A paint vehicle consisting of linseed-oil, heated as set forth, combined with gum and acetate of lead.

141,803.—Loom-Shuttle.—THOMAS K. MCINTYRE, Salem, Mass., assignor to HIRAM A. PEASLEE and JAMES R. ARNOLD, same place. Application filed May 16, 1873.

To prevent injury from the pin on which the head of the spindle turns, it is permanently fixed on the body of the shuttle by means of a plug driven into one or both ends of the orifice which receives it, the pin being made shorter than the orifice. To remove the spindle without removing the pin the head is notched or slotted, and, when placed upon the pin, the head is held in position by a blade-spring, the end of which serves also as a stop when the spindle is raised to remove or receive a cop. A down-stop holds the spindle in position when it is within the body of the shuttle.

Claim.—1. In the loom-shuttle the spindle-shank *i*, and notched head *b*, the pin or pivot *a*, and the spring *d*, constructed and arranged substantially as represented, whereby the spring not only performs the functions of protecting the head and notch from filaments and dust, and of retaining the head upon the pin, or preventing it from getting off such in any of the positions of the spindle, but serves as an up-stop to the shank *i* of the spindle B.

2. With the spindle head provided with the bearing-notch, as described, the pivot-pin hole, carried either wholly or partially through the body of the shuttle, in combination with the pivot-pin fixed in such hole by one or two plugs, all being substantially as specified.

141,804.—Line-Loop.—DUNCAN MCMILLAN, Osage, Iowa. Application filed March 19, 1873.

Claim.—The loop C, consisting of the frames *a b d*, bar A, and hook *i*, constructed specifically as described, and for the purpose set forth.

141,805.—Steam and Air Brake for Railway-Cars.—CHARLES E. MOORE, Boston, and MARTIN L. WYMAN, Melrose, assignors to C. A. KIELGREEN, Boston, Mass. Application filed February 14, 1873.

The pump-cylinder is supported directly upon or over the axle, and held by a link-connection. The trunk-piston is connected and operated by an eccentric upon the axle. Suitable pipes and valves in valve-boxes admit the compressed air and allow it to escape.

Claim.—1. In combination with the car-truck, the pump cylinder supported directly upon or with respect to the axle, and held by the link-connection, substantially as shown and described.

2. In combination with the pump-cylinder, the trunk-piston *l*, connected to and operated by the eccentric upon the axle, substantially as shown and described.

3. In combination with the air-compressing pump and the pipe *q*, the pipe *r* and the valve-box *r*, the pipe *v* conducting the compressed air into the car, and the pipe *y* leading the air either to the cylinder for operating the cylinder-piston or to the pipe *v*, by means of the valve operated by the link *s*, brake-rod *t*, and lever *u*, substantially as shown and described.

141,806.—Shade-Holder.—THOMAS MORAN, New York, N. Y. Application filed May 23, 1873.

The shade-supporters are adjustable upon the arms by means of an endless screw engaging in a rack upon the upper edge of the arms. A spring within the slot of the supports permits an approximate adjustment without employing the endless screw.

Claim.—The combination of the toothed racks on the arms B, the endless screws D on the supporters C, and the springs E, essentially as and for the purpose described.

141,807.—Submerged Pump.—JAMES A. MORRELL and JOHN BREWER, New York, N. Y. Application filed June 28, 1873.

The piston-rods are made adjustable by connecting-rods with screw-threads on their ends, adjustably secured to the working lever by screw-nuts, the other ends clamped upon the piston-rods The pump-cylinder has an external surrounding casing, having side perforation acting both as a support and a strainer.

Claim.—1. In combination with a base, A, into which the pump-cylinders are bored, and which receive the water from the bottom, an external enveloping casing, M, perforated only on the sides, so as to serve as a screen, and also as a support for the cylinders B B, which is suspended within it upon its flanges, substantially as set forth.

2. The combination of the adjustable connecting-rods G^1 G^2, clamps G G, or their equivalents, piston-rods F F, and an operating-lever, H, substantially as and for the purpose set forth.

3. The combination of the adjustable connecting-rods G^1 G^2, pistop-rods F F, toothed rods D D, and their intermediate pinion, or their equivalents, and the pistons C C, substantially as and for the purpose set forth.

141,808.—Road-Scraper.—JOHN MORTON, Cincinnati, Ohio, assignor to himself and GEORGE S. HUNTINGTON. Application filed May 15, 1873.

A swinging or tilting frame is attached to the cart, and at the rear end of the frame is pivoted a scraper, which is composed of two parts hinged together so as to permit it to adapt itself to the surface of the street. The scraper can be oscillated on its pivots, its movement being limited by suitable stops. When the scraper is full it is raised by tilting the frame, and the dirt is emptied into the cart.

Claim.—1. In combination with the cart A B B', the swinging frame C C' and scraper E, operating substantially in the manner and for the purpose described.

2. The combination of cart A B B', frame C C', scraper E, and brush I, operating substantially as and for the purpose described.

3. The scraper E, when made in two parts, hinged together, substantially as and for the purpose specified.

4. In combination with the swinging frame C C' of the cart, the scraper E, when pivoted at *d d'* to oscillate, and provided with stops H *e*, substantially as and for the purpose specified.

141,809.—Hand-Press for Jelly.—JAMES M. NEWTON, Dayton, Ky., assignor to DANIEL D. MARTIN and JOHN ENGLISH. Application filed June 12, 1873.

A perforated cylinder is fitted interiorly with a pressure-head and hand-screw.

Claim.—1. The combination of perforated cylinder A, central screw C, follower D, and handle E, operating substantially as and for the purpose specified.

2. The handle E, when composed of two parts, E *e*, with the grain of the wood at right angles to each other, substantially as and for the purpose described.

141,810.—Nail.—BARAK T. NICHOLS, Roselle, N. J. Application filed July 5, 1873.

Claim.—A nail or spike formed of sheet metal, and grooved, ridged, or corrugated longitudinally to stiffen it, substantially as herein described, as a new article of manufacture.

141,811.—Reefing Fore and Aft Sails.—LAWRENCE NORDEN, Philadelphia, Pa. Application filed January 24, 1873.

Claim.—The combination, substantially as described, with a fore and aft sail and mast, of brails *a* for reefing the said sail against the mast from the deck of the vessel.

141,812.—Non-Conducting Tablet, Platform, or Mat.—HENRY L. PALMER, New York, N. Y., assignor of one-half his right to CHARLES C. SKILTON, same place. Application filed July 10, 1873.

Claim.—1. In a tablet, platform, or mat, a body composed of veneers or thin sheets of wood, and a sheet of metal placed thereon, with its edge turned under the same to secure the body and sheet of metal together, as and for the purpose specified.

2. In a tablet, platform, or mat, a body composed of veneers or thin sheets of wood glued or otherwise secured to each other, and a sheet of metal placed thereon, surrounded by and attached to a bead, border, or molding of wood, substantially in the manner shown.

141,813.—Draft-Equalizer.—JOHN PARKER, Pontiac, assignor of one-half his right to JAMES A. HUBBS, Cato, Mich. Application filed June 21, 1873.

Claim.—1. The three-horse whiffletree, consisting of the two short whiffletrees pivoted to the eccentric evener, substantially as described, for the purpose specified.

2. The single and double draft-chains, arranged to operate in connection with the whiffletree, in the manner described, for the purpose specified.

3. The chafing-plates I, in combination with the whiffletrees and pulley-straps, substantially as described, for the purpose specified.

141,814.—Check-Rein Retainer.—CHARLES H. PERRIN, New York, assignor to SAMUEL E. TOMPKINS, Sing Sing, N. Y. Application filed March 8, 1873.

Claim.—An elastic check-rein guard, constructed as described, and applied to the ordinary check-hook bolt, for the purpose set forth.

141,815.—Balanced Valve for Stand-Pipes.—JOHN N. POAGE, Cincinnati, Ohio. Application filed May 30, 1873.

Water enters the branch pipe through a cylindrically-balanced valve, passing up the stand-pipe to an outlet. The lower end of the stand-pipe is provided with a valve-seat, to which the valve fits. Within this valve is a secondary, or relief valve, allowing the water remaining in the stand-pipe to pass off to the waste-pipe when the main valve is closed.

Claim.—1. The valve-box B, casing C', stand-pipe D, valve-seat section E, and valve G, when constructed and combined to operate substantially as and for the purpose specified.

2. The valve G and valve-seat section E, when constructed and combined with the valve-box B and casing C', substantially as and for the purpose shown.

3. The valve G, provided with the opening *g''*, the casing C', the seat-section E, the operating-rod H, the tube I, and the relief-valve K, when constructed as shown, and combined with each other substantially as and for the purpose set forth.

141,816.—Device for Centering Barrel-Heads.—JOHN J. RALYA, Cleveland, Ohio. Application filed September 26, 1872.

A circular plate is provided with a central point and a radially-adjustable marking-tool.

Claim.—The templet A, having at four or more equidistant points the dimensions of a barrel-head, provided with a central marking-point, *b*, and with or without a center, D, at one point of its periphery, substantially as and for the purpose specified.

141,817.—Lathe-Chuck.—CHARLES H. REED, Danbury, Conn. Application filed July 11, 1873.

The jaws C C' C' are simultaneously moved in a radial direction by the revolution of a single right-and left-hand screw cut on the shaft D, which shaft passes through the yoke-piece E, and is secured in suitable bearings formed in the chuck-case.

Claim.—The combination of the jaws C C' C' with the shaft D, having right and left hand screw-threads, as described, and the yoke-piece E, all connected, substantially as set forth, to produce a three-jawed chuck, attached by a single right and left hand screw.

141,818.—Bee-Hive.—DAVID RICK, Richfield, Ill. Application filed November 2, 1872.

Claim.—A bee-hive lined with liquid or natural slate, substantially as and for the purposes specified.

141,819.—Composition for Cleaning Glass, Silver-Ware, &c.—WILLIAM H. ROOSEVELT, Rochester, assignor to himself, DANIEL J. STRAGUE, and CHAS. E. BLANCHETT, Buffalo, N. Y. Application filed June 5, 1873.

Paris white, English red lead, glycerine, and borax mixed with warm water to the consistency of dough; kneaded, and dried or baked in cakes.

Claim.—The composition for cleaning glass, plated or silver ware, and other articles, compounded of the ingredients and in the proportions substantially as hereinbefore set forth.

141,820.—Pane for Sky-Lights.—OSCAR F. SAUNDERS, Corning, N. Y. Application filed March 27, 1873.

Claim.—Panes of glass for hot-houses, sky-lights, and the like, having their meeting edges at one or both ends turned over toward the body of the pane next adjacent, substantially as herein set forth, for the purpose specified.

141,821.—Base-Burning Fire-Place Stove.—SAMUEL E. SEXTON, Baltimore, Md. Application filed May 14, 1873.

Claim.—1. The conical or dome shaped magazine-top D', having in its inclined face a feed-opening surrounded or flanked by externally-projecting flanges G to stiffen the edges and facilitate feeding, all substantially as set forth.

2. The combination of the feed-door E, having flanges on its inner face, with the feed-opening in the inclined face of the magazine-top flanked by externally-projecting flanges G, all as herein described.

141,822.—Stereoscope.—LORENZO D. SIBLEY, Chicago, Ill. Application filed September 21, 1872.

The eye-glasses are attached to a swinging frame, so as to be readily turned to either side of the box. The stereoscopic views are successively brought into position by an inclined rotating knob or handle suitably toothed to engage with loops on the ends of the wire-frames holding the pictures.

Claim.—1. The button C, provided with the teeth *g* and arranged in an inclined position, in combination with the loops or arms *e* of the wires *d*, as and for the purpose specified.

2. The clasps *e*, arranged as described, and each provided with arms attached to two contiguous wires, *d*, whereby the series of wires are hinged together and the pictures or cards supported, as set forth.

3. The lens-frame D, pivoted by arms E to the box or frame B, so that it can be swung to either side, as set forth.

141,823.—Vapor-Burner.—THOMAS SIMMONS, Halifax, Canada, assignor of one-half his right to ALBERT CLEMEN and CHARLES T. CLEMEN, same place. Application filed June 9, 1873.

Claim.—The burner A', having the chamber D above the outlets F and the notched rings H I below said outlets, and provided with the air-inductor G, fitting over said rings, substantially as and for the purpose shown and described.

141,824.—Watch-Maker's Lathe-Chuck.—JOHN STARK, Waltham, Mass. Application filed June 25, 1873.

The chuck is fastened to the lathe-arbor by a clamp-screw through a hole in the back of the chuck, which is of greater diameter than the screw, to permit adjustment or centering of chuck. A greater bearing surface is afforded between the arbor and chuck by a conical frustum placed loosely on the clamp-screw and bearing against the chuck-back and arbor-sleeve.

Claim.—1. The clamp-screw D, arranged and combined with the chuck C, having its cap *a* provided with the hole *d*, larger in diameter than the screw-shank, all being for use with the watch-lathe arbor and its back screw, as explained.

2. The friction-spring *f* and clamp-screw D, arranged and combined with the chuck C, as specified, and for use with the latter and the lathe-arbor and back screw, as set forth.

3. The conic frustum E, separate from the chuck clamp-screw D, combined therewith and with the lathe-arbor, substantially as described.

141,825.—Fire-Extinguisher.—JOHN H. STEDMAN, Cincinnati, Ohio, assignor of one-half his right to LLOYD CANADAY, Albany, N. Y. Application filed June 23, 1873.

The heads are concave and supported against a bead or flange. The upper head has an opening closed by a screw-plug having weighted handles, so that when unscrewed the handles will tip it over edgewise. Two or more solid tubes and two or more tubes to receive the packages of bicarbonate of soda communicate with the interior of the extinguisher, so that it may be recharged.

Claim.—1. A fire-extinguisher provided with separate and independent acid-tubes C, and valves *f* or their equivalents, allowing the introduction of successive charges of acid, as set forth.

2. In combination with the extinguisher having the acid-tubes C, as set forth, tubes or receivers D to hold the charges of bicarbonate of soda, as set forth.

3. A fire-extinguisher having concave heads *a*, bearing under heads or flanges *b* on the body, as shown.

141,826.—Water-Wheel.—BRADFORD STETSON, Fitchburg, Mass. Application filed February 7, 1873.

The step is supplied with water under pressure, so that the spindle, in effect, turns on a thin film of water, which is constantly supplied to it. There is also a filtering mechanism, by means of which only clear water can reach the step, thus avoiding the necessity of accumulations of foreign matter getting to the step and destroying the usefulness of the wheel.

Claim.—1. A water-wheel having, in combination with the pipe *f*, the filter-cylinder f^2, substantially as described.

2. A water-wheel having, in combination with the step *f* and the central passage *r*, the passage r^2 leading to the chamber r^3, substantially as shown and described.

3. In combination with the wheel *m* and space k^2 above it, the relief-pipe P, operating substantially as described.

4. In combination with the curb-supporting ring or plate, the hemispherical dome p^3, formed and applied substantially as shown and described.

141,827.—Windmill.—SAMUEL F. STOWE, Providence, R. I., assignor of one-half his right to SAMUEL G. THIPPE, same place. Application filed May 31, 1873.

The revolutions of the windmill-shaft are regulated by halving the fans and hinging the same longitudinally to the arms of the shaft, and by keeping them in position by spring-power attached to the shaft and revolving with it, and so constructed that they may be worked with more or less resistance to the direct force of the wind by moving the said spring-power closer to or farther from the fans.

Claim.—1. The combination of a windmill-shaft with the revolving disks I, hub J, spring-cases H, springs G, disks *g*, and tension-chains i^2, arranged substantially for the purpose mentioned.

2. The combination of the sliding hub J, the yoke K, and the screws L, whereby the regulation of the tension-chains is effected in the direction of the axis of the windmill-shaft.

3. The combination, with a windmill-shaft and halved and hinged fans T, of the return-levers l^2, chains i^2, and tension-devices H, arranged as and for the purpose mentioned.

4. The front support of a windmill-shaft, consisting of the wheel F, the side bearings s^1 s^2, and rollers *s s* as circumferential bearings, as specified.

5. In combination with the adjustable tension devices, the halved swinging wings and the device for manipulating the same, consisting of the gear-wheels M on the screw L, the intermediate gear N, wheel *e*, and sprocket-wheel O, with the hand-rope P and weighted pulley *p*, substantially as specified.

141,828.—Crozing and Chamfering Plane.—ALLEN M. STRATTEN, Ladoga, Ind. Application filed March 22, 1873.

The tool is placed with the part B resting upon the ends of the staves of which the vessel is composed, the part A being within the same; a circular movement is then given to the tool, when one of its knives chamfers and the other crozes the staves.

Claim.—The combination of the stock A E F, fence-board B, and bits C and G, when constructed and arranged as herein described to perform the chamfering and crozing operations simultaneously, as explained.

141,829.—Blacking for Leather.—ABNER D. STRONG, Ashtabula, Ohio. Application filed May 28, 1873.

Claim.—Blacking composed of paraffine held in a suitable solvent, and lamp-black compounded therewith, substantially in the manner and for the purposes specified.

141,830.—Pipe-Coupling.—ALBERT C. SWEETLAND, North Attleborough, Mass. Application filed July 23, 1873.

A centrally-projecting hub on the coupling enables the turning of the slip-joint, and disconnecting it by hammering on the hub in the opposite direction. Beads are formed on each side of the hub to prevent the pipe coming in contact with its shoulder.

Claim.—A slip-joint coupling for connecting the sections of any metallic pipe, constructed with the hub or disk *b* and beads *a c*, substantially as set forth.

141,831.—Purifying Sugar, Molasses, and Saccharine Juices.—JEAN M. O. TAMIN, New York, N. Y. Application filed June 16, 1873.

Claim.—1. The process of purifying sugar, molasses, and saccharine juices by the use of soluble metallic silicofluorides, substantially as herein described.

2. The process of regenerating the primitive metallic silicofluoride used in the purification of sugar or saccharine juices, as set forth.

3. The combination of the ammoniacal water, sulphates, or phosphates with the residuum of regeneration or of filtration of the purifying process, for the purpose of producing a manure, as set forth.

141,832.—Manufacture of Chocolate.—JEAN M. O. TAMIN, New York, N. Y. Application filed June 23, 1873.

Claim.—In the manufacture of chocolate into cakes or pieces, the combination therewith of tea, substantially as described.

141,833.—Key-Hole Guard.—WARREN H. TAYLOR, Stamford, Conn. Application filed January 25, 1873.

Claim.—The stop-key having a stationary tooth or projection which enters a notch in the shell of the lock, said stop-key being inserted in the key-hole from the inside, and preventing the insertion of the key from the outside, substantially as herein set forth.

141,834.—Post-Office Letter-Box.—WARREN H. TAYLOR, Stamford, Conn. Application filed January 25, 1873.

One of the ribs of the door-frame is beveled so that the glass may slide over it, sufficient play therefor being provided by the rubber washers.

Claim.—The combination, in a door for post-office letter-boxes, of a beveled rib or beveled pins with a pane of glass and elastic washers or springs, as and for the purposes described.

141,835.—Harness-Pad Tree.—WILLIAM H. TAYLOR, Baldwinsville, N. Y. Application filed June 3, 1873.

Claim.—The combination of pads *b b*, constructed as described, with jockey-plates A A′, grooved to receive the back-strap, and hinged to the yoke, substantially as set forth.

141,836.—Knitting-Machine.—ORMON TWOMBLY, Ashland, N. H. Application filed May 16, 1873.

The needles point outwardly from the center of a stationary radially-grooved disk, and are reciprocated by a rotating cam-grooved disk, being prevented from rising, as they move in and out, by a flange on the cam-disk entering a circular groove in the needle disk or wheel. Rotating spur-wheels press the work back into proper position on the stems of the needles.

Claim.—The shaft A, radially and circularly grooved needle-wheel C, cam-wheel D, flange *i*, and the spur-wheels F G, yarn-guide H, bobbin-carrier I, and tension-wire K, all arranged, combined, constructed, and operating, in connection with a series of knitting-needles, substantially as described.

141,837.—Apparatus for Tempering Steel Plates and Similar Articles.—HERMAN URBAN, Cincinnati, Ohio. Application filed February 24, 1873.

Two boxes or chambers, placed parallel, are perforated on their adjacent sides, and have guides and brackets which support the plate vertically when lowered into place between them by means of tackle. From the tank, in which the perforated boxes are placed, a pump returns the waste-water to the elevated reservoir.

Claim.—1. A tempering apparatus consisting essentially of two or more perforated receptacles, between which the heated plate is temporarily placed and subjected upon both of its sides to the action of jets of water or brine, which are simultaneously ejected under pressure from said perforated receptacles, substantially as herein explained.

2. The combination of tank A, boxes or chambers C C′ D *d*, guides G G′, support H, pipes I I′ J J′ i^2 j^2, reservoir K, valve-operating device M N N′ O O′ R, and pump U, or equivalent devices, for the object herein stated.

141,838.—Top-Plate for Cooking-Stoves.—JOHN VAN, Cincinnati, Ohio. Application filed June 14, 1873.

Claim.—A top-plate for a stove or range, having cast solidly to its under side the hollow stiffening piece or rib B having one or more inlets in the cooler portion of the fire-space and one or more outlets in the hotter portion of the same, substantially as and for the purpose set forth.

141,839.—Valve-Cock.—JAMES WALSH, Philadelphia, Pa. Application filed May 14, 1873.

In a valve, the stem of which is capable of a rotary movement only, an indicator is arranged to rise or fall according to the position of the valve relatively to its seat, by the action of a coiled wire within threads cut upon said stem.

Claim.—The combination, in a valve-cock, of a spindle, A, having a rotary movement only, and a pointer, F, connected to the spindle, so that on the rotation of the latter the pointer will follow the movements of the valve, substantially as specified.

141,840.—Hay and Grain Loader.—WINFORD JAMES WEBBER, Hollister, Cal. Application filed March 29, 1873.

An adjustable derrick, which can be lengthened or shortened, secured to the side of the wagon, and having a wheel at the bottom, which runs on the ground and transmits power to a hoisting-pulley on the same shaft.

Claim.—1. The posts D and E, with their guiding-straps C and F, and the rack and pinion J and I, constructed to elevate either post, substantially as and for the purpose herein described.

2. The traction-wheel L, with its pulley M, and the strap N, for the purpose of raising and lowering the fork P, and operating substantially as herein described.

3. The hinged arm H and the bent lever S, with its binding-block T and rack U, for holding the load suspended, substantially as herein described.

4. A loading device consisting of the sliding posts D and E, with the adjustable traction-wheel L and pulley M, strap N, fork P, and holding device T, constructed to operate substantially as and for the purpose herein described.

141,841.—Window-Blind.—MASON C. WELD, Closter, N. J. Application filed January 17, 1873.

Claim.—1. Blind-slats constructed with two leaves hinged together at their proximate edges, substantially as and for the purposes set forth.

2. Blind-slats composed of two leaves hinged together, in combination with an independent adjusting rod and lever, or their equivalent, for each set of leaves, so as to give them an independent adjustment, substantially as and for the purposes set forth.

141,842.—Fruit-Box.—CHARLES W. WESTON, San Francisco, Cal. Application filed April 21, 1873.

One piece of material is arranged to form the box, with the parts secured by tarsing up the ends and passing the upper portion of it through a slot and secured by a nail. On the corners of the box is a metallic band, through which a tongue is cut which passes through the upper band outside and is clinched for its support.

Claim.—1. The corner flaps *f*, provided with slots *g*, in combination with the outside middle flap *b* with its tongue *h*, substantially as and for the purpose above described.

2. The corner metal strip *j* having the point *e*, in combination with the wooden binding-strips *p*, substantially as and for the purpose above described.

141,843.—Machinery for Finishing the Sole-Edges of Boots and Shoes.—HENRY F. WHEELER, Boston, Mass. Application filed May 6, 1873.

The jack-carrier is secured to a sliding plate, which has intermittent horizontal and semi-rotative movement communicated to it by means of a shaft which rotates within and with a sleeve, the sleeve being locked at intervals to give the horizontal or sliding motion.

Claim.—1. In combination with the sliding jack-plate *f* and guide-plate *d* and rotating shaft *h*, the friction-sleeve *c*, and the mechanism for automatically and intermittently locking and unlocking the sleeve *c* and shaft *h*, to effect the respective movements of the jack-plate, substantially as described.

2. In combination, the sleeve *c*, flange *c*, and its groove *s* and notches *v*, the shaft-collar *t* and its key *q*, and the roll s^2 and spring *j*, all operating together substantially as shown and described.

3. The arms p^2 s^2, jointed at c^2, and the link b^2, in combination with the jack-plate *f*, substantially as shown and described.

4. In combination with the shaft *h* and sleeve *c*, the spring-presser cap *o*, worm-wheel *k*, and worm-gear *l*, and shaft *m*, arranged and operating substantially as shown and described.

5. In combination with the mechanism for imparting motion to the jack-plate, the sliding shaft *m*, loose pulleys d^2 d^3, with notches f^3, and clutch-collar f^2, with teeth g^2 h^2, all substantially as shown and described.

141,844.—Cap and Spoon for Mustard Bottles.—HIRAM J. WHITE, Boston, Mass., assignor to himself and A. B. HILL, same place. Application filed April 5, 1873.

The cap or cover for a mustard-bottle has a steel enameled spoon attached to it by a spring, and may be detached at pleasure.

Claim.—The combination, with the cap *a* of a mustard-bottle, &c., of a spoon, *c*, having the spring *d*, substantially as shown and described.

141,845.—Mode of Lubricating Pistons in Rotary Steam-Engines.—STERLING W. WICKES, Seneca Falls, N. Y., assignor to H. C. STUBBY, same place. Application filed June 19, 1873.

The cams or pistons in rotary steam-engines are lubricated by the application of oil directly to the sides of the cam.

Claim.—1. The oil-pump A, the horizontal pipes B B, with the openings C C, when the several parts are combined in rotary steam-engines, substantially as and for the purposes herein before described.

2. The combination, in rotary steam-engines, of the pipes B B and the stop-cocks D D, substantially as and for the purposes herein before specified.

141,846.—Car-Coupling.—JOSEPH WILCOX, Canton, Pa. Application filed February 28, 1873.

Three springs and a tube are applied to a draw-head with the pin and link in common use, the object being to hold the link in position and provide an automatic coupling.

Claim.—The spring E, attached to the front part of the draw-head, extending backward and resting upon the link C, in combination with the springs D D, having the flanges *a a*, and pin B, all constructed and arranged for operation as set forth.

REISSUE PATENTS.

5,530.—Plow.—GILLUM SHELTON, Normal, Ill.—Patent No. 127,650, dated June 4, 1872. Application filed July 7, 1873.

The upper portion of the plow-standard is bifurcated and secured to the beam by two bolts. A supplementary bolt passes from the sole to the beam in a recess in the rear of the standard. The upper part of the standard is longer than usual, so as to give a high position to the beam, and the standard is thick and rounded to avoid clogging.

Claim.—In combination with the beam C and mold-board B, the elongated standard A, having a broad rounded and polished front edge, a seat and lugs, *a a*, for the attachment of the mold-board, and its upper end having two arms, *d d*, and a bolt or bar, D, substantially as and for the purpose specified.

5,531.—Windmill.—HARRIET W. WHEELER, executrix, and WILLIAM H. WHEELER, Beloit, Wis., assignee of one-third interest of LEONARD H. WHEELER, deceased.—Patent No. 69,674, dated September 10, 1867.—Divis'on A. Application filed March 17, 1873.

A small side vane and a pivoted tail-vane are arranged at right angles to each other upon the turn-table. The tail-vane is weighted and prevented, by stops, from swinging in more than one direction. When the wind blows with great force the side vane causes the tail-vane to be brought into the wind, and, the latter overcoming the resistance of the weights, the tail-vane yields, and the wheel is carried out of the wind, the wheel and the tail-vane standing parallel to each other. As the wind dies away, the weight acts to pull the tail-vane back into its original position, thereby bringing the wheel again into the wind.

Claim.—1. A windmill having a single flexible tale-vane or rudder, combined with the wind-wheel, substantially as described.

2. A side vane or wind-gage, arranged to project laterally beyond one side of the vertical axis, between the pivoted point thereof and the wind-wheel, substantially as described.

3. The arrangement of the pitman and the operating-cords of the rudder to pass down through the vertical tubular axis of the wind-wheel, and to be held therein out of contact with each other by one or more perforated plates, arranged within said tubular axis, substantially as specified.

4. The stops O V, in combination with the vane or rudder and the head of the vertical axis of the wind-wheel, substantially as described, and for the purposes specified.

5. A windmill constructed with a pivoted or swinging main vane or rudder, and a side vane or wind-gage projecting laterally beyond the axis of the vertically-rotating wind-wheel, substantially as described, for the purposes specified.

5,532.—Cultivator and Plow Combined.—LEWIS R. WRIGHT, Schenectady, N. Y.—Patent No. 81,054, dated August 11, 1868. Application filed May 21, 1873.

Claim.—1. The double mold-board B and C, so hinged and connected together that the main part of said mold-board B may be elevated or depressed at will, according to the height of furrow desired to be cut, substantially as hereinbefore described and set forth.

2. The hinging of the sections of the mold-board C and C′ to the center standard E′, whereby a lateral motion may be given to the mold-boards B and B′ to regulate the width of furrow to be cut, substantially in the manner and for the purposes more fully hereinbefore described and set forth.

3. The slotted arms or their equivalents D D, in combination with the mold-boards B and B′, substantially in the manner as and for the purposes herein described and set forth.

4. The curved reversible tooth H, with concave sides, the front surface of which is nearly flat, as and for the purposes set forth.

5,533.—Paper-Folding Machine.—CYRUS CHAMBERS, Jr., Philadelphia, Pa.—Patent No. 26,090, dated November 15, 1859. Application filed June 30, 1873.

The paper is fed against vibrating guides directly to the folding-rollers; the drop-roller G then falls, the paper passes between the carrying-roller and the upper folding-roller, and is pushed into the bite of the folding-rollers by the eccentrically-hung knife, which follows the periphery of the upper folding-roller around until opposite the entrance between the two. That the edge of the paper may not adhere to the upper folding-roller, this is provided with curved bars in grooves on its surface. The sheet next passes between tapes and rods in different planes, that it may be corrugated to insure its more accurate adjustment at the proper point, and against a stop; is then pushed by another knife into the bite of other folding-rollers, from which it is conveyed by rods, and is finally dropped upon the packing-gate, which, operating in connection with a slide, T, packs the folded sheets upon their edges in the box.

Claim.—1. A drop-roller, co operating by direct contact with one of the folding-rollers in feeding in the sheet, as specified.

2. The grooved folding-roller H, in combination with the vibrating guides 2 2 attached to the rock-shaft F, for the purpose of registering by a positively-acting mechanism the forward edge of the sheet as it enters the machine, as specified.

3. The curved bars 3, arranged to project beyond the surface of the folding-roller, for the purpose of raising or bearing off the sheet from the folding-roller, as set forth and shown.

4. The folding-blade J hung on eccentrics and moving in an arc around one of the folding-rollers, as and for the purpose specified.

5. The combination of the tapes, rods, and stops, arranged in the manner described, for the purpose of corrugating the sheet and presenting it properly to the action of the folding-blade, as set forth.

6. The bent bars 13 and 22, in combination with the folding-rollers grooved to receive their curved ends, for the purpose of turning or conducting the paper, in the manner stated.

7. The combination of the bent bars with the straight bars and adjustable stop, arranged substantially in the manner described.

8. The combination of the bent bars with the tapes and stop, for the purpose specified.

9. The combination of the oscillating gate with the packing-box, provided with a yielding slide, and having the rear edge of its bottom board rounded, in the manner and for the purpose set forth.

INDEX OF INVENTIONS PATENTED AUGUST 12, 1873.

	Class No.	Whole No.
Air navigating apparatus, T. Green	143	141,785
Air compressor or blower, L. Chase	12	141,762
Auger, earth, C. D. Pierce	51	141,664
Auger, hollow, G. F. Almy	29	141,745
Axle box and sleeve for vehicle wheels, W. H. Cowell	31	141,699
Axle clips, mode of making, H. M. Beecher	60	141,625
Baling hay, device for, L. Doty	7	141,636
Barrel heads, device for centering, J. J. Relya	40	141,816
Bed bottom, spring, J. Pollitt	62	141,726
Bee hive, D. Rice	9	141,818
Bedding woven fabrics, machine for, J. Patterson	37	141,725
Bell for sleigh shafts, A. E. Taylor	24	141,674
Boiler, vertical steam, C. M. Miller	146	141,656
Bolt blanks, die for swaging clip king, F. Van Patten	31	141,681
Bolts, die for making blanks for king, F. Van Patten	31	141,679
Bolts, die for the manufacture of clip king, F. Van Patten	31	141,680
Bolts, machine for heading, C. Hall	14	141,711
Boot and shoe channeling machine, Chickering and Tuttle	16	141,693
Boot and shoe heels, machine for burnishing, I. Van Nouhuys	16	141,678
Boot and shoe heels, machine for finishing, L. P. Hawkins	16	141,712
Boot and shoe sole edges, machine for finishing, H. F. Wheeler	16	141,243
Boots and shoes, manufacture of, C. A. Keith	16	141,797
Boring machine, Mecrahouse and Wiegand	100	141,657
Bottles containing inflammable liquids, &c., stopper for, L. G. Chaput	1	141,628
Box, match, J. Holtz	90	141,793
Brick machine, D. J. Hunter	20	141,646
Brush, blacking, W. S. Pickett	22	141,638
Bucket, sheet metal, W. Austin	136	141,748
Buckle, A. B. Shaw	23	141,739
Burner, vapor, T. Simmons	64	141,823
Button fastening, E. S. Wheeler	23	141,743
Buttons, machine for making, J. F. Bepteroesse	23	141,749
Can, oil, J. B. Auld	136	141,619
Cap and spoon for mustard bottles, H. J. White	88	141,644
Car brake, hydraulic railroad, W. M. Henderson	122	141,790
Car coupling, R. B. Buckner	122	141,756
Car coupling, Decker and Lee	122	141,635
Car coupling, A. Langellier	122	141,648
Car coupling, J. Wilcox	122	141,846
Cars, steam and air brake for railway, Moore and Wyman	122	141,805
Cars, trussed spring bolster for railroad, J. Anderson	121	141,618
Cars, ventilating railroad, J. G. Allen	106	141,617
Carriage, H. E. Delessert	31	141,704
Carriage bolt, I. Newton	14	141,661
Carriage wheel hub, P. Murphy	31	141,659
Chains, machine for making, L. Souther	60	141,734
Chair, folding, K. Geisler	62	141,784
Chair, reclining, G. C. Paine	62	141,662
Cherry stoner, T. S. Lash	88	141,649
Chocolate, manufacture of, J. M. O. Tamin	58	141,832
Churn, A. W. Pequet	45	141,709
Churn, rotary, W. H. Busch	45	141,892
Clothes pin, Urse and Chester	91	141,740
Coal sifter, L. Tibbetts	170	141,737
Coating canvas to form tarpaulins, C. Cobb	107	141,764
Cock, self-closing, M. S. Clark	167	141,630
Coffee roaster, T. Heermans	154	141,789
Cotter clasp, C. H. Thomas	114	141,675
Column, metallic, J. L. Piper	21	141,665
Compass, solar, H. O. Cook	50	141,766
Composition for cleaning glass, silver ware, &c., W. Boswell	70	141,819
Cooler, milk and cream, M. C. Baldwin	58	141,888
Corn sheller, J. B. Johnson	59	141,795
Corn sheller, feeding elevator for, P. Kauffman	59	141,717
Cotton, manufacture of gun, S. J. Meekin	35	141,654
Cultivator, R. A. Fish	43	141,707
Cultivator, J. M. Gentis	43	141,786
Cultivator and plow, combined, L. R. Wright, (reissue)	43	5,532
Cutter head, D. C. Allen	29	141,744
Dashboard, J. S. Campbell	31	141,758
Dish drainer, W. H. Gould	89	141,643
Door fastener, H. Overtt	24	141,784
Dredging machine, R. Bankhe	88	141,752
Drill, grain and seed, J. H. Shreiner	133	141,730
Drill rod coupling, E. A. Clark	134	141,694
Drills, machine for milling twist, S. W. Card	100	141,760
Drum, heating, J. R. Bertlett	154	141,681
Electric signaling apparatus for railways, R. M. Boyle	30	141,755
Engine, rotary steam, S. Gibson	150	141,719
Engines, mode of lubricating pistons in rotary steam, S. W. Winkes	87	141,845
Equalizer, draft, J. Parker	31	141,813
Fence, portable, G. F. Becker	38	141,750
Fifth wheel heads, die for the manufacture of, F. Van Patten	31	141,682
Fifth wheels of vehicles, machine for milling, F. Van Patten	31	141,683
Fire arm, magazine, J. H. Bean	55	141,624
Fire extinguisher, J. H. Steiner	35	141,825
Fruit box, C. W. Weston	63	141,843
Furnace, coking, H. Engelmann	61	141,778
Furnace, coking, H. Engelmann	61	141,779
Furnaces, apparatus for feeding fuel to, C. P. Lenvitt	149	141,650
Gas from petroleum, &c., manufacture of illuminating, R. H. Smith	44	141,732
Gasaliers, smoke bell for, C. Deavs	44	141,634
Gate, nursery, E. A. Tuttle	62	141,677
Generator, sectional steam, W. E. Kelly	148	141,799
Generator, steam, W. E. Kelly	148	141,798
Generator and apparatus for rendering fats, steam, V. D. Anderson	25	141,746
Gimlet handle, H. S. Shepardson	29	141,671
Glass furnace, A. Pocheron	68	141,666
Glass, gilding on, V. Schwarzenbach	68	141,670
Glass, ornamental window, C. Frederici	68	141,782
Grate, fire, W. H. Farris	149	141,780
Hame fastener, T. L. Booker	72	141,690
Harness, E. Covert	72	141,698
Harness pad tree, W. H. Taylor	72	141,835
Harvester rake, S. Clevenger	74	141,695
Harvester rake, A. Rank	74	141,668
Hat tip lining, W. H. M. Pye	76	141,727
Hay and grain loader, W. J. Webber	79	141,840
Heel breasting machinery, V. K. Spear	16	141,735
Hook and hasp, combined, B. H. Brooks	93	141,691
Horses, feed bag for, T. Adams	144	141,686
Horseshoer's rest, J. Legg	60	141,651
Hose coupling, J. W. Kennedy	167	141,718
Hose pipe nozzle, F. R. Hall	167	141,787
Hose, syringes, &c., distributing apparatus for garden, S. Barton, Jr	167	141,620
Ice cream freezer, E. B. Tilden	56	141,738
Key hole guard, W. H. Taylor	93	141,833
Knitting holder, H. P. Joy	38	141,796
Knitting machine, O. Twombley	89	141,836
Lamp, R. Christy	90	141,763
Lamp extinguisher, W. D. Lindsley	90	141,801
Lantern, advertising, S. Kuh	54	141,719
Latch, knob, A. Reyse	93	141,714
Lathe chuck, C. H. Reid	100	141,817
Leather, blacking for, A. D. Streng	92	141,829
Letter box, post office, W. H. Taylor	146	141,834
Life preserving garment, E. R. Cogswell	138	141,631
Line loop, D. McMillan	72	141,804
Locomotive ash pan cleaner, A. O. Denio	94	141,769
Log turner, E. Tarrant	130	141,736
Log turner, J. Torrent	130	141,739
Loom let off mechanism, J. M. Linscott	95	141,720
Loom shedding mechanism, G. Crompton	95	141,768
Loom shuttle, J. K. McIntyre	95	141,803
Magnet, relay, T. A. Edison	50	141,777
Marble, making artificial, C. F. Barker	153	141,689
Meat chopper, A. R. Silver	25	141,731
Mechanical movement, L. V. Lewis	67	141,800
Mechanical power, C. Van Derzee	67	141,741
Mill for sheet metal, rolling, E. H. Davies	125	141,701
Music leaf turner, N. P. Hall	109	141,644
Nail, B. T. Nichols	103	141,810
Oiler, pneumatic, C. E. Decker	87	141,703
Organ free reed, H. K. Hodgson	106	141,792
Paint, J. Lucas	107	141,802
Paper folding machine, C. Chamberlain, Jr., (reissue)	15	5,533
Paper folding machine, A. Washburn	15	141,742
Photographs, machine for washing, L. V. Moulton	111	141,658
Pipe coupling, A. C. Sweetland	167	141,830
Pipe elbows, pattern for, J. K. Hosse	136	141,645
Plane, crozing and chamfering, A. M. Stratton	40	141,828
Planter, corn, W. Mull	133	141,723
Planter, cotton, R. E. Bowen	133	141,753
Plow, W. Donnelly	114	141,705
Plow, G. Shelton, (reissue)	114	5,530
Press, baling, H. W. Baumann	7	141,622
Press for jelly, hand, J. M. Newton	19	141,809
Printing presses, feeder for, F. L. Hughes	117	141,713
Pump, submerged, Morrell and Brown	118	141,807
Punching metal, machine for, J. Clark	119	141,699
Rake, horse hay, J. H. Walker	77	141,894
Reefing fore and aft sails, L. Norden	139	141,811
Refrigerator, S. M. Fort	56	141,781
Rein retainer, check, C. H. Perrin	79	141,814
Rope clamp, W. H. Downing	139	141,706
Sash fastener, M. Geo	94	141,640
Sash lifter, E. Kingsbury	94	141,647
Saw guard, circular, O. A. Dean	131	141,702
Saw mill, circular, E. H. Stearns	130	141,672
Sawing machine, T. H. Carroll	130	141,761
Scale, platform, J. Bryson	138	141,697
Scraper, road, J. Norton	51	141,808
Separator, grain, W. R. Turner	139	141,676
Separators, sieve for grain, R. Dood	129	141,637
Sewing machine, Hirons and Moore	134	141,791
Sewing machine bobbin winder, T. Podden	134	141,663
Sewing machine tucker, J. H. Bean	134	141,623
Sewing machine tucker, F. W. Brown	134	141,695
Sewing machines, &c., adjustable treadle for, J. McEvoy	134	141,722

	Class No.	Whole No.
Shade holder, T. Moran	90	141,806
Shoe uppers, machine for goring, A. J. Goodwin	16	141,642
Shutter, fire proof, J. B. Cornell	4	141,696
Sign, J. Harrison	54	141,788
Sky lights, pane for, O. F. Saunders	30	141,809
Spike machine, W. A. D. Bowman	103	141,754
Spinning machine, spindle bolster for, J. Birkenhead	148	141,751
Sprinkler, lawn or garden, H. E. Cooke	167	141,632
Steam hammer, Quick and Gardner	60	141,657
Steel plates, &c., apparatus for tempering, H. Urban	85	141,837
Steering apparatus, J. Myers	137	141,660
Stereoscope, L. D. Sibley	157	141,668
Stove, B. Dieretsock	154	141,771
Stove, base burning, W. Doyle	154	141,770
Stove, base burning fire-place, S. B. Sexton	154	141,821
Stove, heating, L. R. Comstock	154	141,765
Stoves, top plate for cooking, J. Van	154	141,836
Sugar, molasses and saccharine juices, purifying, J. M. O. Tamin	155	141,831
Table, ironing, J. H. Frank	91	141,639
Tablet, platform or mat, non-conducting, H. L. Palmer	62	141,812
Telegraph, chemical, T. A. Edison	50	141,774
Telegraphs, circuit for automatic, T. A. Edison	50	141,773
Telegraphs, circuit for automatic, T. A. Edison	50	141,776
Telegraphs, circuit for automatic or chemical, T. A. Edison	50	141,772
Telegraphs, perforator for automatic, T. A. Edison	50	141,775
Thill coupling, P. L. Maltbie	31	141,655
Thrashing machine, P. Geiser	150	141,783
Tire upsetting machine, D. L. Badley	60	141,687
Trap, hog, T. Darby	144	141,633
Tree protector, G. H. Hume	63	141,716
Truck for carrying safes, &c., Luchmann and Beehl	31	141,653
Valve, balance slide, S. Reid	152	141,728
Valve cock, J. Walsh	152	141,839
Valve device for fluid brakes, G. Westinghouse, Jr.	122	141,665
Valve for stand pipes, balanced, J. N. Poage	152	141,815
Valve, screw, P. Corrigan	152	141,697
Vehicle doors, opening and closing, S. Smith	31	141,733
Vehicle wheel, P. C. House	31	141,713
Vehicle wheel, C. Look	31	141,652
Wagon bed lifter, D. Rood	79	141,820
Wagon hub bands, roll for rolling, J. Glass	31	141,641
Wagon jack, N. Crandall	79	141,700
Watchmaker's lathe chuck, J. Stark	36	141,694
Water tanks, outlet valve for, Armstrong and Cheney	167	141,747
Water wheel, B. Stetson	168	141,826
Water wheel, turbine, E. P. H. Capron	168	141,759
Wells, &c., valve for Artesian, J. Fleming	194	141,708
Whiffletree hook, M. Matson	31	141,721
Wick raiser, J. Strazer	90	141,673
Windmill, S. F. Stowe	110	141,827
Windmill, L. H. Wheeler, (reissue)	110	5,531
Window blind, M. C. Weld	62	141,841
Wire way, elevated, C. E. W. Bunster	170	141,757
Wrench, M. G. Crane	100	141,767
Wrench, W. Johnson	100	141,794

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED AUGUST 12, 1873.

Adams, T., Feed bag for horses	141,686
Allen, D. C., Cutter head	141,744
Allen, J. G., Ventilating railroad cars	141,617
Almy, G. F., Hollow auger	141,745
Ames, I., assignee	141,646
Anderson, J., Trussed spring bolster for railroad cars	141,618
Anderson, V. D., Steam generator and apparatus for rendering fats	141,746
Archer and Pancoast Manufacturing Company, assignee	141,634
Armstrong, J., and D. Cheney, Outlet valve for water tanks	141,747
Arnold, J. E., assignee	141,803
Auld, J. E., Oil can	141,619
Austin, W., Sheet metal bucket	141,748
Badley, D. L., Tire upsetting machine	141,687
Baldwin, H. C., Milk and cream cooler	141,695
Bapteresses, J. F., Machine for making buttons	141,749
Barker, C. F., Making artificial marble	141,689
Bartlett, J. E., Heating drum	141,621
Barton, S. Jr., Distributing apparatus for garden hose, syringes, &c	141,620
Baumann, H. W., Baling press	141,622
Bean, J. H., Sewing machine tucker	141,623
Bean, J. H., Magazine fire arm	141,624
Becher, G. F., Portable fence	141,750
Beecher, H. M., Making axle clips	141,625
Birkenhead, J., Spindle bolster for spinning machines	141,751
Birkenhead, J., assignee	141,709
Blanchett, C. E., assignee	141,819
Booker, T. L., Hame fastener	141,690
Boschke, A., Dredging machine	141,752
Bowen, R. E., Cotton planter	141,753
Bowman, W. A. D., Spike machine	141,754
Boyle, R. M., Electric apparatus for signaling between railroad trains	141,755
Brooks, B. H., Combined hook and hasp	141,691
Brooks, H. W., assignee	141,752
Brown, F. W., Sewing machine tucker	141,695
Brown and Merrell	141,697
Bryson, J., Platform scales	141,697
Buckner, R. B., Car coupling	141,756
Busch, W. H., Rotary churn	141,892
Bunster, C. E. W., Elevated wire way	141,757
Cabeen, C. W., assignee	141,757
Calais, W. J., assignee	141,758
Campbell, J. S., dashboard	141,618
Canaday, L., assignee	141,759
Cannington, E., assignee	141,885
Capron, E. P. H., Turbine water wheel	141,668
Capron Water Wheel Company, assignee	141,759
Card, S. W., Machine for milling twist drills	141,760
Carr, C. W., assignee	141,760
Carr, M. W., assignee	141,716
Carroll, T. H. Sawing machine	141,761
Chambers, C., Jr., Paper folding machine, (reissue)	141,761
Chaput, L. G., Stopper for bottles containing inflammable liquids, &c	5,533
Charles and Urso	141,628
Chase, L., Air compressor or blower	141,762
Cheney and Armstrong	141,762
Chickering, A. E., and H. B. Tuttle, Boot and shoe channeling machine	141,747
Christy, R., Lamp	141,693
Clapp, R. D., assignee	141,763
Clark, H. M., assignee	141,679, 141,680, 141,681, 141,682, 141,683
Clark, J., Machine for punching metal	141,745
Clark, J. H., assignee	141,629
Clark, M. S., Self-closing cock	141,737
Clark, R. A., Drill rod coupling	141,630
Clemens, A. and C. T.	141,694
Clevenger, S., Harvester rake	141,883
Cobb, C., Coating canvas to form tarpaulins	141,695
Cogswell, E. R., Life preserving garment	141,764
Comstock, L. E., Heating stove	141,631
Cook, H. C., Solar compass	141,765
Cooke, H. E., Lawn or garden sprinkler	141,766
Cornell, J. E., Fire-proof shutter	141,638
Corrigan, P., Screw valve	141,696
Covert, E., Harness	141,697
Cowell, W. H., Vehicle wheel axle box and sleeve	141,698
Crandall, N., Wagon jack	141,699
Crane, M. G., Wrench	141,700
Crittenden, L. C., assignee	141,767
Crompton, G., Loom shedding mechanism	141,716
Darby, T., Hog trap	141,768
Davies, E. H., Rolling mill for sheet metal	141,633
Dean, O. A., Circular saw guard	141,701
Deavs, C., Smoke bell for gasaliers	141,702
Decker, C. E., Pneumatic oiler	141,634
Decker, P. H., and M. Lee, Car coupling	141,703
Delessert, H. E., Carriage	141,635
Deming, J., assignee	141,704
Denio, A. O., Locomotive ash pan cleaner	141,731
Donnelly, W., Plow	141,769
Doremus, D., assignee	141,705
Doty, L., Hay baling device	141,636
Dood, R., Sieve for grain separators	141,637
Downing, W. H., Rope clamp	141,706
Doyle, W., Base burning stove	141,770
Dürersteck, B., Stove	141,771
Edison, T. A., Circuit for automatic or chemical telegraphs	141,772
Edison, T. A., Circuit for automatic telegraphs	141,773
Edison, T. A., Chemical telegraph	141,774
Edison, T. A., Perforator for automatic telegraphs	141,775
Edison, T. A., Circuit for automatic telegraphs	141,776
Edison, T. A., Relay magnet	141,777
Exley, F., assignee	141,638
Engelmann, H., Coking furnace	141,778
Engelmann, H., Coking furnace	141,779
English, J. assignee	141,639
Farris, W. H., Fire grate	141,780
Fickett, Blacking brush	141,638
Fish, E. A., Cultivator	141,707
Fleming, J., Valve for Artesian wells, &c	141,708
Fort, S. M., Refrigerator	141,781
Frank, J. H., Ironing table	141,639
Frederici, C., Ornamental window glass	141,782
Fugua, A. W., Churn	141,709
Gardner and Quick	141,640
Gee, M., Sash fastener	141,640
Geiser, P., Thrashing machine	141,783
Geisler, K., Folding chair	141,784
Gibson, H., Rotary steam engine	141,710
Glass, J., Roll for rolling wagon hub bands	141,641
Goodwin, A. J., Machinery for goring shoe uppers	141,642
Gould, W. H., Dish drainer	141,643
Grant, E. R., assignee	141,788
Green, T., Apparatus for navigating the air	141,785
Gunzis, J. M., Cultivator	141,786
Hall, C., Machine for heading bolts	141,711
Hall, F. E., Hose pipe nozzle	141,787
Hall, M. P., Music leaf turner	141,644
Harrington, G., assignee	141,773, 141,774, 141,775, 141,776, 141,777
Harrison, C., assignee	141,639
Harrison, J., Sign	141,788
Hawkins, L. P., Machine for finishing boot and shoe heels	141,712
Hedges, L. E., assignee	141,801
Heermans, T., Coffee roaster	141,789

Henderson, W. M., Hydraulic railroad car brake	141,790
Heughes, F. L., Feeder for printing presses	141,713
Heyse, A., Knob latch	141,714
Higgins, E., assignee	141,793
Hill, A. B., assignee	141,844
Hiroms, W., and J. D. Moore, Sewing machine	141,791
Hodgson, H. E., Organ free reed	141,792
Holtz, J., Match box	141,793
Home, J. K., Pattern for pipe elbow	141,645
House, P. C., Vehicle wheel	141,715
Howe, E., & Co., assignees	141,628
Hubbs, J., assignee	141,813
Hume, G. H., Tree protector	141,716
Hunter, D. J., Brick machine	141,646
Huntington, G. S., assignee	141,808
James, W. H., assignee	141,618
Johnson, J. B., Corn sheller	141,795
Johnson, W., Wrench	141,794
Joy, H. P., Knitting holder	141,796
Kaufman, P., Feeding elevator for corn shellers	141,717
Keith, C. A., Manufacture of boots and shoes	141,797
Kelly, W. E., Steam generator	141,798
Kelly, W. E., Sectional steam generator	141,799
Kennedy, J. W., Hose coupling	141,718
Kihlgren, C. A., assignee	141,805
Kingsbury, H., Seah lifter	141,647
Kuh, S., Advertising lantern	141,719
Langellier, A., Car coupling	141,648
Lash, J. S., Cherry stoner	141,649
Leavitt, C. P., Apparatus for feeding fuel to furnaces	141,650
Lee and Deaker	141,635
Legg, J., Horseshoer's rest	141,751
Lertora, J., assignee	141,784
Lewis, L. V., Mechanical movement	141,800
Lindsley, W. D., Lamp extinguisher	141,801
Linscott, J. M., Loom let off mechanism	141,720
Look, O., Vehicle wheel	141,652
Lucas, J., Paint	141,802
Luehmann, F., and C. Roehl, Truck for carrying safes, &c	141,653
Mackie, S. J., Manufacture of gun cotton	141,654
Maltbie, P. L., Thill coupling	141,655
Marine Variometer Company, assignee	141,766
Martin, D. D., assignee	141,809
Maseeth, B., assignee	141,706
Mathias, D. H., assignee	141,741
Matson, M., Whiffletree hook	141,721
McEvoy, J., Adjustable treadle for sewing machines, &c	141,722
McIntyre, T. K., Loom shuttle	141,803
McKay, G., trustee, assignee	141,797
McMillan, D., Line loop	141,804
Miller, C. M., Vertical steam boiler	141,656
Moore and Hiroms	141,797
Moore, C. E., and M. L. Wyman, Steam and air brake for railway cars	141,805
Moorhouse, R. C., and S. L. Wiegand, Boring machine	141,657
Moran, T., Shade holder	141,806
Morgan & Dore, assignees	141,712
Morrell, G. A., and J. Brown, Submerged pump	141,807
Moulton, L. V., Machine for washing photographs	141,658
Mull, W., Corn planter	141,723
Murphy, P., Carriage wheel hub	141,659
Myers, J., Steering apparatus	141,660
Newton, L., Carriage bolt	141,661
Newton, J. M., Hand press for jelly	141,609
Nichols, B. T., Nail	141,810
Nordes, L., Reefing fore and aft sails	141,811
Norton, J., Road scraper	141,808
Orcutt, H., Door fastener	141,724
Paine, G. C., Reclining chair	141,662
Palmer, H. L., Non-conducting tablet, platform, or mat	141,812
Parker, J., Draft equaliser	141,813
Patterson, J., Machine for beetling woven fabrics	141,725
Peaslee, H. A., assignee	141,803
Peiden, T., Sewing machine bobbin winder	141,663
Perrin, C. H., Check rein retainer	141,814
Phillips, S. S., assignee	141,630
Pierce, C. D., Earth auger	141,664
Piper, J. L., Metallic column	141,665
Punga, J. N., Balanced valve for stand pipes	141,815
Pechereau, A., Glass furnace	141,666
Pellitt, J., Spring bed bottom	141,726
Pye, W. H. M., Hat tip lining	141,727
Quick, D. R., and G. A. Gardner, Steam hammer	141,667
Ralya, J. N., Device for centering barrel heads	141,815
Rank, A., Harvester rake	141,668
Reid, C. H., Lathe chuck	141,817
Reid, S., Balance slide valve	141,728
Rice, D., Bee hive	141,818
Roehl and Luehmann	141,653
Rood, D., Wagon bed lifter	141,669
Roosevelt, W., H., Composition for cleaning glass, silver ware, &c	141,819
Saunders, O. F., Pane for sky light	141,820
Schwarzenbach, V., Gilding on glass	141,670
Sexton, S. B., Base burning fire place stove	141,821
Shaw, A. B., Buckle	141,729
Shelton, G., Plow, (reissue)	5,530
Shepardson, H. S., Gimlet handle	141,671
Shreiner, J. H., Grain and seed drill	141,730
Sibley, L. D., Stereoscope	141,822
Silsby, H. C., assignee	141,845
Silver, A. R., Meat chopper	141,731
Simmons, T., Vapor burner	141,823
Skilton, C. C., assignee	141,812
Smith, R. H., Manufacture of illuminating gas from petroleum	141,732
Smith, S., Opening and closing vehicle doors	141,733
Snively, E. V., assignee	141,601
Souther, L., Machine for making chains	141,734
Spear, V. K., Heel breasting machinery	141,735
Sprague, D. J., assignee	141,819
Stark, J., Watchmaker's lathe chuck	141,824
Stearns, E. H., Circular saw mill	141,672
Steiner, J. H., Fire extinguisher	141,825
Stetson, B., Water wheel	141,826
Stowe, S. F., Windmill	141,827
Straszer, J., Wick raiser	141,673
Stratton, A. M., Crozing and chamfering plane	141,828
Strong, A. D., Blacking for leather	141,829
Sundermann, J. H., assignee	141,721
Sweetland, A. C., Pipe coupling	141,830
Tamin, J. M. O., Purifying sugar, molasses, and saccharine juices	141,831
Tamin, J. M. O., Manufacture of chocolate	141,832
Tarrant, E., Log turner	141,736
Taylor, A. E., Bell for sleigh shafts	141,674
Taylor, W. H., Key hole guard	141,833
Taylor, W. H., Post office letter box	141,834
Taylor, W. H., Harness pad tree	141,835
Thomas, C. H., Colter clasp	141,675
Tibbetts, L., Coal sifter	141,737
Tilden, E. B., Ice cream freezer	141,738
Tompkins, S. E., assignee	141,814
Torrent, J., Log turner	141,739
Trippe, S. G., assignee	141,827
Turner, W. E., Grain separator	141,676
Tuttle and Chickering	141,603
Tuttle, E. A., Nursery gate	141,677
Twombley, O., Knitting machine	141,836
Urban, H., Apparatus for tempering steel plates, &c	141,837
Urso, V. D., and B. Charles, Clothes pin	141,740
Van, J., Top plate for cooking stoves	141,838
Van Derzee, C., Mechanical power	141,741
Van Nouhuys, I., Machine for burnishing boot and shoe heels	141,678
Van Patten, F., Die for making blanks for king bolts	141,679
Van Patten, F., Die for the manufacture of clip king bolts	141,680
Van Patten, F., Die for swaging clip king bolt blanks	141,681
Van Patten, F., Die for the manufacture of fifth wheel heads	141,682
Van Patten, F., Die for milling fifth wheels of vehicles	141,683
Vosburgh, A. E., assignee	141,639
Walker, J. H., Horse hay rake	141,684
Walsh, J., Valve cock	141,839
Washburn, A., Paper folding machine	141,742
Webber, W. J., Hay and grain loader	141,840
Weld, M. C., Window blind	141,841
Westinghouse, G., Jr., Valve device for fluid brakes	141,685
Weston, C. W., Fruit box	141,842
Wheeler, E. S., Button fastening	141,743
Wheeler, H. F., Machine for finishing boot and shoe sole edges	141,843
Wheeler, L. H., Windmill, (reissue)	5,531
White, H. J., Cap and spoon for mustard bottles	141,844
Wickes, S. W., Lubricating pistons in rotary steam engines	141,845
Wiegand and Moorhouse	141,657
Wilcox, J., Car coupling	141,846
Wilson, Glass & Co., assignees	141,641
Wright, L. R., Cultivator and plow combined, (reissue)	5,532
Wyman and Moore	141,805
Young, H., assignee	141,710

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 8. TUESDAY, AUGUST 19, 1873. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

BENJAMIN S. CASTLE.—*Appeal.*

[*In the matter of the application of Benjamin S. Castle for patent for* APPARATUS FOR FILING AND SETTING SAWS.—*Decided August* 27, 1873.]

APPEAL FROM THE DECISION OF THE PRIMARY EXAMINER.

A claim for saw-filing clamps and saw-setting tools, arranged independently upon a portable bench, held not to cover a combination of tools or machines.

Such an assemblage of parts also held not to constitute a single patentable article or "kit," because the mere convenient assemblage of different and independent devices upon the same platform does not constitute invention.

An assemblage of distinctive individual parts which is less than a combination of them falls short of invention.

The relative functions of parts are to be kept in view in questions of this nature.

The difference between a mere unpatentable assemblage of parts and a combination of them, in a legal sense, illustrated.

LEGGETT, *Commissioner:*

This invention is described as a "kit" for filing and setting saws. It consists of filing-clamps and setting-clamps attached to the same plank or bed, which is portable, so that the so-called "kit" or bench of tools may be set down and used wherever desired. The first claim is as follows:

"The saw filing and setting kit, consisting of the bench A, filing-clamp B, setting-plate D, clamp E, and the setting-tool F, arranged in one portable apparatus, substantially as specified."

The other three claims cover the specific construction of the setting machinery.

The Examiner says: "The applicant may claim the whole in one application, as is done in the first clause of claim, but he cannot be allowed to include independent improvements in the individual machines in the same grant." This decision proceeds upon a rule of practice correct in the abstract, and it would be sound if the first claim were a valid one. But that is exceedingly doubtful. It is not a claim for a combination of machines operating together to produce some useful result. It comprehends two distinct and independent tools, entirely disconnected in their objects and functions, merely placed for convenience upon the same bed or bench. They have no common purpose to effect. They are not to be used in conjunction in any sense, and have no different relation to each other when placed upon the opposite ends of the same portable work-bench from that they have when placed upon separate benches. Filing and setting saws are distinct and independent operations, as much as making and using saws, and they are in no way connected by this device. A saw often needs filing when it does not need setting, and *vice versa*.

It is clear that applicant has not produced a combination of tools or machines. Neither has he invented a "kit," as he supposes. The mere convenient assemblage of different and independent devices upon the same platform does not constitute invention. An assemblage of distinctive individual devices which is less than a combination of them always falls short of invention. Calling them by an individual name does not help the matter. The relative functions of parts are always to be kept in view in questions of this nature. It is possible the same elements in one situation is a "kit," owing to the conjoining of their functions, may constitute a patentable combination, and in another situation, although their individual functions as such are the same, they will not. For instance, to illustrate—perhaps by making an invention—suppose a receptacle for holding apples to be pared, a paring-machine, and a common four-bladed hollow-axled quartering and coring knife, all to be conveniently placed upon the same portable plank or bench, to perform their respective functions independently in the ordinary way. Here would be the parallel of applicant's "kit" perhaps, but as clearly as in his case no patentable invention. But suppose I should place the receptacle for holding the apples above the parer, making a hopper of it, connect it by a chute with the fork of the parer, and by suitable

mechanism cause the apples to descend successively and automatically present themselves in proper position to be automatically forced upon the fork, and should also contrive that at the proper moment, when the apple was pared, it should be automatically pushed off the fork onto the quartering and coring knife—all this, through proper gearing, to be accomplished by simply turning the paring-machine—then I would have a combination of these elements. The knife, the parer, and the receptacle for the apples would be so conjoined in their functions as to present invention in their assemblage.

Applicant's "kit," as such, exhibits no invention, and this is the objection the Examiner should have made.

The first claim having been admitted to be a proper one, an approval of his decision requiring a division would impliedly commit the Office in favor of this claim in a new application, and would be unjust to the applicant.

The decision of the Examiner is therefore disapproved, and he will examine the case upon its merits in the light of the above suggestions.

F. P. E. CARRÉ.—*Extension.*

[*In the matter of the application of F. P. E. Carré for the extension of the Letters Patent for* APPARATUS FOR FREEZING LIQUIDS, *granted to him October 2, 1860, (patented in France August 24, 1859,) and reissued in two divisions, February 18, 1873.—Decided August 23, 1873.*

The extension of the patent for forming ice, granted to F. P. E. Carré, August 23, 1859, refused, it appearing that the process and machine claimed in the reissues of the patent had been in all essential particulars described in a prior printed publication.

In an application for the extension of a patent it is not sufficient, in order to establish the value or importance of the invention, to show that of a more extensive process and a larger machine in which the invention was embodied.

REPORT OF THE BOARD OF EXAMINERS IN CHIEF, UNDER SECTION 10, ACT OF 1871.

"*To the Hon. Commissioner of Patents:*

"We respectfully report as follows:

"The extension of this patent is opposed mainly on the ground of lack of novelty in the devices as originally patented, the English patent of Perkins, of 1834, and the prior inventions of Twining, (the adverse party in this case,) as set forth in his English patent of 1850 and American patent of 1853, and the experiments of Faraday, as described in the 'Philosophical Transactions of the Royal Society of London' for the year 1823, being urged as anticipations of all that Carré described in his original specification.

"The original patent of Carré, of which the patents which are the subjects of this application are reissues, contained a description of three modes or plans of producing cold, differing from each other in essential respects, but not all equally amplified or illustrated. The first, and that most fully treated and occupying most of the illustration, was that in which the required cold was produced by the vaporization of a suitable material, such as ether, sulphuret of carbon, &c., through exhaustion effected by mechanical means, such as a pump. The pump was of such construction as to exhaust on the one side and condense on the other at the same time. The ether or equivalent substance was drawn through or from the vessel in which the freezing process was to be effected by its rapid vaporization under exhaustion, and by the reverse stroke of the pump the vapor was driven into another receptacle, where, under the combined action of cooling and the pressure exerted by the pump, it was condensed and fit to be again applied to use. A further prominent feature was the construction of the tank in which the cooling or freezing process took place. That was an air-tight vessel through or from which the material to be vaporized was drawn. This was provided with re-entrant receptacles projecting down near the bottom of the tank and opening outward on the top. Into these were set the vessels containing the water to be frozen, fitted loosely to the receptacles and kept in direct communication with their sides by means of a non-congealable liquid or some equivalent means. There were other features not necessary to be mentioned here.

"Substantially the whole of this appears, as is alleged by the opposition, to have been anticipated either by the Perkins patent or that of Twining, and, with a third plan in which the energy of centrifugal force was to be used, was all relinquished and omitted in the reissued patents of February of the present year. These two patents relate exclusively to what was the second leading feature of Carré's original patent. They include that numbered 5,287, the devices, and that numbered 5,288 the process, by which cold can be produced by means of the vapor of ammonia and some liquid capable, at comparatively low temperature, of absorbing it in large quantities and of yielding it again upon the application of heat. This apparatus is simply to take the place of the mechanical action of the pump. What was described in the original application upon this head, and the only matter now contained in the existing patents, is substantially this. The principles of the machine and process is stated in substantially the terms which were used to describe the experiment of Faraday, cited by the opposition.

"A bent tube of V-shape, inverted, contains in the closed end chloride of silver saturated with ammonia-gas. The tube is cleared of air by slightly warming the chloride, and the other end hermetically sealed. Now if the end containing the chloride be heated, while the other end is kept in cold water, the vapor of ammonia will be driven over and condensed in the cold end by the cold and its own pressure. Then if the end containing the condensed ammonia be placed in a cylindrical vessel of small capacity containing water, and the heated end containing the chloride of silver be cooled, the absorptive action of the chloride will vaporize the ammonia, which, in the process of vaporization, takes the caloric necessary for the vapor from the surrounding water, which is thus frozen. It is upon the principle thus illustrated that Carré constructs the machine described and shown in the patents under consideration.

"But that machine is a very slight amplification of Faraday's tube. The end of the tube which is to contain the absorbent is enlarged, and has shelves to hold the liquid in shallow quantities, and thus facilitate evaporation. The other end is also enlarged, and has also, or may have, shelves.

"The operation is precisely the same as that described by Faraday. It operates, of course, intermittently, and is capable of producing ice only in small quantities. It lacks the essential elements, before referred to as described in the original patent, to make it a continuous machine, such as is of any practical use. In fact it is understood to constitute but a very small part of the continuously-operating machine as made and used by Carré or his assignees.

"Considering the device simply as shown and described in the reissued patents, it does not appear to be of any great value. There is no evidence that it has been introduced into use to any considerable extent, and applicant claims to have received only a very small sum from its manufacture and sale.

"But it is not upon this simple intermittent machine that applicant relies. All his estimates of the value of his invention and its importance to the public, and all the profits attributed to its use, are based upon its use in what is called an 'industrial' or continuous machine. These are the only machines used in the country. [Applicant states that some nineteen (19) of them are in use in this country, capable of producing in the aggregate 282,480 pounds of ice in twenty-four hours.] Now these are machines consisting of many parts and no little complication. Without discussing all the details of the machine, it is sufficient, for an understanding of the relation which the machine shown in the reissued patents of Carré bears to that which is used in the practical production of ice, to point out the following particulars:

"The vapor, after being expelled from the absorbent by heat, is conducted to a condensing apparatus, where, by the exterior application of cold water and its own pressure, it is condensed. Thence it is conducted to the tank, where it is vaporized and the cold produced practically applied to form ice. Thence it is carried on and by other apparatus condensed and returned to the absorbent, completing a continuous circuit. The construction of the freezing-vessel is peculiar and essential to the practical operation of the machine.

"Yet all these elements, and others hardly less essential, have no other representatives in the patents of Carré than the bent tube with its enlarged ends with the shelves or the simple substitute shown in Fig. 2. The difference may be seen at a glance by comparing Fig. 1 of Carré's original patent, or the drawing of Twining, or Exhibit 'G' of Twining, with the figures in Carré's reissues. Yet all these elements enumerated are essential to the continuous machine, and were old when Carré took out his patent.

"So he has really done no more than substitute for the exhausting and condensing pump of Twining and of Perkins the principle made known and illustrated by Faraday, and so far as appears in those patents, so far as he has set forth to the public, he has applied it only to the simple intermittent machine so like the bent tube. At most, in practice he has substituted the absorbent and heat for the mechanical means. Now for this he has received from the public more than sixty-five thousand dollars ($65,000.)

"Considering the clear and ingenious experiment of Faraday, the basis from which the applicant started, and the small advance he has made and disclosed to the public in these patents, the sum appears to us an ample compensation.

"Bearing in mind that there is no proof that he either in this patent or at any subsequent time himself applied the process or the apparatus to a continuous machine, in which it alone is of any practical value, so far as appears, it does not seem just that he should be allowed longer to oppose the monopoly of this one necessary element to the use by the public, or by prior or subsequent inventors, of the other elements equally necessary but equally needing this.

It might be well mentioned here that the original invention of Carré on this point was so narrow that the broad claims made in the reissues, and which cover the use of the invention in the continuous apparatus, cover also (with the exception of the second of No. 2,287) the bent tube and the use of it, as described in the printed publication so long prior to applicant's invention.

"Applicant's interest in the extended term would be one-third of the proceeds. It is satisfactorily shown that the continuous machines in use in this country embody applicant's invention, and produce ice at New Orleans at $5.00 per ton less than the natural ice, and that in these latitudes a great saving is undoubtedly effected. It is shown that they have been quite extensively introduced, the number of machines and the amount of ice produced having been previously given. No objection appears on these points, but for the reason stated above we are constrained to advise against the extension.

"ELLIS SPEAR,
"S. H. HODGES,
"*Examiners-in-Chief.*"

This report is approved and the extension is refused.

M. D. LEGGETT,
Commissioner of Patents.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—DISTRICT OF KENTUCKY.

WENDELL R. KING *vs.* THE LOUISVILLE CEMENT COMPANY.

The unauthorized use of a combination which operates upon the same principle with one that is patented is an infringement of the patent, although in the place of some of the constituent devices others are substituted which were known to be the equivalents of them when the patent was issued.

A screw which is rotated in a stationary nut by means of a spur-wheel upon the screw-gearing with another, and which is thereby made to move longitudinally, is but the equivalent of one to which, while it is prevented from turning, a like movement is imparted by a nut made to rotate upon it by means of a pulley placed upon the nut and belted to a drum.

BALLARD, *J.*:

This is a suit in equity, by which the complainant seeks to enjoin the defendant from infringing certain letters patent granted to complainant by the United States, for an "improvement in baling-presses," and also to recover of the defendant all gains and profits realized by it from the unlawful making, using, and vending of said improvement.

The defendant, by its answer, does not question the validity of the plaintiff's patent, but denies the infringement. And it also denies that it has ever made any machine of the kind referred to in the bill, except the one which it is using, or that it has sold any whatever.

The complainant in his specifications declares that his "invention consists in the arrangement in one apparatus of two presses, which are operated alternately by a single screw in such manner that turning the screw in one direction to compress the bale in one compartment of the press retracts the follower and releases the bale in the other compartment thereof, so that said bale may be readily removed as desired, thus by said simultaneous and alternating action avoiding all loss of time in operating the press."

The machine is provided with two boxes, constructed in all respects alike, having lids opening upward for placing in the boxes hair or other material to be pressed and for removing the bale when pressed. When the press is being operated the lids are fastened down by means of clamps, pins, or other suitable means. A screw is arranged between the boxes, one end extending into one box and the other into the other box, and each end of the screw is provided with a follower which moves against and away from the bale alternately. The screw is supported by passing through cross-pieces and through collars, through which it has a free longitudinal sliding motion, but is kept from turning by projections which enter a slot extending horizontally on the screw from one end to the other. There is a nut arranged on the screw, and on this nut are keyed two cog-wheels, one small the other large. The nut is turned by turning either of these cog-wheels, and when the nut is turned the screw moves laterally without turning. In order to turn these cog-wheels and operate the machine, there is a countershaft, supported in bearings on standards, which is supplied with two cog-wheels, one large and one small, so arranged that the small one engages with the large cog-wheel on the nut, and the large one with the small one, but they do not both engage at the same time. This shaft is made adjustable in its bearings, so that either of the cog-wheels arranged on it may be brought into gear. When the process of compression is commenced, the hair in the box being loose, but little power is required, and rapidity of motion is desired, but when the compression has proceeded to a given point increased power is desired and slowness of motion. To accomplish these results, the large wheel on the countershaft is first thrown into gear with the small wheel on the nut, when the turning of the wheels causes the screw to move in the direction of its axis rapidly, and the bale in one box to be released and the loose hair in the other to be compressed with corresponding rapidity. After the compression is carried to a point when increased power is required, the countershaft is moved so that its small wheel is thrown into gear with the large wheel on the nut, and the process of the compression is completed. The screw is made to move alternately in the direction of each box by turning the countershaft in different directions, and being, as before stated, provided with a follower at each end, it will be readily seen how, while one bale is being compressed in one box, the compressed bale in the other box is being released, and how, by having a double train of gearing, speed can be exchanged for power and power for speed, as desired.

The complainant does not claim any of the separate parts of this machine. He claims only the combination of the gearing with the screw and the boxes, when constructed and operating substantially as described.

The machine used by the defendant, like that of complainant's, is provided with two boxes, a screw between and extending into both boxes, and a gearing by which the slow and rapid motion is obtained.

The same result substantially is accomplished by each machine, but in the defendant's machine the screw, instead of sliding first in the direction of one box and then in the direction of the other, revolves. And this is accomplished by having nuts or female screws firmly secured on the inner heads of both boxes, and by suitable gearing. The gearing consists in a small wheel fastened firmly to a blank space on the screw, which is connected by means of a belt with a large drum or wheel, and a large wheel provided with spokes like a pilot-wheel, which is also firmly attached to the blank space on the screw. When the rapid motion is required at the beginning of the compression the large wheel or drum is geared to the small wheel on the screw, and when increased power is required the large wheel is used.

Now it occurs to me as obvious that the large wheel or drum, geared by means of the belt to the small wheel, in defendant's machine, is nothing but a mechanical equivalent for the large wheel geared to the small wheel in complainant's machine, and that the large pilot-wheel in defendant's machine is a substantial mechanical equivalent for the small wheel geared to the large wheel in complainant's machine. The drum, belt, and small wheel of defendant's machine, operating in conjunction, perform precisely the same function as the large wheel, cogs, and small wheel of complainant's machine, and in fact involve the same mechanical powers. So, also, the large pilot-wheel of the defendant's machine performs the same mechanical functions as the large wheel operated by the small wheel in complainant's machine. The mechanical power in each is the same. Increased power being desired, the mechanical device employed in each machine to accomplish the result is a lever of increased length. It certainly can make no difference that in the one case the power is applied directly to the end of the lever, and in the other that it is applied to the same point by means of appropriate gearing. Nor can I perceive any difference between the mechanical function performed by the screw in one machine and that performed by it in the other, or any substantial difference in the mode of operation. In each machine the screw moves in the line of its axis alternately toward the boxes, and though in the one machine it revolves and in the other slides, I cannot see that this makes any mechanical difference. In the one it revolves because the wheel to which the power is applied is firmly attached to the screw, and the screw works and moves in and through nuts which are stationary. In the other it is prevented from revolving by means of projections into a slot on the screw, but the screw works and moves because it is operated upon by a nut which revolves. There is not a particle more of apparent or real difference between these mechanical devices than may be seen by the operating of a screw with a single nut. If the nut be held stationary and the screw turned the screw will move through the nut and project beyond. On the other hand, if the screw be held stationary and the nut turned, the nut will move and cause the screw to project beyond it precisely as it did before. The result is the same, and the mechanical operation is the same in each case.

It is hardly necessary to add that the mechanical powers employed in both of the machines have been long known, and that it was hardly necessary to prove what the testimony, however, does establish, that it would occur to the merest tyro in mechanics that a substitution of the gearing employed in defendant's machine for the gearing employed in complainant's would enable him to accomplish the same results which complainants do. As he would substitute strictly mechanical equivalents, it is obvious he would produce the same results, and by an operation really similar, though somewhat disguised.

The question then is—the complainant's patent being admitted to be valid, though it is for a combination—can the defendant avoid the charge of infringement by substituting, in lieu of some of the parts of the combination, well known mechanical equivalents? I am quite sure that he cannot, either on principle or authority.

It is not to be disputed that the inventor of an ordinary machine is, by his letters patent, protected against all mere formal alterations and against the substitution of mere mechanical equivalents. Why should not the inventor of a mere combination receive the same protection? If he cannot, then will his patent not be worth the parchment on which it is written. If no one can be held to infringe a patent for a combination unless he uses all the parts of the combination and the same identical machinery as that of the patentee, then will no patent for a combination ever be infringed, for certainly no one capable of operating a machine could be incapable of adopting some formal alteration in the machinery, or of substituting mechanical equivalents. No one infringes a patent for a combination who does not employ all the ingredients of the combination, but if he employs all the ingredients or adopts mere formal alterations or substitutes for one ingredient, another, which was well known at the date of the patent as a proper substitute for the one withdrawn and which performs substantially the same function as the one withdrawn, he does infringe. In the case of *James Rees* vs. *Wm. L. Gould*, reported in the 2d Official Gazette of the U. S. Patent Office, 624, and also to be reported, I suppose, in 15 Wallace, the Supreme Court say: "*Bona fide* inventors of a combination are as much entitled to equivalents as the inventors of other patentable improvements, by which is meant that a patentee in such a case may substitute another ingredient for any one of the ingredients of his invention, if the ingredient substituted performs the same function as the one omitted, and was well known at the date of his patent as a proper substitute for the one omitted in the patented combination." * * "And it is clear that an alteration in a patented combination which merely substitutes another old ingredient for one of the ingredients in a patented combination is an infringement of the patent, if the substitute performs the same function and was well known at the date of the patent as a proper substitute for the omitted ingredient." This authority, it seems to me, is entirely conclusive of this case, and it is hardly worth while to refer to other decisions, but the opinion of the same court in the case of *Seymour* vs. *Osborne*, 11 Wallace, 555, and of Judge Sawyer, of the Circuit Court of the United States for the district of California, in the case of *Carter* vs. *Baker*, 4 Fisher, 404, may be consulted.

I have not examined minutely the testimony of the experts produced by the respective parties in this case, because I do not ordinarily attach much importance to the opinions of witnesses so produced—I find them generally advocates of the party producing them—and I have rarely ever derived any assistance from any expert who was not summoned and examined on the suggestion of the court itself. But in this case I have not referred to their testimony, chiefly because the nature of the complainant's invention and of the operation of both his and the defendant's machines is so easily understood that assistance has not been needed.

Being of the opinion that the machine used by defendant is clearly an infringement of complainant's patent, I shall direct a perpetual injunction and give a decree for costs, but as complainant has offered no proof touching the damages, and as they must be small, I shall direct no inquiry concerning them.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

25,484.—Grain-Separators.—Granted to Jonathan L. Booth, September 20, 1859; reissued September 25, 1860, and November 29, 1864. Application filed June 14, 1873. Hearing September 3, 1873.

25,488.—Hydraulic Presses.—Granted to M. H. Clark, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,499.—Railroad-Car Seat.—Granted to Eli Wheeler, September 20, 1859. Application filed June 17, 1873. Hearing September, 3, 1873.

25,506.—Lamps.—Granted to Halvor Halvorson, September 20, 1859; reissued June 6 and December 5, 1871. Application filed June 6, 1873. Hearing September 3, 1873.

25,508.—Tailers' Shears.—Granted to Rochus Henrich, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,512.—Bung-Hole Borer and Reamer.—Granted to Josiah Kirby, September 20, 1859. Application filed June 19, 1873. Hearing September 3, 1873.

25,544.—Try-Cocks for Steam-Boilers.—Granted to John F. Cook, September 20, 1859. Application filed June 10, 1873. Hearing September 3, 1873.

25,565.—Rolling-Mills.—Granted to John and George Fritz, September 27, 1859. Application filed June 27, 1873. Hearing September 10, 1873.

25,569.—Bedstead-Slats.—Granted to Tyler Howe, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,570.—Mode of Arranging Couches in Railroad Cars.—Granted to Edward C. Knight, September 27, 1859. Application filed May 31, 1873. Hearing September 10, 1873.

25,572.—Molding Water-Traps.—Granted to James Allen Lown, September 27, 1859. Application filed June 24, 1873. Hearing September 10, 1873.

25,586.—Burglar-Alarms.—Granted to Abbott Q. Ross, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,588.—Steam Punching-Machines.—Granted to John Sparrow, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,648.—Steam-Boilers.—Granted to Joseph Harrison, Jr. October 4, 1859. Application filed June 26, 1873. Hearing September 17, 1873.

25,669.—Construction of Prisms.—Granted to Edwin May, October 4, 1859. Application filed June 23, 1873. Hearing September 17, 1873.

25,670.—Machines for Lasting Boots and Shoes.—Granted to James Purinton, October 4, 1859; reissued January 6, 1863. Application filed July 5, 1873. Hearing September 17, 1873.

25,682.—Hydrants.—Granted to Charles L. Stacy, October 4, 1859; reissued June 6, 1865. Application filed June 26, 1873. Hearing September 17, 1873.

25,692.—Sewing-Machines.—Granted to Kasimir Vogel, October 4, 1859; reissued November 1, 1864. Application filed July 5, 1873. Hearing September 17, 1873.

25,701.—Skeleton Skirt.—Granted to James Draper, October 4, 1859; reissued August 1, 1865. Application filed July 2, 1873. Hearing September 17, 1873.

25,726.—Head-Machine for Wiring Blind-Rods.—Granted to Ezra C. Davis, October 11, 1859. Application filed July 12, 1873. Hearing September 24, 1873.

25,733.—Double-Friction Couplings.—Granted to Joshua Hendy, October 11, 1859; reissued March 25, 1873. Application filed July 7, 1873. Hearing September 24, 1873.

25,747.—Method of Combining Emery with Caoutchouc.—Granted to Thomas J. Mayall, October 11, 1859. Application filed June 16, 1873. Hearing September 24, 1873.

25,767.—Cutting and Panning Cakes.—Granted to John H. Simons, October 11, 1859. Application filed July 11, 1873. Hearing September 24, 1873.

25,784.—Mode of Manufacturing Barrels, &c.—Granted to George W. Barker, October 11, 1859. Application filed July 9, 1873. Hearing September 24, 1873.

25,786.—Jacquard Machines.—Granted to Avery Barrett, October 18, 1859. Application filed June 30, 1873. Hearing October 1, 1873.

25,797.—Harvesters.—Granted to Ephraim Ball, October 18, 1859. Application filed July 18, 1873. Hearing October 1, 1873.

25,807.—Hame-Folders.—Granted to Leverett Clark, October 18, 1859. Application filed July 19, 1873. Hearing October 1, 1873.

25,814.—Sleeping-Cars.—Granted to John Danner, October 18, 1859. Application filed July 12, 1873. Hearing October 1, 1873.

25,842.—Cultivators.—Granted to Thomas McQuiston, October 18, 1859; reissued May 16, 1871. Application filed July 11, 1873. Hearing October 1, 1873.

25,869.—Weeding-Hoes.—Granted to James M. Adams, October 18, 1859. Application filed July 18, 1873. Hearing October 1, 1873.

25,887.—Machines for Covering Saddle-Trees.—Granted to John Maclure, October 18, 1859. Application filed July 14, 1873. Hearing October 1, 1873.

25,974.—Browning-Machines.—Granted to George H. Babcock, October 25, 1859. Application filed July 25, 1873. Hearing October 8, 1873.

25,982.—Construction of Glass Coffins.—Granted to John R. Cannon, October 25, 1859. Application filed July 23, 1873. Hearing October 8, 1873.

25,986.—Cut-Off Valves of Steam-Engines.—Granted to Edward B. Ahrens, November 1, 1859. Application filed August 1, 1873. Hearing October 15, 1873.

25,978.—Tackle-Blocks.—Granted to Isaac E. Palmer, November 1, 1859; reissued September 9, 1863, April 11, 1865, and December 6, 1868. Application filed July 26, 1873. Hearing October 15, 1873.

25,994.—Bit-Stocks.—Granted to Nelson Stowford, November 1, 1859; reissued April 23, 1867. Application filed July 22, 1873. Hearing October 15, 1873.

26,002.—Telegraphic Machines.—Granted to George M. Pumyea, November 1, 1859. Application filed July 30, 1873. Hearing October 15, 1873.

26,026.—Manufacture of Gas.—Granted to Leonard D. Gale, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Hearing October 22, 1873.

26,030.—Manufacture of Gas.—Granted to Leonard D. Gale, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Hearing October 22, 1873.

26,066.—Machines for Making Box-Joints.—Granted to James Stimpson, November 8 1859. Application filed August 2, 1873. Hearing October 22, 1873.

26,069.—Sleeping-Cars.—Granted to John Danner, November 8, 1859. Application filed August 4, 1873. Hearing October 22, 1873.

26,087.—Fastening Metal Hoops on Cotton-Bales.—Granted to John T. Butler, November 15, 1859. Application filed August 7, 1873. Hearing October 29, 1873.

26,090.—Machines for Folding Paper.—Granted to Cyrus Chambers, Jr., November 15, 1859; and reissued August 12, 1873. Application filed August 14, 1873. Hearing October 29, 1873.

26,097.—Electro-Magnetic Telegraphs.—Granted to Moses G. Farmer, November 15, 1859; and reissued December 10, 1872. Application filed August 16, 1873. Hearing October 29, 1873.

26,128.—Billiard-Table Cushions.—Granted to George D. Sharp, November 15, 1859; and reissued April 8, 1873. Application filed August 16, 1873. Hearing October 29, 1873.

26,135.—Portable Pumps.—Granted to William T. Vare, November 15, 1859; reissued February 26, 1861. Application filed August 11, 1873. Hearing October 29, 1873.

26,136.—Mode of Advertising.—Granted to Edward Wiebe, November 15, 1859. Application filed August 16, 1873. Hearing October 29, 1873.

26,139.—Pumps.—Granted to William Wright, November 15, 1859. Application filed August 14, 1873. Hearing October 29, 1873.

26,145.—Cocks for Water-Closets.—Granted to Darius Wellington, November 15, 1859. Application filed August 11, 1873. Hearing October 29, 1873.

26,147.—Machine for Bundling Kindling-Wood.—Granted to William L. Williams, November 15, 1859; and reissued October 4, 1870. Application filed August 14, 1873. Hearing October 29, 1873.

26,177.—Rubber Belting.—Granted to Dennis C. Gately, November 22, 1859. Application filed August 16, 1873. Hearing November 5, 1873.

26,178.—Making Rubber Belting.—Granted to Dennis C. Gately, November 22, 1859. Application filed August 16, 1873. Hearing November 5, 1873.

26,202.—Manufacture of Paper-Pulp.—Granted to John B. Palser and Gardiner Howland, November 22, 1859; and reissued July 2, 1867. Application filed August 20, 1873. Hearing November 5, 1873.

26,243.—Water-Closet Basins.—Granted to William Boch, Sr., November 29, 1859. Application filed June 10, 1873. Hearing November 12, 1873.

26,276.—Manufacture of Rubber Hose.—Granted to Thomas J. Mayall, November 29, 1859; and reissued October 22, 1872. Application filed August 19, 1873. Hearing November 12, 1873.

26,291.—Molding for Metal Casting.—Granted to John P. Broadmeadow, November 29, 1859. Application filed August 15, 1873. Hearing November 12, 1873.

26,329.—Boot and Shoe Tips.—Granted to Newman Silverthorn, November 29, 1859; reissued September 2, 1862, and August 4, 1868. Application filed August 22, 1873. Hearing November 12, 1873.

26,364.—Top-Props for Carriages.—Granted to George Cook and Hannibal I. Kimball, December 27, 1859. Application filed August 23, 1873. Hearing December 10, 1873.

27,539.—Manufacture of Gun-Barrels.—Granted to James H. Burton, March 29, 1860, and antedated to September 29, 1859; reissued December 24, 1871. Application filed July 1, 1873. Hearing September 10, 1873.

EXTENSIONS GRANTED.

25,183.—Improvement in Nail-Machines, granted to Daniel Dodge, August 22, 1859.

Claim.—1. A griper having a reciprocating movement toward and from forging on pointing mechanism, and opening automatically at the outer extremity of its stroke, so as to allow the introduction, feeding forward, or removal of the rod while it is in this position, but holding the rod fast at every other stage of its operation and while in any other position, substantially as herein described.

2. In combination with a so operating griper, the employment of a gage and a cutter or cutters, operating in the within-described order of succession with respect to each other and to the griper.

25,191.—Machine for Making Paper Bags, granted to William Goodale, August 23, 1859.

Claim.—1. The pasting apparatus, consisting of the roller G fitted to work in an opening in the bottom of a paste-box, the spring K or its equivalent, and the adjustable stopper e, all combined to operate substantially as herein described.

2. The combination of the continuously-revolving measuring-rollers I I′, and the intermittently-revolving feed-rollers J J′, operating substantially as and for the purpose herein described.

3. The drop E′, operating in combination with the cutter B and the feed-rollers, substantially as and for the purpose herein specified.

4. Folding the paper around a plate, q, or flat piece of any material narrower than the bag itself, or of the same width as, but shorter than, the bag itself, substantially as herein specified.

5. The folders E E′, applied and operating in combination with the inclined planes l l′ at the sides of the folding-table C, substantially as and for the purpose herein set forth.

6. The combination, with the folding-table and with a plate, Q, narrower than the bag, to fold the bag upon, of one or more movable inclined planes, F, and crossing-blades U, operating substantially as herein described.

7. The drop Z, applied and operating substantially as and for the purpose herein described.

8. The bar 21, applied to the vibrating roller-frame, and operating in combination with the knock-off s, substantially as and for the purpose herein set forth.

25,199.—Improvement in Feeding Paper to Printing-Presses, granted to Richard M. Hoe, August 23, 1859; reissued June 29, 1871, numbered 4,689.

Claim.—1. The combination of the feeding mechanism, cutting apparatus, and the printing-machine, or their equivalents in the said combination, for feeding the paper from a roll to a printing-machine, and cutting or partially cutting it into sheets as it passes along to be printed, substantially as set forth and specified.

2. Constructing the cutter so as to leave the several sheets united in certain places, substantially as described, in combination with the conducting-tapes, or the equivalents thereof, as described, so that the conducting-tapes may pass around the cylinder, substantially as described and set forth.

3. The combination of the cutting-cylinder and the grooved cylinder, or the equivalents thereof, of the two pressure-rollers, or their equivalents, for keeping the sheet distended, substantially as described and specified.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date August 19, 1873.]

6,803.—Band-Saw Frame.—Labon M. Collins, Lebanon, N. H. Application filed April 11, 1873.

6,804.—Glass Goblets.—John H. Hobbs, Wheeling, W. Va. Application filed March 8, 1873.

6,805.—Glass Dish.—John H. Hobbs, Wheeling, W. Va. Application filed October 10, 1872.

6,806.—Seal-Presses.—Charles A. Mathiesen and John C. Schrader, New York, N. Y. Application filed August 7, 1873.

6,807.—Safety-Stirrup.—Rufus Reniff, Bloomington, Ill. Application filed April 19, 1873.

6,808.—Gauntlet.—James F. Travis, New York, N. Y.—A. Application filed August 4, 1873.

6,809.—Gas-Bracket.—James F. Travis, New York, N. Y.—B. Application filed August 4, 1873.

6,810.—Oil-Cloth.—Joseph Barrett, New York, N. Y., assignor to Thomas Potter, Sons & Co., Philadelphia, Pa. Application filed August 6, 1873.

6,811.—Carpet.—John Donnan, Philadelphia, Pa., assignor to Donnan, Mayhin & Co., same place. Application filed August 6, 1873.

6,812.—Oil-Cloth.—James Hutchison, Newark, N. J., assignor to Thomas Potter, Sons & Co., Philadelphia, Pa.—A. Application filed August 8, 1873.

6,813.—Oil-Cloth.—James Hutchison, Newark, N. J., assignor to Thomas Potter, Sons & Co., Philadelphia, Pa.—C. Application filed August 8, 1873.

6,814.—Oil-Cloth.—James Hutchison, Newark, N. J., assignor to Thomas Potter, Sons & Co., Philadelphia, Pa.—F. Application filed August 8, 1873.

6,815.—Oil-Cloth.—James Hutchison, Newark, N. J., assignor to Thomas Potter, Sons & Co., Philadelphia, Pa.—G. Application filed August 8, 1873.

6,816.—Oil-Cloth.—James Hutchison, Newark, N. J., assignor to Thomas Potter, Sons & Co., Philadelphia, Pa.—E. Application filed August 8, 1873.

6,817.—Oil-Cloth.—James Hutchison, Newark, N. J., assignor to Thomas Potter, Sons & Co., Philadelphia, Pa.—B. Application filed August 8, 1873.

6,818.—Oil-Cloth.—James Hutchison, Newark, N. J., assignor to Thomas Potter, Sons & Co., Philadelphia, Pa.—D. Application filed August 8, 1873.

6,819.—Carpet.—Charles A. Righter, Philadelphia, Pa., assignor to Donnan, Mayhin & Co., same place. Application filed August 8, 1873.

6,820.—Carpet.—Charles A. Righter, Philadelphia, Pa., assignor to Donnan, Mayhin & Co., same place. Application filed August 8, 1873.

6,821.—Carpet.—Charles A. Righter, Philadelphia, Pa., assignor to Donnan, Mayhin & Co., same place. Application filed August 8, 1873.

6,822.—Carpet.—Charles A. Righter, Philadelphia, Pa., assignor to Donnan, Mayhin & Co., same place. Application filed August 8, 1873.

6,823.—Carpet.—Charles A. Righter, Philadelphia, Pa., assignor to Donnan, Mayhin & Co., same place. Application filed August 8, 1873.

6,824.—Carpet.—John T. Webster, Philadelphia, Pa., assignor to John and James Dobson, same place. Application filed August 1, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date August 19, 1873.]

1,410.—Cotton-Gins.—The Gullett Gin Manufacturing Company, Amite City, La. Application filed July 5, 1873.

"The word 'Magnolia,' together with the figure of one or more magnolia flowers or buds."

1,411.—Fertilizers.—Moses J. Solomons, Savannah, Ga. Application filed July 19, 1873.

"'M. J. S.,' in a monogram having the word 'Solomons' above, the word 'Rowland' separated in two syllables, one of which is placed on each side, and the word 'Compound' below."

1,412.—Packed Oysters, Fruits, and Vegetables.—Wentz & Barndollar, Baltimore, Md. Application filed July 12, 1873.

"a Maltese cross, having the word 'Trade-Mark' on the upper and lower limbs, and the letters 'W. B.' on the left and right hand limbs, respectively, and the figure '2' in the center. These are printed in black or dark ink over a striped base of lighter color."

1,413.—Selected Nails.—John Coyne, Pittsburg, Pa. Application filed August 5, 1873.

"the words 'Coyne's Alpha Selected' and the figure of a nail arranged inside the outline of a shield."

1,414.—Fancy and other Dry-Goods.—Ed. Flahland & Co., Paris, France. Application filed August 1, 1873.

"'O and A.'"

1,415.—Fancy and other Dry-Goods.—Ed. Flahland & Co., Paris, France. Application filed August 1, 1873.

"a crown supporting a lion."

1,416.—Wines, Liquors, Beer, Mineral Waters, &c.—Seymour McCullagh, London, England. Application filed August 5, 1873.

"a red cross, and in the center thereof the initials 'McC.,' in a diamond."

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date August 19, 1873.]

ORIGINAL PATENTS.

141,847.—Firkin.—CLARK ALVORD, Westford, Wis. Application filed March 17, 1873.

A firkin constructed in form of a cylinder, with heads or ends of wood which project outside of it to receive bolts, and has grooves in which the cylinder is fitted, and a close package is formed.

Claim.—The cylinder *a*, heads *c*, and rods *i*, or their equivalents, substantially as described.

141,848.—Fertilizer.—ALBERT F. ANDREWS, New Haven, Conn., assignor to ALFRED EDWARDS and ALBERT F. ANDREWS, same place. Application filed March 19, 1873.

Chloride of calcium and salt are added to tank-stuff, after which pulverized unslaked lime is added in the proportion of one of lime to three of tank-stuff. The mass is raised to about 300° Fahrenheit by artificial heat, and thoroughly agitated by a mechanical mixer.

Claim.—1. The within-described treatment of tank-stuff and analogous matter with unslaked lime, and agitation in a power mixer, substantially as herein set forth.

2. The utilization of animal fertilizers by treating with artificial heat, in connection with a liberal quantity of unslaked lime, and agitation in a power mixer, as specified.

3. The treatment of animal fertilizers with chloride of sodium or chloride of calcium, in connection with unslaked lime and heat, with agitation, as herein specified.

141,849.—Dressmaker's Marking and Cutting Gage.—MARY BLAUVELT, Ithaca, N. Y. Application filed April 28, 1873.

A gage rod or scale provided with an adjustable slide and cross-arm carries at its extremity a marking-wheel, over which a chalk-holder is fixed for supplying the marking material to the wheel as it is moved over the fabric.

Claim.—1. The gage *a*, in combination with the cutting or marking wheel *c* and an adjustable slide, *i*, substantially as described.

2. The chalk-holder *g*, in combination with the marking-wheel *c*, substantially as set forth.

3. The slide *i*, wheels *l*, and rod *a*, substantially as specified.

141,850.—Washing-Machine.—BENJAMIN W. BOWEN, Greenville, Pa. Application filed July 5, 1873.

U shaped springs are pivoted between the cross-bars and are combined with hook-rods that are hung on the upper roller. Small transversely-grooved rollers are placed under the upper roller.

Claim.—1. The U-shaped springs H, arranged in connection with the bars A and hook-rods G, substantially as herein shown and described, and for the purposes set forth.

2. The combination of the bars A, uprights B, shaft C, fluted roller D, crank E, small transversely-grooved rollers F, hook-bars G, and springs H with each other, substantially as herein shown and described, and for the purpose set forth.

141,851.—Horse Hay-Fork.—SAMUEL B. BOWERS, Stockton, Cal. Application filed June 3, 1873.

A shield or hood is placed on the tine side of the cross-head to receive the lower end of a vertical locking-lever and locking-bolt, which are operated by a spring and trip-rope.

Claim.—The mechanical device for locking the fork in position for loading and liberating the same, consisting of the arm D, socket E, catch F, spring *f*, and dog *d*, all combined and arranged to operate substantially in the manner as herein shown and described, for the purposes set forth.

141,852.—Machine for Edging Lumber.—WILLIAM G. Caldwell, Three Rivers, Mich., assignor to THREE RIVERS MANUFACTURING COMPANY, same place. Application filed May 19, 1873.

The feed-rolls are heated to prevent the adhesion to their surface of gum, snow, or ice, and the movable saws are adjustable independently of each other or all together.

Claim.—1. A hollow shaft or sleeve, in combination with one or more shafts passing through it and devices for shifting the saws back and forth, whom the said shafts are connected and operated all together or independently of each other, substantially as shown and described.

2. The shafts *b c*, each provided with a pinion, in combination with the wheel *e*, crank *g*, and devices for shifting the saws, the shafts being arranged to operate together or independently, substantially as set forth.

3. The wheel *e*, crank *g*, and spring-handle, provided with a projection for catching in the holes *l*, when arranged to operate the shafts *b c*, substantially as specified.

4. A corrugated hollow feed-roller, 3, heated by steam or hot air, substantially as described.

141,853.—Drying and Disintegrating Animal Matters.—CHARLES C. COX, Hartford, Conn. Application filed April 17, 1873.

Mixes with animal matter from five to ten per cent. of unslaked lime and puts the mixture in a drying apparatus for about ten minutes, then adds from two to five per cent. of sulphuric acid and continues the drying process until the compound is reduced to a dry, easily pulverized mass.

Claim.—The process for drying and disintegrating animal matters herein set forth.

141,854.—Panier.—JULIA S. COLBY, New York, N. Y. Application filed January 13, 1872.

Circular springs are placed under the hoops at the waistband to form a bustle. The front of the skirt is open, and at its edges are attached flaps or wings which regulate the distension of the hoops.

Claim.—In combination with the wires comprising a bustle or skirt, as herein described, the wings *d d*, circular springs *g g*, rods or braces *i i* and *j j*, all constructed and arranged substantially as herein shown and described.

141,855.—Brick-Machine.—WILLIAM COLE, Milan, Tenn. Application filed November 16, 1872.

A "feeder" pushes the clay into the press-box as it descends from the hopper, where it is compressed in the molds between the plunger and pressure-platform H, raised by eccentrics, after which the surplus clay is scraped off by the cutter M.

Claim.—The combination and arrangement of the hopper B, plunger G, molds F, platform H, cams K, pedal K', feeder D, cutter M, pitmen E and L connected to the rock-shaft E', provided with the arm C', substantially as specified.

141,856.—Car-Lamp.—JAMES E. CROSS, Adrian, Mich. Application filed June 7, 1873.

Claim.—An open globe and lamp supporting bracket, B C, for allowing access through it to a wick-adjusting device, substantially as described.

141,857.—Screw-Driver.—JOSEPH H. DAVIS, Livingston county, Mo. Application filed July 8, 1873.

By the clamps E having bent ends *d* near the handle screws can be inserted and withdrawn by the use of one hand only.

Claim.—The clamps E, provided with the hooks *d*, and so contracted by the guide D as to be operable by the hand grasping the handle B, in combination with the pivot-stand F and springs *m*, when arranged upon the blade A, substantially as shown and described.

141,858.—Straw-Conveyer for Thrashing-Machines.—CHARLES D. DECKER, Bonus, Ill. Application filed February 24, 1873.

Connected with a vibrating shaker an inclined removable slotted extension or tail-piece, and a chute underneath the slots to deliver the grain out of the way of the falling straw.

Claim.—1. The inclined extension or tail-piece C, provided with the slatted bottom, in combination with the vibrating shaker or straw-carrier, substantially as and for the purpose described.

2. The removable inclined slatted extension or tail-piece C, provided with the inclined bottom or chute-board F, constructed and operating substantially as described.

141,859.—Railroad-Car Truck.—GEORGE DIXON, Toronto, Canada. Application filed July 28, 1873.

The center of gravity of the trunk is lowered to a point limited only by the diameter of the wheels on the truck.

Claim.—1. In combination with the rigid frame A of a car-truck supported intermediate of the diameter of the wheels of the truck, the bolster B', shoes d^3, elliptic springs *d d*, shoes d^3, links *e e*, and bars *f*, arranged and operating substantially as described.

2. In a car-truck, the combination of the rigid frame A composed of side frames A', and cross-beams *a* with a bolster, B', shoes d^3, elliptic springs *d d*, shoes d^3, links *e e*, and bars *f*, arranged and constructed to operate substantially as described.

141,860.—Sectional Folding-Frame for Boats.—WILLIAM M. DUCKER, Brooklyn, N. Y. Application filed August 4, 1873.

Folds in three sections by hinging the side supports, to which the covering is attached, its sides supported by ribs attached to the folding bottom or keel by staples. For adjustment, the two center ones held in position by the extended arms or brace to which the row-lock is attached and the bottom or keel attached to the bow and stern by brackets.

Claim.—The frame or skeleton of a boat constructed of sectional side pieces *a* and *g*, and keel-piece B, in combination with the ribs *f*, bow-piece D, stern-piece C, constructed and operating substantially as described, and for the purposes set forth.

141,861.—Manufacture of Watch-Case Centers.—JOHN C. DUNNER, Cincinnati, Ohio. Application filed April 18, 1873.

A bar or plate is first cast, and from this an annular ring is punched which is afterward operated upon in a lathe by special tools to finish both the inner and outer surfaces of the watch-center.

Claim.—The process of manufacturing watch-case centers by casting the metal in the form of a homogeneous flat bar, and by the successive punching and turning operations, all as herein specified.

141,862.—Machine for Making Paper-Bags.—GEORGE DUNHAM, Unionville, Conn. Application filed December 2, 1872.

Sheets pasted on one edge are fed onto a table by reciprocating clamp-bars, where a former (on an intermittingly-moving wheel-frame) carries it down through an opening. The projecting edges of the sheet are folded upon the top of the former by side folders. At the next rotary movement of the former the end of the tube thereon is folded against its end by a series of folders and pasting-plungers, and, as the former moves on the finished end is preserved against radial rollers until the former arrives opposite two vibrating revolving endless aprons, which at the proper time are moved apart and a blade reciprocated between, against the end of the former. A plunger moves out of the former, stripping the bag off, which is supported between it and the blade, and delivers the bag between the aprons. The plunger now collapses by the action of pressing-plates, which, separating, allow the belts to move and feed out the completed bag.

Claim.—1. The radially-arranged rolls I' for preserving the folded end of the bag in its folded form while passing to its position to be removed from the machine, substantially as set forth.

2. As a means of operating the folding-plates f^2 the rod *d*, provided with projections i' and i^2 and *h* and h^1, said rod sliding within the frame O, and the curved pieces i^3 upon said folding-plates, substantially as described.

3. The combination of the rod *d* with the moving frame O, and the arms *f* pivoted thereto, substantially as described.

4. In combination with the moving frame O and the folding-plates f^2, the reciprocating blade V, substantially as set forth.

5. The endless aprons L^1 and L^2, carried by rolls having a stationary bearing at one end, and over rolls which move apart at the other end, substantially as described.

6. The combination of the vibrating endless aprons L^1 and L^2, with the longitudinally-moving frame O, substantially as set forth.

7. The combination of the vibrating endless aprons L^1 and L^2 and frame O, with the folding-plates f^2, and reciprocating blade V, substantially as described.

8. The spring *n*, in combination with the curved piece f^3, as a means of preventing the folding-plate f^2 from swinging open too far, substantially as set forth.

9. The combination of the rotating disk A^4, formers A^5, and the mechanism for removing the bag from the formers, substantially as herein described.

10. The frame O, provided with folding-plates and arranged to move longitudinally within the former, substantially as and for the purpose herein described.

11. The combination of the arms *f* with the reciprocating blade V, operating substantially as and for the purpose herein described.

12. The combination of the arms *f*, reciprocating blade V, and vibrating endless aprons L^1, substantially as herein set forth.

13. A series of formers, A^5, equidistant from each other, revolving around a common center and having a hinged or folding end, substantially as described.

14. The hinged or folding end former A^6, in combination with the blade V, substantially as described.

141,863.—Harvester.—JOHN H. ELWARD, St. Paul, Minn. Application filed March 13, 1873.

The coupling-frame and shoe are made rigid with the main frame, but capable of vertical adjustment.

Claim.—1. The cutter or coupling frame K K', provided with the brace K^2 and and shoe L, rigidly connected with the frame A A', but made capable of vertical adjustment, substantially as described.

2. The fixed or stationary shoe L, provided with boxes or bearings for the crank-shaft N, and made capable of adjustment, as described, in combination with the jointed tumbling-shaft E and finger bar or head *m*, hinged to and turning upon the journals of the crank-shaft, as described.

141,864.—Harvester.—JOHN H. ELWARD, Polo, Ill. Application filed December 27, 1871.

The cut grain falls upon a horizontal endless apron which carries it to the elevating-apron, and by the latter is carried to the binders, who stand upon a platform which is provided with openings to allow the loose grain to fall through, when it is gathered by a receptacle provided for that purpose.

Claim.—1. In combination with the binders' platform, provided with openings, the pouch H^1, or supplemental grain-receptacle, adapted to receive the shattered grain from the platform and protect it against injury from the feet of the binders.

2. The combination, substantially as described, of the elevating apparatus and binders' platform with the grain guard, made in two or more hinged sections, whereby ready access is afforded to the gearing and under side of the elevator.

3. In combination with a removable gear plank or frame, the main-driving and gear wheel A, provided with two concentric gears and two crank-shafts, the forward one being inclined and driven at a high speed for mowing, the rear shaft being driven at a lower speed for reaping, these parts being arranged substantially as described, whereby the gearing is adapted to be used for both reaping and mowing.

141,865.—Harvester.—JOHN H. ELWARD, St. Paul, Minn. Application filed February 14, 1873.

The elevating-apron is provided on its lower side with a continuous shield, between which and the compressing and clearing rods the grain is carried and dropped upon a stationary binders' attachment, which is surrounded by a curved receptacle.

Claim.—1. The combination of the continuous shield H, elevator-rakes *g g'*, and spring-rods *k*, arranged and operating substantially as described.

2. The shield H H^1 H^2, extending from the horizontal apron to and terminating in the grain-receptacle I, substantially as and for the purpose set forth.

3. The combination of the shield H, rakes *g g'*, spring-rods *k*, receiving-fingers *i*, and receptacle I, substantially as and for the purpose set forth.

4. The binders' support, composed of the overhanging pivoted arms M, saddle-bars N, stirrups or saddles O, and stirrup-bars P, substantially as and for the purpose described.

5. The binders' support, as recited in the last-preceding clause of claim, in combination with the canvas receptacle surrounding or inclosing said support, substantially as described.

6. The reciprocating sickle-lever plate *q*, arranged and operating substantially as described.

141,866.—Harvester.—JOHN H. ELWARD, St. Paul, Minn. Application filed May 26, 1873.

The cut grain is carried by the elevating-apron to the binders' table or to the secondary elevating-apron, by which it is discharged into a receptacle.

Claim.—1. The roller J', in combination with the yielding spring-board J, substantially as and for the purposes set forth.

2. The lifting-roller K, in combination with the spring-board J, substantially as and for the purpose set forth.

3. The lifting-roller K, mounted in pivotal bearings on the seat-support, substantially as and for the purpose set forth.

4. The discharging-roller D, provided with hubs or rings *d*, in combination with the notched slats of the elevator-apron, substantially as and for the purpose set forth.

5. The arrangement of the secondary-elevating and discharging apron C^2 in the described relation to the shield E and shattered grain-receptacle F, substantially as and for the purpose set forth.

141,867.—Harvester.—JOHN H. ELWARD, St. Paul, Minn. Application filed March 13, 1873.

The grain-platform is provided with lifting and sliding bars, whereby the grain is carried to the elevating apparatus.

Claim.—1. The binders' stand I and grain-receptacle I', separated by the partition H, substantially as and for the purpose set forth.

2. The lifting and reciprocating rake-bars *j'*, connected with the parallel bars *j*, and operated by the means and substantially as described.

141,868.—Harvester.—JOHN H. ELWARD, St. Paul, Minn., assignor to ST. PAUL HARVESTER WORKS, same place. Application filed March 13, 1873.

The shipping-lever is operated by a spring to engage the pinion with the driving-shaft, and a stop limiting the throw of said lever, to prevent constant pressure and friction between the shipping-lever and pinion.

Claim.—1. The combination, with the pinion or shipping clutch of a harvesting-machine, of the fork or lever F and spring H for holding the pinion engaged with its shaft in the forward movement of the machine, and at the same time permitting its disengagement in backing, and the stop *g* for relieving the pinion when thus engaged from the friction due to the tension of the spring, as described.

2. The combination of shaft D, pinion E, lever F, spring H, stop *g*, rod I, nuts *i i'*, lever J, and spring H', substantially as and for the purposes set forth.

141,869.—Spark-Arrester.—WILLIAM D. FARRAND, New York, N. Y. Application filed July 2, 1873.

Smoke and non-consumed products of combustion ascend a curved flue and empty into a laterally enlarged chamber, from whence they are driven into a water reservoir by force of the exhaust-steam, thence out through two side flues. The water is prevented from being forced out by two guards at the contracted mouth of the reservoir.

Claim.—1. The combination of the smoke-flue B with the laterally-enlarged central chamber C, substantially as and for the purpose herein set forth.

2. The combination, with each other, of the smoke-flue B, the laterally enlarged central chamber C, the guard-plates A A, and the water-tank E, substantially as and for the purpose herein set forth.

3. The combination of the smoke-flue B with the laterally-enlarged central chamber C and the discharging-tubes F F, substantially as and for the purpose herein set forth.

141,870.—Boiler-Furnace.—SAMUEL A. FORD, Chicago, Ill. Application filed May 23, 1873.

Air passes through the hot-air chamber located between the perforated deflected chamber and the boiler, and commingles with the products of combustion as they pass through said deflected chamber.

Claim.—The hot-air chamber C, and deflected perforated chamber D, in combination with the air-pipes E, steam-pipes F and G, arranged substantially as specified and shown, and for the purpose set forth.

141,871.—Screw-Propeller.—DAVID FREED, Philadelphia, Pa. Application filed June 11, 1873.

A flange is arranged at the extremity of the blades, at an obtuse angle to their plane.

Claim.—The concavo-convex angular furrow circularly on the verge of the propeller-blades, the concavity being on the forward

propelling-surface of the blades, and the convexity on the backward propelling-surface thereof, thereby giving propelling advantage by reason of the rush of the water thrown by centrifugal action against the grooved angular surfaces on the verge of the blades, substantially as set forth.

141,872.—Ballot-Box.—JACOB GAMBER, near Petersburg, Pa. Application filed June 4, 1873.

Votes by balls, which, being dropped into the hopper, the first platform is reciprocated, (by means of the crank and gearing,) receiving one of the balls in each opening and retaining them until they pass over the opening in the stationary platform, when they fall into the drawer, and the alarm-bell is struck by mechanism connected with the crank.

Claim.—1. The combination and arrangement, within a box, of a hopper, W, and a sliding platform, F, and stationary platform H, having, respectively, the perforations *g h* to allow the balls dropped into the hopper to pass to the drawer beneath, substantially in the manner and for the purpose set forth.

2. In combination with the cogged gearing M N, ratchet-wheel O, pawl P, connecting-rods L with the bar K, the foot V on the vertical connection with K, to operate the levers T U and hammer of the bell R, in the manner and for the purpose set forth.

141,873.—Coach-Pad for Harness.—ALGERNON GILLIAM, Pittsburg, Pa. Application filed May 29, 1873.

Claim.—The pad-strap B, having formed within it an elongated slot or depression, *a*, to receive the bur or nut E, without any other mode or means of fastening such nut, in combination with the pad-tree A and terret F, the whole constructed and arranged in the manner and for the purpose herein described.

141,874.—Bolt for Safe-Doors, &c.—WILLIAM HALL, Brookline, Mass. Application filed June 16, 1873.

A series of triangular-headed bolts is arranged in the corners of the door, and wedge-shaped bolts interposed between them so as to form a protection entirely around the door when the bolts are thrown out.

Claim.—1. A series of triangular-headed corner bolts, C, in combination with the wedge-shaped bolts D, so as to form a protection entirely around the door of a safe or vault, substantially as and for the purpose set forth.

2. The bolts C D, with their inclined joints *m*, operated together so as to prevent them from separating when thrown out, substantially as described.

3. A safe or vault door provided with triangular-headed bolts C, constructed as described, and thrown out from two or more of its corners, substantially as and for the purpose set forth.

141,875.—Three-Horse Equalizer.—THOMAS HOADLEY, Tonica, Ill. Application filed May 9, 1873.

Claim.—In a three-horse equalizer, the combination of the central draft-lever C, pivoted to the tongue A, straps *g g*, levers D E, bar B, and tongue A, substantially as and for the purpose described.

141,876.—Combination Lock.—AUSTIN D. HOFFMAN, Chicago, Ill., assignor, by mesne assignments, of part interest to NATHAN FRIEDMAN and ABRAHAM LIEBENSTEIN, same place.—B. Application filed March 21, 1873.

An adjustable graduated disk is loosely mounted on the operating spindle, and confined between a collar on the spindle and the knob, the latter being longitudinally adjustable on the spindle by means of a screw, for the purpose of releasing and readjusting the graduated disk when it is desired to change the combination. The head of the screw that secures the knob to the spindle is arranged in a depression in the face of the knob, so that a seal may be applied to the depression, and thus secure the screw.

Claim.—1. In a combination tumbler-lock, the adjustable graduated disk H, loosely mounted on the spindle F and arranged between the collar *d* and the knob I, the said collar being rigid on the said spindle, and the knob I being longitudinally adjustable on the spindle and attached thereto by means of a screw arranged in a depression in the face of the knob, and entering the end of the spindle, all substantially as and for the purposes specified.

2. In a combination tumbler-lock, the latch or bolt K, provided with a lifting-arm extending through the case, and having its outer end made hook-shaped, and its inner end constructed and arranged to engage the tumbler-notches, substantially as shown and described, and for the purposes set forth.

141,877.—Nut and Bolt Fastening.—PHINEAS F. KING, St. Louis, Mo. Application filed May 19, 1873.

Claim.—1. Two half-bolts, provided with nuts, and arranged to operate in opposite directions with relation to each other, as and for the purpose set forth.

2. The combination of the parts A A', having heads *a a'*, nuts B B', as and for the purpose set forth.

141,878.—Process for Preserving Milk.—LOUIS F. KIECHNOVER, Union Hill, New Jersey, assignor, by mesne assignments, to JAMES E. WHEELER. Application filed February 10, 1873.

Claim.—The process herein described for preserving milk, consisting in the gradual raising of the temperature of the milk, before it has cooled after milking the cow, from its natural temperature to between one hundred and sixty degrees (160°) and one hundred and seventy degrees (170°) of Fahrenheit's thermometer, and the continued subjection of the milk to that temperature for a longer or shorter period, according to the length of time it is desired to preserve the milk.

141,879.—Wire Tie for Baling Hay, &c.—GEORGE L. LAUGHLAND, New York, N. Y. Application filed August 2, 1873.

Claim.—1. A wire tie for baling hay and similar substance, composed of a bright or unannealed wire band, the ends of which are upset, riveted, or enlarged at opposite ends of a holder, constructed and operating substantially as herein described, and for the purpose set forth.

2. As a new article of manufacture, for baling hay, wires or wire rods cut into suitable lengths, and their ends upset or enlarged, and ready to be united to holders without twisting, as described and represented.

141,880.—Smoothing-Iron.—AUSTIN S. MANN, Pittsburg, Pa. Application filed June 3, 1873.

From each end of the handle descends a shank, having at its extremity a horizontal pivot, which, by the flexibility of the shanks, can be made to spring into a front and rear depression in the ironing-block, for the purpose of reversing its upper and under faces. A shield between the block and the handle has also the function of holding the pivots to the block.

Claim.—1. The ironing-block A and its handle, constructed and connected together as described, in combination with a tie, D, arranged on a line intermediate between the handle proper and the top of the iron, substantially as specified.

2. A reversible ironing-block, A, of wedge-shaped form, and its handle, constructed and connected together as described, in combination with a tie, D, arranged in an inclined position on a line intermediate between the handle proper and the iron, substantially as and for the purpose specified.

3. A seal-iron in which the ironing-block A and the handle are constructed and connected together as described, in combination with a tie, D, composed of a plate of sheet metal, and arranged on a line intermediate between the handle proper and the iron, substantially as specified.

141,881.—Plow.—JAMES MARR, Simcoe, Canada. Application filed March 14, 1873.

Self-holding plow; balance-wheel in rear and wheel in front to gage furrow to uniform width.

Claim.—1. The combined axle and lever *a*, constructed in one piece, bent and arranged as described, and attached to the beam A by the hanger *b*, in combination with the wheel D and rack *d*, as hereinbefore specified.

2. In a self-holding plow, the upright *e*, carrying the holding-wheel E and attached to the slotted arm *f*, substantially as and for the purpose described.

141,882.—Mold for Ice-Cream, Jellies, &c.—EDGAR M. MAY, Fond du Lac, Wis. Application filed February 8, 1873.

Claim.—In a mold for ices, &c., the cups B B attached to the pivoted bars A A, and provided with the filling-openings *b*, substantially as shown and described.

141,883.—Reversible Knob-Latch.—CHRISTOPHER MOODY, Toronto, Canada, assignor to WILLIAM GRIFFITH, same place. Application filed February 10, 1873.

Claim.—The combination, with the knobs H, levers I, and a lever, A, of a lock, the double-ended reversible bolt C, (provided with lugs J,) pivoted pawl D, and sliding block G, all arranged, constructed, and operating substantially as shown and described.

141,884.—Horse Hay-Rake.—BEN MOSES, Ithaca, N. Y.—Case A. Application filed March 6, 1873.

A sliding stop arranged on the presser-bar, and operated by a spring and levers, engages with a supporting-wheel by which the rake is raised and the accumulated hay discharged.

Claim.—1. The whiffletree-bar *b* with its adjustment at *a*, in combination with stop *b'*, as and for the purpose described.

2. The combination of foot-lever *e*, connected with the angled part of piece *g*, and the stop *i* holding the bars *d* and teeth to the ground.

3. The stop *i* with its spring-arm *i''*, in combination with the plate *j*, as and for the purpose set forth.

4. The angled part or lever *g* fast to the axle of the rake-frame, and with three connections, one to the foot-lever, another to the stop, and the other to the slide *m*.

5. The slide *m* with head *m'*, its spring *o*, and snap lock *p*, in combination with the catch-wheel *n* and lever *l*, rod *k*, angled lever *g*, rod *f*, and foot-piece *e*, as set forth.

6. The snap-lock *p* and stop for the notch *n'* in the slide *m* and trip-screw bolt *r*, in combination with the levers *l* and *g*, rods *k* and *f*, and foot-piece *e*, as set forth.

7. The lever *l* arranged on the left-hand brace of the rake-head, with a slot in one end and a swivel in the other.

8. The set-screw arranged in the seat-rod *r* for tilting the snap *p*.

141,885.—Apparatus for Oiling, Testing, and Washing Fire-Engine Hose.—PERSON NOYES, Lowell, Mass. Application filed February 26, 1873.

An inclined trough is connected with a pump and tank, so that water or oil may be forced through or into the hose for cleaning oiling, or testing it, as desired. The pipe to which the hose is connected has a supplemental pipe through which the surplus oil can be returned to the tank.

Claim.—1. The inclined trough H, in combination with the tank A and pump B, with a pipe, M, as described, all arranged and operating in the manner and for the purpose specified.

2. The method or process, substantially as herein described, of oiling fire-engine hose, viz., by filling the hose with oiling material, and by pressure applied to force the oil into or through the leather, as set forth.

141,886.—Gas Apparatus for Railway Cars.—JAMES B. OLNEY, Brooklyn, N. Y. Application filed July 22, 1873.

Claim.—1. A gas apparatus suitable for lighting railroad cars, composed of a strong vessel for holding compressed air, an automatic valve or governor for discharging the air under uniform pressure, and a carbureting apparatus, all substantially as described.

2. The air-receiver D and governor E, having an automatic valve between them, in combination with a carbureting-chamber for operating in close connection with one or more vapor-burners, the whole mounted upon a railway car, substantially as described, for the purpose specified.

141,887.—Table-Leaf Support.—EDWIN W. PERRIN, Portland, Oreg., assignor of one-half his right to W. RO. WELDON, Solano County, Cal. Application filed December 16, 1872.

To the side frame of the table is attached a rod working in bearings, to which is attached, at the end of the table, a segment, and, near the center of the table, a lever, which has, at its upper end, a cross-head working in groove guides attached to the under side of the leaf. To the end of the table is pivoted a weighted pawl, which is pressed into the notches of the segment on the rod by a suitable spring.

Claim.—The pawls D, the gears A, the rods E, and levers F, together with the cross-heads H and grooved guides G, so attached and arranged as to act as supports to table leaves.

141,888.—Bellows.—WILLIAM PILCHER, Chicago, Ill. Application filed November 25, 1872.

Pockets or receptacles for weights are attached to the inside of the top of the bellows and provided with covers, so that the weights are less liable to be tampered with as when they are attached to the outside.

Claim.—A bellows when provided with one or more receptacles for weights, or with weights located within the bellows, substantially as and for the purposes specified.

141,889.—Soldering-Furnace.—WILLIAM S. POTWIN, Chicago, Ill. Application filed February 10, 1873.

Claim.—In a soldering-pot, the combination, construction, and arrangement of one or more tool-receiving chambers, F, fire-pot E, grate E', opening G, and damper G', all substantially as shown and described, and for the purposes set forth.

141,890.—Furnace Grate-Bar.—ALONZO RAWSON, Des Moines, Iowa. Application filed June 23, 1873.

An air-reservoir communicates with hollow bars by means of a sliding perforated top and pendent slide. When solid bars are used communication is established through the perforations in the top slide between the reservoir and furnace.

Claim.—1. The open box-reservoir A B and sliding cover and duplex register C D, when combined and operated with hollow grate-bars, substantially as described, and for the purposes specified.

2. The box-reservoir A B and sliding cover C, when combined and operated with hollow or solid grate-bars, in the manner described, and for the purposes specified.

141,891.—Grate for Stoves and Furnaces.—JEREMIAH J. RICHARDSON, Brooklyn, N. Y. Application filed March 3, 1873.

Claim.—1. The conical grate center E, solid-faced and radially-ribbed, and having a central aperture, *e*, as set forth.

2. The combination, with the perforated grate-center E, of the hollow center pivot D, adapted to communicate shaking motion to the said grate-center, and to conduct air to the aperture therein, as explained.

3. The combination with the supporting-bridge B, with flat ends resting on suitable seats *a a* in the ring A, and with a central socket, the grate E F pivoted to the said bridge, and the rest *j* to permit the tipping of the grate forward for dumping, but prevent it tipping backward, all substantially as set forth.

4. The compound grate constructed, as herein described, with a ribbed center, E, and with an annular external portion, F, constructed with angular bars, the said parts being adapted for either independent or simultaneous shaking, and for dumping in connection, all substantially as described.

141,892.—Earth-Auger.—WILLIAM H. SALTER, Corning, Iowa, assignor of one-half his right to JAMES M. CAMPBELL. Application filed June 25, 1873.

The skeleton frame is connected to the tube which slides on the shaft, and is coupled with it by means of a spring and notch. The hinged sections D E are attached to the frame to form the bucket. When the bucket is full it is drawn up on the shaft and emptied, and then returned to its work.

Claim.—1. The shoulder *a* and spring *b* combined with the shaft A, substantially as described, and for the purposes specified.

2. The skeleton frame B B B' B', carrying cutters 1 2 3, the tube C, and hinged sections of a bucket, D D and E E, when combined and operated substantially as described, and for the purposes specified.

3. The roller *f*, when mounted in a loop and combined and operated with the rope or chain *g*, shaft A, and tube C, substantially as described, and for the purposes specified.

141,893.—Pipe-Coupling.—LEVI T. SCOFIELD, Cleveland, Ohio. Application filed June 23, 1873.

A long tapering coupling, diminishing in size from left to right, receives pipes, having their ends which enter the coupling of slightly-tapering form and provided with screw-threads, the other ends of the pipes entering the sleeves of an ordinary coupling.

Claim.—The combination of the two parts B and C with the parts A D E, substantially as described.

141,894.—Shuttle for Sewing-Machines.—JEROME B. SACON, Bridgeport, Conn. Application filed July 25, 1873.

One side of the frame is rounded to prevent abrasion of the thread, and the other is notched and grooved to properly guide it. The frame carries the tension-plates and also forked projections for securing the bobbin in place.

Claim.—The pivoted frame B, having its side portions constructed as described, and provided with the forked projections *b* and tension devices C *c*, when combined with a shuttle, as and for the purposes herein set forth.

141,895.—Car-Coupling.—FREDERICK J. SEYBOLD, Chicago, Ill. Application filed January 9, 1873.

The link striking the lever in front raises the lower end of the lever, which passes through the slot in the pin and raises the pin; the link passes under the pin, the pin drops, and the coupling is completed.

Claim.—The combination, in a draw-head, A, of an angular lever, D, with a pin, C, having an angular slot, B, substantially as described, and for the purpose set forth.

141,896.—Apparatus for Closing Doors.—HENRY F. SHAW, West Roxbury, Mass. Application filed December 27, 1872.

Claim.—In an apparatus for automatically closing doors, the combination of the cylinder C and the weighted piston D, provided with the flexible cup-packing *a*, fitted to slide freely therein, and connected to the door in a suitable manner, when constructed and arranged to close the door by the force of gravity, and prevent the acceleration of the motion of the weight in its descent by the gradual escape of the air from the chamber below the weight, substantially as herein set forth and described.

141,897.—Compound for Paint.—FREDERICK A. STALL, Boston, Mass. Application filed August 4, 1873.

Mixture of tar, asphaltum, silicate of soda, dead-oil, ground slate or equivalent, plumbago, gum dammar or equivalent, lime, coal-ashes, rosin-oil. Heat slowly, stirring constantly.

Claim.—The improved paints, prepared in the manner and of the materials substantially as described.

141,898.—Electric Annunciator.—ALBERT STORER, Cleveland, Ohio. Application filed April 7, 1873.

An armature concealing a number is centrally pivoted between poles of magnet, and is attracted thereby on closure of circuit, swinging from a vertical to horizontal position. In so swinging the armature closes a local circuit, locking itself into position. Breaking this circuit restores armature to position, thus avoiding need of special devices therefor.

Claim.—1. An electro-magnetic annunciator, having the armature C centrally pivoted at a point between the poles of the magnet, in the manner described, so as to assume a horizontal position when acted upon for the purpose of indicating the locality from whence operated, as set forth.

2. The armature C, arranged and operating as described, provided with a pin, E, in combination with spring-arm F and post G, so as to transfer the current from the main to a local circuit, for the purpose of retaining the armature in its horizontal position until said local circuit shall be broken.

141,899.—Hook for Hanging Tobacco.—HENRY N. STILSON, Portland, Conn. Application filed April 16, 1873.

The hanger is formed into a hook to fit upon and project horizontally from the lath, and has a flat spear-point, the projections of which extend laterally. The point is forced through and afterward turned in the stalk so that the spear-point will prevent dislodgement.

Claim.—A tobacco-hook, having one of its legs, as *b'*, inclined, as shown, and having a laterally-expanded spear-point, *b''*, all constructed and designed for use upon a lath, substantially as described.

141,900.—Automatic Gate.—JOSEPH E. STONE, Newton Brook, Canada. Application filed July 24, 1873.

Claim.—The combination, with a tilting gate such as herein described, of the balance-levers *g g*, supported in stirrups *h'*, suspended from a cross-bar, *i*, and provided with chains or ropes *g'*, connecting-rods *f*, and looped chains *c'*, all arranged, constructed, and operated substantially as shown and described.

141,901.—Clamp for Thill-Couplings.—MARTIN TAYLOR, Hartford, Conn. Application filed May 29, 1873.

Claim.—The combination of the box *c*, having the shoulder *c'* fitted to take hold of the beak of a thill-shackle, the rod *b*, provided with the claw *c*, fitted to embrace the end of the thill-strap, and the hand-wheel *d*, the whole constructed, arranged, and designed for operation and use substantially as described.

141,902.—Pitman.—OSCAR F. THOMAS, Barnes' Corners, assignor to himself, ARNOLD C. HUGHES, Rodman, and ANDREW J. GLASURE, Pinckney, N. Y. Application filed November 8, 1872.

Claim.—The combination of the rod A and adjustable piece D, having conical points C C', with the nut F and collar G, when constructed and arranged to operate as and for the purpose herein specified.

141,903.—Potato-Digger.—SAMUEL W. TYLER, Troy, N. Y. Application filed August 6, 1873.

A thin blade cuts beneath the hills, and the potatoes are separated by sectional diggers, which follow in the rear of the blade.

Claim.—1. A narrow slicing-blade, A, which serves as a gage, in combination with sectional diggers, which are arranged to follow, substantially as described.

2. An entering-blade for potato-digging machines which is made to tilt independently of the draft device while being drawn along through the soil, in combination with controlling handles, substantially as described.

3. Rotary diggers which consist of bent arms extending from a central hub, and are arranged to dig potatoes by bringing the convex or highest side of the arms in contact with the earth and potatoes, substantially as described.

141,904.—Sash-Holder.—THEOPHILUS WEAVER, Harrisburg, Pa., assignor to HENRY C. DEMINO, same place. Application filed April 26, 1873.

A sliding friction-plate, slotted in double inclines, and having a double-inclined toothed rack—all formed of one piece—is attached to side of the sash. On this plate works a rotating lever having a toothed crown and suitable handle. A single screw passing through both attaches the device and serves as a fulcrum for the lever.

Claim.—A sash-holder, consisting of the double-inclined toothed rack M N and the slotted plate A C B V in one piece, and the rotating lever W G provided with the toothed crown R G R and handle W S, all constructed, arranged, and operating as shown and described, and for the purpose set forth.

141,905.—Vehicle.—EUGENE D. WELLER, Lima, N. Y. Application filed June 28, 1873.

The axles are centrally elevated or arched. The reaches are jointed and vertically adjustable, and the springs are arched longitudinally.

Claim.—1. A vehicle having its reaches attached to the rear axle or bolster and front bolster, and jointed together between said axle and bolster, in combination with longitudinal springs which support said jointed reaches, substantially as described.

2. The braces G or G', arranged, as described, in front and rear parts of the running-gear, the latter containing raised and jointed reaches, substantially as described.

3. The arrangement of the spring-supporting links below the front and rear extremities of the reach-sections, substantially as described.

4. The reach-sections D D, sustained by springs S S at or near the middle of their length by means of the brackets K K, said sections being jointed substantially as described.

5. Wedges w and packing c, applied between the central extremities of the jointed reaches D and a block, F, said wedges being adjusted substantially as described.

6. The combination of jointed reaches and longitudinal springs, which are centrally raised at their extremities, the springs being depressed below the reaches, and connected to axle and bolster, substantially as described.

141,906.—Cant-Hook.—REUBEN WHITTIER, Oshkosh, Wis., assignor of one-half his right to RICHARD HACKETT, same place. Application filed February 1, 1872.

Claim.—The flexible cant-hook B, when constructed with joints having a limited movement, substantially as shown and described.

141,907.—Loom.—JOHN ZÜRCHER, Lancaster, Pa. Application filed June 18, 1873.

The improvement relates to the class of looms known as swivel-looms for ornamenting fabrics. The shuttles are arranged in a series upon a reciprocating stitching-frame, and each consists of a metal plate carrying a perpendicular bobbin and moving in a groove in a plate fixed upon the frame, being held in said groove by flat springs, which bear upon the top of the shuttle-plate. The shuttles are passed from one shuttle-guide to another and back by vibrating fingers pivoted to the stitching-frame and operated by a shifting rail.

Claim.—The arrangement of the grooved shuttle-guides H, springs E E', fingers F f, held under or between the strips o o' P, with pivot-pins p on the stitching-bar B, in combination with the shifting rail A and lever R, substantially in the manner shown, and for the purpose described.

141,908.—Boot-Heel Screw.—WILLIAM ACKERMAN, Flint, Mich. Application filed February 1, 1873.

Claim.—A heel-screw for boots and shoes, having the conical form, threaded point, and channeled sides, as shown in Fig. 1 of drawing, and for the purpose described.

141,909.—Reversible Rotary Steam-Engine.—ORWIN ADAMS, Black Hawk, Colorado Ter. Application filed March 8, 1873.

Circular and elliptical guides are arranged in the sides of the case, and adjustable from without to operate the sliding yoked piston, so that the exhaust steam may freely escape around the edge of the pistons as soon as they have completed their stroke. The balanced poppet cut-off valve is operated by a cam on the shaft of the oscillating valve, and a dog, pivoted ball-crank lever, and spring. As the valve opens the steam is caught and locked by a catch or tappet attached to the lever.

Claim.—1. The circular guide L and the elliptical guide M, in combination with the slides K, yokes J, pistons I, drum H, and cylinder or case N, substantially as herein shown and described.

2. In combination with the valve-stem X, the spring A', bell-crank lever V, dog T, trip-bar U, and reciprocating rod Q, as specified.

141,910.—Fish-Hook.—BENJAMIN F. ALLEN, Boston, Mass. Application filed July 10, 1873.

Claim.—The fish-hook A, provided with the quadruple beads W X Z Y, substantially as herein described and shown.

141,911.—Ferry-Bridge.—CARROLL J. ATKINS, Louisiana, Mo. Application filed July 19, 1873.

Claim.—1. The combination of an incline, F, on the bow of a ferry-boat with a bridge, A, arranged to swing down at the front edge as low as the deck of the boat at low water, substantially as specified.

2. The combination of projections H on the boat and counterpart notches G on the bridge, to align the rails on the boat and the bridge automatically when they come together, substantially as specified.

141,912.—Furnace for Smelting Ores.—EDWARD BALBACH, Jr., Newark, N. J. Application filed June 30, 1873.

Claim.—A furnace for smelting ores or other purposes, having its bottom and sides surrounded by a trough or troughs of running water, substantially as and for the purposes herein set forth and described.

141,913.—Land-Marker.—GEORGE W. BETTS, Shadeville, Ohio. Application filed June 7, 1873.

A frame mounted on wheels. To the front cross-bar is secured the marker or plow-beams; from the center of the beams arms project upward, which are secured to arms pivoted to the front cross-beam, and extend back and between uprights secured on the rear part of the frame. The markers are adjusted by means of a foot-lever.

Claim.—The combination, with the lever-frame F F H, the treadle I K, and plow-beams D, connected with the former by bars E, of the sliding bar O, working between uprights P, and the vertical pivoted lever M, as shown and described.

141,914.—Apparatus for Treating Cane-Juice with Sulphur Fumes.—WILLIAM G. BILLIU, Thibodeaux, La. Application filed January 11, 1873.

Claim.—1. A series of heating-wheels, C, arranged on the same shaft and separated by partitions D, in case A, in combination with the spray-receiving table F, which passes the juice successively to each wheel, from one end of the case to the other, and finally out at D, as set forth.

2. The combination of the return-spout G', having a perforated bottom at one end only, with the first heater-wheel C, and the compartment in which it revolves, as and for the purpose specified.

141,915.—Micrometer-Gage.—ANTOINE BONNAZ, Paris, France. Application filed May 9, 1873.

The head of the micrometer-screw and its graduated sleeve are connected to the screw by a swivel with interposed friction-washer, for the purpose of giving uniformity of contact pressure.

Claim.—1. The washer M having the springs m m m and the swivel-screw G applied as a connection between the parts C D and knob E in the manner described, to cause them to rotate together until the article is reached, when the screw and socket may stop while the knob continues.

2. The combination, with vertically-rotated stationary nut or socket a and a stationary support, B, of the screw C and knob E connected by friction, substantially as and for the purpose set forth.

141,916.—Earth-Boring Machine.—JOSEPH BURNS, Anamosa, Iowa. Application filed April 12, 1873.

The screw-shaped cutting-blade is loose on the square shaft, upon which it is adjusted by a set-screw, so as to expose more or less of the centering point. A screw-shaped carrier rests upon the cutting-blade, and is also movable. The boring-shaft is actuated by vibrating levers driven from a continuously-rotating shaft by cranks and links, and having spring-pawls which engage with a ratchet-wheel upon the boring-shaft, so as to be reversible and rotate it in either direction at pleasure.

Claim.—1. The three-part auger, consisting of the square-shanked centering-bit B, the spiral cutting-blade C, adapted to be adjusted relatively to the centering-bit, and the spiral carrier D, resting upon and continuous with the blade C, all substantially as described.

2. The vibrating levers E E, provided with carrying-pawls S S, and pivoted loosely on auger-shaft, in combination with the ratchet-nut T, as and for the purpose described.

141,917.—Grain-Sieve.—LOREN D. CARPENTER, Buffalo Grove, Iowa. Application filed June 21, 1873.

The short grain passes through, while the long grain is retained.

Claim.—An improved grain-sieve formed of the pieces a, arranged to incline and overlap, and bent up at their lower edges, and perforated with holes c at or near the angle, as shown and described, whereby a series of inclined troughs with perforated bottoms are formed, as set forth.

141,918.—Crib.—WARD B. CARPENTER, West Topsham, Vt. Application filed May 31, 1873.

Claim.—1. A cradle or crib, provided with sectional pivoted rockers to adapt the cradle to be converted into a stationary crib or vice versa, by simply elevating or depressing said rockers, as herein shown and described.

2. The combination, with the cradle A having recessed head and foot boards, of the slides C pivoted to the adjacent ends of the rockers B B, as shown and described, whereby said slides are adapted to be adjusted vertically by means of a suitable device attached to the cradle.

3. In combination with the pivoted rockers B and adjustable slides C, the shaft h eccentric f, connecting-rod g, and handle or crank e, as and for the purpose specified.

141,919.—Hoisting-Jack.—JOHN H. CHURCHILL, Cross River, N. Y. Application filed July 26, 1873.

A bell-crank lever with treadle, which acts by means of an intermediate connecting-rod and weighted link on a sliding rack, guided between a frame.

Claim.—The hoisting-jack consisting of frame A with upright pillars C, in combination with bell-crank lever D, intermediate rod E, weighted link F, and sliding rack G, all arranged and operated substantially as and for the purpose described.

141,920.—Can for Oil, &c.—JONAH R. COLE, Morrisania, N. Y. Application filed June 27, 1873.

The side of the spout extends beyond the metal cylinder so that all the oil in the cylinder can flow freely out. A part of the wood casing is removed in order that the metal loop, at its upper end, and the spout of the can may be soldered together.

Claim.—1. The pouring-spout and cork-holding thimble, applied to the sheet-metal can so that the thimble projects beyond the side of the can, as and for the purposes set forth.

2. The sheet-metal can, with the pouring-spout and cork-holding thimble projecting at one side, in combination with the notched wooden case and the hoop t that surrounds the case and spout, as set forth.

141,921.—Clothes-Line Holder.—WILLIAM COOKE, New York, N. Y. Application filed June 28, 1873.

A cleat, attached by screws, has two vertical prongs at top and one at bottom, with a buckle between. Two lines may be attached by passing each through the buckle and around one of the prongs.

Claim.—The within-described clothes-line holder, consisting of the body A with hook B, fork C having its prongs bent outward and then inward, and the buckle E, all constructed and arranged substantially as and for the purposes herein set forth.

141,922.—Machine for Feeding Wire to Hammer-Dies.—WILLIAM H. DAYTON, Wolcottville, Conn., assignor to "EXCELSIOR NEEDLE CO.," same place. Application filed March 21, 1873.

The hopper that contains the short sections of wire rises and falls, to permit the feeding-jaws to automatically draw a single section therefrom. The jaws feed the section between reducing-dies and slightly reciprocate it while there. An elastic bearing, between the cam that feeds the jaws forward and their table, prevents a rigid grasp on the section when had between the dies and while under their operation.

Claim.—1. A pair of jaws opened and closed to grasp a blank, and moved back and forth in line of the blank, in combination with the rubber spring 11 or other yielding material interposed between the jaws and their actuating mechanism, substantially as set forth.

2. A hopper to which a rising-and-falling motion is communicated, in combination with a pair of jaws that are reciprocated to draw the blank out of the hopper, and then carry the same forward into the reducing-dies, substantially as set forth.

3. The cam t, arm t', shaft v, arm u, adjusting-screw 24, and stop w, in combination with the hopper s and attaching-screw 25, for moving and adjusting such hopper, as set forth.

4. The wedge 7 and its cam w, pinion 9, rack p, slotted lever w', and cam w^2, in combination with the jaws g, for closing such jaws and holding the blank during the movement of such jaws, substantially as set forth.

141,923.—Fluting-Machine.—EDWARD M. DENT, New York, N. Y. Application filed May 17, 1873.

The pressure-springs pass through the frame so the roller can be raised without contracting them. The tongue is a guide to prevent lateral vibration of the roller. The wheel which imparts motion to the roller is an independent shaft which couples with the roller.

Claim.—1. The pressure-springs J, arranged to extend through frame K and bear against bar D, substantially as specified.

2. The rotating rod F, pin M, and spiral cam-slot H, combined with frame K and bar D, for raising and lowering the latter, substantially as specified.

3. The combination, with springs C, arranged as described in the first clause of the claim, of devices for raising bar D, and forcing and holding it down, substantially as described in the second clause.

4. The frame K and cap O, when constructed and combined in the manner described, to form the cam-slot.

5. The combination of the slotted extension Q of the bearing-plate E with the tongue P of the frame K, substantially as specified.

6. In a fluting-machine geared with an independent driving-crank, the wheel T and its shaft S fitted rigidly together, and the shaft coupled with the fluted roller, substantially as specified.

141,924.—Washing-Machine.—DENNIS B. DORSEY, Chittenden, Me., assignor of one-half his right to JOHN DE SHA, same place. Application filed April 25, 1873.

Is constructed with uprights or sides with a center corrugated roll, its upper side covered with a bed of small rolls secured and held in position by a cross-bar, over which is another pivoted at one end. Connected to the upright or side is a lever pivoted to it, resting upon the cross-bar, by which and by the coiled spring the tension of the rolls is regulated.

Claim.—The cylinder D, rollers H, blocks F, tie I, lever K, and spring L, in combination with the lever M, for the uses and purposes shown and described.

141,925.—Automatic Gate.—JOHN S. FOIT, Kenton, Ohio. Application filed May 5, 1873.

The gate is hinged at its upper rear end to hinge-post, with its lower rear end resting on a triangular plate pivoted to the hinge-post, from which extend, in opposite directions, horizontal rods operated by vertical levers pivoted to side posts. An additional vertical lever is pivoted to an inner side post, and also at its bottom to one of the horizontal rods, having a pivoted rod at its top connecting with the top of the gate.

Claim.—The combination of the centrally-pivoted levers F and I and the connecting-rods E K with the swinging plate D and gate C, said gate being pivoted on the plate, as shown and described, to operate as specified.

141,926.—Suspender.—BENJAMIN J. GREELY, Boston, Mass. Application filed June 7, 1873.

A safety-pin, bent from a piece of wire, is attached to the end of the suspender-strap, for pinning it to a waistband.

Claim.—1. The safety-pin A, when constructed substantially as herein shown.

2. The combination of the safety-pins A and suspender-straps B, in the manner described.

141,927.—Annunciator.—CHARLES H. GREENLEAF, Franconia, N. H. Application filed April 28, 1873.

The annunciator is provided with indicating-faces on opposite sides, the sliding bars for representing the numbers as desired extending entirely through, so that a knob when depressed on one side will cause the knob on the opposite end of the bar to be protruded. The usual arrangement is made for connecting all the bars with a bell, and for allowing them to be all restored to place simultaneously or each one separately.

Claim.—The combination of two dials or faces on opposite sides of the annunciator, with a series of sliding bars, D, actuated by springs, whereby the movement of a bar will indicate the number of a room on both dials simultaneously, substantially as and for the purpose described.

141,928.—Foot-Power Apparatus.—EBENEZER HARDING and HENRY HARDING, Delavan, Minn. Application filed July 5, 1873.

Claim.—The combination of a foot-treadle, crank-shaft, balance-wheel, transmitting and converting lever, and connecting-rod, the transmitting-lever being connected at one end to a fixed bar, and at the other end to the machine to be driven, and the connections of said rod with said fixed bar and with the connecting-rod by which it is worked being variable, substantially as specified.

141,929.—Sheet-Metal Roofing.—EDWARD C. HEISLER and FREDERICK W. MATTHIESSEN, La Salle, Ill. Application filed July 26, 1873.

Claim.—The fine corrugation of sheet-zinc and other sheet metal used in the construction of roofs, eaves-troughs, gutters, and similar articles, arranged in the direction crosswise to the pitch of the roof; also crosswise to the length direction of the gutter, substantially in the manner and for the purpose specified.

141,930.—Mallet.—ALBERT HOLBROOK, Providence, R. I. Application filed June 14, 1873.

The body of the mallet, made of metal, has a screw-socket at each end, in which is screwed a coiled raw-hide hammer-head.

Claim.—As a new and improved article of manufacture, a hammer constructed as shown and described, and for the purposes set forth.

141,931.—Fly-Trap.—JESSE R. JOHNSON, Benton Harbor, Mich. Application filed March 29, 1873.

A dish-shaped base, with an elevated plate, having openings and covered ways; above these a perforated cone, a tube, and two inverted cones; and on supports above these a pedestaled vessel and a sliding cover; within that a rod and cover for the tube.

Claim.—1. The raised part B, in connection with plate A and the short covered ways N, in combination with the supports u u and cup H, as constructed and arranged.

2. The obtuse cone D, the small reversed cone E, the tube or pipe F, and the small reversed cone E E, the supports G G, the cup or vessel H, the movable bottom I, the ball or handle J, the

cover K, and the small movable cover L, and also the springs M, to be constructed substantially as described, and for the purposes herein before set forth.

141,932.—Machine for Making Taper Tubes.—THOMAS J. JONES and JOHN T. JONES, Sharon, Pa. Application filed June 28, 1873.

A clamp secures the plate to the bending-mandrel when the bending-plates, operated by its lever, comes down to cause the plate to assume the shape of the mandrel. In welding the tube is placed on a mandrel and both are drawn into holder, leaving only the joint exposed, when the carriage upon which they are supported is passed under the welding-roller.

Claim.—1. The combination of the bending-mandrel A, clamp F, the bending-lever J, bending-plate H, and a ratchet and pawl or other holding devices, substantially as specified.

2. The combination of the movable holder or clamp L, welding-mandrel K, welding-roller N, or its equivalent, and means for operating the carriage and roller, substantially as specified.

3. The combination, in a machine for bending and welding taper tubes, of the bending-mandrel A, lever I, and plate H with the bending-mandrel K, movable holder L, and welding roller N, substantially as herein described.

141,933.—Lamp.—JOHN KIRBY, Jr., Adrian, Mich. Application filed July 5, 1873.

An improvement in hanging-lamps which have a detachable filling-reservoir. In clamping the upper or filling reservoir to a supporting-ring affixed to the lower ends of brackets depending from the ceiling, and also to the upper ends of posts depending from the lower ends of the brackets, lugs on the reservoir work through notches in the ring.

Claim.—1. The reservoir J provided with lugs M, in combination with the ring K having notches, as described, and supported by brackets L, formed on the posts D of the hangers, all as shown and described.

2. The combination of the secondary bottom W, screw V', and stopper V with the permanent reservoir A, substantially as specified.

141,934.—Tool-Receptacle.—LEVI L. LAMB, Chelsea, Mass., assignor to himself and SEWELL K. LOVEWELL, same place. Application filed May 5, 1873.

A cylindrical case, A, containing a block, B, supported on a spring, which block has a row of holes passing downward from its upper surface for the reception of bits. A cover-plate, D, with corresponding holes, and a rotatable intermediate plate, C, with like perforations. The bits are dropped in the holes in block B, and the latter is then depressed until the tools descend below plate C, when plate C is turned to bring its holes out of coincidence with the ends of the tools.

Claim.—The die-block B *f*, movable on guide *e* and spring supported in case A, the squared rotary stem *i* swiveled in die-block, the squarely-apertured, perforated, and spring-supported plate D, and the perforated top D, combined as and for the purpose described.

141,935.—Glass-Furnace.—WILLIAM LEIGHTON, Jr., Wheeling, W. Va. Application filed March 26, 1873.

Introduces blast into fire-place. Blast-pipe passes through space between cupola and hood, so that blast is heated.

Claim.—In combination with a glass-furnace, the blast-pipe E, passing through the hood and leading into the air-chamber, for conveying a heated blast to the furnace, substantially as specified.

141,936.—Furnace-Grate.—WILLIAM B. LE VAN, Philadelphia, Pa. Application filed May 5, 1873.

Four segments, provided with a series of bars and air-spaces, are united by means of downwardly-projecting lugs. A series of removable central bars are arranged to rest upon bearing-surfaces and to afford support for the fuel, and air-spaces for the maintenance of combustion, such bars being made removable in order that new ones may be substituted as fast as any burn out.

Claim.—1. In a circular grate for furnaces, the combination of four segments, A A A' A', each provided with a series of bars and air-spaces, and united by the downwardly-projecting lugs *a'*, with the series of removable central bars B, these members being combined so as to provide bearing-surfaces for the fuel and air-spaces to support combustion throughout the whole extent of the grate, as set forth.

2. The combination, with the segments, of bearing-bars so arranged as to provide air-spaces between themselves and the segments, substantially as set forth.

141,937.—Fire-Place.—WILLIAM LOSEE, Owensborough, Ky. Application filed May 5, 1873.

Claim.—1. The screw-rod E, secured in the front plate F and passing through the swiveled nut D, connected to the hinged part C of the grate back, as and for the purpose specified.

2. The stationary removable parts G H of the grate, connected by hook side bars K, and the oscillating bottom part I, pivoted in said bars so as to balance, as shown and described.

141,938.—Harvester.—SIMEON LUCE, Syracuse, N. Y., assignor to WILLIAM WALLACE, same place. Application filed April 10, 1873.

The main frame is made tubular, in which the driving-shaft and its journal-bearing are placed.

Claim.—1. The adjustable journal-bearings *c'* and *e e*, constructed and arranged as described, combining the bevel-wheel shaft *c*' and the main shaft *b* with the harvester-frame, substantially as and for the purposes set forth.

2. The combination of the lever *d* with the rear end of the pole by means of the arms *g* and *h* and their shaft connection, substantially as specified.

141,939.—Saw.—VALENTINE LUPPERT and PETER ST. PIERRE, Williamsport, Pa. Application filed September 5, 1872.

Claim.—The saw described, provided with the series of teeth *a a* and the reversed teeth *a' a'*, the latter being located at the extreme lower end of the cutting portion, as and for the purpose described.

141,940.—Turning-Lathe.—JUSTUS P. LUTHER, Berlin, Wis. Application filed April 6, 1873.

The material rests upon a vertically-adjustable bed, and is cut into the required shape by cutters secured in a rotating disk.

Claim.—The construction and arrangement of the frame A, cross-head B, shaft C, disk D provided with cutters *d*, the wedge E, rest F, chuck I, and crank J, substantially as and for the purpose set forth.

141,941.—Umbrella.—JOHN MCAULIVER, New York, N. Y. Application filed March 8, 1873.

The lap or "middle bit" for connecting umbrella-ribs and stretchers.

Claim.—The combination, with ribs A, of the sheet-metal strip, having a double lap, D, at each end, and an intermediate space, E, which entirely closes said rib, as shown and described.

141,942.—Mold or Box for Brick-Presses.—JOHN MCKENNA, Cambria, Pa. Application filed July 26, 1873.

A steel-faced brick-mold, so constructed that, when the steel facing is unevenly worn, it may be trued up and the mold adjusted to its original size.

Claim.—An improved press-box, formed of the separate side pieces A having transverse grooves formed upon the inner sides of their ends, the end pieces B having tenons formed upon their ends, the clamping-bolts C, and the thin metallic packing-strips D, substantially as herein shown and described.

141,943.—Lithographic Stone.—GEORGE H. MOORE, Norwich, Conn., and LOUIS RAGOZE, Washington, D. C.; said MOORE assignor of his right to ESTELLE C. MOORE, Norwich, Conn. Application filed January 11, 1873.

Saws the natural lithographic stones into slabs, (too thin to use in the press by themselves,) and embeds them in a base or backing of artificial stone.

Claim.—A lithographic stone composed of one or more slabs of natural lithographic stone permanently embedded in, or united by or to, a body, base, or back formed of an artificial-stone composition, substantially as herein described, and for the purpose specified.

141,944.—Apparatus for Preserving Beer on Draft.—JOHN W. MOORE, Bellefonte, Pa., assignor to himself and P. GRAY MEEK, same place. Application filed April 19, 1873.

Introduces air into flexible bag in barrel, to take the place of liquid drawn out.

Claim.—1. The two sets of valves I and J, the arms K, connecting-rod L, and lever M, in combination with the bellows H, pipe E, and bag C, substantially as herein shown and described, and for the purposes set forth.

2. The perforated pipe N, in combination with the hollow bung B, and bag C, substantially as herein shown and described, and for the purposes set forth.

141,945.—Metallic Lathing.—TIMOTHY O'CALLAHAN, Boston, Mass. Application filed May 5, 1873.

Claim.—As a new article of manufacture, a metallic sheet or plate for covering ceilings, the same being provided with projections or studs *a*, cast or formed with it, as shown and described.

141,946.—Steam-Trap.—E. LAMSON PERKINS, JOSEPH H. MOULTON, and CHARLES E. SAWYER, Boston, Mass. Application filed March 22, 1871.

Claim.—A steam-trap composed of a wooden frame or side pieces, E E, the braces or guides K, expanding tube A, and adjustable wood valve-seat, as described.

141,947.—Mortar-Mixer.—CHARLES PIERCE, Portland, Mich., assignor to himself and ALMERON PIERCE, same place. Application filed May 8, 1873.

A mortar-mixing machine provided with a beater-shaft, slaking-cylinder, revolving screen, and an adjustable discharge-spout, concaved at its lower end, against which revolves a grinding-wheel, the spout receding as an obstruction passes between it and the wheel.

Claim.—1. In a machine of substantially the described construction, the combination of the screw F, the beaters E, the grinding-wheel H, and the adjustable spout and spring *c*, as described.

2. The adjustable spout, in combination with the grinding-wheel, substantially as described.

141,948.—Machine for Making Chair and Basket Splints.—JOHN B. POE, Worthington, Ind., assignor to himself and JOHN F. ALLISON, same place. Application filed April 12, 1873.

The material is first passed through a gang of circular saws, which are partially immersed in water, and the strips produced by this operation are again divided by a reciprocating saw.

Claim.—1. The combination, with rotary cutters F, of the subjacent water-vessel L, to prevent the cutters from being gummed, in the manner described.

2. The combination, with reciprocating cutter P, of the plates Q R S T, applied as and for the purpose set forth.

141,949.—Millstone-Dressing Machine.—LEWIS RANDOLPH, Jeffersville, Ill. Application filed April 14, 1873.

The end of the guide-bar nearest the eye of the stone is depressed to any required degree by set-screws.

Claim.—The guide-bar L, as constructed as to be adjustable horizontally, substantially as and for the purposes described.

141,950.—Stopper for Bottles.—LAWRENCE RHOADES, Providence, R. I., assignor of one-half his right to WILLIAM E. CLARKE, same place. Application filed July 24, 1873.

A button is held over the opening in the cork by a strip of rubber attached thereto and passing through said opening, the other end secured between the cork and glass. The button is pushed back and the hole in the cork left free, the thumb remaining upon the button while the powder is being sprinkled upon the brush.

Claim.—The device herein described, consisting of the button *a* with its elastic spring, in combination with the cork and bottle, the whole constructed and operating in the manner substantially as described.

141,951.—Wheel-Plow.—LIONEL W. RICHARDSON, Roscoe, Ill. Application filed May 31, 1873.

A bent axle-tree is mounted on wheels, one of which is vertically adjustable. The plow-beam is swiveled at its middle portion to highest section of the axle-tree, and, by means of a catch-lever, can be elevated above the ground.

Claim.—1. The combination of the sleeves F, pivoted rods G, clamp H I, and draft-rod K, with the arched or bent axle A and plow-beam J, substantially as herein shown and described.

2. The combination of the bent lever Q and swivel connecting-rod R with the arched or bent axle A, and the clamp H I, pivoted connecting-rods G, and sleeves F, substantially as herein shown and described.

141,952.—Whip-Socket Fastener.—WILLIAM W. RICHARDSON, Ypsilanti, Mich. Application filed March 17, 1873.

The strap, which is fastened around the outside of the dash-rail, is made of elastic material, the ends of the strap being strengthened by metal eyelets; the object being to adapt the fastener to different-sized dash-rails.

Claim.—1. The combination of the elastic strap C with the rigid jaw B, substantially as described, and for the purposes specified.

2. In fastenings for whip-sockets, the elastic strap C having plates *a*, the latter being punched so as to form an eyelet, *b*, in said strap, for the purposes set forth.

141,953.—Whip-Socket Fastening.—WILLIAM W. RICHARDSON, Ypsilanti, Mich., assignor to himself and WILLIAM A. RICHARDSON, same place. Application filed February 6, 1873.

Made of a single strip of steel, its jaws tempered, and secured to the dash-rail by means of a key.

Claim.—1. In combination with a whip socket or holder, and the dash-rod of a vehicle, the clasp A, embracing and conforming to the outline of said socket and rod, substantially as and for the purposes set forth.

2. The small spring-clasp *d*, or other equivalent device, to secure the clasp A in place, and in combination with it, substantially as specified.

141,954.—Extension-Table.—CHRISTIAN RIEGER, Morrisania, N. Y. Application filed May 17, 1873.

The extension-rails are connected together by pivoted strips, and when extended are held in position by a button on each side. Under the stationary part of the table is a drawer having on its rear edge a spring-catch that, when the the extension-rails are folded, engages with a lip on the rail of the extension-frame.

Claim.—The side and extension rails, the buttons G, the drawer J, and the catches L K, combined as and for the purpose described.

141,955.—Portable Steam-Engine.—REINHARD SCHEIDLER and JOHN H. MCNAMAR, Newark, Ohio. Application filed May 16, 1873.

By the peculiar arrangement of the heater space is economized, and water can be drained therefrom when the engine is stopped, to prevent freezing in winter.

Claim.—The inclined heater J, arranged substantially as and for the purpose described.

141,956.—Crimping-Clamp.—PHILIP A. SCHOELLHORN, Buffalo, N. Y. Application filed May 13, 1873.

The lateral arms afford a means of opening the jaws by compressing them between the thumb and fingers.

Claim.—The combination of the screw D, block or wedge C, tongues B B having lateral arms or projections E E, and the jaws *a a* having holes F F, substantially as shown and described.

141,957.—Pole for Vehicles.—HENRY SCHMIDT, Albany, N. Y. Application filed June 14, 1873.

A trot-bar designed to keep the horses "head and head" while traveling, and to assist a horse that has stumbled in recovering himself.

Claim.—A trotting-bar formed of the two parts A B, the double connecting-nut C, the knobs D, the slotted or grooved sleeves E, the tongue F, the collar G, the swiveled bow H, the rein-bars I, and the ornaments J K, constructed and combined substantially as herein shown and described.

141,958.—Steering Apparatus.—CHARLES A. SEAVEY, Hodgdon's Mills, Me. Application filed May 24, 1873.

Two rack-bars are arranged upon opposite sides of a pinion and engage therewith. These rack bars are attached by sliding connections to a cross-head on the top of the rudder-post, and the rudder is operated through the medium of the rack-bars by rotating the pinion.

Claim.—The combination of the blocks S S working in slots of the yoke P, the rack-bars O O, the spur-gear M, and the shafts B K and their connections, as shown and described, operating as specified.

141,959.—Sawing-Machine.—WILLIAM H. SHUGART, New Garden, Ind. Application filed May 31, 1873.

The saw is reciprocated by means of a lever attached to a segmental gear, acting upon a pinion, which in turn operates the crank to which the saw is attached.

Claim.—The frame A, provided with the segmental gear B, pinion C, and crank G, in combination with the saw E and its operating and guiding mechanism, substantially as specified.

141,960.—Plow.—PATRICK H. STARKE, Richmond, Va. Application filed July 11, 1873.

Parts of the plow are so formed as to be capable of being cast in a two-parted flask. The plow-point is made wedge-shaped, with a tenon having parallel sides extending into a mortise formed by cavities in the land-side and mold-board, and it is held in place by a stud upon the share, entering a cavity in the side of the point.

Claim.—1. The standard R, with beveled side A, bottom B, projection *g*, and swell *f*, as and for the purpose described.

2. The front piece K, with flange *d'*, fork *c*, recess *c'*, sides D *d''*, and flattened surface *d'''*, as and for the purpose set forth.

3. The front piece K, flange *d'*, fork *c*, recess *c'*, sides D *d''*, and flattened surface *d'''*, in combination with flange b and lugs *d e* on standard R, as and for the purpose set forth.

4. The mold-board C, with beveled flange E and flange *e''*, as and for the purpose set forth.

5. The mortise formed by combining the standard, front piece, and mold-board, substantially as shown and described.

6. In a plow, the combination of standard, front piece, and mold-board, each having the form substantially as shown and described.

7. The single wedge-shape plow-point H, provided with a tenon, *a*, and having a groove, G, on each of its two sides, running parallel to the length of the tenon and terminating so as to leave a space between it and the shoulder, in order to fasten the point by means of the share, as set forth.

141,961.—Medical Compound or Piles Liniment.—PETER H. STEINMANSON, Chico, Cal. Application filed April 28, 1873.

Green Jamestown leaves, night-shade, (leaves and all,) elder-bark. Cover with water and boil three days, after which press and strain the juice and boil, adding rusty-bacon grease, sweet-oil, flour sulphur. The whole is then boiled until the water is evaporated.

Claim.—An ointment for the cure of piles composed of the ingredients above enumerated, in about the proportions specified.

141,962.—Device for Preventing Horses from Cribbing.—ALEXANDER STILWELL, Dwaar's Kill, N. Y. Application filed May 31, 1873.

Claim.—1. A device for preventing horses from cribbing, formed of a frame, A D C, bent or elbow lever E, provided with spurs, and a lever, F, arranged substantially as shown and described.

2. The cross N or its equivalent, in combination with the lever F and the guards M M, as and for the purposes described.

3. The combination of the lever F and the cross N with the points H or their equivalent, substantially as and for the purposes described.

141,963.—Veneer Keg.—GEORGE W. SWAN, San Francisco, Cal. Application filed June 18, 1873.

The keg is made of one or more thicknesses of veneer and covered with cloth, the whole united by a cement.

Claim.—As a new article of manufacture, the keg herein shown and described.

141,964.—Plow-Coupling.—THOMAS L. TERRASSON, Paris, Tex. Application filed July 5, 1873.

An extra rod is united with the coupling-rods above and below the angles to strengthen them.

Claim.—The bent bars A, strengthened at their bends by the extra rods *a'*, provided at their lower ends with swiveled clamp-

log-plates B and set-screws C, and at their upper ends with the eyes a^2, slides E, and notches to receive the key D, substantially as herein shown and described.

141,965.—Wheel and Axle for Harvesters.—BENJAMIN G. TURNER, Fremont, Neb. Application filed April 19, 1873.

The wheels are held in place on the axles by adjustable washers, and revolve with the axles. The axles are hollow, open at the ends, and thimble-skeins are cast on them.

Claim.—1. The wheels B B of a header, arranged centrally on hollow axles A A with open ends, between adjustable washers *d d*, the axles having the thimble-skein *e* cast thereon, and arranged to revolve with the wheels in boxes C D attached to beams *b c* of the machine, the whole constructed, combined, and adapted for the purposes substantially as shown and set forth.

2. The adjustable scraper *c*, with arms attached and arranged one on each side of the wheel, in combination with its pivotal or axial support, and the shoe F having beveled shoulders *h*, substantially as set forth.

141,966.—Telegraph-Sounder.—HENRY VAN HOEVENBERGH, Brooklyn, N. Y. Application filed May 9, 1873.

Loose core pivoted at one end to bow *a* plays at other end between end of bow and stop *l*.

Claim.—1. The loose core *c*, hinged to the stationary bow *a* and vibrating between the bow *a* and stop *l*, substantially as set forth.

2. An electro-magnetic sounding-instrument made with a loose core within the helix, substantially as set forth.

3. An electro-magnetic sounding-instrument made with a core that is raised by magnetism and drops by gravity, substantially as set forth.

141,967.—Adjustable Pulley for Gas-Machines, &c.—EDWIN F. VAN HOUTEN, Newark, N. J., assignor of one-half his right to SAMUEL T. TATE, Brooklyn, N. Y. Application filed March 26, 1873.

The bar to which the pulleys are attached is carried by a wheel from one end to the other of a curved bar, arranged above the spool so that the cord is kept in a perpendicular position as it is wound.

Claim.—In combination with the spool E of a gas or other machine, the adjustable bar A, provided with the wheel C and pulleys *a a*, when operating substantially as and for the purposes herein set forth.

141,968.—Apparatus for Carbureting Air.—EDWIN F. VAN HOUTEN, Newark, N. J., assignor of one-half his right to SAMUEL T. TATE, Brooklyn, N. Y. Application filed March 26, 1873.

The vessel containing gasoline is composed of two cylinders, and has within it a bell-shaped float suspended over a cylinder, through which the air to be carbureted passes. A steam-coil in the bottom heats the fluid.

Claim.—1. In an air-carbureting machine, a floating air distributer, E, constructed with an upper chamber, *b*, side pipes *c c*, and air-chamber K, in the manner substantially as described, and for the purposes set forth.

2. The floating air-distributer E, as above described and claimed, in combination with air-pipe F and cylinders A and B, the whole constructed substantially as described, and for the purposes set forth.

3. In an air-carbureting machine, a hot-water or steam-chamber, D, situated in the bottom thereof, in combination with circulating-pipes G *f* extending into the oil-chamber of said machine, each constructed substantially as described, and for the purposes set forth.

141,969.—Log-Turner.—CHARLES VAN VLECK, Sidney, Mich. Application filed July 26, 1873.

A system of adjustable levers, sustained in position by weights, is used to assist the chain and hook in rolling the log upon the carriage.

Claim.—1. In combination with the driven shaft *b*, the chain or rope A, overplane H, shaft *f* with its lifters and pulley, and weight J, for the double purpose of first raising up the inclines *c* to receive the turned-over log, and then to return them into a position out of the way, as described and represented.

2. In combination with the shaft *b*, turned in opposite directions at different times, as stated, the chain or rope *i*, beam-lever *j*, and chain or rope *k* with its hook *w*, as and for the purpose described and represented.

141,970.—Harvester.—WILLIAM WALLACE, Syracuse, N. Y. Application filed April 10, 1873.

The drag-bar is supported by, and allowed to rise and fall on, a quadrant attached to the outer end of the main axle.

Claim.—The sleeve *c*, drag-bar *d* having the bead thereon, and quadrant *g*, against which the drag-bar and bead bear, constructed, arranged, and combined substantially as and for the purposes herein described.

141,971.—Advertising-Lamp.—FRANCISCO R. WARNER, Paris, FRANCE. Application filed November 14, 1872.

A frame, having detachable transparent windows, is adjusted upon a post by means of set-screws and the central tube, which passes vertically through the frame.

Claim.—The lamp-post advertising medium herein described, consisting of the skeleton frame B, glass plates C, central tube E, set-screws *a*, and post A, as set forth.

141,972.—Machinery for Pulling Wool.—JULES WATTEAU, Antwerp, Belgium. Application filed October 28, 1872.

Improvement on patent No. 121,505, of December 5, 1871. The skin is secured upon a drum by means of spring-catches, and, as the drum revolves, the skin is presented to the action of a series of spiral plates attached to a revolving shaft, removing the wool. The fleece, falling upon a table, is rolled up by means of paddle-shaped wings attached to the shaft L.

Claim.—1. The feed-table B, drum B, provided with catches *c*, shaft D, with spiral plates *e*, endless table H, and paddle-shaft L, combined and arranged substantially as described, to pull and roll up the fleece of a sheep-skin.

2. The endless tables E and H, drum B, provided with an automatically-operating catch, and a shaft with striking-plates to pull and preserve entire the fleece of a sheep-skin, substantially as described.

3. The shaft L with its paddle-shaped wings to roll the fleece brought against it by the table, substantially as described.

141,973.—Air-Gas Machine.—PELAG WERSI, Newark, N. J. Application filed June 7, 1873.

The object is to connect a series of ball-blowers with mechanism in such a manner that they will give a steady and uniform stream of air to a carburetor.

Claim.—1. The combination, with a series of topless chambers, A, of a series of bottomless chambers, B, that successively move into the former at the times, in the manner and for the purpose described.

2. An air-pipe, L, having upwardly-opening valve J, connected, as described, with chambers A B, as and for the purpose set forth.

141,974.—Steam-Generator.—HARRY P. WRIGHT, Bonaparte, Iowa. Application filed June 21, 1873.

By this arrangement the products of combustion not only pass through the fire-tubes in the boiler, but also through secondary flues arranged on each side thereof, before entering the smoke-stack.

Claim.—The combination, with a steam-generator, of the secondary return-flues D, arranged by the sides of the generator, in the masonry setting, and connected with the flues C and the passage to the chimney, substantially as specified.

141,975.—Sawing-Machine.—ALLEN XANDER, Slatington, Pa. Application filed June 7, 1873.

Adjustable slides are placed upon the under side of the table.

Claim.—The combination of the adjustable boards S T with the table F and the saw, substantially as specified.

141,976.—Wood-Grinding Machine for Making Pulp.—SÖREN B. ZIMMER, Elkhart, Ind. Application filed June 21, 1873.

The blocks of wood are held under spring-pressure in boxes, which revolve in contact with the beveled face of a stationary grindstone, being lubricated by water from a pipe passing through the pen-stock.

Claim.—1. The combination of the bevel-faced stationary stone A, rotating jointed arms D, boxes E, and springs G, substantially as specified.

2. The arrangement of the pen-stock I and water-pipes J K with the stone, substantially as specified.

141,977.—Machine for Pointing Wire.—FRANK H. AIKIN, Franklin, N. H. Application filed March 15, 1873.

A hammer-die on reciprocating slide E, and a corresponding anvil-die on the frame, and a blank-holder, K, rotated by means of belt P, and that is capable of endwise movement.

Claim.—1. The combination with dies, one reciprocating and one fixed, of the grooved blank-holder K and shell H, having a pin entering the slot in the blank-holder, substantially as and for the purpose specified.

2. The shaft C, cam-block D, spring G, reciprocating slide E, and friction-roll M, with dies attached, one to the slide, and the other to the bed, vertically beneath it, in combination with the grooved blank-holder K and shell H, all arranged, constructed, and operated as set forth.

141,978.—Chuck.—THOMAS R. ALMOND, Fitchburg, Mass. Application filed July 2, 1873.

The jaws are crescent-shape in cross-section, and are guided in correspondingly-shaped grooves in the sleeve by pins entering through the sleeve into spiral grooves on opposite sides of each jaw, said spiral grooves being straighter near the ends of the jaws to give more power when griping large bits.

Claim.—1. The improved drill-chuck, consisting of a shell, A, partly-cylindrical jaws C C, adjusting-screw B, and of the pins *e* to fit the spiral grooves *d*, substantially as herein shown and described.

2. A spiral groove, *d*, for the jaw of a drill-chuck, when made straighter toward the outer and more spiral toward the inner end, substantially as described.

3. The arrangement of the two pins *e* in the shell A to bear against and enter opposite sides of the same jaw C, substantially as described.

141,979.—Railway Rail.—WILLIAM W. ALTER, St. Louis, Mo. Application filed April 16, 1873.

Claim.—The lower member A, having bent flange *a*, and beveled flange *a'*, in combination with the upper member B, having one side of its base *b* beveled, and the bolts C, having inclined heads *c*, all arranged substantially as and for the purpose set forth.

141,980.—Nut and Bolt Fastenings.—JOHN T. ANTRIM, Smith's Ferry, Pa., and WILLIAM J. SLOAN, Liverpool township, Columbiana county, Ohio. Application filed April 5, 1873.

Claim.—The sheet-metal keeper *c* having an eye, *d*, and straps ends *c'* to bear against the sides of the nut, arranged on the bolt under the nut, and secured by the bolt *f* in the slot of the bolt, substantially as set forth.

141,981.—Bobbin-Holder for Sewing-Machines.—WILLIAM F. BARNES, JOHN BARNES, and PETER MESICK, Rockford, Ill. Application filed May 13, 1873.

Claim.—1. The portable bobbin-holder A for sewing-machines, consisting of the body, formed substantially as described, and provided with holes *d*, arranged as shown, to and for the purpose set forth.

2. The combination of the bobbin-holder A, constructed as described, with the needle-cushion *c*, substantially as specified.

3. The combination of the bobbin-holder A with the pin-cushion B, substantially as described.

4. The combination of the bobbin-holder A with the emery cushion E, substantially as described.

5. The combination of the bobbin-holder A with the emery slab or needle-grinder C, substantially as described.

6. The combination of the bobbin-holder A with the emery slab C and pin or stud *c*, substantially as described.

7. The combination of a bobbin-holder, needle-cushion, needle-grinder, and pin-cushion, and pin or stud *c*, in a single device, substantially as and for the purpose described.

141,982.—Rotary Valve and Cut-Off.—WARREN S. BARTLE, Newark, N. Y. Application filed June 25, 1873.

The valve has two inlet-ports opposite each other, and two exhausts arranged the same way; the ports in the seat correspond with those in the valve; opposite ports lead to the same end of the cylinder. The spindle slides in the valve-stem.

Claim.—The combination of the valve-seat B with ports *b b* and *b' b'* and passages *b² b²*, the valve D with ports *d d* and *d' d'*, the stem E, spindle I, and chest G with inlet H and outlet G, all constructed and arranged substantially as and for the purposes herein set forth.

141,983.—Machinery for Burnishing the Sole-Edges of Boots and Shoes.—JOSHUA BRADLEY and JOSHUA BRADLEY, Jr., Lynn, Mass., assignors of one-half their right to GEO. W. KERRY, same place.—Case A. Application filed January 23, 1873.

Claim.—The combination, in a jack or holder for a boot or shoe edging machine, of the stud U, binding-slide V, and pawl W, mounted on a pivoted rest, all constructed and capable of being operated as described, and for the purposes set forth.

141,984.—Machine for Burnishing the Edges of Boot and Shoe Soles.—JOSHUA BRADLEY and JOSHUA BRADLEY, Jr., Lynn, Mass., assignors of one half their right to GEORGE W. KERRY, same place.—Case B. Application filed January 23, 1873.

A forked arm, which supports the burnishing-tool, is attached to a sliding rack-bar, which engages a toothed pinion, from which it receives longitudinal reciprocating motion. The jack-head is composed of two flanged disks, one of which is secured firmly to the axis, while the other is allowed to rotate upon the axis, but may be held in a fixed position by a sliding bolt.

Claim.—1. The head B, having the handle C and bracket F, carrying the burnishing-tool A, in the manner described, in combination with the rack E, pinion D, and arms G H, substantially as and for the purpose specified.

2. The crank-wheel Q, rod P, rack O, and pinion N, in combination with the shaft K and arms G H, arranged as described, for operating the head B, carrying the burnishing-tool A, substantially as set forth.

3. The jack or support for boots or shoes composed of the two disks to form the head, with the stud 7 and 8 and sliding bolt 9, as described, and for the purposes set forth.

4. The tapering tongue 11, in combination with the sliding bolt 9, as described, and for the purposes set forth.

141,985.—Sewing-Machine Table.—JOSEPH BENNOR, Philadelphia, Pa., assignor to NEHEMIT D. STOOPS and JOHN B. MYERS, same place. Application filed July 9, 1873.

Between the belts and the table-top springs are interposed that serve to hold the belts either in a drawn or closed position. When the belts are drawn out to support the cover the notch near the end of each belt engages with the acute edge of the leg on the cover. The legs are made adjustable by being inclined lengthwise, and also slotted to receive the attaching-screws.

Claim.—1. The belts C C, having notches *d d d' d'* and *g g* in their upper edges, in combination with the sockets D D, having slots *s* in their upper sides, and lips *e* at their front ends, the springs E E, eye-plates F F, and legs G G, substantially in the manner and for the purpose above set forth.

2. The adjustable inclined legs G G, in combination with the cover B and belts C C, having notches *g g*, substantially in the manner and for the purposes above described.

141,986.—Bearing for Shafts.—CHARLES BEEB, Lower Merion township, Montgomery county, and WILLIAM H. SUTLEMEMER, Harrisburg, Pa. Application filed August 1, 1873.

Claim.—1. The combination of the rod or journal B, center bearing or packing A, central recessed casing D, and screw-plug F, substantially as and for the purpose described.

2. The combination, with the case D, the packing A, and ring F, of the washer H, for the purpose described.

3. The curving of the surfaces *s s* of the wedge-shaped sectional bearing, or of the interior of the casing, or of both, for the purpose set forth.

141,987.—Sewing-Machine.—HELEN A. BLANCHARD, Boston, Mass. Application filed June 19, 1873.

Machine adapted for producing the button-hole stitch. The usual four-motioned feeding device works in a slide operated by a pawl that receives its motion from an arm on the end of a vibrating lever.

Claim.—1. The pawl D, turning on an arbor, G, and provided with the tongue *d²* and notches *d'* at its lower end, and the lug *d* at its upper end, the latter engaging with and operating the slide E of the feed-bar M, and combined with and operated by the arm B, substantially as described.

2. The lever A, provided with the pivoted arm B and interposed spring C, said arm being so arranged as to impinge alternately against the notched sides of the pawl D and confine the latter, thereby operating the slide E and feed-bar M, substantially as described, for the purpose specified.

3. The lever A, provided with the pivoted arm B and interposed spring C, in combination with the screw I, substantially as described.

4. The combination of the screw K, frame H, pawl D, slide E, and feed-bar M, all arranged and operating substantially as and for the purposes specified.

5. The combination of the spring A, frame H, screw I, arm B, pawl D, and slide E, all arranged and operating substantially as described.

141,988.—Corn-Cultivator.—NOAH G. BEAUMS, Mesa, Ohio. Application filed May 14, 1873.

Claim.—The combination of the beams L, plates *k k*, bell *s*, braces *f f*, stirrup *h*, and rod *m*, for making a joint and adjustable connection for the front end of the beams, as is herein set forth.

141,989.—Hinge.—ETIENNE BOILEAU, St. Louis, Mo. Application filed July 26, 1871.

The pintle-base has an upper surface of a somewhat conical shape, and affords inclines in several directions. The pintle itself projects from the forward part of this base near its middle, so that a space is left between the pintle and the attaching-leaf. The female part of the hinge has cam-surfaces, which are prolonged in the form of horns, which allow an extended movement of the gate and allow it to close automatically from any point.

Claim.—The pintle-base *l l*, constructed with an upper surface in convex conoidal form, inclined in both directions from an apex or ridge in rear of the pintle *m*, which latter projects upward from the forward margin of the base, leaving a space between the said pintle and the attaching-leaf of the hinge, in combination with the socket-piece, having concave cam-surfaces projecting in front of the pintle-base when the hinge is closed, and prolonged in the form of horns *f*, to allow an extended movement and permit the gate to close automatically from any point, all as herein described.

141,990.—Device for Setting Saw-Teeth.—GEORGE W. BUSSEN, Cincinnati, Ohio, assignor to J. A. FAY & CO., same place. Application filed May 20, 1873.

The two jaws G' carry at their upper ends a pair of bits and die-blocks, both adjustable, that operate simultaneously upon two teeth of the saw, which is clamped and held by the lower faces of the opposite die-blocks. The saw is held between the vibrating jaws by spring-clamps, and when under the setting-dies rests on a stub projecting from a bar that connects the holding-jaws. A vibrating arm, carrying an adjustable pawl, operates to feed the saw along after the teeth have been set.

Claim.—1. A saw-setting machine consisting, essentially, of the bearing B, driving-shaft C, cams E E' *e e'*, springs V V', and vibrating jaws F F' *f f'*, whose upper ends carry two pairs of bits, H H', and beveled die-blocks J J', occupying parallel planes at the pitch distance apart, for operating simultaneously and in opposite directions upon two contiguous teeth of a saw, as herein described and set forth.

2. In combination with the simultaneously-vibrating jaws F F', the bits H H' and beveled die-blocks J J', together with their adjusting and retaining devices G G', *g g'*, I I', and K K', substantially as explained.

3. The combination of the vertically-adjustable vises L L' M and bearing-bar N *n*, or equivalent devices, as and for the object stated.

4. The combination of the eccentric D and adjustable feeding mechanism O *o* P *p* Q *q* R S T, as herein described and set forth.

141,991.—Car-Coupling.—DANIEL C. CAMERER, Martinsburg, Pa. Application filed February 14, 1873.

The links are pivoted to boxes which slide in the draw-head against suitable springs. One draw-head has an inclined flange on its upper side, which receives and forces back the pin-bolt for on the other when the cars come together. Then the coupling is automatic.

Claim.—1. The links C C, pivoted to sliding boxes E E, the draw-heads A B, coupling-pin D, and the springs G G, all combined for operation as set forth.

2. In combination with the pivoted links C C and holder M, the sliding boxes E E, springs G G, and draw-heads A B, as and for the purpose specified.

141,992.—Apparatus for Shrinking Metal Bands.—WILLIAM CARR, Logansport, Ind., assignor to KELSEY BROWN, same place. Application filed April 16, 1873.

The open end of the box is slightly tapered to receive the tapering segmental pieces C, in the inner faces of which shoulders are formed to receive the band. The segments, when forced into the box, act like a number of wedges to compress the metal.

Claim.—1. The tapering sections C, forming a hollow sectional ring, and having shoulders *e* on the inner faces, in combination with the box A, tapering on its inner face, substantially as and for the purpose set forth.

2. The spring F and head D, in combination with the sections C C and body A, substantially as and for the purpose set forth.

141,993.—Hemmer for Sewing-Machines.—FRANK CASWELL, Moline, Ill. Application filed June 25, 1873.

The scroll is secured to the adjustable guide-plate by means of the flange, and the projecting arm supports the spring-plate for smoothing the hem.

Claim.—The combination of the casting A, with flange *b* and arm C, double-scroll hemmer B, constructed as described, with flange *d*, bends *f e*, guards *f*, and wire *r*, and the spring-plate D, all substantially as and for the purposes herein set forth.

141,994.—Preserve-Can.—JOHN K. CHACE, Brooklyn, assignor to HENRY J. JOHNSON, New York, N. Y. Application filed April 12, 1873.

One end of the body of the can is made with a groove and the other end with a tongue, so that when joined a channel is formed for the solder.

Claim.—1. The body A, formed with the tongue and groove *a b*, as herein set forth, and for the purpose specified.

2. The combination, with the soft-metal ring C and outward bead B, with free edge *d* turned inwardly, forming the space *c*, of the lid F, with channeled rim embracing the free edge *d*, and the edge of the rim entering the space *c*, substantially as and for the purposes specified.

3. The inward bead G, in combination with a flanged flat bottom, substantially as and for the purpose set forth.

141,995.—Construction of Roads.—EDWIN CHADWICK, East Sheen, Mortlake, England. Application filed October 2, 1872.

A hard and continuous track for the wheels is formed of a fine asphaltic cement, while the portion traveled upon by the horses is of coarser material.

Claim.—The construction of a road or way with continuous jointless tracks of asphalt, or analogous material, laid in a concrete bed, in combination with horse-tracks and other parts of the road of other material, substantially as herein specified.

141,996.—Sewing-Machine Motor.—BENJAMIN C. CHAMBERS, Shady Plain, Pa. Application filed July 23, 1873.

During the operation of the motor the spring is continuously wound by the operators by means of the stirrups, which have pawl attachment, the latter engaging with and rotating the ratchets, one of which is firmly secured to each end of the gear and spring-shaft.

Claim.—The combination, with a sewing-machine motor, constructed substantially as shown, of a pair of ratchets arranged, respectively, at opposite ends of the power-shaft, and a pair of stirrups, having straps to hold the feet, and provided with springdogs to turn the ratchets and produce a continuous revolution of the power-shaft, as described.

141,997.—Machinery for Finishing the Sole-Edges of Boots and Shoes.—CHARLES M. CHASE, Boston, Mass., assignor to FREDERICK CURTIS, same place. Application filed April 29, 1873.

The jack-carriage, attached to the face of a disk, is provided with semi-rotative as well as horizontal or sliding movement, that the cutting-edge of the sole may be presented to the finishing-tool. The operative-tool is suspended from a curved bar, which is attached to the frame of the machine and disposed above the working parts thereof.

Claim.—1. In combination, the disk or head E, the jack-carriage *f* with its arms *i i*, the plate *k*, and the lever *l*, substantially as and for purposes stated.

2. In combination with a disk or head and a jack-carriage sliding transversely thereupon, a trimming or cutting tool suspended above such head and carriage by means of a rod and spring, as herein shown and explained, the same being substantially as and for purposes stated.

3. The operative tool suspended from a curved bar or gooseneck which is attached to the frame of the machine, and disposed above the working parts thereof, substantially as and for purposes stated.

4. The combination of the tool *a'*, tilting block *d'*, gimbal *f'*, shank or rod *h'*, and spring *l'*, the whole being suspended above the jack, and from or by a suitable support, substantially as and for purposes stated.

5. As a means of effecting the traverse of the jack-carriage upon the disk or head E, the two-armed lever *l*, actuated by the drum F and its wiper-stud *p*, substantially as and for purposes stated.

6. The drum F, with its continuous or annular rack *a*, segmental rack *b*, and stud *p*, in combination with head E, jack-carriage *f*, and lever *l*, substantially as and for purposes stated.

7. In combination, the drum F and its segmental rack *b*, and the pawl or dog *p'*, substantially as and for purposes stated.

8. The sliding bars *r r*, playing within the head E, and connected with the jack-carriage by the levers *u u*, and operating substantially as and for purposes stated.

141,998.—Borer for Sampling Cotton.—EDWIN A. CLARK, Jackson, Tenn. Application filed July 22, 1873.

The shank A is inserted in the bale by the end C being placed under the end of the bale and by using the handle D as a lever. The shank A is withdrawn by the reverse motion of the lever.

Claim.—The combination of the handle C D with ears B B and the auger A pivoted between said ears, all constructed and arranged substantially as and for the purposes herein set forth.

141,999.—Hay-Tedder.—THOMAS J. CLARK and GEORGE M. CLARK, Higganum, Conn. Application filed March 25, 1873.

A short tube, flattened and perforated, is placed transversely on the lower end of the tine-handles as a means of holding the adjacent ends of the tines.

Claim.—The combination of the handle *a*, the sleeve *c* open at the ends and sides, the two fork-tines, and the bolt *f* with a conical or wedge-shaped head, the whole constructed, arranged, and designed for use, substantially as described.

142,000.—Men's Drawers.—EUGENE L. CLOSSE, Cleveland, Ohio. Application filed April 28, 1873.

The drawers are adjustable to different-sized persons.

Claim.—As a new article of manufacture, the drawers herein described, provided with the waistband B and facing C cut in one piece, reaching down to the crotch, with a central seam cut curved so as to give fullness to the left leg and stomach, said band extending across the front to engage with a buckle for securing the garment, one button being used half-way down from the waist to close the front.

142,001.—Cotton-Bale Tie.—FREDERIC COOK, New Orleans, La. Application filed July 16, 1873.

Claim.—1. The bale-tie constructed substantially as shown and described.

2. The combination of the double notches in the straight band with the looped band end and a strengthening-plate riveted on said straight end.

3. A bale-tie constructed so that when the looped end of the band enters a side notch in the straight end the bent end of the loop enters simultaneously a second side notch, and is locked by pressure against the straight band, or by the strengthening-plate riveted on it.

142,002.—Legislative Voting Apparatus.—JAMES A. CRISWELL, Mifflintown, Pa. Application filed December 21, 1872.

The ballots, after being carried to the indicating spring-scales, where their respective aggregates are registered, are brought up to the clerk's desk by a suitable elevator, and a distributing-desk is used for restoring the numbered or marked ballots to their respective holders.

Claim.—1. The elevator D and connections, in combination with the vote-registering apparatus, substantially as specified.

2. The improved distributing-desk, having the drawers A and distributing-tubes B, substantially as and for the purpose specified.

142,003.—Reel for Ovens.—ALEXANDER CRUMBIE, Brooklyn, N. Y. Application filed April 25, 1873.

A wire rope is used. Notches in the wheels prevent the rope from slipping, and keep the pans at equal distances apart.

Claim.—1. The connecting device consisting of the transversely-attached sockets *e h*, clamping-piece G, and set-screws E, or their equivalents, in combination with the endless band A and rod D, substantially as and for the purpose herein specified.

2. The wheels B B, constructed with double flanges, notched as described, in combination with the sockets *e h*, substantially as and for the purpose herein set forth.

142,004.—Pump-Piston.—WILLIAM C. CULBERTSON, Girard, Pa. Application filed March 10, 1873.

On the down-stroke of the piston the shoulder d^1 and slot *s*, in combination with the plug B and washers G H, arranged and operating substantially as shown and described.

142,005.—Pendulum-Level.—ADRIEN CHARLES LOUIS DELSARTE, Paris, France. Application filed August 31, 1872.

A multiplying-gear is introduced between the pendulum or plumb and the index for enlarging the range of the latter; and to prevent play a loose wheel, in gear with the pinion of the index, is counterpoised or loaded so as to exert a slight pressure in one direction.

Claim.—A wheel, D', provided with a counterweight, *d'*, and fitted loose on the spindle *n* of the wheel D, and for the purpose of causing the indentations of the wheel D constantly to act to the full extent of their power on those of the pinion *r* in order to insure the exactness of the indications of the index E.

142,006.—Steam Cloth-Press.—JOHN DENNIS and CHARLES H. WESTON, Lowell, Mass. Application filed June 26, 1873.

Claim.—The arrangement of the chain G, spoked wheel D', guide-shaft H, and hand-power J d I, all as shown and described, and for the purposes herein set forth.

142,007.—Reciprocating Churn-Dasher.—TIMOTHY EARLE, Valley Falls, R. I. Application filed March 26, 1873.

In a churn which forces air into the cream through a hollow dasher-rod, the valve at the top of the rod is arranged to be fixed in an inoperative position after the butter has been formed.

Claim.—The combination with the hollow dasher-handle G, the cap and valve C and D, arranged substantially as described, and for the purpose set forth.

142,008.—Apparatus for Steaming Grain.—JOHN H. EBERT and EZEKIEL PITTS, Decatur, Ill. Application filed March 18, 1873.

Wheat subjected to jets of steam to heat and dampen it while passing through a cylinder to the grinding-stones.

Claim.—The device for steaming and dampening wheat, consisting of the cylinder A provided with the tunnels B C, bar E, shaft F, dedectors G G', steam-pipe H, rose I, and valve J, constructed, arranged, and operating substantially as shown and set forth.

142,009.—Machine for Dressing Millstones.—WILLIAM FARROW, Alexandria, Ill. Application filed July, 11, 1873.

A tappet on the crank-shaped shaft of the main frame engages with the teeth of the wheel on the shaft of the reciprocating frame parallel to the main driving-shaft so that each revolution of the latter forces an advance of the said wheel's shaft; on the end of shaft a pinion engaging with a rack-bar on the main frame, thus driving the pick-holder, which is attached to the reciprocating frame, forward till the end of the rack-bar is reached by the pinion, when a reverse motion of the crank takes place, and this operation is repeated.

Claim.—1. The reciprocating frame C, when arranged to operate with the stationary frame A, by means of shafts D and E and H, pinions *s s*, rack-bars B, and pulleys *c'* and *h*, substantially as described, and for the purpose specified.

2. The pick K, shaft L, pitman N, and crank-shaft H, when combined and arranged to operate substantially as described, and for the purpose specified.

3. The bar R, when arranged to operate with the shaft L, and with the transverse shaft M, substantially as described, and for the purpose specified.

142,010.—Clamp.—LAWRENCE FEELY, Rochester, N. Y. Application filed June 20, 1873.

Claim.—1. In a clamp for putting together chairs, the combination of the head-block D, follower C, rest G, gage-bar I, bed J, saddles H H H^1, endless screws E E, and gear-wheels 1 2 3, arranged and operating substantially as described.

2. The block *f*, cross-bar *i*, and rest G, in combination with the follower C, head-block D, saddles H H H^1, gage-bar I, and bed J, substantially as and for the purpose specified.

3. The combination of the clamp N, arm O, cross-bar L, clamp-bar M, and hand-screws *p p t*, operating as described.

142,011.—Side Bar for Vehicles.—FRANCIS L. FLOWERS, Tarrytown, N. Y. Application filed December 16, 1872.

Claim.—The spring-bar, consisting of the wooden sections A and A, central whalebone strip B, and steel bottom strip C, constructed and combined by means of the encircling spiral wire D, substantially as and for the purpose specified.

142,012.—Till-Alarm.—GEORGE L. GEIGER, Philadelphia, Pa. Application filed May 13, 1873.

A series of reversible tumblers, swinging upon sliding carriages, is so arranged with the operating-keys as to secure the drawer and ring an alarm-bell unless manipulated in a known order. The locking-plate is arranged to be held out of action by a sliding bolt on its under side, when desired.

Claim.—1. The combination, with a drawer, of a series of tumblers, each secured to and sliding with a slide, and a locking-plate or lever, D, as set forth.

2. The locking-plate or lever D, having pivots *i* adapted to slots in the lock-case, a projection, *k*, bearing upon the tumblers and a spring or springs, *m*, arranged between the said pivots and projection, upon either of which the said plate may be turned as a fulcrum, as set forth.

3. The combination, with the said locking-plate or lever D, of a sliding bolt, *e*, adapted to an opening in the lock-case or drawer, as set forth.

4. The combination, with each of the slides B, of a reversible tumbler, A, adjustable, as set forth.

5. The tumblers A, constructed, substantially as described, with parallel edges *g g* and beveled edges *h h*; and pivoted to standards *f* of the slides so as to be capable of reversal thereon, as set forth.

6. The combination, with the reversible tumblers, of spring-retaining arms f^2, adapted to notches in the opposite ends of the said tumblers, as specified.

142,013.—Sewing-Machine.—EBENEZER A. GOODELL, Philadelphia, Pa. Application filed November 16, 1872.

A pin on the needle-bar, actuating connecting-rod, enters a slot in the arm of the looper, and rocks the looper on its revolving crank axle to properly enter and discharge the loop about the bobbin confined in a stationary case. The sides of the case and holder are open to allow the removal of the bobbin alone, it being held in position by a spring. The feed consists of an L-shaped bar, having the short arm serrated and the end of the long arm attached to the bed-plate. A bar pivoted to the feed-bar is adjustable by means of a set-screw, and the position of the outer end of this bar with reference to the cam governs the extent of the feed.

Claim.—1. The revolving hook-keeper M pivoted to the crank-wrist K, and connected by slotted arm R and pin or screw S with the needle-actuating connecting-rod L, operated directly from the same crank, as and for the purpose herein set forth.

2. In combination with the subject-matter of the preceding clause, the case A' supporting the double-convex stationary bobbin-holder, and provided with an opening to permit the independent removal of the bobbin, as set forth.

3. The pivoted bar W and adjusting-screw X, in combination with the feed-bar U and a rotary actuating-cam, substantially as set forth.

142,014.—Centering Device for Lathes.—HARVEY GRAY, Bristol, Conn., assignor to NATIONAL WATER-WHEEL COMPANY, same place. Application filed March 17, 1873.

Claim.—The centering roller-tool *b c*, in combination with the tool-carriage and its feed-screw, and adapted for operating upon the loosely-clamped work for bringing the work central upon the face-plate of the lathe, all substantially as and for the purpose described.

142,015.—Machine for Raising Panels.—FRANCIS D. GREEN, Williamsport, Pa. Application filed May 14, 1873.

The rabbet on each side of the board is cut at the same operation, and a guide-bar, L, supports the lower rabbet as the panel moves over the bed.

Claim.—The combination of the main frame A and its stationary revolving cutters C C, the adjustable holder G with cutters J, vertical screw-rod H, adjustable feed-table E with adjustable guide L, and vertical screw-rods H' H', all constructed and operated substantially as set forth.

142,016.—Eaves-Trough Fastening.—WILLIAM H. HAMMOND, SYRACUSE, Mo. Application filed July 12, 1873.

Claim.—The combination, with the eaves-trough sections A A, of the strap B, having its ends *b d* bent as described, the spike C, and strap D, all arranged substantially as and for the purposes herein set forth.

142,017.—Self-Braking Lowering and Hoisting Apparatus.—WALTER HART, Philadelphia, Pa. Application filed July 11, 1873.

The draft-rope passes around a pulley on the upper arm of the lever, the lower curved arm of which forces the draft-rope against the base-plate, and thus the movement is arrested.

Claim.—1. A hoisting and lowering apparatus in which the weight of the load is caused to apply a brake to the draft rope or ropes, through the medium of a lever or levers, substantially as herein described.

2. In a hoisting and lowering apparatus, the combination, substantially as described, of a brake-lever, J, arranged to bear upon and stop the movement of a draft rope or ropes, with a lever or levers, A, actuated by the said draft rope or ropes and transmitting movement through a rock-shaft, G, arm L, and link K to the said brake-lever.

3. The combination of the said brake-lever J with the pedestal E, its recess *d*, guides *f f*, and separator *g*, all substantially as specified.

4. The combination, substantially as described, of geared capstans H and H', of equal diameter, with the two draft-ropes X and X' of a hoisting and lowering apparatus, for the purposes specified.

5. The combination, substantially as described, of the foot-lever D with the rock-shaft and its appliances and the brake-lever J.

6. A hoisting and lowering apparatus, in which are combined upon a suitable frame a rock-shaft, G, levers A A', arm L, link K, brake-lever J, pedestal and guides E, and geared capstans H and H', all substantially as herein described.

142,018.—Machine for Bending and Twisting Metal Bars.—SAMUEL HOLMES, Philadelphia, Pa. Application filed October 24, 1872.

Two blocks, at a fixed distance apart, are adjustable to and from the squeezer A by two screws connected by gearing. The squeezer having a limited and uniform reciprocal movement, the degree of curvature to be given the bar depends on the nearness or remoteness of the blocks. Two levers, one at each side of the machine, suspended by their rounded heads, in sockets, have slots in their ends corresponding in shape to the bar to be twisted, and are vibrated in opposite directions to twist a bar placed in these slots—the one by a stirrup that connects its lower end to an eccentric, and the other by a screw connected to its lower end.

Claim.—1. The two arms K L, both working in sockets k^1, with a suitable clamping device, *m*, or with one arm only working in a socket and the other fixed, the two arms being so arranged in relation to each other that one is capable of a motion independent of the other for the purpose of twisting an iron bar, as herein described.

2. The notches *m*, arranged centrally within the disks k^2 k^2 for clamping the bar to be twisted, as herein described.

3. The combination of the socketed arms K L, the adjusting-link N, and the thrusting-block n^1, operating as herein described.

4. The combination of the arms K L and the spring-bar K', operating as and for the purpose herein set forth.

5. The combination of the pinion R, the rack r^6 arranged to adjust the arm I, as herein described.

6. The combination of the adjustable blocks E E, the screws F F acting in unison, and the squeezer A, operating as herein described.

7. The arrangement of the shaft C, thrusting-block c^1, and arm L, in combination with the squeezer A and adjustable blocks E E, so that the said shaft operates both the bending and twisting mechanisms.

142,019.—Machine for Cutting, Rubbing, and Drilling Stone.—PATRICK H. HOPKINS, Brooklyn, N. Y. Application filed June 16, 1873.

The stationary supporting-frame is provided with an adjustable guide-frame for giving any desired outline to the edges or molding to be formed on the stone. A vertically-adjustable sleeve is arranged on the tool-holder, which sleeve, during the process of working the stone, moves along the above-named guides; while for operating it is raised out of the way of said guides by means of a pin and curved slot.

Claim.—1. The vertically-adjustable sleeve N fitted around the cylindrical grooved projection O of the frame I, and embracing the lower part of the shaft J, substantially in the manner described.

2. The guide-frame B, composed of slotted rods or bars, and arranged on a machine for cutting, rubbing, or drilling stone around the jointed tool-holder, substantially as specified.

142,020.—Railway-Rail Joint.—JOHN L. HUDSON, Cumming, Ga. Application filed June 25, 1873.

Claim.—The combination of the rails A A, with flanges B B on their under sides, the grooved chair D, and curved plates C C, all constructed and arranged substantially as and for the purposes herein set forth.

142,021.—Dumping-Car.—JOHN HUGHES, New Berne, N. C. Application filed August 9, 1873.

To the bottom and the ends of the body of the dumping-car rollers are secured, which move upon inclined ways secured to the truck. The body is moved to either side of the truck by means of a central shaft, to the ends of which a pulley is secured, and around which a cord or chain is wound, its ends secured to the rollers of the body. By turning the shaft in either direction the body is dumped and held in place by means of the cords.

Claim.—1. The ways *c*, having the horizontal plane 4, recesses *g*, and inclined planes *i*, substantially as set forth.

2. The combination of the ways *c*, having the recesses *g* and inclined planes *v*, arranged relatively to each substantially as shown.

3. The combination of the shaft 6, pulleys 7, cord 8, and pulleys 9, and rollers *a*, substantially as specified.

4. The truck *c*, having the inclined planes *v* formed upon its ends, recessed and beveled ways *e*, body *c*, provided with rollers *a* 2, shaft 6, pulleys 7 9, and cord or chain 8, substantially as shown and described.

142,022.—Middlings-Purifier.—ANDREW HUNTER and CHARLES E. WHITCOMB, Quincy, Ill. Application filed July 2, 1873.

The first suction-fan removes the moisture and cools the middlings before entering the compartment where the blast-fan is used. The blast-fan removes the fine fuzzy particles and light brown specks. The middlings or tailings, as they pass into the third compartment, are acted upon by the second suction-fan, where a heavy current of air is required to remove the heavy brown particles.

Claim.—In a machine for purifying middlings, the two suction-fans and a blast-fan, combined with a screen and feed-tube, the fans operating in distinct and separate compartments, and independently of each other, substantially as set forth.

142,023.—Middlings-Purifier.—ANDREW HUNTER and CHARLES E. WHITCOMB, Quincy, Ill. Application filed June 16, 1873.

Blast-fan operating first on the fine, and the suction on the tailings containing the coarse middlings, as they pass over the screen in the separate compartments. Feed-trough spreads the middlings evenly on upper end of screen. Oscillating rods or agitators, operating upon under side of bolting-cloth or supporting-wire, agitate the middlings as they pass over the screen.

Claim.—1. In a machine for purifying middlings, a blast and suction combined with a screen, the currents of air therefrom acting in separate and independent compartments, substantially as set forth.

2. The agitators arranged to oscillate beneath the screen for the purpose of striking transverse blows upon the under side of the screen or bolt covering, substantially as described.

3. The vibrating feed-trough, constructed with a perforated bottom, and with the front side E lower than the outer side F, substantially as described, and for the purpose specified.

142,024.—Sewing-Machine Table.—EDWIN A. JEFFERY, Jersey City, N. J. Application filed July 2, 1873.

A pendulous bracket is journaled in a bearing affixed to the table, and has on its upper and outer face a cross-head that enters a slotted hollow arm attached to the cover. The lower part of the bracket engages with a second eye on the cover. The cross-head is arranged at right angles with the bracket, so that the bracket has to assume a horizontal position to enter the cross-head, when the bracket is dropped to a perpendicular position and locked.

Claim.—The pendulous bracket C, journaled in a bearing, *d*, affixed to the table A, and provided with the cross-head I, in combination with the eyes G G', arranged and operating substantially as and for the purpose set forth.

142,025.—Pantaloon-Stretcher.—LOUIS KALTENBACHER, Louisville, Ky. Application filed June 25, 1873.

Claim.—1. The combination of the several devices hereinbefore described for stretching the legs of pantaloons, consisting of the table-frame A with its sliding top B, lever C, knob-screw D, and catch E, stationary top F with its clamp G, racks H H, pinions I I, and crank J with the ratchet and catch K, pinions L L, and racks M M for operating the sliding cover, with the ratchet and catch N N and crank O, and the slides P P and jaws Q Q, when constructed and arranged to operate substantially as and for the purpose set forth.

2. The combination of the devices for shaping the legs, as hereinbefore described, consisting of the grooved bars R R and expansion-wedges S S, when constructed and arranged to operate substantially as and for the purpose hereinbefore set forth.

142,026.—Seams for Leather-Work.—CHARLES KENISTON, Somerville, assignor to himself and WILLIAM BUTTERFIELD, Boston, Mass. Application filed June 26, 1873.

The seam is formed of staples beveled upon their inner faces so as to spread when driven, thus forming, substantially, a continuous metal stitch.

Claim.—Leather-work, the parts of which are united by metal fastenings, formed and inserted substantially as shown and described.

142,027.—Automatic Regulating-Valves.—GEORGE L. KITSON, Philadelphia, Pa., assignor to himself and GEORGE W. CARR, same place. Application filed June 28, 1873.

The steam is caused to enter the chest in the same direction in which the valve moves, and to enter and escape from the chamber in which the valve operates from opposite sides.

Claim.—1. The automatic regulating-valve G, combined with a chest to which steam is admitted in the same direction as that in which the valve moves, all substantially as and for the purpose described.

2. The automatic regulating-valve G, operating within a cylinder or chamber, F, to which steam is admitted from opposite sides, and from opposite sides of which steam escapes, as set forth.

3. The automatic regulating-valve G, so combined with a cylinder or chamber, and inlet and outlet passages, that during the operation of the valve the outlet-passages will be closed, while the inlet-passages permit a pressure of steam beneath the valve, as set forth.

142,028.—Pump.—THEODOR C. H. KRAUS, Fishkill, N. Y. Application filed July 23, 1873.

Globe-shape shell contains two valve-chambers.

Claim.—The spherical shell A, containing in its interior the cylinder B, valve-chamber C D, supply and discharge chambers E F, and valves c c^1 c^2 c^3, to which access can be had by means of screw-plugs *g*, all constructed in the manner and for the purpose substantially as shown and described.

142,029.—Machinery for Trimming the Sole-Edges of Boots and Shoes.—RICHARD C. LAMBART, Quincy, Mass., assignor to THE SHOE MACHINERY MANUFACTURING COMPANY. Application filed July 10, 1873.

The shoe is jacked upon a stationary guide-pattern or former, and held in position by a suitable clamp. The cutter-stock, provided with universal motion, is mounted upon a sliding block attached to a band or chain, which passes around pulleys—one at each end of the stationary guide-pattern.

Claim.—1. The combination and arrangement, substantially as shown and described, of the stationary last-holding block *j* with its guide-rail *c*, and the movable cutter-carriage *n* with its guide and cutter mechanism.

2. In combination with the stationary block *j*, the clamping-arm a^3, and its roll b^3, and the vertical slide d^3, to which said arm is pivoted, and from which the last-pin c^6 extends.

3. In combination with the cutter-carriage *n*, the stationary guide-rails *m* and the mechanism for imparting to the carriage a continuous and combined rectilinear and rotative movement, substantially as described.

4. In combination with the carriage *n*, the slide *r*, spring *s*, post *t*, spring h^3, roll *z*, cutter *c*, and flange *y*, the whole arranged to operate substantially as shown and described.

142,030.—Railroad-Rail Joint.—WILLIAM D. LINDSLEY, Wathena, Kans., assignor to himself, EZRA V. SHIVELY, same place, and L. E. HEDGES, Frederick, Md. Application filed May 20, 1873.

Claim.—The fish-plate B, having solid flanged base *b* that fits the excised part of the inside base-flange of rail, and rests with offset b^1 upon the shoulder a^2 of rail, in the manner and for the purpose described.

142,031.—Horse Hay-Rake.—CHARLES M. LUPKIN and CHARLES G. ALLEN, Barre, Mass. Application filed May 26, 1873.

A sulky-rake, having the rake-head pivoted to and in front of the axle, is provided with a gravitating pawl to lock the rake-head to the wheel, for the purpose of raising the teeth for dumping the hay.

Claim.—1. The lever M, provided with the curved arms *g g'*, foot-rest *h*, and stirrup P, pivoted to legs on the foot-board H, and having lifting-springs *e e'*, in combination with the connecting-lever N and slotted arm Q of the rake-head, all adapted to hold the rake in operative position, and also release the same and throw it forward into position to engage the dumping mechanism, substantially as described.

2. The shields S S', connected with one end of the head and stripper-bar of a horse-rake, and formed with an inner nave, *s*, inclined ledge *s'*, step *s''*, and inclined plane or segmental flange *y*, substantially as described, for the purpose specified.

3. The weighted pawl *w*, provided with the roller *n*, in combination with ratchet *r* and flange *y*, all arranged and operating substantially as described.

4. The ratchet-wheel *x*, adapted to receive and be released from the pawl *w*, and provided with a spring-pawl, *x'*, so arranged as to engage with the ratchet-wheel *x* on the wheel-hub, and prevent the backward turning of the ratchet-wheel *x* when dumping the rake by the horse, and to allow the same to revolve when the rake is dumped by the driver, or raised for backing or other purposes, substantially as described.

5. The spring-bearings F, bolted to the rake-head and provided with seams *f*, adapted to secure the bent ends of the teeth I, in combination with springs G, the latter being clamped to the rake-head and hooked around the teeth in such manner as to allow the teeth to turn slightly in the seams, substantially as described, for the purpose specified.

142,032.—Cant-Hook.—EDWARD MANSFIELD, Orono, Me. Application filed March 15, 1873.

Claim.—A cant-dog, constructed as herein described, to wit, having a ferrule, *a*, with lips *b b* thereon, and an opening, *f*, between them, in combination with a corresponding opening or hollow, *g*, in the handle and the hook *c*, so that the inner or hinged end of said hook *c* when in place shall project into the hollow *g* of the handle, all arranged substantially as and for the purposes set forth.

142,033.—Machine for Notching Shingle-Bands.—CHARLES E. MCGREGORY, East Corinth, Me. Application filed May 22, 1873.

A hollow rotating cutter is provided with notching-knives, which project inward and cut the notches in the end of the binder when it is inserted in the cutter and pressed up against them.

Claim.—A notching-machine in which the stick is presented to the cutters by being first inserted within a recessed cutter-head, and afterward presented vertically to the action of the knives or cutters, substantially in the manner herein set forth and specified.

142,034.—Spoke-Machine.—ALEXANDER MCNEILE, London, England. Application filed July 2, 1873.

The rotating cutters have both a vertical and horizontal movement controlled by suitable guides.

Claim.—1. The swinging frames b^2 b^3, with the spindles c^1, provided with cutters *c c*, having edges partly straight and partly curved, as shown, in combination with the pattern-rollers *i i'*, as and for the purposes herein set forth, so that by causing the said pattern-rollers to bear against a traveling pattern, A, the corresponding cutters *c c*, while in rapid rotation, may be raised, lowered, or otherwise acted upon independently, and a compound motion imparted to them, in order to cause them to cut away the wood to the desired shape, as above described.

2. The arrangement, substantially as herein described, of the rotary cutters *c c*, the pattern-rollers *i i*, their spindles i^2, and the traveling pattern A, whose figure in one direction is that of a horizontal section of the form to be produced, and in the other is composed of such gradients as correspond to the varying sections of that form, whereby the pattern-rollers are caused to so act as to cause the cutters to present different portions of their cutting-edges at different points or stages of the cutting operation, substantially as and for the purpose herein set forth.

3. Arranging in one and the same machine a series or pairs of vertically-rotating cutters of irregular shape, and mounted in swinging-frames, and provided with pattern-rollers, as and for the purpose herein set forth, in combination with a movable pattern capable of traveling longitudinally to and fro in the machine, the whole being so combined and arranged that each rotary cutter, being under the control of the pattern-rollers, shall act only on a given portion of the piece of wood, and so that by the combined operation of all the cutters the piece of wood shall be reduced to the desired shape and form, as above shown and described.

142,035.—Water-Heater.—ISRAEL S. MEAD, Blue Earth City, Minn. Application filed May 14, 1873.

Claim.—As a new article of manufacture, an annular domestic heater, adapted to be applied to and removed from the exterior of a stove-pipe, or the exterior of the drum of a stove, such heater being constructed of annular plates b^1 b^2 connected together by plates *d e*, the plate *d* being provided with apertures d^2 d^3, cap or cover d^4, and pipe d^1, and the external pipe b^1 having applied thereto a gage, *f*, and tap *g*, all arranged and constructed substantially as shown and described.

142,036.—Saw-Hanging.—JOSEPH E. MERRITT, Bangor, Me. Application filed June 2, 1873.

An oblong opening is cut in each end of the saw, which is strengthened by plates having an opening corresponding with that in the saw, and provided with serrations upon one side, into which the hanging-straps hook.

Claim.—In a saw, the transverse plate *b c*, provided with notches *d*, whereby the straps are made adjustable, substantially as set forth and shown.

142,037.—Match-Plane.—CHARLES G. MILLER, New Britain, Conn., assignor to OLIVER S. JUDD and CHARLES BLAKESLEE, same place. Application filed March 12, 1873.

A metallic plane having an arch to span the throat, which forms an abutment for the adjusting-screw to regulate the bit.

Claim.—The combination of the body *a*, having the cross-cut for the iron open at one side, and the arch a^2, spanning the cross-cut and forming a buttress for the adjusting-screw, and also a part of the handle, all of cast-metal, in one piece, substantially as described, and for the purposes set forth.

142,038.—Mode of Recovering and Regenerating Steam in Motive-Power Engines.—FRANÇOIS MAURICE HIPPOLYTE MOTARD, Paris, France. Application filed November 16, 1872.

The live steam admitted from the dome of the boiler passes in a jet beyond the mouth of the suction-pipe, by which the exhaust steam is drawn from the cylinder. The two kinds of steam combined pass through a second nozzle, perforated for the admission of water which mingles with them, and all pass through the expanding tube to the delivery-pipe, the latter being controlled by a check-valve.

Claim.—In combination with the chamber A, above the boiler and the dome C, the herein-described apparatus for producing the fluid current arranged between the said dome and chamber, the said apparatus consisting of the pipe *a*, nozzle *c*, smoking-tube *f*, taper tube *c*, pipe *h*, expanding tube *f*, pipe *l*, and check-valve *k*.

142,039.—Self-Reclining Chair.—GEORGES NIEDERSON, West Mount Vernon, N. Y. Application filed June 25, 1873.

The lower ends of the pivoted back are provided with pins or projections, on which rests the rear end of the seat, which is hinged at its front end.

Claim.—1. A chair provided with a pivoted back and a seat hinged at its front end, with the rear end of the seat resting loosely on the supports on the lower end of the back, substantially as and for the purpose set forth.

2. The pivoted chair-back G, provided with the legs *m m* and projecting pins *n n*, which constitute the supports for the hinged seat, as specified.

142,040.—Grain-Binder.—ALEXANDER PHILLIPPI, St. Louis, Mo. Application filed April 21, 1873.

The grain is carried by elevating-aprons to a receiver, whence it is dropped upon a sliding frame between compressing-fingers operated by the feet of the binder. The bands are formed of twine supplied from a spool, and are tied by hand.

Claim.—1. A sliding binding-frame, D, carrying finger devices *d* d^1, shafts d^2 d^3, pinions d^4, arm E, lever E^1, crank-shaft *e*, chain e^1, crib C, rope *f*, stirrup F, all combined to operate as and for the purpose set forth.

2. The frame D, fingers *d* d^1, shafts d^2 d^3, pinions d^4, arm E, lever E^1, rope *f*, pulley-shafts f^1 f^2, stirrups F F^1, when arranged to operate as and for the purpose set forth.

3. The combination of the crib C, chain e^1, crank-shaft *e*, lever E^1, arm E, pinions d^4, shafts d^2 d^3, fingers *d* d^1, rope *f*, pulley-shafts f^1 f^2, and stirrups F F^1, as and for the purpose set forth.

142,041.—Meter for Driving Machinery.—ALFRED E. PROCTOR, Boston, Mass., assignor to JOSEPH PROCTOR, same place. Application filed March 21, 1873.

Claim.—In combination with the interior frame or plates *a b*, and train of gears embraced therein, the outer plates *c d*, constructed and arranged substantially as and for the purposes set forth.

142,042.—Sewing-Machine.—WILLIAM A. RATER and WILLIAM S. LINCOLN, Boston, Mass. Application filed July 22, 1873.

Improvement on patent No. 137,007. The cutter is attached to a machine arranged to sew together the ends of pieces of cloth, and it is operated automatically to cut the thread connecting adjacent pieces.

Claim.—In a sewing-machine, the lever G, pivoted to the post H, and carrying the cutter F, all combined and operated in the manner and for the purpose specified.

142,043.—Button-Fastening.—CHARLES H. REID, Danbury, Conn. Application filed July 16, 1873.

Claim.—The cloth C, formed with looper-neck *a* and the points *b b*, disposed as described, to form a fastening for eye-shanked buttons.

142,044.—Machine for Forging Horseshoe-Nails.—FRANCIS HENRY RICHARDS, New Britain, Conn. Application filed September 14, 1872.

The four hammers work in pairs, and the distance of their stroke toward the common center is adjusted or controlled by means of their fulcrums, which are eccentric prolongations of shafts that project from each side of the plate, and are connected in such a manner that when one shaft is turned all are turned, and in the same direction and degree, thus throwing the hammer-faces toward or from the center, as required.

Claim.—1. In forging-machines, the lever K carrying the forging-tools at one end and at the other end connected to the operat-

ag mechanism, substantially as described, and intermediate or their length hung upon the fulcrums b, so constructed as to be changed, as herein shown, for the purpose specified.

2. The combination, substantially as described, with a forging-machine adapted for forging horseshoe nails from a continuous blank, of forging-tools formed as shown, so as to forge the shank of the nail to a taper and to taper off the nail-head at its striking end, as herein set forth.

3. The shafts L, forming the fulcrums for the forging-tools, when said shafts L are connected together by rods N for simultaneous operation, substantially as described.

4. The forging-tools connected through rods I to eccentrics J of shaft F, in combination with fulcrum-shafts L, connected together by rods N, substantially as and for the purpose specified.

142,045.—Centrifugal Clothes-Wringer.—HENRY ROSAMYER, Jr., Rochester, Pa. Application filed June 14, 1873.

A tub provided with an inner basket or receptacle for the clothes, to which motion is imparted by a shaft and crank, having on its end a friction-wheel formed to be brought in contact with the outer shaft of the basket, by which motion is given to it, and its tendency to regulate its motion by an upright having a spring attached to it and controlled by a thumb-screw. To the center of the bottom of the tub leaders or springs are attached, having on their ends caps to receive the bottom of the legs of the machine.

Claim.—The combination of the tub A, provided with feet B, strips C, and cups D, with the basket A', driving friction-wheels h and k, shaft l, flexible strip P, and set-screw s, all constructed, arranged, and operating substantially as herein described, and for the purpose set forth.

142,046.—Cooling and Purifying Air in Breweries, Packing-Houses, and other Buildings.—LOUIS SCHULER, Philadelphia, Pa. Application filed August 14, 1873.

By means of a fan or other pressure-blower air is forced into a tightly-closed box or chamber provided with partitions attached above and below alternately. From the cooling-chamber the air is distributed to different apartments to be cooled, and is drawn out of them by the blower and returned to the refrigerator to be again cooled and purified.

Claim.—1. The combination of a closed cooling-chamber, a pressure-blast apparatus, and a double system of flues or pipes provided with valves, so as to distribute cold air and return it to the blast apparatus to be recooled and purified, substantially as set forth.

2. The refrigerating or cooling chamber B, provided with partitions m m m and tight-fitting covers e e, substantially as described.

3. The cooling-chamber B, in combination with the reservoir I, as and for the purpose described.

4. The process herein described for cooling and purifying air in buildings and apartments, the same consisting in compressing it in contact with ice or a freezing-mixture, distributing and recollecting it by a system of flues and a pressure-blast apparatus, all substantially as and for the purpose set forth.

142,047.—Steering Apparatus.—HENRY F. SHAW, West Roxbury, Mass. Application filed March 19, 1873.

The alleged invention is for a combination of parts the construction of which allows the worms e and e' to slide toward or from each other by means of an elastic substance interposed between them, by which the rudder may be relieved from strain caused by the sudden shocks of a sea.

Claim.—In combination with the internal gear C, the spur-pinions H and H', the worm-wheels G and G', and the shaft E, the right and left hand worms e and e', constructed separately and fitted to slide toward or from each other upon said shaft in the direction of its length, and compelled to revolve therewith by means of a spline or its equivalent, and having the springs d, d', and d² arranged relatively to said worms and shaft, and to operate substantially as described, for the purpose specified.

142,048.—Cutter-Head.—ALBERT H. SHERMAN, Arcadia, N. Y. Application filed August 7, 1873.

A flexible straight-edged cutting-blade is fastened to the warped surface of a cylinder-head, thus giving a spiral-edged cutter.

Claim.—A flexible knife or cutter converted from a flexible flat knife by means of a spiral surface on the cutter-head and a corresponding surface on a cap or confining plate, substantially as described, for the object specified.

142,049.—Dumping-Wagon.—DANIEL D. SMITH, Louisville, Ky., assignor of one-half his right to CYRENE SMITH, same place. Application filed April 3, 1873.

The timbers under each side of the bed are made in two parts with hinge in the center. On the rear bounds are slides, which work on guides attached to or formed on the front timbers B B, by which means the bed is kept straight while being backed over the rollers on the hind axle.

Claim.—The combination of the timbers B B' hinged together, the front part B fastened to the fifth-wheel, the rear part B' secured to the box A, slides b b pivoted on the rear bounds E E, and the guides d d formed on or attached to the parts B B, all substantially as and for the purposes herein set forth.

142,050.—Carriage-Top.—JOHN H. SNYDER, Rockford, Ill., assignor to THOS. B. GAULT and HARRISON SMITH, same place. Application filed June 13, 1873.

To obviate sagging in the top-cover.

Claim.—The folding brace B B' B², in combination with the worm-screw D, arranged to operate substantially as described.

142,051.—Self-Venting Bung.—CHARLES F. SPENCER, Cleveland, Ohio. Application filed March 6, 1873.

A disk, made of steam-packing, to resist the action of steam when the barrels are cleaned is confined by a staple to the lower end of the passage through the bung. This disk is caused to fold on each side of the staple when the faucet is opened, whereby air is admitted to the barrel to aid the discharge of its contents.

Claim.—The bung A, having the central channel or passage C and recess D, in combination with the elastic steam-packing valve F, secured in position against its seat by the staple G, all constructed and arranged substantially as and for the purpose specified.

142,052.—Rolling-Mill.—WILLIAM H. STEPHENS, Evansville, and GEORGE B. F. COOPER, New Albany, Ind. Application filed January 30, 1873.

The improvement is in mechanism for turning the bar over after it has left one pair of rolls and before it has entered the succeeding pair,—namely, two rolls, B, to support the bar and carry it forward, and between them a hollow journaled guide, D, with a long upright arm, to the extremity of which is attached a chain that leads to a winding-drum, G, that is automatically put in rotation through a system of levers and a clutch by the bar itself as it slides upon and depresses an inclined table, d, in front of the next succeeding pair of rolls. Weighted levers return the parts to their normal position after the passage of each successive bar.

Claim.—1. The plate d, having an attached lever, I, and the clutch J, with their connecting devices, in combination with the winding-drum G, the chain b, the lever F, the pendent weight g and the weight or weighted lever K, essentially as and for the purposes herein set forth.

2. The combination, with the turn-over box D, its attached lever F, and the clutch J, of the lever L, the clutch p, the free or loose drum G, the weighted lever r, and the revolving shaft H, substantially as specified.

3. The positively-driven carrying-rollers B B, in combination with the turn-over box D and drawing or compression rolls A A' A², essentially as herein described.

142,053.—Mowing-Machine.—WILLIAM S. STONE, New Philadelphia, Ohio. Application filed January 3, 1873.

A grooved and flanged plate, fitted upon and strengthening a corner of the main frame, serves also as a means of connecting tongue therewith.

Claim.—The tongue-plate C, provided with the grooves b, d, and e, substantially as and for the purposes herein set forth.

142,054.—Manufacture of Hydraulic Hose.—EDWIN A. STREET, South Orange, N. J. Application filed June 18, 1873.

Improvement on patent No. 136,867; consists in vulcanising, instead of cementing, the welt-piece over the inside of the seam.

Claim.—A hose having the inner surface of the seam covered by a strip vulcanised thereto, substantially as described.

142,055.—Harrow.—WILLIAM D. SUMMERS, Hopkinsville, Ky. Application filed July 5, 1873.

Claim.—The within-described convertible implement, consisting of a permanent triangular harrow and a separable one of similar shape, whose side beams may be rigidly coupled to the side beams of the permanent one, and maintained in their proper position by the removable brace O, the handles of the permanent harrow serving for the enlarged triangular-shaped harrow thus formed, substantially as shown and described.

142,056.—Tile Roofing.—DANIEL SWAIN, Dover, N. H. Application filed April 19, 1873.

The tile, formed of sand and cement, is flat upon its under side and trough-shaped above. The joints are covered with inverted semi-conical tiles in the ordinary manner, and formed of the same material. The ridge is surmounted with a tile of double slope, formed to fit the part protected.

Claim.—1. In a roofing, the plates A A, molded from sand and cement, and formed with flat bases and concave upper surfaces, as shown, in combination with the semicircular shields D, all applied substantially as herein described, and for the purpose specified.

2. The angular roofing-plates E, with their angular covering-tubes F, substantially as described.

142,057.—Bell-Pull.—AMOS L. SWAN, Cherry Valley, N. Y. Application filed May 1, 1873.

A swivel-jointed door-bell pull adjustably connected to the mortise-crank.

Claim.—The combination of the swivel-jointed bell-pull, the sliding adjustable block H with set-screw P, the connecting-link N, and crank-lever O, operating substantially as specified.

142,058.—Market-Wagon.—JOHN TAMKINS, Sr., Conklin, N. Y. Application filed June 5, 1873.

The top is removable, and designed for market-wagons to exclude dust, flies, sun-rays, &c.

Claim.—A wagon-top consisting of the cover, having the front and rear drop-curtains as side drops, the bows of one of which are slanted to support the back of the seat, the side-boards having water-tables, seat-supports, and supporting-arms, the swinging end-gate having a jointed support, and the partition to close the opening under the seat, the whole combined and adapted to be applied to a wagon-body having an end-gate and folding step, or to an ordinary wagon-body, all substantially as set forth.

142,059.—Car-Coupling.—JAMES TEMPLE, Moorefield, Pa., assignor of one-half his right to DANIEL J. ROTE, same place. Application filed June 25, 1873.

Spring-gates support the coupling-pin and guide the coupling-link in its entrance into the draw-head, the height at which the link shall be held being regulated by a spring-plate in the rear part of the draw-head.

Claim.—The combination of the draw-head A A', the spring-gates E, which operate as a support for the coupling-link D and to eject it from the draw-head, the coupling-pin F, guiding-yoke F', and the angular guard H, the whole arranged to operate as set forth.

142,060.—Condenser.—HORACE A. TOWNE, Hannibal, Mo. Application filed June 24, 1873.

A flat pipe is connected with the exhaust-pipe of an engine, and wound spirally around a central axis or air-pipe, which communicates with the air at one end and with a reservoir for holding the condensed water at the other. A valve is provided in the central pipe to regulate the admission of air to said reservoir.

Claim.—1. A condenser composed of a flat pipe coiled spirally around a vertical axis within a water-reservoir, substantially as and for the purpose specified.

2. In combination with the steam-pipe of a condenser, a vertical air-pipe, connected therewith at its lower end, and uninclosed at the upper end, substantially as and for the purpose shown.

3. In combination with the air-pipe D, communicating with and extending upward from the condenser-pipe E, the valve I, pivoted within said air-pipe, substantially as and for the purpose set forth.

4. The relative arrangement of the condenser A and E, the reservoir C, and the air-pipe D, substantially as and for the purpose shown and described.

142,061.—Plowman's Boot.—AARON G. WALKER and SAMUEL BROWN, Worcester, Mass. Application filed June 26, 1873.

The parts forming the upper of a plowman's boot are cut in the form shown, so that when united the boot will be wide at the ankle-joint and narrow at the top of the leg.

Claim.—A plowman's boot, the edges d, e, p, k, m, and n of the parts A, B, and C of which are cut in the peculiar form and stitched together, as shown and described, and for the purposes set forth.

142,062.—Railroad-Car.—JOHN C. WANDS, Nashville, Tenn. Application filed April 22, 1873.

To prevent falling between the cars in passing from the top of one to the top of another as they stand together.

Claim.—The foot-piece B and the rail D, raised on a bracket, C e e, applied together upon the top of cars, as and for the purpose described.

142,063.—Removing Vegetable Fiber from Felted Fabrics.—JOHN T. WARING, Yonkers, N. Y. Application filed April 9, 1873.

Subjects the fabric to a bath of sulphuric acid of from 6° to 12° Baumé, subsequently neutralizing the acid remaining in the fabric by a suitable alkali.

Claim.—The process, substantially as herein described, of treating felted or woven woolen cloths after the same have been formed or hardened, and before dyeing, at any stage in the process of felting or fulling, or between any two stages thereof, or after the felting or fulling is completed, by exposing the same to an acid solution and afterward removing the acid from the fabric, for the purpose or purposes herein set forth.

142,064.—Dyeing Felt Hats and Caps.—JOHN T. WARING, Yonkers, N. Y. Application filed March 15, 1873.

A hat-body, made of vegetable and animal fibers mixed, is subjected to an acid bath to neutralize the vegetable matter, so that all its fibers will dye an even color.

Claim.—The process, substantially as herein described, of treating the hat or cap body after the same has been formed, and before dyeing, at any stage in the process of felting, or between any two stages thereof, or after the felting is completed, by exposing the same to an acid solution, and afterward removing the acid from said body, for the purpose or purposes herein set forth.

142,065.—Fire-Proof Cotton-Lint Room.—RUFUS R. WARREN, Raleigh, N. Y. Application filed July 14, 1873.

The cotton passing through the gin is delivered into a lint-room, the ceiling of which is suspended so that when the cotton takes fire the ceiling can be let down by a windlass to extinguish the fire.

Claim.—1. A lint-room having a ceiling or cover arranged so that it may be lowered at will and raised again, substantially as described, and for the purpose specified.

2. In an apparatus for smothering fires in lint-rooms, the combination of the rods b b with the cross-bars or plate c c, movable cover B, windlass E, and rope D, substantially as shown and described, for the purpose specified.

142,066.—Game-Board.—GEORGE WENTZ, Cincinnati, Ohio. Application filed June 16, 1873.

A journaled disk, provided with a series of numbers on its face, is caused to revolve beneath a pointer or other fixed indicator, by means of a vibrating lever carrying a pivoted toothed rack or segment which engages with a pinion on the dial-shaft, said lever being vibrated at the will of the operator by the inflation of a bellows supplied with air from a hollow rubber ball whenever the same is compressed.

Claim.—1. In combination with the pinion c' of the disk C, the toothed segment E, pivoted upon and working with the pivoted lever D, substantially as and for the purpose specified.

2. The disk C, pinion c', lever D, segment E, springs d' and F, detent G, bellows H, tube I, hollow flexible ball K, and rod L, when constructed and combined to operate substantially as and for the purpose shown.

3. The hereinbefore-described device as a whole, when its several parts are constructed and combined to operate substantially as and for the purpose set forth.

142,067.—Lamp-Extinguisher.—FRANKLIN C. WIREMAN, New York, N. Y. Application filed June 25, 1873.

A float rests on the fuel of the lamp and descends as consumption proceeds. To the upright stem of the float a vertical rod is adjusted. When the descending float and rod have reached any point determined by their adjustment the rod releases a trigger and permits a spring to throw up a short tube inclosing the wick-tube until a cap worked by another spring may close over the flame.

Claim.—1. The self-extinguishing lamp, containing the float G, slide I, trigger L, and arm h of the extinguishing attachment, all parts being arranged substantially as herein shown and described.

2. The slide I, provided with a notch or bend, p, for alternately holding and releasing the trigger L, and made adjustable on the stem H of the float G, substantially as described.

3. The vessel A, connected by the tube t with the vessel F, the latter being arranged to contain, and combined with, the float G for extinguishing the light in the burner that is supported on A, substantially as described.

4. The combination of a wick-tube slide or extinguisher with the spring g, pinion h, and spindle d, whereby the extinguisher is made self-acting, as set forth.

142,068.—Furnace-Grate.—JAMES WITHINGTON, Bloomsburg, Pa. Application filed March 29, 1873.

The grate-blocks are placed on bars, the lower ends being connected by a reach-rod, by means of which they are vibrated.

Claim.—The triangular grate-block C, pivoted at about its middle portion, and having the convex upper surface or edge c, acute angle e, and the concave converging side edges d terminating at their lower ends, substantially as shown and described.

142,069.—Portable Stock-Shed.—DANIEL H. YERKES, Danville, Ky. Application filed March 21, 1873.

The roof and sides are removable, the rack adjustable, and a front apron also adjustable.

Claim.—A portable stock-shed, composed of the back sections A, top sections C, posts D, adjustable rack E, and adjustable apron G, all constructed, arranged, and combined together substantially in the manner and for the purposes herein set forth.

142,070.—Die for Forming Hammers.—JONATHAN YERKES, Philadelphia, Pa., assignor to YERKES & PLUMB, same place. Application filed July 16, 1873.

Claim.—The dies A A for the manufacture of hammers, constructed and operating as herein set forth.

REISSUE PATENTS.

5,534.—Hanging Lamp.—GEORGE BOHNER, Chicago, Ill.—Patent No. 126,254, dated April 30, 1872. Application filed June 30, 1873.

A lamp is so suspended that the weight of the shade balances it, and it may be raised or lowered by lowering or lifting the shade.

Claim.—1. The supporting-ring B, provided with the guide-bars C and guide-eyes c c, or tube C', as and for the purpose set forth.

2. The shade A, ring B, guide-bar C, with their guide-eyes c c or equivalent, the bar D, sheaves b, socket F, lamp G, rods H, and chains I when constructed, arranged, and operating as and for the purposes specified.

5,535.—Molding-Machine.—HEZEKIAH B. SMITH, Smithville, N. J.—Patent No. 99,894, dated July 6, 1858; extended seven years. Application filed June 7, 1873.

The revolving cutter is provided with an adjustable counterbalance, and the vertical adjustment of the table is controlled by a single screw.

Claim.—1. The combination of the cutter-head, the adjustable cutter, the screw counter-balance, and the set-screw for securing the same in position, substantially as set forth.

2. In a molding-machine, the combination of a vertically-moving feed-table or platen, L, the screw I for raising and lowering the table, acting thereon at or near its center, and guides or ways Q Q upon the frame of the machine, upon which the table moves, these members being combined for joint operation so that the table shall maintain a horizontal position under all circumstances, substantially as set forth.

5,536.—Sawing-Machine for Edging Lumber.—ESAU TANEANT, Muskegon, Mich.—Patent No. 66,013, dated August 20, 1867. Application filed August 7, 1873.

The frame of the machine carries two spiked feed-rolls placed in the front and rear of the saws, which act as guides, causing the lumber to pass through the machine in a direct longitudinal line, it being retained in contact with the feed-rolls by a self-adjusting pressure-roll.

Claim.—The adjustable pressure-roll E, in combination with the toothed guide-rolls D D and circular saws C, all being constructed and arranged substantially as and for the purposes herein set forth.

5,537.—Tea-Kettle Spout.—JAMES ASH, Sterling, Ill.—Patent No. 123,215, dated January 30, 1872. Application filed April 26, 1873.

The blank is made of one piece of sheet metal, cut and bent to form a spout with a single seam, and united to the body of the kettle by overlap seams.

Claim.—1. A sheet-metal kettle-spout blank, consisting of the shoulders *a' a'* and wings *b b*, and having an incision cut in the body thereof at the junction of said shoulders and wings, substantially as shown and described.

2. A sheet-metal kettle-spout consisting of the shoulders *a' a'*, united together as shown and described, and the wings *b b* formed to correspond to the circumference of the kettle, substantially as specified.

3. A sheet-metal kettle having its spout provided with wings *b*, bent outward from the angle, and secured to the body by seams along the outer edge of the wings, as specified.

5,538.—Harvester.—ORSON BILLINGS, Elyria, Ohio.—Patent No. 33,691, dated November 12, 1861. Application filed May 7, 1873.

The finger-bar is pivoted to lateral braces, the front of which is independently hinged and is strengthened by a longitudinal brace, to which the hand-lever is attached, for the purpose of changing the inclination of the points of the cutters.

Claim.—1. The front end of the shoe K of the finger-bar hinged to the adjustable brace-bar M, and combined with the pendent P and lever Q, as described, for the purpose of regulating the height of the front ends of the fingers *c*, as set forth.

2. A lateral brace jointed to and supporting the rear end of the shoe, combined with an independently-jointed lateral brace-bar supporting said shoe at its front end, so as to permit the points of the fingers to move above or below their plane of advance, as described.

3. A lateral brace jointed to and supporting the rear end of the shoe, combined with an independent lateral brace-bar jointed to the main frame and to the front end of said shoe, and a longitudinal brace to support said independent brace against longitudinal strains, substantially for the purpose set forth.

4. The arrangement of the spring-lever R, relatively with the lever S and finger-bar L, as shown and described, whereby the weight of the outer part of the finger-bar and sickle is counterbalanced, or nearly so, and whereby said finger-bar and sickle may be raised bodily, when required, in order to pass over obstructions.

5. The arrangement of the crank-axle E of the track-wheel C, segment G, and spring H, substantially as and for the purpose specified.

5,539.—Machine for Punching the Lifts of Boots and Shoes.—GEORGE W. ELLIS, Lynn, Mass., assignor, by mesne assignments, to JAMES W. BROOKS, trustee. Patent No. 41,037, dated December 22, 1863; reissue No. 5,094, dated August 6, 1872. Application filed August 11, 1873.

Claim.—1. In combination with mechanism for securing heel-lifts together, or for punching in assembled heel-lifts nail-receiving holes, mechanism for forming upon the heel-blank a gage guide or index for determining the position of the blank in a machine for driving the nails or trimming the curved edge of the heel.

2. A heel-blank having a gage register or guide for positioning the blank in a heel nailing or trimming machine, substantially as described.

3. In a machine for uniting or punching an assemblage of heel-lifts, a guide or a flange, E, for placing the lifts, substantially as shown and described.

4. Awls or punches operating to form the nail-holes, when acting in unison with drivers for inserting the nails to unite the lifts, substantially as described.

5. In combination with mechanism, substantially as described, for punching in assembled heel-lifts nail-receiving holes, a receptacle for receiving the assembled lifts, which acts to determine the position of said lifts in relation to each other.

6. In combination with mechanism, substantially as described, for punching in assembled heel-lifts nail-receiving holes, a receptacle for receiving said lifts, which acts to determine their position in relation to the punching mechanism.

7. In a machine for pricking heel and shoe heels, the combination of a tapering receptacle to contain the assembled lifts and a set of awls or punches operating through a series of holes in the plate that forms the smaller end of the receptacle, so as to prick the heel from the bottom thereof toward the top.

8. In combination with a guide for placing the heel or blank, a cutter, G, for cutting the breast or front of the heel, substantially as described.

5,540.—Anchor for Securing Cores.—ZADOCK ELLIS, Philadelphia, Pa. Patent No. 98,676, dated January 11, 1870. Application filed June 23, 1873.

The anchor is driven through the various layers directly against the spindle of the core, whereby the core is firmly held in place.

Claim.—The anchor A, constructed substantially as described, and capable of being driven through the various layers against the barrel of the core, so as to hold down the core, in the manner set forth.

5,541.—Dumping-Car.—JOHN HUGHES, New Berne, N. C. Patent No. 140,779, dated July 15, 1873. Application filed August 9, 1873.

The body is supported upon rollers, which travel upon inclined ways secured on the ends of the truck. A guard attached to the way prevents the car-body from falling off the truck.

Claim.—1. The truck C D, having the horizontal way *d*, with ends inclined downward, upon which the rollers travel which support the body, in combination with a guard or other device for holding the body of the truck, substantially as set forth.

2. The car A, having the wheels E secured to each end, in combination with the truck C D, having the ways *d* with inclined ends formed upon its top, and guard L, substantially as shown and described.

3. The castings G, arranged around the axles, substantially as specified.

4. In a dumping-car, the slotted brake H, in combination with the lever J, arranged so as to prevent lateral play of the car, substantially as shown.

5,542.—Seed-Planter.—BENJAMIN KUHNS, Dayton, Ohio. Patent No. 85,455, dated December 29, 1868. Application filed June 20, 1873.

The seed-cups are made spiral for half their length, and straight the other half. The gears for changing the rate of feed are cone-pinions cast in one piece, and are adjusted to the leading wheel by a shifting-lever.

Claim.—1. The rollers D, constructed with pockets formed by fixed heads *d*², and intermediate partitions formed by ribs, part spiral and part straight, substantially as set forth.

2. In a grain-drill, in combination with the shaft D', carrying the seed-distributing wheels and a shaft, B', parallel thereto, and rotated by one of the carrying-wheels, intermediate mechanism adjustable without removal from the machine for communicating a variable movement to the grain-distributing wheels, while the speed at which the machine is moved forward is unchanged.

3. In combination with the spur-wheel on the hub or axle and the spur-wheel on the seed-roller, an intermediate set of pinions concentric with one another, so as to form a cone spur-pinion, so arranged as to give a variable speed by shifting the wheels in relation to one another, substantially as set forth.

4. The combination of the cone-wheel, the oscillating arm, and sliding pinion, arranged, in relation to one another, substantially as set forth.

5. The combination of the shifting-lever H, the sliding pinion G, and cone-pinion F with the feed mechanism of a grain-drill, substantially as set forth.

5,543.—Pump-Rod Attachment.—HENRY H. LOCKE, Pleasantville, Pa., assignor to DOUGLAS BLY, Rochester, N. Y. Patent No. 103,632, dated May 31, 1870; reissue No. 4,662, dated December 26, 1871. Application filed August 9, 1873.

The cross-head, which forms the pivotal bearing, and the clamping-head are connected by an intermediate tubular piece. The clamping-head is formed with a shouldered socket for the reception of the clamping-bolt. The bolt has a slot through which the pump-rod passes, and a screw-thread on one end for the tightening-nut.

Claim.—1. A pump-rod attachment consisting of a cross-head, A, which forms the pivotal bearing, and a clamping-head, D, which forms the point of attachment for the pump-rod, when said parts are distinct from each other, and are connected by an intermediate part, E.

2. The clamping-bolt C, having a transverse opening or passage, *c*, in combination with a clamping-head, D, for the purpose of allowing the adjustment and producing the clamping of a pump-rod.

5,544.—Water-Tank for Railways.—JOHN MORTON, Cincinnati, Ohio, assignor, by mesne assignments, to THE MCGOWAN PUMP COMPANY. Patent No. 62,416, dated April 2, 1867; reissue No. 4,543, dated September 5, 1871.—Case A. Application filed March 8, 1873.

The delivery-pipe is both hinged and swiveled to the supply-pipe, so that the former may have a vertical movement as well as a movement from side to side.

Claim.—1. In a water-tank for railways, a supply and delivery pipe combined by means of a swivel-bearing and a hinged or jointed connection, by means of which said delivery-pipe may pass from a vertical to a horizontal position, and may be moved laterally in a horizontal plane without changing the relative positions of its inner end and the contiguous or bearing end of said supply-pipe, substantially as and for the purpose specified.

2. In combination with the supply and delivery pipes C and G, respectively, the stud or swivel bearing E, and hinged or jointed connection F, when arranged with their axes at right angles with each other, substantially as and for the purpose shown.

3. In a railway water-tank, a fixed supply and delivery pipe with its hinged swiveled connection, having the contiguous ends of their elbows so constructed that when said pipes are in a horizontal position their said ends fit together, to one containing the other, substantially as and for the purposes set forth.

5,545.—Water-Tank for Railways.—JOHN MORTON, Cincinnati, Ohio, assignor, by mesne assignments, to THE MCGOWAN PUMP COMPANY. Patent No. 63,418, dated April 2, 1867; reissue No. 4,542, dated September 5, 1871.—Case C. Application filed March 8, 1873.

To the front end of the supply-pipe is a hinged a delivery-pipe made in two sections, as at b, slide one over the other. A rod attached to one section passes through an eye attached to the other, the end of the rod being turned up to prevent the displacement of the outer section.

Claim.—In a water-tank, a delivery-pipe made longitudinally extensible, substantially as and for the purpose specified.

5,546.—King-Bolt for Railway-Car Trucks.—SAMUEL W. MURRAY and BENJAMIN P. LAMARSH, Milton, Pa. Patent No. 114,028, dated April 25, 1871. Application filed June 16, 1873.

A headless king-bolt is supported upon a bearing beneath the bolster. By this arrangement the car-body may be raised from the truck without disturbing the king-bolt.

Claim.—1. The king-bolt C, formed without a collar or head and supported at its lower end upon a seat secured beneath the truck-bolster, for connecting together the bolster of the car-body and the truck, substantially as described, for the purpose specified.

2. The truck and body bolster A B, having bearing-plates A' B', in combination with the headless king-bolt C, supported upon a bearing secured beneath the bolster A, substantially as described.

3. The bolster A, having a supporting-bearing, D, in combination with the headless king-bolt C and car-body bolster B, substantially as described.

4. The saddle D, forming a truss-bridge for the braces E, and having a central opening, *i*, for the passage of the king-bolt, and constructed with a stirrup, K, for the latter to rest upon, substantially as shown and described, and for the purpose set forth.

5,547.—Cultivator.—ARTHUR C. SMITH, Fayetteville, N. C. Patent No. 120,113, dated October 17, 1871. Application filed July 12, 1873.

A cotton-scraper combined with a cultivator.

Claim.—1. In combination with the plow-beams D D and their handles E' E', connected by rod I with sleeve *i*, the diagonal braces A^5 A^5, passing from the rear ends of the plow-beams to and through the handle of the plow on the other side, and adjusted by nuts A^5 A^6, substantially as and for the purposes herein set forth.

2. The combination of the land-marker L' adapted to slide along the pivoted arm L, and rendered adjustable by means of the arms N N and adjusting-plate *n*, with the stirrup K, cord *m*, and post L', all arranged and operating as described.

5,548.—Machine for Making Match-Sticks.—FREDERICK ZAHN, Philadelphia, Pa. Patent No. 136,893, dated March 18, 1873. Application filed May 15, 1873.

The sticks after being cut drop into a winnower.

Claim.—1. The transverse plate or butting-block H and its cross-bar I, in combination with the match-stick cutters G, substantially for the purpose shown and described.

2. The winnower J, in connection with a match-stick machine, for the purpose shown and described.

INDEX OF INVENTIONS PATENTED AUGUST 19, 1873.

	Class No.	Whole No.
Air, apparatus for carbureting, E. F. Van Heuten	37	141,902
Air in breweries, packing harness, &c., cooling and purifying, L. Schulze	35	142,042
Alarm, till, G. L. Geiger	34	142,012
Anchor for securing cores, Z. Ellis, (reissue)	33	5,540
Animal matter, drying and disintegrating, C. C. Coe	96	141,852
Annunciator, C. H. Greenleaf	34	141,897
Annunciator, electrical, A. Storer	34	141,893
Auger, earth, W. H. Salyer	30	141,898
Bale tie, cotton, F. Cook	7	142,021
Baling hay, &c., wire tie for, G. L. Leaghland	7	141,879
Ballot box, J. Gamber	142	141,873
Bear on draft, apparatus for preserving, J. W. Moore	19	141,944
Bell pull, A. L. Swan	34	142,027
Bellows, W. Pilcher	12	141,899
Boats, sectional folding frame for, W. M. Decker	13	141,909
Bolt for safe doors, &c., W. Hall	32	142,074
Boot heel screw, W. Ackermann	16	141,889
Boot, plowman's, Walker and Brown	16	142,051
Boot and shoe sole edges, machine for burnishing, J. and J. Beasley, Jr	16	141,894
Boot and shoe sole edges, machinery for burnishing, J. and J. Beasley, Jr	16	141,895
Boot and shoe sole edges, machinery for finishing, C. M. Chase	16	141,897
Boot and shoe sole edges, machinery for trimming, R. C. Lambert	16	142,030
Boots and shoes, machine for punching the lifts of, G. W. Ellis, (reissue)	16	5,539
Borer for sampling cotton, E. A. Clark	49	141,908
Boring machine, earth, J. Burns	31	142,016
Bottle stopper, L. Rhoades	1	141,939
Braking, lowering and hoisting apparatus, and, W. Hart	19	142,017
Brick machine, W. Cole	29	141,910
Bridge, ferry, C. J. Atkins	20	141,911
Bung, self-venting, C. F. Spencer	49	142,031
Button fastening, C. H. Reid	14	142,020
Can for oil, &c., J. R. Cole	138	142,029
Can, preserve, J. K. Chace	53	141,894
Cane juice with sulphur fumes, apparatus for treating, W. G. Billin	38	141,914
Car coupling, D. C. Cameron	139	141,924
Car coupling, F. J. Seybold	139	141,938
Car coupling, J. Temple	139	142,033
Car, dumping, J. Hughes	139	140,779
Car, dumping, J. Hughes, (reissue)	139	5,541
Car lamp, J. E. Cross	69	141,899
Car railroad, J. C. Wands	139	142,036
Car truck, railroad, G. Dixon	139	141,900
Car trucks, king bolt for railroad, Murray and Lamarsh, (reissue)	139	5,546
Carriage top, J. H. Snyder	51	142,028
Chair, self-reclining, G. Wiederkern	68	142,039
Chair and basket splints, machine for making, J. E. Pee	146	141,949
Chuck, T. E. Almond	139	141,779
Churn dasher, reciprocating, T. Earle	45	142,027
Clamp, L. Peaky	80	142,040
Clothes line holder, W. Cooke	91	141,901
Clothes wringer, centrifugal, B. Baumayer, Jr	91	142,005
Condenser, H. A. Towne	139	142,035
Cotton flat rams, fire proof, R. R. Warren	41	142,037
Crib, W. B. Carpenter	68	141,910
Crimping clamp, P. A. Schollhorn	16	141,950
Cultivator, A. C. Smith, (reissue)	62	5,547
Cultivator, corn, H. G. Skinner	43	141,903
Cutter head, A. H. Simpson	173	142,026
Digger, potato, S. W. Tyler	114	141,936
Door closing apparatus, H. F. Shaw	84	141,904
Drawers, man's, E. L. Chase	36	142,009
Dressmaker's marking and cutting gage, M. Blanvalt	36	141,949
Eaves trough fastening, W. H. Reasoner	139	142,024
Engine, portable steam, Schleicher and Mellmann	94	141,923
Engine, reversible rotary steam, O. Adams	139	141,909
Engines, reservoiring and regenerating steam in motive power, F. M. H. Mercier	139	142,022
Equalizer, three horse, T. Hartley	31	141,875
Fertilizer, A. F. Andrews	98	141,948
Fiber from felted fabrics, removing vegetable, J. T. Waring	35	142,038
Fire place, W. Lewis	134	141,927
Firkin, C. Alvord	45	141,947
Fluting machine, E. M. Doty	36	141,953
Fork, horse hay, S. B. Bowen	77	141,955
Furnace, boiler, S. A. Ford	149	141,870
Furnace for smelting ores, E. Balbach, Jr	65	141,918
Furnace grate, W. J. Le Van	149	141,928
Furnace grate, C. Withington	149	142,042
Furnace grate bar, A. Rawson	149	141,930
Furnace, soldering, W. S. Potwin	138	141,929
Gage, measuring, A. Bunnes	138	141,915
Game board, G. Weale	142	142,035
Gas apparatus for railway cars, J. B. Olney	69	141,931 = 1
Gas machine, air, P. Werni	2	141,972 = 4
Gas machines, &c., adjustable pulley for, E. F. Van Heuten	37	141,967 = 7
Gate, automatic, J. S. Futi	88	141,925
Gate, automatic, J. R. Strong	88	141,935
Generator, steam, H. P. Wright	149	142,043
Glass furnace, W. Leighton, Jr	66	142,026
Grain binder, A. Phillippi	78	142,023
Grain stirring apparatus, Fourth and Pitts	87	142,032
Harness, die for forming, J. Yerkes	69	142,070
Harness comb rod, A. Gilliam	73	142,013
Harrow, W. D. Summers	73	142,033
Harvester, O. Billings, (reissue)	74	5,538
Harvester, J. H. Edward	74	142,003
Harvester, J. H. Edward	74	142,004
Harvester, J. H. Edward	74	142,005
Harvester, J. H. Edward	74	142,006
Harvester, J. H. Edward	74	142,007
Harvester, J. H. Edward	74	142,008
Harvester, S. Lane	74	142,025
Harvester, W. Wallace	74	141,970
Harvester wheel and axle, B. G. Turner	74	142,034
Hats and caps, dyeing felt, J. T. Waring	76	142,044
Hay tedder, T. J. and G. M. Clark	77	141,869
Heater, water, I. S. Mead	154	142,028
Hinge, E. Bollman	81	141,950
Hook, coat, R. Mansfield	139	142,020
Hook, coat, R. Whistler	139	142,045
Hook, fish, B. F. Allen	143	141,910
Horses from cribbing, preventing, A. Sellwell	144	141,933
Horseshoe nails, machine for forging, F. H. Richards	69	142,044
Hose, apparatus for oiling, testing, and washing fire engine, P. Noyes	61	141,926
Hose, manufacture of hydraulic, E. A. Street	61	142,034

	Class No.	Whole No.
Ice cream, jellies, &c., mold for, R. M. May	56	141,898
Jack, hoisting, J. H. Churchill	70	141,919
Kettle spout, tea, J. Ash, (reissue)	136	5,537
Lamp, J. Kirby, Jr.	90	141,923
Lamp, advertising, F. R. Warner	54	141,871
Lamp extinguisher, F. C. Wiseman	90	142,067
Lamp, hanging, G. Bohmer, (reissue)	90	5,534
Land marker, G. W. Bottle	133	141,913
Latch, reversible knob, C. Moody	93	141,893
Lathe, turning, J. P. Luther	173	141,940
Lathes, centering device for, H. Gray	100	142,014
Lathing, metallic, T. O'Callahan	4	141,945
Leather work, seam for, C. Knowlton	16	142,022
Level, pendulum, A. C. L. Delcarte	137	142,025
Lithographic stone, Meeve and Bagger	54	141,863
Lock, combination, A. D. Hoffman	93	141,876
Log turner, C. Van Vleck	130	141,949
Loom, J. Strober	95	141,907
Lumber, machine for edging, W. G. Caldwell	130	141,898
Mallet, A. Holbrook	39	141,920
Match sticks, machine for making, F. Zeise	174	5,548
Metal compound, P. H. Steenbergen	96	141,961
Metal bars, machine for bending and twisting, S. Holmes	135	142,018
Mills, preserving, L. P. Kirchhofer	58	141,878
Mill, rolling, Stephens and Cooper	135	142,038
Millstones, machine for dressing, W. Farrow	153	142,009
Millstones, machine for dressing, L. Randolph	153	141,949
Molding machine, H. B. Smith, (reissue)	173	5,535
Mortar mixer, C. Pierce	30	141,947
Motor for driving machinery, A. M. Proctor	67	142,041
Mowing machine, W. S. Stone	74	142,053
Nut and bolt fastening, Antill and Sloan	14	141,940
Nut and bolt fastening, P. F. King	14	141,877
Oven, reel for, A. Crumble	6	142,003
Paint compound, F. A. Stall	35	141,897
Panels, machine for raising, F. D. Green	173	142,015
Pantry, J. S. Colby	90	141,854
Pantaloon stretcher, L. Kaltenbacher	38	142,025
Paper bags, machine for making, G. Dunham	109	141,882
Paper tubes, machine for making, T. J. and J. T. Jones	109	141,933
Pipe coupling, L. T. Scofield	167	141,893
Pitman, O. F. Thomas	67	141,902
Plane, match, C. G. Miller	39	142,037
Planter, seed, B. Kuhns, (reissue)	133	5,542
Plow, J. Marr	114	141,881
Plow, P. H. Starks	114	141,900
Plow coupling, T. L. Thresher	114	141,904
Plow, wheel, L. W. Richardson	114	141,951
Power apparatus, foot, E. and H. Harding	67	141,926
Press, steam cloth, Dennis and Weston	37	142,005
Presses, mold or box for brick, J. McKenna	30	141,949
Propeller, screw, D. Freed	139	141,877
Pump, T. C. H. Kraus	118	142,028
Pump piston, W. C. Culbertson	118	142,004
Pump rod attachment, H. H. Locke, (reissue)	118	5,543
Purifier, middlings, Hunter and Whitmore	57	142,012
Purifier, middlings, Hunter and Whitmore	57	142,024
Railroad rail, W. W. Alter	139	141,979
Railroad rail joint, J. L. Hudson	139	142,030
Railroad rail joint, W. D. Lindsley	139	142,039
Railroad water tank, J. Morton, (case A.) (reissue)	118	5,544
Railroad water tank, J. Morton, (case C.) (reissue)	119	5,545
Rake, horse hay, Loftin and Allen	77	142,031
Rake, horse hay, B. Morse	77	141,864
Reeds, construction of, E. Chadwick	51	141,905
Reading, sheet metal, Hegeler and Matthiessen	136	141,939
Roofing, tile, D. Swain	136	142,056
Rack holder, T. Weaver	94	141,964
Saw, Luppert and St. Pierre	131	141,859
Saw hanging, J. B. Merritt	130	142,036
Saw teeth, setting, G. W. Bugbee	131	141,900
Sawing machine, A. Xander	134	141,975
Sawing machine, W. H. Shugart	130	141,959
Sawing machine for edging lumber, E. Tarrant, (reissue)	130	5,536
Screw driver, J. H. Davis	39	141,857
Sewing machine, H. A. Blanchard	134	141,967
Sewing machine, B. A. Gooden	134	142,013
Sewing machine, Boyer and Lincoln	134	142,042
Sewing machine bobbin holder, Barnes and Mesick	134	141,931
Sewing machine hemmer, F. Caswell	134	141,892
Sewing machine motor, B. C. Chambers	134	141,896
Sewing machine shuttle, J. B. Secor	134	141,894
Sewing machine table, J. Benner	134	141,965
Sewing machine table, E. A. Jeffery	134	142,024
Shaft bearing, Bird and Sellenberger	87	141,988
Shingle bands, machine for notching, C. E. McGregory	173	142,033
Shrinking metal bands, apparatus for, W. Carr	66	141,891
Sieve, grain, L. D. Carpenter	159	141,917
Smoothing iron, A. S. Mann	91	141,939
Spark arrester, W. D. Farrand	94	141,869
Spoke machine, A. McNeile	31	142,034
Steering apparatus, C. A. Seavey	137	141,896
Steering apparatus, H. F. Shaw	137	142,047
Stock shed, portable, D. H. Yeiser	144	142,069
Stone, machine for cutting, rubbing, and drilling, P. H. Hopkins	134	142,019
Stoves and furnaces, grate for, J. J. Richardson	154	141,951
Stove, J. Greeley	38	141,926
Table, extension, C. Rieger	62	141,954
Table leaf support, E. W. Perrin	62	141,877
Telegraph sounder, H. Van Hoevenbergh	59	141,909
Thill coupling, clamp for, M. Taylor	31	141,901
Threshing machines, straw conveyer for, C. D. Deakin	159	141,856
Tobacco, hook for hanging, H. M. Strong	109	141,899
Tool receptacle, L. L. Lamb	109	141,934
Trap, fly, J. E. Johnson	63	141,931
Trap, steam, Perkins, Moulton, and Sawyer	159	141,948
Umbrella, J. McAuliffe	165	141,941
Valve, automatic regulating, G. L. Kitson	159	142,027
Valve and cut off, rotary, W. S. Burtis	159	141,988
Vehicle, R. D. Weller	31	141,905
Vehicle pole, H. Schmidt	31	141,957
Vehicle side bar, F. I. Flowers	34	142,011
Veneer keg, G. W. Swan	69	141,963
Voting apparatus, legislative, J. A. Criswell	42	142,049
Wagon, dumping, D. D. Smith	91	142,059
Wagon, market, J. Tumkins, Sr.	31	142,058
Washing machine, B. W. Bowen	91	141,870
Washing machine, D. B. Dorsey	91	141,884
Watch case centers, manufacture of, J. C. Dueber	38	141,761
Whip socket fastener, W. W. Richardson	31	141,952
Whip socket fastener, W. W. Richardson	31	141,953
Wire pointing machine, F. H. Alban	170	141,977
Wire to hammer dies, machine for feeding, W. H. Dayton	164	141,923
Wood grinding machine for making pulp, S. B. Zimmer	108	141,976
Wool, machine for pulling, J. Watteau	28	141,972

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED AUGUST 19, 1873.

Ackerman, W., Boot heel screw 141,908
Adams, O., Reversible rotary steam engine 141,908
Aiken, F. H., Wire pointing machine 141,977
Allen and Lufkin 142,031
Allen, B. F., Fish hook 141,910
Allison, J. F., assignee 141,948
Almond, T. B., Chuck 141,978
Alter, W. W., Railway rail 141,979
Alvord, C., Firkin 141,847
Andrews, A. F., Fertilizer 141,848
Antill, J. T., and W. J. Sloan, Nut and bolt fastening 141,940
Ash, J., Tea kettle spout, (reissue) 5,537
Atkins, C. J., Ferry bridge 141,911
Balbach, E. Jr., Furnace for smelting ores 141,912
Bagger and Moore 141,943
Barnes, W. F., and J. and F. Mesick, Sewing machine bobbin holder 141,931
Bartle, W. S., Rotary valve and cut off 141,932
Beasley, J. and J., Jr., Machine for burnishing the sole edges of boots and shoes 141,923
Beasley, J. and J. Jr., Machine for burnishing the edges of boot and shoe soles 141,924
Benner, J., Sewing machine table 141,965
Betts, G. W., Land marker 141,913
Billings, O., Harvester, (reissue) 5,539
Billin, W. G., Apparatus for treating cane juice with sulphur fumes 141,914
Bird, C., and W. H. Sellenberger, Bearing for shafts 141,908
Blakeslee, C., assignee 142,057
Blanchard, H. A., Sewing machine 141,967
Blauser, N. G., Corn cultivator 141,968
Blauvelt, M., Dressmaker's marking and cutting gage 141,849
Bly, D., assignee, (reissue) 5,543
Bohner, G., Hanging lamp, (reissue) 5,534
Bolleau, E., Hinge 141,969
Bonnas, A., Micrometer gage 141,915
Bowen, B. W., Washing machine 141,850
Bowen, S. B., Horse hay fork 141,851
Brooks, J. W., trustee, assignee, (reissue) 5,539
Brown, K., assignee 141,992
Brown and Walker 142,001
Bugbee, G. W., Device for setting saw teeth 141,900
Burns, J., Earth boring machine 141,916
Butterfield, W., assignee 142,046
Caldwell W. G., Machine for edging lumber 141,852
Camerer, D. C., Car coupling 141,991
Campbell, J. M., assignee 141,892
Carpenter, L. D., Grain sieve 141,917
Carpenter, W. E., Crib 141,918
Carr, G. W., assignee 142,007
Carr, W., Apparatus for shrinking metal bands 141,992
Caswell, F., Sewing machine hemmer 141,893
Chase, J. K., Preserve can 141,894
Chadwick, E., Construction of reeds 141,905

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but few smaller of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 300 of drawings; total of each volume about 1,000 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,000 pages per month: 9,000 pages of specifications, 3,120 pages of drawings—12,720 pages.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot affix upon itself to make subdivisions of certain lines of inventions, making portions only of the patents in the classes so specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproductions of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of chosen many be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks) 6,500
SEWING-MACHINES and attachments 2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes 4,000
PRINTING; including presses, type, and printers' furniture. 2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles 1,200
FELTING and HATS; including caps, bonnets, flock, &c. 1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments) 1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs 1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 9. TUESDAY, AUGUST 26, 1873. PRICE { $10.00 per year—single. $5.00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DIGEST OF FOREIGN PATENT LAWS.*

AUSTRIA-HUNGARY.

BY A. H. MOURSEY, OF THE BRITISH LEGATION AT VIENNA.

On the establishment of the dual system of government in Austria-Hungary, it was decided by a special agreement between the Ministers of Hungary and Cisleithania that the Imperial Decree of August 15, 1858, in which the law and practice with regard to inventions are fully explained, should remain in force throughout the whole Empire.

In accordance with the terms of this agreement, the Cisleithanian and Hungarian Ministers of Commerce submit to mutual approval the inventions for which they intend granting patents, and subsequently to such approval each Ministry issues patents, bearing identical dates, for its respective division of the Empire.

Thus, an inventor, desirous of securing an exclusive right to his invention in Austria-Hungary, must provide himself with two patents. These are, however, granted on a single application, addressed, at the choice of the applicant, either to the Cisleithanian or Hungarian Ministry of Commerce, and on one payment of the fees.

The patents thus issued are likewise valid in the principality of Lichtenstein.

In the laws of Austria-Hungary inventions are claimed under three heads, and defined as follows:

1. *Discoveries*—*i. e.*, the introduction of the methods of production hitherto unknown in the country, and the resuscitation of methods once known but now forgotten and lost.

2. *Inventions*—*i. e.*, the creation of a new object by new means, or a new object by means already known, and of a known object by other means than those used for its production.

3. *Ameliorations*—*i. e.*, any addition to an existing invention which improves the quality or reduces the price of the product of such invention.

Each of these classes of inventions is considered new, provided it is unknown in the Empire either in practice or in a printed book or document accessible to the public.

All inventions must have for their object either—

A new industrial production; or

A new means of production; or

A new method of production.

And subject to the above conditions, patents can be granted to their owners irrespective of their nationality.

To this general rule there are four exceptions:

1. Patents are not granted for inventions which affect the preparation of food, drink, and medicine, nor for those which cannot be used without injury to the interests of the State, the public health, morality, and safety.

2. A foreign invention can only be patented in Austria-Hungary on condition that it is still patented abroad, and a patent for such invention can only be granted to the foreign patentee or the possessor of his rights in it.

3. Patents for ameliorations are granted for the part ameliorated, not for the whole invention.

4. Patents are not granted for the discovery of scientific principles, unless the latter are actually brought to bear upon production.

One patent is never granted for two or more inventions, except in cases where both or all of them are to be used in the production of one and the same object.

Applications for patents must be addressed to the competent authorities, political authorities of the district, or provincial governors, (*statthalterien*,) accompanied by the requisite fee, or a certificate of this deposit of the same, and by a detailed description of the inven-

*The British Government, through its foreign legations, has secured digests of the patent laws of nearly or quite all countries that possess an salient provisions for inventions. These digests are as well prepared, and are of as much interest to inventors, as to justify their publication in the ORIGINAL GAZETTE.

tion, as well as by models and drawings, if necessary, in such detail that a professional man can, on the expiration of the patent, construct it therefrom.

The application must be made by the proprietor of the invention himself, or his duly accredited agent, (if by the latter, his mandate must be produced,) and must state:—

A. The full name, profession, and domicile of the applicant. If the latter lives abroad, similar information must be given relative to his agent in the empire; and if the invention is to be used by others than the inventor, their names, domicile, and profession must likewise be stated. If the invention is a foreign one, the original patent, or a certified copy of it, must be inclosed.

B. The title of the invention.

C. The number of years for which the patent is demanded. This number cannot exceed fifteen without the special consent of the emperor; or, if the invention is already patented abroad, the expiration of the patent there granted.

D. Whether or not secrecy is desired.

The taxes on patents, for natives and foreigners indiscriminately, are as follows:

	fl.	kr.	
For the first five years	100	10	= $48 73
For the second five years	200	20	= 97 44
For the third five years	400	40	= 194 88
For fifteen years	700	70	= 341 04

These taxes must be paid or deposited in the hands of the government officials previous to the issue of the patent. They are only returned in cases where patents are canceled on public grounds.

On receipt of an application the district authorities, after seeing that it is properly drawn up and signed, that it is accompanied by the proper inclosures, and that provision has been made for the payment of the taxes, must mark on the envelope the day and hour of its presentation, give a receipt to the applicant, and forward the application at once (within three days, at the latest) to the provincial governor.

From this day and hour the priority of right to the invention belongs to the applicant.

The provincial governor must see that the subject of the application is one for which a patent can be granted, and that the proper forms have been observed. Should he decide that the subject is not patentable he must return it to the applicant; but the latter can appeal from his decision to the Ministry of Commerce. If the proper forms have not been complied with he must return the application and fix a date for its re-presentation.

If in due form the provincial governor must forward it to the Ministry of Commerce, which is alone authorized to open the sealed description of the invention.

Should the Ministry find that the description tallies with the invention, and that all the other legal forms have been complied with, it issues the patent at once, without examining the question of the utility or novelty of the invention. No responsibility attaches to the Ministry on the latter account, and the applicant must alone bear the consequences of any encroachment on the rights of others.

Should the description of the invention be incorrect, or its subject not patentable, the documents are returned to the applicant for correction, or as being useless, according to the circumstances.

The exercise of patents is subject to the interests of public health, and may be limited or prohibited accordingly.

Once issued, the patent is immediately entered in a register at the Ministry of Commerce, where all drawings and models of patented inventions are kept.

These archives are accessible to all comers, who, except when secrecy has been requested by the inventor, can take copies of their contents.

A monthly report, describing the patents registered during each month, is made by the keeper of the archives to the Ministry of Commerce, who forwards copies of it to the provincial authorities.

An annual report of the same tenor is published, and descriptions of useful inventions of which the patents have expired are likewise from time to time published for the public use.

A patent secures to the patentee the exclusive use of his invention for the number of years mentioned in the application.

He is thereby authorized to take all requisite measures for working his invention and selling its products, and to empower others to work it for him. He may dispose of his patent as he likes, by sale, testament, lease, &c., and obtain foreign patents for his invention.

The rights conferred by a patent for an amelioration are restricted to the part ameliorated.

Patentees can procure for one or more years the renewal of patents originally granted for less than fifteen years, by making the application to that effect, accompanied by the original patent and the necessary fee to the Ministry of Commerce, which must at once notify the renewal to the public.

Patents become invalid—

1. In consequence of being canceled on the following grounds:

(*a.*) When all the legal requirements have not been complied with in obtaining them.

(*b.*) On proof being given that the invention in question was not new at the time at which the patent was issued, or that it was introduced from abroad without the consent of the foreign patentees.

(*c.*) On proof being given by a patentee that the invention is identical with one for which a patent has already been granted.

(*d.*) As being injurious to the public interests.

2. By lapsing.

(*a.*) When the patentee fails to make use of his patent for one year from the date of its issue; or, later, allows two consecutive years to elapse without working his invention.

(*b.*) On the expiration of the term for which the patent was granted or renewed.

(*c.*) In consequence of a voluntary renunciation of the rights conferred by a patent.

As soon as patents are declared invalid their subjects become public property.

All cessions and testamentary disposal of patents must be notified to the proper authorities, and made known to the public by the Ministry of Commerce.

The encroachments on patented rights are—

(*a.*) The imitation or counterfeiting of the products of a patented invention, even when such imitation or counterfeiting results from the possession of a subsequent or partially identical patent.

(*b.*) The importation for sale of counterfeit products of a home invention.

(*c.*) The sale, exhibition, or storage of such products.

A first encroachment on a registered patent, a second one on a secret patent, is punishable with a fine, varying from $12 16 to $486; and on non-payment of the same, by one day's arrest for every $2 24 of the fine imposed, and by confiscation of the machinery, tools, &c. The fine is paid into the pauper fund of the place where the encroachment was made.

Should a patentee, whose rights have been encroached upon, be unwilling to prosecute, he may apply for a rule prohibiting further counterfaction or sale and ordering the exportation of imported counterfeits.

In all actions relative to patents the original description of the invention given by the patentee is the sole evidence of its nature.

The Ministry of Commerce is alone competent to decide on the invalidity or lapsing of patents.

In cases of encroachment, the political authorities of the district are competent in the first instance. Appeals may be made from their decisions to the provincial authorities, and finally to the Ministry of Commerce.

These authorities may at once order an examination of the subject in dispute, and, if necessary, its immediate confiscation.

RESOLUTIONS OF THE PATENT CONGRESS.*

VIENNA, AUSTRIA, AUGUST 5–10.

I. The protection of invention should be guaranteed by the laws of all civilized nations, under the condition of a complete publication of the same, because—

(*a.*) The sense of the right among civilized nations demands the legal protection of intellectual work.

(*b.*) This protection affords the only practical and effective means of introducing new technical ideas without loss of time, and in a reliable manner, to the general knowledge of the public.

(*c.*) The protection of invention renders the labor of the inventor remunerative, and induces thereby competent men to devote time and means to the introduction and practical application of new and useful technical methods and improvements, and attract capital from abroad, which, in the absence of patent protection, will find means of secure investment elsewhere.

(*d.*) By the obligatory complete publication of the patented invention the great sacrifice of time and of money, which the technical application would otherwise impose upon the industry of all countries, will be considerably lessened.

(*e.*) By the protection of invention the secrecy of manufacture, which is one of the greatest enemies of industrial progress, will lose its chief support.

(*f.*) Great injury will be inflicted upon countries which have no national patent laws by the native inventive talent emigrating to more congenial countries, where their labor is legally protected.

(*g.*) Experience shows that the holder of a patent will make the most effectual exertions for a speedy introduction of his invention.

II. An effective and useful patent law should be based on the following principles:

(*a.*) Only the inventor himself or his legal representatives should be entitled to a patent. A patent should not be refused to a foreigner. It is advisable in carrying out this principle to introduce a system of preliminary examination.

(*b.*) A patent should be granted either for a term of fifteen years or be permitted to be extended to such a term.

(*c.*) Simultaneously with the issue of a patent, a complete publication of the same should take place, rendering the technical application of the invention possible.

(*d.*) The expense of obtaining a patent should be moderate, but, in the interest of the inventor, a progressive scale of fees should be established, enabling him to abandon, when convenient, a useless patent.

(*e.*) Facilities should be given, by a well-organized patent office, to obtain in an easy manner the specification of a patent, as well as to ascertain what patents are still in force.

(*f.*) It is advisable to establish legal rules, according to which the patentee may be induced, in cases in which the public interest should require it, to allow the use of his invention to all suitable applicants for an adequate compensation.

(*g.*) The non-application of an invention in one country shall not involve the forfeiture of the patent if the patented invention has been carried into practice at all, and if it has been rendered possible for the inhabitants of such country to purchase and make use of the invention.

In all other respects, and particularly as regards the proceedings in the granting of patents, the congress refers to the English, American, and Belgian patent laws and the draft of a patent law for Germany by the Society of German Engineers.

III. Considering the great differences in patent legislation and the altered international commercial relations, the necessity of reform is evident, and it is of pressing moment that governments should endeavor to bring about an international understanding upon patent protection as soon as possible.

IV. The congress empowers the preparatory committee to continue the work commenced by this first international congress, and to use all their influence that the principles adopted be made known as widely as possible and carried into practice.

The committee is likewise authorized to endeavor to bring about an exchange of opinions on the subject, and to call from time to time meetings and conferences of the friends of patent protection.

To this end the Preparatory Committee is hereby appointed to act as a permanent Executive Committee, with power to add other members to their number and to appoint the time and place for the next meeting of the congress, in case such a meeting should be considered necessary for the promotion of the results achieved.

*This congress turned out to be little more than a convention of friends of patents for inventions. It proved to be entirely unofficial.

COMMISSIONER'S DECISIONS.

THOMAS J. MAYALL—*Appeal.*

[*In the matter of the application of Thomas J. Mayall for patent for* IMPROVEMENT IN PACKING.—*Decided August 20, 1873.*]

APPEAL FROM THE DECISION OF THE PRIMARY EXAMINER.

Before the propriety of a division of an application can be determined it is essential that claims be presented the significance of which is not a matter of doubt.

Every claim should be so drawn as to plainly indicate the nature of the invention sought to be covered by it, whether it is an improvement in an "art" or in a "manufacture," &c. There is no middle ground, such as the use of a thing upon which which a claim can rest. A claim for the "employment" of canvas, therefore, held to be nondescript in character and indefensible.

A claim for a manufacture must rest upon the novelty of the thing itself without reference to the "art" or process employed in its production. The two, as features of invention, are distinct, and must be respectively and independently novel in order to be patentable.

In a claim for a product a recital of the method of constructing it is a circuitous way of indicating its nature, tends to obscure the claim, and is not a proper limitation of it.

LEGGETT, *Commissioner:*

The applicant sets out that he has invented "certain new and useful improvements in the manufacture of packing" for pistons, steam-joints, &c., "composed in the main of canvas or other woven fabric."

To prepare his fabric he coats one or both sides of it with bees-wax or other lubricant, in a manner to thoroughly saturate it, and then treats it with a rubber solution. His object is, first, that layers of the material thus prepared, when placed together to form packing, shall adhere to one another; and, second, that the lubricant shall be held in the fabric by the rubber, and prevented from being given off too freely.

To make packing of this prepared fabric he cuts it parallel with the warp or weft threads into strips, which he winds spirally upon a mandrel, so that each succeeding strip shall break joints with the preceding. A tube of packing is thus obtained, the fabric of which is bias, and which may be cut into packing-rings. Assuming their novelty, here would seem to be four distinct features of invention, although this is not, at present, a question for decision. First, a method or improvement in the "art" of preparing fabric for making packing; second, a prepared fabric as a "manufacture" or product for making packing, (or for whatever other use it may be adapted to;) third, a method or improvement in the "art" of making packing, (applicable to any suitable fabric or material;) and, fourth, a packing as a "manufacture" or product, formed in tubes or rings of bias adhering layers, having the quality of retaining a contained lubricant, as specified.

The three following claims have been made in this application which the Examiner holds should be divided:

"1. The employment in the manufacture of packing of canvas, or other suitable woven fabric, treated first with bees-wax or other lubricant, and then with rubber solution, substantially as and for the purposes described.

"2. The manufacture of packing from strips of canvas, or other woven fabric, suitably treated, wound spirally upon a mandrel in successive, opposite, and independent layers, the tube thus produced being divided into packing-rings substantially in herein described and illustrated in the accompanying drawings.

"3. Packing composed of canvas strips, preliminarily treated with bees-wax or other lubricant, followed by rubber solution, as described, and then wound spirally in successive, opposite, concentric layers on a suitable mandrel or form, substantially as and for the purposes shown and set forth."

Before the propriety of a division of an application can be determined, it is essential that claims be presented the significance of which is not a matter of doubt. The Examiner remarks the ambiguity of the first claim, and, upon consideration of it, very properly concludes that the more reason appears for regarding it as a claim for a product. This the applicant denies, and says it is the use of prepared canvas which he claims. Very true. But that was obvious before, and is precisely what creates the ambiguity. What is signified by a claim for the use of a device?

There are but two heads under which either invention here shown can be comprehended—an improvement in an "art" or in a "manufacture." Each invention must clearly appear to be one or the other. There is no middle ground, such as the use of a thing, upon which a claim can rest. Every claim must be so drawn as to plainly indicate what kind of invention is sought to be covered, whether an improvement in an "art" or in a "manufacture," whether a process or a product. There is certainly nothing in the language of the first claim to indicate with any certainty that it covers a process. The fact is, it is purely nondescript in character, and wholly indefensible. But if it should be held to cover a product, then the first and third claims cover the same product, and, as the Examiner suggests, there is an objectionable duplication of claims which, as a preliminary step, should have been corrected.

The second claim, although it is not entirely postponous on account of the use of the word "manufacture" in the first line, seems to cover the third feature of invention pointed out above, viz.: The improvement in the "art" of forming, or the mode of proceeding to form, packing from prepared canvas. The latter part of the claim is in no sense a limitation of it, and only tends to obscure its real significance. The packing is as complete before being sized—that is, cut into rings of the requisite width—as it is afterward. That is a mere fitting of it to a particular place, and nothing more. It does not enter into the method of making it or form one of the characteristics of the packing itself. Sometimes, in fact, a tube, properly speaking, rather than a ring is required.

The third claim covers a packing. It indirectly indicates its nature, however, by reference to the method or methods employed in its construction, instead of directly setting out the characteristics of the completed packing itself. This is objectionable, because a claim for a manufacture or product must rest upon the novelty of the product, without reference to the "art" employed in its production. The two, as features of invention, no matter where claimed, are always distinct, and must be respectively and independently novel in order to be patentable.

The question of the patentability of one is entirely separate from the question of the patentability of the other.

The manufacture or product complete in itself, and new in its individual qualities and characteristics, and not merely in its plan of production, is what the claim should clearly and only specify. It is a fallacy to suppose, as this claim seems to imply, that an article is ever patentable merely because produced by a certain mode of proceeding. It is only patentable because it is itself a new thing.

A reference to a method, therefore, in a claim for a product, is a circuitous way of indicating what the product claimed is. It tends to obscure such a claim, and is not a proper limitation of it. All this is matter for preliminary correction.

I think the Examiner was premature in requiring a division while the claims remained so defective—especially as the first, over which a dispute has now arisen, which, perhaps, was to be anticipated, is indefinite as to what invention it comprehends.

The case is therefore returned to him, and he is directed to require such amendments as are necessary to render the claims clear and definite in their significance, when it will not be difficult, probably, to determine whether or not a division is necessary.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

25,565.—Rolling-Mills.—Granted to JOHN and GEORGE FRITH, September 27, 1859. Application filed June 27, 1873. Hearing September 16, 1873.

25,569.—Reducing Gluten.—Granted to THOMAS HOWE, September 27, 1859. Application filed June 28, 1873. Hearing September 16, 1873.

25,570.—Mode of Arranging Couches in Railroad Cars.—Granted to ROWLAND C. KINNEY, September 27, 1859. Application filed May 26, 1873. Hearing September 10, 1873.

25,572.—Molding Water-Traps.—Granted to JAMES ALLEN LOWE, September 27, 1859. Application filed June 28, 1873. Hearing September 10, 1873.

25,586.—Burglar-Alarms.—Granted to ARNOTT Q. HOW, September 27, 1859. Application filed June 28, 1873. Hearing September 10, 1873.

25,595.—Steam Punching-Machines.—Granted to JOHN SPARROW, September 27, 1859. Application filed June 28, 1873. Hearing September 10, 1873.

25,640.—Steam-Boilers.—Granted to JOSEPH HAMMOND, Jr. October 4, 1859. Application filed June 28, 1873. Hearing September 17, 1873.

25,692.—Construction of Prisms.—Granted to EDWIN MAY, October 4, 1859. Application filed June 28, 1873. Hearing September 17, 1873.

25,698.—Machines for Lasting Boots and Shoes.—Granted to JAMES PUSHTON, October 4, 1859; reissued January 6, 1863. Application filed July 5, 1873. Hearing September 17, 1873.

25,699.—Skylights.—Granted to CHARLES L. STAUT, October 4, 1859; reissued June 6, 1865. Application filed June 28, 1873. Hearing September 17, 1873.

25,699.—Sewing-Machines.—Granted to KASPER VOGEL, October 4, 1859; reissued November 1, 1864. Application filed July 5, 1873. Hearing September 17, 1873.

25,701.—Skeleton Skirt.—Granted to JAMES DRAPER, October 4, 1859; reissued August 1, 1865. Application filed July 2, 1873. Hearing September 17, 1873.

25,725.—Hand-Machine for Wiring Blind-Rods.—Granted to BRIAN C. DAVIS, October 11, 1859. Application filed July 12, 1873. Hearing September 24, 1873.

25,732.—Double-Friction Couplings.—Granted to JOSHUA HENDY, October 11, 1859; reissued March 25, 1873. Application filed July 7, 1873. Hearing September 24, 1873.

25,747.—Method of Combining Hardy with Caoutchouc.—Granted to THOMAS J. MAYALL, October 11, 1859. Application filed June 14, 1873. Hearing September 24, 1873.

25,767.—Cutting and Pressing Cutlery.—Granted to JOHN H. SHOOTS, October 11, 1859. Application filed July 15, 1873. Hearing September 24, 1873.

25,784.—Blade of Hinged Knife, &c.—Granted to GEORGE W. BARBER, October 11, 1859. Application filed July 9, 1873. Hearing September 24, 1873.

25,795.—Jacquard Machines.—Granted to AVERY RAMSEY, October 11, 1859. Application filed June 28, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,797.—Harvesters.—Granted to BENJAMIN HALL, October 11, 1859. Application filed July 12, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,807.—Steam-Feeders.—Granted to LAWRENCE GLASS, October 11, 1859. Application filed July 12, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,814.—Sleeping-Cars.—Granted to JOHN RAMSEY, October 11, 1859. Application filed July 12, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,843.—Cultivators.—Granted to THOMAS MCQUISTON, October 18, 1859; reissued May 16, 1871. Application filed July 11, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,860.—Weeding-Hoes.—Granted to JAMES M. ADAMS, October 18, 1859. Application filed July 12, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,867.—Machines for Covering Saddle-Trees.—Granted to JOHN MACLURE, October 18, 1859. Application filed July 14, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,874.—Steaming-Machines.—Granted to GILBERT H. BABCOCK, October 25, 1859. Application filed July 25, 1873. Testimony closes September 23, 1873. Hearing October 8, 1873.

25,883.—Construction of Glass Coffins.—Granted to JOHN R. CARSON, October 25, 1859. Application filed July 23, 1873. Testimony closes September 23, 1873. Hearing October 8, 1873.

25,905.—Cut-Off Valves of Steam-Engines.—Granted to EDWARD R. ARNOLD, November 1, 1859. Application filed August 1, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

25,976.—Saddle-Blocks.—Granted to ISAAC E. PALMER, November 1, 1859; reissued September 9, 1862, April 11, 1865, and December 8, 1868. Application filed July 26, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

25,984.—Bit-Stocks.—Granted to HIRAM STOCKTON, November 1, 1859; reissued April 25, 1867. Application filed July 26, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

26,022.—Telegraphic Machines.—Granted to GARDNER M. PERLEY, November 1, 1859. Application filed July 29, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

26,028.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 5, 1870. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,029.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 5, 1870. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,060.—Machines for Making Box-Joints.—Granted to JAMES SUMPTER, November 8, 1859. Application filed August 2, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,063.—Sleeping-Cars.—Granted to JOHN DANIELS, November 8, 1859. Application filed August 4, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,087.—Fastening Metal Hoops on Cotton-Bales.—Granted to JOHN T. BUTLER, November 15, 1859. Application filed August 7, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,090.—Machines for Folding Paper.—Granted to CYRUS CRANDELL, Jr., November 15, 1859; and reissued August 12, 1873. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,097.—Electro-Magnetic Telegraphs.—Granted to MOSES G. FARMER, November 15, 1859; and reissued December 10, 1872. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

96,126.—Billiard-Table Cushions.—Granted to GEORGE D. SHARP, November 15, 1859; and reissued April 8, 1873. Application filed August 16, 1872. Testimony closes October 14, 1873. Hearing October 29, 1873.

96,135.—Portable Pumps.—Granted to WILLIAM T. VAIL, November 15, 1859; reissued February 26, 1861. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

96,136.—Medes of Advertising.—Granted to EDWARD WIBER, November 15, 1859. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

96,139.—Pumps.—Granted to WILLIAM WISNER, November 15, 1859. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

96,145.—Cocks for Water-Closets.—Granted to DARIUS WELLINGTON, November 15, 1859. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

96,147.—Machine for Bundling Kindling-Wood.—Granted to WILLIAM L. WILLIAMS, November 15, 1859; and reissued October 4, 1870. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

96,177.—Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 18, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

96,178.—Shirking Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 18, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

96,208.—Manufacture of Paper-Pulp.—Granted to JOHN B. PALMER and GARDNER HOWLAND, November 29, 1859; and reissued July 2, 1867. Application filed August 26, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

96,242.—Water-Closet Bushes.—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 16, 1873. Testimony closes October 29, 1873. Hearing November 12, 1873.

96,244.—Machines for Registering Music.—Granted to HENRY F. BOND, November 29, 1859. Application filed August 29, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

96,262.—Journal-Boxes for Saw-Mill Carriages.—Granted to WM. M. PERRY, November 29, 1859. Application filed August 20, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

96,276.—Manufacture of Rubber Hose.—Granted to THOMAS J. MAYALL, November 29, 1859; and reissued October 28, 1873. Application filed August 19, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

96,281.—Molding for Metal Casting.—Granted to JOHN P. BROADSHADOW, November 29, 1859. Application filed August 13, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

96,297.—Nursing-Bottles.—Granted to FRANCIS J. LA FORGE, November 29, 1859, and reissued January 14, 1868. Application filed August 27, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

96,329.—Boot and Shoe Tips.—Granted to NEWMAN SILVERTHORN, November 29, 1859; reissued September 2, 1862, and August 4, 1868. Application filed August 22, 1873. Testimony closes October 29, 1873. Hearing November 12, 1873.

96,410.—Seed-Planters.—Granted to WILLIAM BLESSING, December 13, 1859. Application filed August 27, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

96,564.—Top-Props for Carriages.—Granted to GEORGE COOK and HANNIBAL I. KENDALL, December 27, 1859. Application filed August 29, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

97,532.—Manufacture of Gun-Barrels.—Granted to JAMES H. BURNS, March 29, 1869, and antedated to September 29, 1859; reissued December 26, 1871. Application filed July 1, 1873. Hearing September 16, 1873.

EXTENSIONS GRANTED.

25,269.—Improvement in Nail-Machines, granted to DANIEL DODGE, August 30, 1859.

Claim.—1. The combination of an anvil, B, and fixed die C, or other equivalent fixed surfaces, a roller, E, hammer F G, and a vibrating guide, I, the whole operating substantially as herein described.

2. The operation of a hammer in combination with the roller E and anvil B, by means of an eccentric on the roller-shaft and a universal joint at the connection of the hammer with the connecting-rod of the eccentric, substantially as herein described.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date August 26, 1873.]

6,825.—Saw-Frame.—THOMAS S. DENTON and HENRY DENTON, 2d, Philadelphia, Pa., assignors to themselves and HENRY DENTON & SONS, same place. Application filed August 1, 1873. Term of patent 7 years.

6,826.—Muff.—MORITZ GROSS and BERNHARD B. ZIPPERT, New York, N. Y. Application filed June 26, 1873. Term of patent 3½ years.

6,827.—Lady's Fur Collar.—MORITZ GROSS and BERNHARD B. ZIPPERT, New York, N. Y. Application filed June 26, 1873. Term of patent 3½ years.

6,828.—Chair.—SAMUEL HAYWARD, Boston, Mass. Application filed June 30, 1873. Term of patent 3½ years.

6,829.—Material for Gored Skirts.—JOHN ANDERSON, New York, N. Y. Application filed June 23, 1873. Term of patent 14 years.

6,830.—Paper-Clip.—THOMAS ORTON, Chicago, Ill. Application filed June 21, 1873. Term of patent 14 years.

6,831.—Stove.—WILLIAM D. SOUTHARD, New York, N. Y. Application filed June 26, 1873. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date August 26, 1873.]

1,417.—Kaleidoscope.—C. G. BUSH & Co., Providence, R. I. Application filed August 6, 1873.

"a representation of a parlor-kaleidoscope."

1,418.—Seeds, Bulbs, Vines, and Cuttings.—CHASE BROTHERS & WOODWARD, Rochester, N. Y., and Augusta, Me. Application filed July 25, 1873.

An old man sowing seeds, and the words "Chase Brothers and Woodward."

1,419.—Spices, Mustard, Soda, and Cream of Tartar.—E. R. DURKEE & Co., New York, N. Y. Application filed July 12, 1873.

"'Challenge.'"

1,420.—Carpets, Drugget, Rugs, and Mats.—JOSEPH EDWARD HUGHES, Kidderminster, England. Application filed July 26, 1873.

"a lion rampant on a crown and the word 'English' above the lion."

1,421.—Pepsin.—LILLY AND PERLAN, Evansville, Ind. Application filed August 4, 1873.

"'Arcanite.'"

1,422.—Liniment.—WILLIAM H. RAINEY, Brunswick, Ga. Application filed August 6, 1873.

"a telegraph line with four posts, the words 'Trade-Mark' immediately over telegraph line, the word 'Lightning' on left of telegraph line, the word 'Relief' on right."

1,423.—Wines and Liquors.—OTTO SCHLOSSER, New York, N. Y. Application filed May 20, 1873.

"a crescent, inscribed with the word 'Crescent' and a vignette of Ceres surrounded by the products of harvest."

1,424.—Castor-Oil Pills.—WILLIAM SCRUTON, New York, N. Y. Application filed August 9, 1873.

"'U. S.' and an eagle on a shield."

1,425.—Celery Sauce.—HENRY, NOBLE & Co., Pittsburg, Pa. Application filed August 16, 1873.

"'Celebrated Celery Sauce' and a figure of the celery plant."

1,426.—Horse-Radish.—HENRY, NOBLE, AND COMPANY, Pittsburg, Pa. Application filed August 16, 1873.

"'Strictly Pure Horse-Radish' and the figure of a horse-radish plant and root."

1,427.—Rye Whisky.—THOMAS L. HYDE, Washington, D. C. Application filed August 20, 1873.

"'Old Stag Whisky.'"

1,428.—Alpaca.—WILLIAM B. LEWIS, New York, N. Y. Application filed August 23, 1873.

"a horse mounted by a jockey, and the word 'Cremorne.'"

1,429.—Gas-Machine.—F. W. OEHLDT & Co., Newark, N. J. Application filed July 12, 1873.

"'Star Gas-Machine.'"

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date August 26, 1873.]

ORIGINAL PATENTS.

142,071.—Sauce for Food.—ANSELMO P. AGRESTA, New York, and ANTONIO MEUCCI, Clifton, N. Y. Application filed July 9, 1873.

Meat, of good quality, one hundred pounds; salt pork, one-fourth pound; fresh tomatoes, eight pounds; finely-cut carrot, eight pounds; finely-divided celery, eight pounds; onions, four pounds; gelatine, one-fourth pound; salt, one-half pound; pepper, one ounce. Mix well and brown over a slow fire. When brown, add warm water and boil until thoroughly cooked.

Claim.—The sauce prepared and preserved in the manner and of the materials herein set forth.

142,072.—Croquet-Wicket Driver.—EDWIN A. BARKER, Providence, R. I. Application filed May 14, 1873.

For driving into and removing from the ground the ordinary curved or round-top croquet-arches.

Claim.—1. A croquet-wicket driver, constructed substantially in the manner described, for the purpose specified.

2. In combination with a croquet-wicket driver, the prolonged legs to operate as a gage, substantially as described.

3. A wicket-driver provided with the hooks E for withdrawing the wicket, substantially as described.

142,073.—Packing for Show Cases.—GEORGE G. RATH, New York, N. Y. Application filed June 9, 1873.

Two or more cases are arranged in telescopic form, on which are wound fringes for exhibition, and closed for transportation.

Claim.—The combination of two, three, or more boxes, A B C, provided with projecting flanges on each end, and operating similar to a telescope, substantially as and for the purpose hereinbefore set forth.

142,074.—Plow.—JAMES F. BENTON, Penn Yan, N. Y. Application filed December 5, 1872.

A common plow is provided with a supplemental sole, which is pivoted in a slot in the rear end of the land-side and adjusted at the forward end by an oblique slot to govern the pitch of the plow.

Claim.—The adjustable sole B, when pivoted to the rear end of the land-side and secured by the slotted strap, as described.

142,075.—Playing-Card.—HANNATY BULLIVAN, Boston, Mass. Application filed January 22, 1873.

The designs upon playing-cards are here printed small, and in the center of the card, with fortune-telling sentences ranged about the margin.

Claim.—1. A playing-card bearing the two signs above described, and adapted, as explained, not only for use in playing the more common games, but also the game of fortune-telling by cards.

2. The arrangement of the two signs above described, the one in the middle portion of the face of the card, and the other in the margin, formed substantially as above described.

142,076.—Buckle.—JULIUS M. BORCHARDT, New York, N. Y., assignor to MORIZ ARNEMO, same place. Application filed March 10, 1873.

Claim.—1. The bow A, rigidly secured to the chord B, forming with it collars or bearings, as and for the purposes described.

2. The combination of the bow A and the chord B with the loop and tongue wire C D D, substantially as described, and for the purpose set forth.

142,077.—Table-Hinge.—ELIAS C. BOSSERT, Middletown, Pa., assignor of one-half his right to SOLOMON C. BOSSERT, same place. Application filed December 9, 1872.

The stationary part of the hinge has two parallel flanges projecting downward, and a pin from one flange to the other. The movable part of the hinge has an arm with stop or projection and hook, so arranged that the stop will engage with the cross-bar when the leaf is raised, and the hook will catch on the cross-bar and support the leaf when lowered.

Claim.—1. The combination of the pin or cross-bar *c* of the stationary part C with the open hook *d* of the movable part D of a hinge, substantially as and for the purpose herein specified.

2. The combination of the pin or cross-bar *c* of the stationary part with a hook, stop, or projection on the arm of the movable part of the hinge, substantially as and for the purpose herein specified.

3. The combination of the depression *g* in the upper side of the movable part, and a hook, stop, or projection on the arm, with the pin or cross-bar *c* of the stationary part of the hinge, substantially as and for the purpose herein specified.

142,078.—Heating-Stove.—RICHARD H. BROWN, Linneus, Mo. Application filed April 28, 1873.

The saddle is raised above the top of the stove sufficiently to form a chamber thereunder. Upon an extension, at one side of the saddle, the pipe is attached, allowing room for heating-drum or other article.

Claim.—The stove A, the bottom fire D, the exit-flue E, extension F, opening J, damper K, saddle G, and extension H, combined, constructed, arranged, and operating substantially as described and shown.

142,079.—Heating-Stove.—RICHARD H. BROWN, Linneus, Mo. Application filed March 8, 1873.

The draft enters near the longitudinal center of the stove. The products of combustion may divide and pass down either of the end flues.

Claim.—1. The combination of the stove-body A, plate B, flues C *b* D, and dampers *d* and *e*, all constructed and arranged substantially as shown and specified.

2. The combination of the stove-body A, elbow W, drum R, diaphragm G, opening *g*, pipe *m*, and dampers S and *s*, substantially as shown and specified.

3. A heating-stove combining in its construction the body A, plate B, flues C *b* D, elbow W, drum R, diaphragm G, opening *g*, pipe *m*, and dampers *d*, *e*, and S, the various parts being constructed and arranged substantially as shown and specified.

142,080.—Reservoir Cooking-Stove.—RICHARD H. BROWN, Linneus, Mo. Application filed April 28, 1873.

Claim.—In a cooking-stove, a hot-water reservoir arranged at the forward end of the stove under the hearth-plate thereof, and over or upon the extended side and bottom plates of the stove, the top of the reservoir being the said projecting hearth-plate, the bottom being the top of the chamber or flue space formed by the said extension of the side and bottom plates, and the rear wall of the reservoir being the front plate of the oven, substantially as shown and specified.

142,081.—Automatic Fan.—JOHN D. BUSH, Hyten, Ala. Application filed March 18, 1873.

Claim.—Vibrating suspended shafts G, carrying fans or fly-brushes, and composed, respectively, of jointed sections and sliding-slides *g*, in combination with jointed supports S, substantially as and for the purposes described.

142,082.—Telegraph-Pole.—JOSEPH L. CHAPMAN, Philadelphia, Pa., assignor of two-thirds his right to JOHN C. STOCKTON and JAMES WATSON, same place. Application filed March 1, 1873.

Four uprights of angle-iron are secured in the ground to a bed-plate. Said uprights incline inwardly toward their tops, where they clamp the cross-bars, and are united to each other by horizontal tie-rods, which also form a means for climbing the pole.

Claim.—The combination, in a telegraph-pole, of the four bars of angle-iron A A A A, provided with flanged feet at the lower ends for securing them to the base-plate B, connected by rods E E, and arranged at the upper portion to receive the cross-pieces C C C, substantially as herein shown and described.

142,083.—Flour-Bolt.—DAVID T. CROAT and HENRY BIGH, Cedar Falls, Iowa. Application filed April 14, 1873.

The series of spiral ribs, arranged on the inside of the bolt at regular intervals, support the cloth, and allow the flour, middlings, or meal to pass through.

Claim.—In a round mill-bolt or separator, the bolting-cloth supported directly upon a series of spiral ribs, substantially as specified.

142,084.—Gang-Plow.—RUDOLPH CORETH, West Belleville, Ill. Application filed June 21, 1873.

The plow-frame, when released from front supports, revolves, lifting the plows out of the ground and making a complete revolution. The carriage-frame is mounted on a crooked axle having bearings in standard-cranks, and supported in front by clutches.

Claim.—1. The standard-cranks F F, mounted on the crooked axle D', applied to the standards E E on frame A A, and having combined with them the gears *f f* and the devices for operating these gears, substantially as described.

2. The clutch *s*, applied to a rock-shaft, r, having a hand-lever, G, on it, in combination with the revolving frame, carrying coulter-plows, F, and a crooked axle, D', constructed in front end of the way of said frame, substantially as described.

3. The standards E, pendulated and provided with adjustable stop-pins *p*, in combination with the standard cranks and their

guide, and with lifting-arms b' on a turning plow-frame, substantially as described.

142,095.—Hitching Attachment.—EUGENE CROCKERELL, AUGUSTUS TELMAR, and EDWARD L. VANDERBURG, San Francisco, Cal. Application filed March 29, 1873.

Claim.—The hook-head top and loop attachments, constructed as follows: The movable loop L, either loose or forming part of the top I, provided with screw b and plate g or nut n, in combination with the adjustable ring R, in connection with the hook-head top I, substantially as and for the purpose hereinbefore set forth.

142,096.—Milking-Tube.—JOHN H. DEERING, Milwaukee, Wis., assignor to MCCORMICK, STEVENS & Co., same place. Application filed May 13, 1873.

Claim.—The composition of the several ingredients and the mode of manufacturing the brick, substantially as described.

142,097.—Apparatus for Renovating Velvet, &c.—MARY J. DEWEY and JAMES T. DEWEY, West Troy, N. Y., assignees of one-third their right to HARRIET MARIA DEWEY, same place. Application filed March 3, 1873.

Claim.—The combination of the vertical inspirator-pipes with the steam-chamber and the horizontally-perforated top, substantially as and for the purpose specified.

142,098.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination of the steam-generator A, having the annular flue a, the steam-chamber C having the perforated top d, tube-receiving plate e, tubes g, two-way valve-pipe F, and vaporizing-passage A, with or without the diameter H, substantially as described.

142,099.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination of the adjustable cover or covers I, having the tube or tubes g g, and cylinder, having k with the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,100.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,101.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,102.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,103.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,104.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,105.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,106.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,107.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,108.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,109.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,110.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,111.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,112.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,113.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,114.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,115.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,116.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,117.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,118.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,119.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,120.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,121.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,122.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,123.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,124.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,125.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,126.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,127.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,128.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,129.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,130.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,131.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,132.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,133.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,134.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,135.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,136.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,137.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,138.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,139.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,140.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,141.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,142.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,143.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,144.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,145.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,146.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,147.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,148.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,149.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,150.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,151.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,152.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,153.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,154.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,155.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,156.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,157.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,158.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,159.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,160.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,161.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,162.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,163.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,164.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,165.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,166.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,167.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,168.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,169.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,170.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,171.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,172.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,173.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,174.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,175.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,176.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,177.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,178.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,179.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,180.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,181.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,182.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,183.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,184.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,185.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,186.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,187.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,188.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,189.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,190.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,191.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,192.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,193.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,194.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,195.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,196.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,197.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,198.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,199.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,200.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,201.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,202.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,203.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,204.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,205.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,206.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,207.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,208.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,209.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,210.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,211.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,212.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,213.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,214.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,215.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,216.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,217.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,218.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,219.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,220.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,221.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,222.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,223.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,224.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,225.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,226.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,227.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,228.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,229.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,230.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,231.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,232.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,233.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,234.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,235.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-chamber C, having the perforated top d, and tube or tubes g g, substantially as described.

142,236.—Steam-Generator.—ALONZO S. GEAR, Boston, Mass. Application filed May 1, 1873.

Claim.—The combination, with the steam-generator A, having the annular flue a, the steam-ch

142,111.—Mowing-Machine.—WILLIAM A. KIRBY, Auburn, N. Y., assignor to himself and DAVID M. OSBORNE, same place. Application filed March 21, 1873.

A shoe cast with the main frame has inner projections, to which the inner end of the finger-bar is pivoted; said projections also serve as guides to a pendulum which supports the inner end of the cutter.

Claim.—1. The main frame, constructed as set forth, having the shoe a rigid part thereof, and having points of support for the pole, the lifting-lever, and the hinged finger-bar, substantially as described and represented.

2. The combination of the main frame, the finger-bar hinged to the main frame, the cutters, the hanger, pitman, and the guides, as and for the purpose described and represented.

142,112.—Wood-Screw.—AUSTIN S. LADD and CYRUS N. CORNING, Concord, N. H. Application filed April 22, 1873.

German twist-bit combined with thread of screw.

Claim.—As a new article of manufacture, a wood-screw provided with the cutter *b*, groove *c*, and point *a*, combined and operating as shown.

142,113.—Plow-Scraper.—HIRAM LEACH, Camanche, Iowa. Application filed July 9, 1873.

The land-side is hinged at the rear of the plow-point, so that the adjustment of the angle of the mold-board with the land-side always leaves the point and mold-board in a rigid and continuous line. The adjustment is effected by overlapping perforated braces secured by bolts and nuts.

Claim.—1. The arrangement of the hinged joint C at the heel of the plow-point B, in combination with the adjustable land-side A, substantially as described and shown.

2. The combination of the adjustable land-side A, plow-point B, hinged joint C, braces D D, and mold-board E, all arranged substantially as described and shown.

142,114.—Brick-Machine.—JOHN N. MCLEAN and JOSEPH BENNOR, Philadelphia, Pa. Application filed July 12, 1873.

Horizontal mold-wheel and beaters to impact the clay at each intermission of the revolution; also, a grooved support for the pulleys to pass through and rest upon at the moment of receiving the blows, and depending arms to remove the bricks.

Claim.—1. A horizontal mold-table having its molds arranged equidistant from each other, and in the same relative positions to the center, in combination with a series of hammers arranged to correspond as set forth, so that each mold can receive the different hammers in turn.

2. In combination with the mold-table C and its spur-wheel I, and with the hammers M connected to the levers N, the wheel I provided with the teeth or ribs *g* and the pins *f*, whereby the table is given an intermittent movement, and the hammers operated at the proper intervals, as set forth.

3. In combination with the sliding mold-bottoms, supported on rollers, the grooved support H, arranged to sustain the bottoms and relieve the rollers from the blows of the hammers, as set forth.

4. In combination with the mold-wheel, the open-bottomed case L, extending outward from the bottom of the pug-mill, substantially as described, to insure the fitting of the molds, as set forth.

5. The case L, in combination with the mold-table and the hammer M, arranged to strike through the end of the case, to force the clay into the molds, as set forth.

6. The mold-wheel, in combination with the cylindrical head P, provided with spiral blades for dressing and finishing the upper face of the bricks, as set forth.

7. The rocking-frame S, provided with the depending arms *m*, *n*, and *o*, and with the sliding rod *s*, in combination with the cams *r* and *u*, when arranged to operate as described, for the purpose of removing the brick.

8. The shaft, provided with the head P at one end and the brush R at its opposite end, in combination with the horizontally-rotating mold-wheel, as herein set forth.

142,115.—Horse-Power.—EPHRAIM G. MCMILLAN, Berlin, Ohio. Application filed November 30, 1872.

Claim.—The section A, provided with the central depression F, with vertical rollers G and balls H, in combination with the step I and section B, the several parts being constructed and arranged for operation substantially as and for the purpose specified.

142,116.—Machine for Splitting Wood.—ROBERT MURRAY, New Castle, Del. Application filed August 7, 1873.

Reciprocating knives traverse the boxes in which the material is held, and split the wood from the top.

Claim.—1. The combination of the geared cog-wheels O O with the pivoted head-blocks R R, shaft or guide-rod S, bar U, sliding knife-blocks V V, and the engaged arms, knives, or cutters T T, substantially as and for the purposes hereinbefore set forth.

2. The combination, with the geared cog-wheels O O, pivoted head-blocks R R, shaft or guide-rod S, bar U, sliding knife-blocks V V, and the engaged arms, knives, or cutters T T, of the feed-table F, ratchet-bar H, ratchets I and J, driving-pawl M, and holding-pawl N, levers K and Q, and the rod L, substantially as and for the purposes hereinbefore mentioned and set forth.

142,117.—Composition for Coating Wood and Iron.—E. FREEMAN PRENTISS, Philadelphia, Pa. Application filed July 28, 1873.

Claim.—The composition consisting of a solution of gum shellac mixed with the oxide of iron, plumbago, lamp-black, and verdigris or Brunswick green, substantially as and for the purpose specified.

142,118.—Stocking-Supporter.—EVA K. RAND, Boston, Mass. Application filed June 12, 1873.

Claim.—1. The stocking-supporter composed of the waist-band A, the four buckles *a a a a*, the two straps B B, the rings D D, and the straps C C, provided with the buckles *b b b b*, all arranged and applied together as shown and described.

2. The four buckles *f f f f*, the straps S S, and the waist-band A, all arranged and applied together as shown and explained.

142,119.—Machine for Separating Cockle, &c., from Wheat.—GEORGE H. RICH, Geneva, Ill. Application filed February 4, 1873.

The grain is fed into a revolving inclined perforated cylinder at one end and passes out at the other, while the cockle-berries and small seed separated therefrom pass through the perforations, and are carried off by the endless apron held up closely against the outside of the cylinder.

Claim.—1. The perforated cylinder A, constructed substantially as described, in combination with the endless apron B, substantially as and for the purpose specified.

2. The chamber E, into which project the mouth or mouths *a* of the cylinder, in combination with said cylinder, provided with the internal inclined feeding-vanes *b b'*, or their equivalents, substantially as specified.

142,120.—Cock for Controlling Discharge Through Two Pipes.—JOHN RICHARDSON and THOMAS D. RICHARDSON, New York, N. Y. Application filed November 16, 1872.

The relative amount of discharge is regulated by the conical plug, the passages therein being cut of axial line. The positive amount is controlled by a central spindle within the plug.

Claim.—1. The herein-described cock, having its barrel provided with the passages *a* and *b*, and its plug provided with the throats *c* and *d*, when arranged substantially as shown and described, whereby the relative discharge through the two openings may be varied, as set forth.

2. In combination with a cock constructed substantially as herein described, the central spindle C, for regulating the size of both throats.

142,121.—Machine for Sawing Wood.—IVER G. RIEGSTAD, Decorah, Iowa. Application filed June 28, 1873.

A reciprocating saw so arranged as to operate by the foot or hand of the operator, through the medium of a crank and treadle.

Claim.—1. The horizontal lever E, in combination with the fly-wheel D, shaft *d*, crank *d'*, reciprocating rod *e*, connecting-rod *g*, and slide *h*, for operating the saw-frame F, substantially as and for the purpose set forth.

2. In combination with the mechanism E, D, *d*, *d'*, *e*, *g*, and *h*, the saw-frame F pivoted to the slide *h*, which imparts to it a reciprocating motion, guided by the lateral guide *i* or its equivalent, substantially as and for the purpose set forth.

3. The mechanism for lifting the saw-frame F, consisting of the bar G and projection *l*, in combination with the L-shaped lever H, arranged and operating substantially as and for the purpose set forth.

142,122.—Cock.—H. SCHUYLER ROES, Chicago, Ill. Application filed January 8, 1873.

A supplemental valve attached to the rod of main valve closes the cock while packing is renewed.

Claim.—The stem S provided with valves V and W, in combination with the eccentric crank C, screw-shank D, and chamber A, substantially as and for the purpose set forth.

142,123.—Pump.—EDWARD G. RUSSELL, Ravenna, Ohio. Application filed May 28, 1873.

The brake is attached to the piston-rod by a link, and the latter is connected to the standard by an arm, to insure true vertical motion of the rod and plunger.

Claim.—The link E and arm F, in combination with the handle C and rod B, in the manner as and for the purpose set forth.

142,124.—Registering Ballot-Box.—JAMES S. SAVAGE, Kingston, N. H. Application filed July 11, 1873.

The vote is received between two rollers, one of which carries an inked canceling-stamp for marking the vote or ballot, and is revolved by a crank, once for each vote. A tripping-lever, operated by the printing-roller, moves one tooth of a counting-register at each revolution, for indicating the whole number of votes entered.

Claim.—In combination with a ballot-box, one or more graduated dials, I K L, provided with an index, S, and operated by the revolution of the printing or canceling cylinder D, substantially as and for the purpose set forth.

142,125.—Process of Ornamenting Glass.—CHARLES SCHUSSLER, New York, N. Y. Application filed March 6, 1873.

Attaches silver or other leaf to transfer-paper; then prints design in colors directly on the leaf; then cements the leaf to the inside of the glass; and finally removes the paper by saturation, in the usual manner.

Claim.—The process of preparing and applying transfer ornamental designs to glass, substantially in the manner herein described, for the purpose set forth.

142,126.—Fishing-Rod Holder.—FREDERICK SENEUR, Mount Sterling, Ky. Application filed April 24, 1873.

To fasten into the bank to sustain the rod.

Claim.—A fishing-rod holder, consisting of the tubes A and B, in combination with the stake C, substantially as described.

142,127.—Rein-Guide for Vehicles.—ALPHEUS D. SMITH, Grafton, Ohio. Application filed February 17, 1873.

Claim.—The rein-guard B, applied to the shafts A, substantially in the manner shown and set forth.

142,128.—Pressure-Gage.—GEORGE SEWELL, Brooklyn, assignor to WILLIAM KING PHILLIPS, New York, N. Y. Application filed December 17, 1872.

The steam-pressure, acting on a mercury-chamber, transmits through a differential piston its fluctuations to a short mercury column, the indication being given on a circular dial by means of a rotating index in gear with the piston. Provision is made to prevent the escape of the mercury through any change in the position of the gage.

Claim.—1. Mercury A, amalgam *c*, air-space *c'*, and differential pistons *f g*, in combination with the arm *i* and rod *j*, substantially as herein described, for the purpose of imparting motion to mechanism, whereby the pressure of steam may be indicated.

2. The floating valve *b*, arranged substantially as described, in combination with the chambers *c*, for the purpose set forth.

3. The chamber *c*, with its plug *p* and passages *r r r*, constructed and arranged substantially as shown and described, to retain the mercury but allow communication with the atmosphere.

4. The strand of yarn or other fibrous material through the tube *e*, substantially as and for the purpose herein described.

142,129.—Car-Roof.—JACOB B. SLICHTER, Chicago, Ill. Application filed April 12, 1873.

The V-shaped rib is made of elastic material, and the end-plates are L-shaped.

Claim.—In combination with the felting C C', elastic rib B and V-shaped strip D, the angle-plates E F G and cement H, all arranged substantially as and for the purpose specified.

142,130.—Fire-Proof Roofing-Cement.—JACOB B. SLICHTER, Chicago, Ill. Application filed June 24, 1873.

Asphaltum, one hundred pounds; residuum-oil, six gallons; water-glass, nine gallons; oxide of iron, forty-five pounds; ground soap-stone, forty pounds. Heated, mixed, and applied to felt.

Claim.—The fire-proof roofing-cement composed of the ingredients specified, and mixed in or about the proportions as described.

142,131.—Circuit-Closer for Railway-Signaling Apparatus.—HENRY W. SPANG, Reading, Pa. Application filed April 1, 1873.

Conducting-wires brought to metal plates, insulated from each other on a base; circuit completed by a roller, connected to track-lever, being lifted onto the conductors and metallically connecting them.

Claim.—1. The combination, in a circuit-closer to be operated by a lever or a lever and a spring presser-bar, as set forth, of an insulated foundation, with metallic conducting-pieces arranged thereon, and metallic roller or rollers for electrically connecting the same, substantially as set forth.

2. The metallic rails or conductors O O^1 O^2 or O^3 O^4 O^5 O^6, in combination with the insulating-plate N, the guide rod P, the sleeve Q, the roller-head R, and the roller R', as and for the purpose shown and described.

3. The combination of the electro-magnets T^1 T^1 T^2 T^2, the armature-lever U, the armatures U^1 U^2, and the springs V^1 V^2, substantially as and for the purpose shown and described.

142,132.—Weather-Threshold.—JAMES P. STARK, Morrisonville, Ill., assignor of one-half his right to JAMES F. SIMPSON, same place. Application filed May 26, 1873.

The threshold is covered by an angular metallic strip, fitted and hinged thereto, which is raised against the beveled edge of the door as it closes, by a curved projection carried on a concave metallic plate affixed to the lower edge of the door.

Claim.—In combination with a hinged weather-strip, *d*, and a cam-shaped device, A, a plate, *f*, adapted to be affixed to a door, which, when so applied, shall present an internal curved flange the whole width of the door, substantially as shown and described.

142,133.—Cutter-Head for Drilling-Machines.—EDWARD WEICKE, Philadelphia, Pa. Application filed June 18, 1873.

The cutters are fastened by the stirrups E to the face of the carriers B, sliding in slots in the head A, and adjusted toward or from the center by screws B' working through the ends of the head, and held in the carriers by screws *c* setting into an annular groove formed in the end of the screw.

Claim.—The cutter-head A, in combination with the carrier B, flanged cap C, bolt *c*, adjusting-screw B', tool D, and the stirrup E, as and for the purpose shown and described.

142,134.—Lantern.—WILLIAM WESTLAKE, Chicago, Ill. Application filed July 28, 1873.

Globes of differing size are held firmly in place by screwing down upon them a metallic collar fitting into the head of the lantern, and supported with pins, which work in diagonal slots in the lantern-head.

Claim.—The globe-holder C, provided with the pins or lugs *b b'*, in combination with the dome A, provided with inclined slots *a*, substantially as and for the purpose specified.

142,135.—Car-Replacer.—AMOS WHITTEMORE, Cambridgeport, Mass. Application filed February 7, 1873.

The hinged apron B' drops upon the ground and forms an inclined plane for the ascent of the wheel from either side.

Claim.—The hinged apron B', in combination with the V-shaped flanged replacer, substantially as described.

142,136.—Plow.—EDWARD WIARD, Louisville, Ky., assignor to BENJAMIN F. AVERY, same place. Application filed July 19, 1873.

Peculiar devices for bracing and strengthening.

Claim.—1. The brace-rods *c c*, extending from the clevis-bolt *b* to a bolt, *j*, and connected by braces *k k* to the beam-handle D', said brace-rods and connecting-rods being spread, substantially as described.

2. The clasps *n n*, constructed with lips and tubes, as described, and secured to the beam-handle D' by means of a bolt to which the rods *k k* are attached, substantially as described.

3. The flanged clamps *d d*, constructed with tubes d^2 d^2, and confined at the bend of the beam A by means of a bolt, *j*, to which the rear ends of the truss-rods *c c* are connected, substantially as described.

4. The brace g^2, bent at g^3 and g^4, and connected to the mold-board, the standard, and the beam-handle, substantially as described.

5. The spreader-brace g^1, connected to the handle D D', and having bolted to it the mold-board B, substantially as described.

142,137.—Machine for Driving Brush-Handles.—JOHN AMES, Jr., Lansingburg, N. Y. Application filed July 19, 1873.

The handle is held between two blocks notched at their inner ends, and their outer ends are hinged to two inclined arms that are pivoted to bolts, adjustably attached to the sides of the frame. To the bed of the frame is attached a slotted tube, in the slots of which slides a cross-bar attached to an encircling ring. From projecting lugs on said ring extend upward cords that connect with the bow-spring; the handle rests on said cross-bar, and the spring allows the cross-bar to descend as the handle is driven down.

Claim.—1. The notched and hinged blocks M, the hinged and pivoted arms N, and adjustable bolts O, in combination with the slotted frame C and the driver L, for holding the brush-handle while being driven, substantially as herein shown and described.

2. The guide U, cords V, and spring Y, in combination with the slotted tube T and driver L, for holding the brush-handle while being driven, substantially as herein shown and described.

142,138.—Shingle-Machine.—ALANSON ANDERSON, Chadwick's Mills, N. Y. Application filed July 5, 1873.

Two vibrating bolt-carriages are so arranged as to present the shingle-bolts alternately to the opposite sides of the saw.

Claim.—1. In a shingle-sawing machine, the combination, with the block-holding frames C, pivoted to the frame at b^2, and rigidly connected with the slotted levers *k*, of the crank-shafts *f f g g*, and the mechanism for rotating said shafts, all constructed and arranged as shown and described, whereby a vibratory movement is imparted to the said frames alternately, as set forth.

2. The combination of the slide-piece *l*, provided with pin P, and slotted elbow-lever *m*, with the pivoted horizontally-vibrating frame C, the fixed lug O, and the tilting platform D, all constructed and arranged as shown and described.

142,139.—Harvester-Rake.—JOSEPH K. AUGSPURGER, Trenton, Ohio. Application filed April 2, 1873.

A vertical post, attached to a horizontal beam over the rear of a rectangular platform, has attached to its lower pendent end a revolving plate, which has slots and flanges, by means of which the rake is guided in its movements over the platform.

Claim.—The construction and arrangement of the shaft *c*, slotted crank-plate E, the diagonal bar G secured thereto, the levers H H', wrists *i i'*, cams K L M, the bracket C, standard *g*, rod D, rake E, with its pin A projecting through the slot *f* of the crank-plate, and pivoting it to the bar F, and the links I I', with relation to the girt *b* and platform A, substantially as and for the purpose set forth.

142,140.—Ventilator.—JOHN BALLOU, Boston, Mass. Application filed April 26, 1873.

A revolving frame in the form of a cross, having attached thereto plates of wire-gauze and plates of glass, so that whatever position of the ventilator the light is never excluded.

Claim.—The improved revolving ventilator formed of the perforated plates *d d* and glass plates, attached to the frame *a* at right angles to each other, and radiating from the axis terminating in the pivots *b b*, as shown and described.

142,141.—Fire-Escape.—PETER W. BARNES, Albany, N. Y. Application filed July 26, 1873.

A folding platform forming the cover of a box placed beneath a window, which, in case of fire, can be unfolded and made a safe

means of exit in connection with a rope-ladder contained within the box. The platform or balcony is surrounded by folding railings, and is held securely in position by spring-arms I having the steps K. Descent is made through the opening *g*.

Claim.—The hinged plates E F G, the hinged railings H, the pivoted arms I, the springs J, steps K, and catches L, with each other and the box C D, to adapt them for use, substantially as herein shown and described.

142,142.—Car-Coupling.—LUMAN D. BENNETT, Willimantic, Conn. Application filed April 26, 1873.

The coupling is designed to be automatic.

Claim.—An improved car-coupling formed by the combination of the sliding slotted block C, coiled spring D, U-shaped pin F, lever G, sliding block H, and the draw-head A, substantially as herein shown and described.

142,143.—Pipe-Tongs.—JAMES R. BROWN, Cambridgeport, Mass., assignor to himself and HAREN P. HUNTOON, same place. Application filed March 15, 1873.

The bolt that forms the pivot is connected to the toothed lever, and is supported at two points by passing through the yoke.

Claim.—In pipe-tongs, the yoke E, the screw D, (whether single or double, as set forth,) the fulcrum-pin C, the toothed lever B, and the slotted and hooked lever A, constructed, arranged, and combined substantially as specified.

142,144.—Bake-Pan.—WILLIAM B. CHAMBERLIN, Westfield, N. J. Application filed May 5, 1873.

Claim.—The case K, slotted at M, ribbed at N, and apertured at O, in combination with a baking or roasting apparatus, as and for the purpose described.

142,145.—Spring Rocking-Chair.—FRANKLIN CHICHESTER, Milwaukee, Wis. Application filed June 14, 1873.

The plate-springs that form the rockers for the chair are continued at the rear of the seat up to about the center of the back, said back being pivoted to the rear ends of the adjustable arms.

Claim.—The plate-springs B B, attached to the front of seat at G, to the rear at H, and to the middle of back D, in the manner and for the purpose described.

142,146.—Grate-Bar.—GEORGE H. CLARKE, Brooklyn, N. Y. Application filed July 15, 1873.

A center or supporting bar constructed with projections on both sides, forming a dovetail, into which the side bars are locked longitudinally, thereby forming a set.

Claim.—In combination with the bar B, provided with the lugs *a a* and longitudinally-locking lugs *b b*, the bar A, provided with the locking-lugs *c c* and stops *d d*, constructed and operating substantially as described and specified.

142,147.—Fruit-Drier.—ISAAC B. COTTRELL, Bridgeville, Del. Application filed May 19, 1873.

Substances to be dried are placed on an endless belt of netting, which carries them over a furnace. An air-chamber is interposed between the furnace and endless belt to prevent burning. Ventilation is controlled by valves and pivoted slats.

Claim.—The hot-air chamber D, provided with pivoted slats *d d* and valves *e e*, and having the endless netting H passing through it, in combination with the furnace A having air-chamber *f*, the flue B, and chimney C, all constructed and arranged substantially as and for the purposes herein set forth.

142,148.—Fruit-Crate.—DANIEL CRANE, Saginaw, Mich., assignor to himself and CHARLES A. LEE, same place. Application filed June 28, 1873.

Slats are strung together at their ends and middle by strands of wire or cord passed over and under and twisted between them, the whole passed around disks or barrel-heads at both ends, and the end slats hooked together.

Claim.—The combination, with a series of staves arranged in grooves of heads B, of the flexible binders C and gripers E, as and for the purpose described.

142,149.—Wooding-Hoe.—HENRY S. CROSSLAND, Dresden, Tex. Application filed May 17, 1873.

Claim.—A hoe-blade, A, formed with an inclined forward or cutting edge, substantially as herein shown and described.

142,150.—Railroad Water-Crane.—HENRY S. CUSHERLEY and DAVID MANN, Bloomington, Ill. Application filed June 14, 1873.

The valve is operated by a screw supported on the outside of the delivery-pipe, and connected to a pinion which gears in a rack-bar formed on the valve-rod.

Claim.—1. A railroad water-crane consisting of the column B, interior tube D, rack H, pinion P, arm Q, bar S, screw R, valve-chamber I, valve E, and valve-rod G, arranged to operate substantially as shown and described.

2. The screw R, in combination with the rack and pinion H P, rod G, and valve E, for the purposes described.

142,151.—Arithmetical Frame.—EDWIN T. CURTIS, Calumet, Mich. Application filed May 17, 1873.

Bands with figures upon them are interwoven to form a regular warp-and-woof lattice. Each band of the said warp and woof has its ends fastened to make an endless band, and can be slipped, respectively, in a horizontal or vertical direction, so as to bring new figures into view.

Claim.—1. The means described for combining numbers for arithmetical instruction, consisting of the endless movable bands interwoven to form a lattice, upon which the said numbers appear, substantially as set forth.

2. In a number-lattice, constructed substantially in the manner described, the movable stripe E, either blank or having the arithmetical signs upon them, for separating said numbers into arithmetical examples, substantially as described and shown.

3. The combination of the wires D, carrying the movable beads, with the frame C and number-lattice, as and for the purpose set forth.

142,152.—Rotary Puddling, Melting, and Heating Furnace.—SAMUEL DANKS, Cincinnati, Ohio. Application filed May 1, 1873.

Claim.—1. The cylinder of a rotating puddling, heating, or melting furnace, constructed of separate staves *b* with hollow ribs and wrought-iron bars cast in the said ribs, substantially as herein set forth, for the purpose specified.

2. The end rings b^2 for securing the said staves, constructed in one piece with the end plates b^3, as shown in Fig. 2, or secured to the said end plates by bolts or rivets, as shown in Fig. 4^a, for the purpose specified.

3. The fixed rings *c h i*, Fig. 2, in combination with the channel for keeping them constantly supplied with water or other cooling fluid, substantially as herein set forth.

4. The fire-brick, or its equivalent, and the lining or felting compound, described herein, for protecting the interior of the shiftable piece *g*, in combination with the shelves g^2 in the interior of said shiftable piece, for the purposes described.

5. The adjustable props *j*, or their equivalents, constructed to be used in combination with the said shiftable piece, substantially as herein set forth, for the purpose specified.

6. In combination with the rotating cylinder *b*, the adjustable blocks or brackets *m'* carrying the rollers, substantially as herein set forth, for the purpose specified.

142,153.—Diamond Millstone-Dressing Machine.—FREDERIC S. DAVENPORT, Jerseyville, Ill. Application filed May 21, 1873.

The sliding plate and sliding bar, both provided with guiding-slots, and fitted with guide-blocks pivoted to the bed-plate beneath, are pivoted or hinged together by means of a slotted plate fitted with a fastening-screw, so that they may move unitedly, and admit of horizontal angular adjustment to each other. The sliding plate has a sliding block at one edge, on which the diamond-holder moves.

Claim.—1. The sliding plate B and sliding bar C, provided with the guiding-slots *b b'*, the said parts being hinged or pivoted together for united operation, substantially as and for the purpose specified.

2. The diamond-holder F, pivoted to the sliding block T, in combination with the adjusting-screw O.

3. The diamond millstone-dressing machine producing the curvilinear motion described by means of two straight guide-slots made so as to admit of horizontal angular adjustment to each other, for the purpose specified, the said guide-slots being arranged either in the sliding parts B and C or in the bed-plate A.

142,154.—Sawing-Machine.—JAMES EACHUS, Contesville, Pa. Application filed February 23, 1872.

A sawing-machine table is so arranged as to run on tracks placed at right angles to each other.

Claim.—The combination of shaft D, shaft F, saws S S S and C C C, carriage A, and frame E, for the purpose of cutting binders' and box-makers' paper, substantially as shown and described.

142,155.—Gas-Regulator.—CHARLES H. EDWARDS, Chicago, Ill., assignor to LEVI C. BOYINGTON, same place. Application filed May 17, 1873.

The diaphragm is clamped between the hemispheres of which the casing is composed, and consists of a disk of hair-cloth, upon each side of which is a thin layer of cotton. The whole is held in place by disks of fine wire-cloth. A metallic plate rests upon the diaphragm, from which a governing-weight is suspended.

Claim.—1. The combination and arrangement, in a gas-regulator, of the diaphragms D, layer E, and weighted valve G, all substantially as and for the purposes specified.

2. The combination and arrangement, in a gas-regulator, of the diaphragms D D and F, layers E E, and weighted valve G, all substantially as and for the purposes specified.

3. As a new article of manufacture, a gas-regulator consisting of the parts A' and A'', diaphragms D, layer E, and weighted valve G, all constructed and arranged together, substantially as shown and described, and for the purposes set forth.

142,156.—Picture-Hanger.—FRANKLIN W. ELY, Du Luth, Minn. Application filed March 1, 1873.

The web is attached to the frame at two points, one near the top of the frame, and the other below the center. The web is double at the lower point, and passes through a metal slide having two slots. One part of the web extends to the supporting-ring and the other part connects with the upper portion of the frame.

Claim.—The web B, end-fastened at C D, passing double through slots or plate G, and then separating, the one part I going straight to point D, while the other part H is elongated and connected with the ringed wall-cord F, as and for the purpose described.

142,157.—Implement for Uncapping, Capping, and Charging Cartridges.—WILLIAM M. FOWLER, Brooklyn, N. Y. Application filed April 3, 1873.

Claim.—1. The combination of the perforations a^7 a^7, formed in the bearing-flanges a^6 a^6 of the shank A, with the coinciding perforation d^2 formed in one arm of the compound lever D D', for the purpose specified.

2. The combination of the shank A, provided with the forming-channel a^5 and gage-stud a^4, and the crimping-roller F, having an annular convex surface, *f*, with the compound lever D D', constructed, arranged, and operating substantially as described, and for the purpose specified.

3. In combination with the compound lever D D' and shank A, the trimming-knife attachment K, for the purpose specified.

142,158.—Rice-Cleaner.—DAVID L. GEER, Lake City, Fla. Application filed May 5, 1873.

A bulge in the case near the top forms a cavity, into which the grain is forced by the upwardly-moving blades employed for agitating the grain, where the removal of the hull is finished.

Claim.—1. The blades F F, each spirally-arranged on shaft at opposite ends, on opposite sides, and turned in opposite directions to throw the grain upward, backward, and forward, in the manner described.

2. The combination, with spiral grain-gathering blades F, of the cylinder A having the bulge C, as and for the purpose set forth.

142,159.—Hoe.—JACOB H. GOULD, Rutland, Ohio, assignor of two-thirds his right to HORACE HOLT, same place. Application filed July 25, 1873.

Claim.—The recessed blade 1, in combination with the eye 2 having the brace 5, and transverse slots 3 to receive the edges of the recess in the blade, substantially as shown and described.

142,160.—Check-Runner.—JOHN HAGGERTY, Corry, Pa. Application filed August 12, 1872.

Claim.—In combination with a check-runner having a base-block, B, provided with pins or projections, a screw and washer, as described, whereby the runner may be attached to the head-piece of a bridle, as set forth.

142,161.—Rubber Sole for Boots and Shoes.—DANIEL E. HAYWARD, Malden, Mass. Application filed April 8, 1872.

Claim.—1. A sole formed of a vulcanizable compound of rubber and vulcanized on its lower surface, as above described.

2. The method above described of manufacturing boots and shoes of rubber, consisting in vulcanizing the lower surface of the sole before applying it to the upper, and uniting the sole so formed to the upper by vulcanizing them together, all as and for the purposes above described.

142,162.—Candlestick.—SAMUEL D. HILL, Downieville, Cal. Application filed May 24, 1873.

The candle-socket is made in two parts, held together by a band-spring.

Claim.—The socket E having detachable part E', to be adjusted to candle by spring *e* having slot *g* and lug *g'*, as described.

142,163.—Chuck.—ELI HORTON, Windsor Locks, Conn. Application filed July 26, 1873.

A chuck-jaw having a raised seat on its face and a groove at the junction of the face and biting portion to admit of accurate grinding.

Claim.—As an improvement in chucks, the jaws B, which grips the work placed between them, provided with raised seats *a* on the face part of the same and grooves *b* for rounding off the corners of the face and bite parts, to hold the work perfectly true, and allow the accurate grinding of seats *a*, substantially as set forth.

142,164.—Griddle.—SAMUEL KENNEDY, Allegheny City, Pa. Application filed December 31, 1872.

The upper surface is imperforate. A flange, entirely surrounding the griddle, and provided with a damper, depends from the edge.

Claim.—As an article of manufacture, a griddle having flange B, with adjustable damper C, arranged as and for the purpose described.

142,165.—Chandelier-Center.—JOSEPH KINTZ, West Meriden, Conn., assignor to himself and P. J. CLARK, same place. Application filed May 31, 1873.

A concavity in the lower part of the chandelier-center and a nut upon the stem prevent the separation of the parts during adjustment. The arms have each two projections, the upper one having a hook which bears upon the depending interior flange of the upper section, and the lower one a beveled edge, against which the lower section wedges. The center rod is prevented from turning by a pin, which passes through it and fits in notched projections upon the bar across the center ring or section.

Claim.—1. The combination and arrangement of the parts A, B, and C, knob W, nut V, and the rod D of the chandelier-center, in such manner that the part A can be lowered away from parts B and C sufficiently to introduce and remove the arms without being removed from the rod D; also, so that said part A will be retained when the knob is removed from the rod.

2. The arms E, secured to the center by the upward-projecting hook at the upper side and the inward-projecting hook on the under side, substantially as specified.

3. The arrangement of the notch I in the lower edge of ring B for the hook H, in combination with the upper hook and its fastening devices, substantially as specified.

4. The arrangement of the projecting flange D on the under side of the upper part of the center, in combination with the hooks K and ring B, substantially as specified.

5. The rod D, secured to the center by the pin M and notches *a* in the bar L, to prevent turning by the nuts, substantially as specified.

142,166.—Steam-Whistle.—OTTO KROMER, Sandusky, Ohio. Application filed April 2, 1873.

The bell consists of a fixed open cylinder and a slightly-larger cylinder closed at one end, which slides over the first. This makes a sounding-tube, the length of which may be varied, thus giving different tones.

Claim.—1. The combination of the bell C and rod D with the bell B, the bell C being adapted to slide into the bell B, as described.

2. A telescopic whistle wherein the bowl A and bells B and C are constructed and arranged to operate substantially as and for the purposes set forth.

142,167.—Steam-Engine Governor.—ANDERS MATSON, Quincy, Ill. Application filed June 21, 1873.

Upon a too-rapid motion of the engine, or the breaking of the governor-belt the valve is closed by means of the arms on the valve-rod and its top, in contact with which the arms rotate.

Claim.—1. The weighted lever J, and hook K in combination therewith and with the valve-rod, as and for the purposes described.

2. The arms R R, connected with the valve-rod, in combination with the balls N N and levers O O', as and for the purposes described.

142,168.—Mold for Earthen Pipes.—PETER MCINTYRE, Hartford, Conn. Application filed July 16, 1872.

A hollow core made in longitudinal sections, the base being moved downward and away from the core in order to release the foot of the core-sections.

Claim.—The combination of a casing for forming the exterior of the pipe, the table *d*, a hollow core made in longitudinal sections, the cap *f*, and the core-bar *e*, arranged to support the core while a pipe is rammed up, and to move downward and away from the core, in order to release the foot of the core-sections, all constructed and arranged substantially as and for the purposes described.

142,169.—Head-Band.—DANIEL MCKINNON, Wappinger's Falls, N. Y., assignor to ELIAS BROWN, same place. Application filed June 21, 1873.

Claim.—An ornamental head-band provided with hooked teeth, substantially as herein shown and described.

142,170.—Seed-Separator.—FRANK C. MILLER, Blue Earth City, Minn. Application filed May 31, 1873.

A small perforated cylinder within the large one, which first receives the grain and separates the large matters the grain passing through the perforations into the large cylinder.

Claim.—The small perforated cylinder E, suspended by rods F and bearing against the inner side of cylinder A, so as to derive its rotary motion therefrom, as shown and described.

142,171.—Harvester-Rake.—THOMAS MURPHY, Pine Bluffs, Wis. Application filed June 3, 1873.

The rake is raised and lowered, and made to sweep the platform, by means of connections with horizontally-traveling belts passing around pulleys upon vertical shafts.

Claim.—1. The rake K, pivoted in the head O and raised and lowered by the intermittently-revolving crank S, connected by a rod, *p*, with the arm R' of the rake, as and for the purposes set forth.

2. The endless chains I I', carrying the bars N N', in combination with the head O, rod P, and crank S, for the purposes herein set forth.

3. The combination of the platform B, tilting gate C, rake K, endless chains I' I', bars N N', head O, rod P, and crank S all constructed and arranged to operate substantially as and for the purposes herein set forth.

142,172.—Stamp-Mill for Ores.—GILES S. OLIN, Deer Lodge, Montana Ter. Application filed June 21, 1873.

Variable speed and height are given to the stamps by decreasing the size of the pulleys attached to each lower shaft and by reducing the lift of each lower stamp.

Claim.—1. A quartz-crusher, having the stamps driven from a single shaft and with variable speed, substantially as shown and described.

2. A quartz-crusher, having stamps moving with variable speed and raised to variable heights, substantially as shown and described.

142,173.—Machine for Gumming Saws.—SANFORD P. OLNEY, Detroit, Mich. Application filed May 8, 1873.

The swinging arm L, carrying at one end the emery-wheel and at the other a balance-weight, is sleeved onto the counter-shaft I, journaled in the yoke G, the lower part of which forms a hinge-joint with the plate F, turning on a pivot in the vertical sleeve E. This arrangement allows the emery-wheel to be adjusted either horizontally, vertically, or at an intermediate angle.

Claim.—1. The frame A, table B, driving-shaft C, driving-pulley D, standard E, bearing F, yoke G, eye-bolt H, counter-shaft I, pulley J, cord K, arm L, arbor C, pulleys O O′, and belt P, combined and arranged substantially as and for the purposes set forth.

2. The counter-weight M, constructed as described, in combination with the arm L, as shown and set forth.

3. The combination of the slotted segment R and standard S with the guide-arc T pivoted thereto, as and for the purpose described.

142,174.—Automatic Fire-Escape for Safes.—IRA PARKE, Mineral Point, Mo. Application filed March 12, 1873.

Claim.—1. A platform supporting the safe on wheels, and suspended on a pivot at one end, and an explosive or combustible cord or other device at the other end, in combination with a door in the wall of the building and fastening devices therefor, arranged so that the falling of the platform will release the fastenings and cause the door to open, substantially as specified.

2. The said door arranged to constitute a continuation of the track for the safe-truck when open, substantially as specified.

3. The combination of the bolt I, door K, and the platform, substantially as specified.

4. The combination of the catches J with the platform A and door K, substantially as specified.

142,175.—Revolving Fire-Arms.—WILLIAM H. PHILIP, Brooklyn, N. Y. Application filed June 7, 1873.

Claim.—1. The combination of the sliding pawl-bar and a series of pawls with a series of cylinders connected by a stud-pin, J L, and each having a groove, O′, for its pawl arranged in such manner that, when one cylinder is exhausted, it sets the next one in motion, and then itself ceases to rotate, substantially as described.

2. The pawl-bar K, hammer M, and pawls N, combined with the series of cylinders, substantially as specified.

142,176.—Device for Dressing Saw-Teeth.—WILLIAM ROWE, Westerville, Ohio. Application filed June 14, 1873.

The saw is placed in a longitudinal recess in the bed A and held in place by clamp-screws, the end of a tooth resting on an anvil-block, E, held in place in a lateral recess in the bed by a wedge-pin driven in by the side. The point of the tooth resting on the anvil-block is dressed in the usual manner.

Claim.—1. The improved machine for dressing the teeth of circular saws, consisting of clamp A with handle B, set-screws *d*, steel anvil E, and wedge piece *e*, substantially as and for the purposes described.

2. The improved clamp A, having longitudinal recess *a* for saw, and lateral recess *f* for anvil E, as set forth.

142,177.—Reel for Skeining Silk.—ROBERT SIMON, New York, N. Y. Application filed June 23, 1873.

The strands are crossed between alternate pairs of arms on the reel by the thread-guides, which are also traversed back and forth at each revolution of the wheel, to lay the strands in parallel lines between other pairs of arms, the reel-bars being notched to receive the first layer of strands.

Claim.—1. The combination, with a crossing traverse-guide, of mechanism, substantially as described, for shifting it forward and backward to lay the threads side by side throughout the width of the skein, substantially as specified.

2. The combination, in a reel having a crossing traverse-guide, of bars or arms A, provided with notches or grooves B or their equivalent, and mechanism for shifting the guide forward and backward to lay the threads side by side, substantially as specified.

142,178.—Water-Cooler.—THOMAS SMITH, Brooklyn, N. Y. Application filed August 4, 1873.

Claim.—In combination with a water-cooler having a central ice-chamber, B, the liquid-receptacle C provided with an inclined bottom, *a*, and indentation *b*, and having a faucet, *e*, and opening *f*, substantially as and for the purposes described.

142,179.—Railway-Rail.—ROBERT STEEL, Philadelphia, Pa., assignor of one-half his right to JOHN S. RICHARDS and HENRY S. RICHARDS, same place. Application filed July 16, 1873.

A piece of metal, the fiber of which runs transversely, is welded onto the ends of the ordinary rail, to obviate brooming or splitting.

Claim.—A street or other railway-rail having welded to the ends thereof pieces of metal, the fiber of which is at right angles to that of the rail.

142,180.—Steam-Boiler.—CHARLES STEWART, Worcester, Mass., assignor of one-half his right to WILLIAM ALLEN, same place. Application filed July 1, 1873.

The steam is taken by a pipe from the scum-collector, and in its passage it draws the scum into the collector, which is blown off through a cock provided for such purpose.

Claim.—1. The combination, with a steam-boiler, of a scum-collecting chamber connected with the steam-supply pipe, and communicating with the interior of the boiler by openings arranged partly above and partly below the line of water-level, substantially for the purpose set forth.

2. The combination, with the boiler A and steam-supply pipe F, of the scum-collecting chamber C, provided with lateral openings *c*, blow-off cock D, and hand-hole and cap E, substantially as and for the purpose set forth.

142,181.—Low-Water Indicator and Alarm.—FREDERIC STRANGE, Detroit, Mich. Application filed February 16, 1873.

A float with an elongated lower open end, and hollow tube with valve upon it, seating in a chamber above the boiler and connected to an alarm. Connected to the hollow tube is a lever and weight for balancing the float.

Claim.—The vessel D, with open tube D′ attached to the tube E, having valve *b*, in combination with a lever having a counter-balancing weight, substantially as described.

142,182.—Railway-Rail.—JOHN H. WALES, Marlborough, and HENRY S. CUSHMAN, Milford, Mass. Application filed July 16, 1873.

Claim.—The rails *a*, having the recesses *c c* formed in their ends and provided with corresponding projections, so as to overlap and interlock and form a continuous rail, substantially as set forth.

142,183.—Hydraulic Motor.—WILLIAM WALTER, Arkada, Washington Ter. Application filed June 7, 1873.

A vertical cistern and cistern-valve balanced by a weighted lever, so that on floating the water rushes into a horizontal pipe and trough filled with water. The forward motion of the water, in connection with the closing of the cistern-valve, produces a forward motion of the piston-valve at the closed end of the horizontal pipe, which is connected suitably to the machinery to be driven by it.

Claim.—1. The hydraulic motor, consisting of pipe B, in trough A, cistern C, valve E, weighted lever F, piston-valve D, and standards G and H, operated substantially as and for the purpose described.

2. The cistern C, having funnel-shaped entrance *d* for water from flume *e*, guide-rod *h*, and ring *g* at lower end, as set forth.

3. The pipe B, with wider and narrower ends *a b*, and piston-valve D at end *a*, as set forth.

4. The lever F, having spring extension *i* and weight W at one end, and valve E arranged at the other end within the cistern C, as shown and described.

142,184.—Grain-Drier.—RICHARD J. WILLIAMS, Ottumwa, Iowa. Application filed May 5, 1873.

The chambers D and E being subdivided by the partitions *c*, different varieties may be treated simultaneously.

Claim.—1. The apparatus for drying and steaming grain, consisting of receiving-chamber B, heating-chamber C, steam-chamber D, discharging-chamber E, and the tubes F perforated within the chamber D, arranged and operated substantially as and for the purposes described.

2. The connecting-tubes F having that portion within the chamber D perforated for the admission of steam to dampen the grain, as specified.

3. The discharging chamber E having the exit-pipes *f* arranged to correspond with the compartments of the steam-chamber to separate varieties of grain having husks of different textures, substantially as and for the purpose specified.

142,185.—Steam-Bathing Apparatus.—WILLIAM WOLFF, New York, N. Y. Application filed February 20, 1873.

The tub has a double bottom to form a water-reservoir. A pump connected to the reservoir supplies the telescopic tubes. A perforated bottom is placed above the reservoir for the escape of waste water. The cover or inclosure is made of material that may be folded together in the tub after use. A portable steam-generator is connected, through pipes, to the tub, so that it may be placed inside of the tub when not in use.

Claim.—A portable Russian steam-bathing apparatus, consisting of the tub B with water-tight bottoms C and D and perforated bottom or floor F, inlet and outlet pipes A and *m*, the hand force-pump E, and telescopic pipes *b b* and *c c*, and water-roses *d* and *e*, cover G with the string *k*, in combination with the steam-generating apparatus H and pipe *l*, substantially as and for the purpose hereinbefore set forth.

142,186.—Flux for Smelting Ores.—SAMUEL D. YOUNG, Elizabethtown, Ill. Application filed July 5, 1873.

Claim.—As an improved flux for iron, the calcined fluor-spar hereinbefore described.

142,187.—Stalk-Cutter.—VANVLET ASHLEY and JOHN W. WEAVER, Morrison, Ill. Application filed June 28, 1873.

A rectangular frame is mounted upon a pair of wheels in front and a roller near the rear end. A pair of standards rises from the forward end of the frame, to which are pivoted the frames of the cutting-knives. These are raised by cam-pins on the ends of the roller, and fall to the ground by their own gravity.

Claim.—1. In a stalk-cutter, a drop-knife, hinged to the frame by which it is carried, substantially as and for the purpose specified.

2. The combination of the frames E, carrying hinged or oscillating knives, cams H, and revolving studs I, substantially as and for the purpose specified.

3. A series of knife-frames, E, longitudinally adjustable with reference to one another, substantially as and for the purpose specified.

4. The combination of the guide-rods N, crushing-roller C, knife-frames E provided with oscillating knives, cams H, and revolving studs I, substantially as specified.

142,188.—Bobbin-Winding Machine.—WILLIAM ATKINSON, Philadelphia, Pa., assignor to THOMAS WOOD, same place. Application filed February 17, 1873.

The stop is arranged to suddenly arrest the descent of the counter-arm, causing a jerk that frees the tangled yarn.

Claim.—1. The lever *a*, formed with a curved counter-arm, *a′*, in combination with the fulcrum-pin *b* and stop *f*, substantially as and for the purposes set forth.

2. The combination and arrangement of the rail *h*, standards *l e*, bearing *k*, pin *b*, lever *a*, bent counter-arm *a′*, barrels *d d*, and pins *s c′*, substantially as and for the purposes explained.

142,189.—Lamp-Chandelier.—JOHN AULBACH, West Meriden, Conn., assignor of one-half his right to AUGUST PERGAMANN, same place. Application filed July 30, 1873.

A tube depends from the ceiling. A helical spring inside of the tube rests on a collar affixed to the lower end of the tube, and is covered at its upper end by the head of a rod, to whose lower end the lamp-bracket is affixed. By pulling down the lamp-bracket the helical spring is compressed. A set-screw holds the lamps in position.

Claim.—In a lamp-chandelier, the combination of the tube A, the rod C within the tube provided with a head, *a*, the socket D at the lower end of the tube provided with the adjusting device *d*, and the spring E around the said rod within the tube, between the head and the socket D, substantially as and for the purpose described.

142,190.—Thermoscope.—GEORGE F. BARKER, New Haven, Conn., and ALFRED M. MAYER, Hoboken, N. J. Application filed September 14, 1872.

The double iodides of mercury and copper or of mercury and silver, or similar compounds having the property of temporarily changing color when exposed to a certain temperature, are painted on cards or suitable strips, and applied to places where it is desirable that a definite limit of temperature should be readily ascertained.

Claim.—A thermoscope consisting of the application, to points where excessive or required heat is desired to be detected or indicated, of a substance or compound which will by heat change its color, and immediately on the reduction of the temperature return to its original color, either with or without intervening material, substantially as set forth.

142,191.—Refrigerator.—ALFRED RAINDELL, New York, N. Y. Application filed August 7, 1873.

The ice-reservoir is supported, and revolves together with the shelves on a tube leading from it, on rollers at its upper end, which move over a rail on the top wall of refrigerator. An air-chamber around the ice-reservoir receives cold air through perforations in its top and conveys it to the shelves through perforated pipes that support the outer edges of the shelves.

Claim.—1. The revolving ice-chamber C and shelves F, connected together substantially as described, whereby the same can be removed as an entirety out of the case A, as and for the purpose specified.

2. The revolving ice-reservoir C, supporting the shelves F, and air-tubes G, in combination with each other and with the case A, substantially as described, for the purpose specified.

3. The combination, with the ice-reservoir C, of rollers or wheels K, arranged to run upon the top of the refrigerator A, substantially as described.

4. The air-space H, having openings *h* in its wall, so as to communicate with the interior of the ice-reservoir, and provided with perforated air-tubes G, that extend downward into the refrigerator A, substantially as described.

142,192.—Self-Closing Faucet.—WALLACE H. BATE, Charlestown, Mass. Application filed June 9, 1873.

A sleeve is fastened to the spindle, and has two radial projections, in which friction-wheels are placed, which bear on a cam on the screw-cap when the stem is turned, causing it to open the valve.

Claim.—The sleeve E, having one or more arms, D, provided with one or more friction-rolls, C, in combination with one or more inclines, *a b c d*, spindle G, spring I, and a device for connecting the sleeve with the spindle, constructed and operating substantially in the manner and for the purpose set forth.

142,193.—Belt and Rivet Machine.—NAPOLEON BEAUREGARD, San Francisco, Cal. Application filed June 18, 1873.

The cutter and its inclined sliding frame, the guide-way in which they operate, and the tappet (on the transverse shaft) which operates them are adjustable to suit dies of different lengths. After the cutter has passed across the face of the dies and cut off the blank it remains as anvil until the header has performed its function.

Claim.—The adjustable inclined way or guide *b*, with its horizontal portion *d*, the slotted sliding frame E, and cutter *r*, in combination with the transverse shaft *v*, adjustable arm T, fixed crank-arm T′, and cam *f* on the main driving-shaft, substantially as and for the purpose set forth.

142,194.—Piano-Forte.—WILLIAM W. BENNETT, Jersey City, N. J. Application filed January 8, 1873.

A bridge, fast to the iron frame at its ends only, has attached to its under side agraffes in sets of different lengths.

Claim.—1. The wrest-plank bridges M, the sound-board bridges D, and the hitching-blocks or points E, made in separate pieces of different heights, and combined and arranged substantially as and for the purpose shown and described.

2. The combination of the suspension-bridge A with the agraffes B, made of different lengths, or the plates C used in lieu thereof, when constructed and arranged with respect to the metal frame, substantially as and for the purpose shown and described.

142,195.—Coffee-Pot.—WILLIAM S. BLANCHARD and EPHRAIM KETCHUM, Factory Point, Vt. Application filed June 14, 1873.

The conical chamber conveys the liquid which has passed through the ground coffee to the center of the lower portion of the pot, whence it rises in the chamber around the cone and passes up through the spouts.

Claim.—1. In a steeper and drencher, the steeping-cup B, suction-chamber C, perforated plates, spouts A, flannel disk *n*, ledge *s*, and packing-ring *v*, arranged and operating substantially as specified.

2. The steeper consisting of the herb-chamber B, having a perforated bottom, *b*, a depending suction-chamber, C, in the form of an inverted cone open at the apex, the side spouts A rising from the upper portion or base of said cone into the chamber, and the dedecting-plate *e* extending across said chamber over said spouts, substantially as specified.

142,196.—Steam-Boiler for Warming Buildings.—GEORGE W. BLAKE, Brooklyn, N. Y. Application filed May 23, 1873.

Claim.—1. The lower section I′ of the magazine, having an attached surrounding water-chamber, J, both made separate and distinct from the upper portion of the boiler, and said water-chamber being provided with one or more openings to establish communication with the water-space of the boiler, substantially as specified.

2. The sectionally-constructed magazine I I′ and water-chamber J, in combination with the communicating annular steam and water sections E F G H K and the bolts F, essentially as herein shown and described.

3. The annular water-sections G H, constructed to form central fuel reservoir or magazine sections, and provided with water sockets or sleeves connecting them with each other, and with water-sections above and below them, substantially as specified.

142,197.—Fanning-Mill.—LORENZO M. BOARDMAN, Ottawa, Minn. Application filed March 12, 1873.

Screen made in two parts, so that it may be used as a continuous long one or as two short ones. Grain discharged from the upper section into a spout arranged transversely thereto, and receiving a longitudinal vibration from an arm attached to the shaker.

Claim.—1. The screen E, having its upper end or section hinged and arranged to drop down when constructed and arranged to operate as shown and described.

2. In combination with the screen E, the transverse spout I, operated by the rigid depending arm *m*, attached to the shoe or shaker C, as shown and described.

142,198.—Windmill.—HARRY H. BODWELL and EPHRAIM A. ATWOOD, San Francisco, Cal. Application filed July 31, 1873.

The vane is adjusted at any desired angle by two segmental bevel-gears, one of which is secured to the turn-table; the other is mounted on a wrist-pin projecting from the shoe, and is provided with a weighted lever.

Claim.—1. The bevel-gears E and C, mounted, respectively, upon the shoe and the wheel-support of a windmill, having a swinging tail, together with the operating-lever F and the cord or equivalent connection H, substantially as and for the purpose herein described.

2. The bevel-gear E, turning upon a wrist-pin projecting from the side of the shoe of the swinging tail E, and provided with the lever F and the weight G, for the purpose of turning the gear E and throwing the tail to an angle with the wheel-axis by operating upon the stationary gear C upon the wheel-support, substantially as herein described.

3. The locking device consisting of the pin J, with its operating lever or spring K upon the wheel-support and the plate M, with its perforations *n*, secured to the shoe of the tail E, substantially as and for the purpose described.

4. The cord O, in combination with the pin J, with its operating lever or spring K, and the perforated plate M, for the purpose of unlocking the device and allowing the tail to turn, substantially as herein described.

142,199.—Manufacturing White Lead.—ERNST A. BOEHME, St. Louis, Mo. Application filed April 12, 1873.

Claim.—1. Pig-lead converted into a granular state to produce the acetate of lead herein described, and for the purpose set forth.

2. Combining with the acetate of lead at one and the same time oil of vitriol, sal-soda, and ammonia, as and for the purpose set forth.

142,200.—Apparatus for Emptying Cellars, Water-Closets, &c.—REINHOLD BOEHLER, Brooklyn, assignor of one-half his right to JAKOB FUCHS, New York, N. Y. Application filed June 6, 1873.

Steam passes from a boiler into the vacuum vessel, into which water is sprinkled. The flow of air from the vacuum vessel into the boiler-furnace can be cut off by a stop-cock in the pipe that connects the vessel and furnace.

Claim.—1. The reservoir E, pipe M, stop-cock N, and sprinkler F, arranged in connection with vessel C, substantially as and for the purpose set forth.

2. The arrangement of pipes M and J, stop-cocks K L N with vessel C and boiler A, substantially as and for the purpose set forth.

3. The arrangement herein described of boiler A, vessel C, and pipes J Q O M, for the purpose set forth.

142,201.—Metallic Column.—SEMI BRANDEIS, Philadelphia, Pa., assignor to himself, JONATHAN R. JONES, and SAMUEL T. BENNER, same place. Application filed July 25, 1873.

Claim.—A tubular column composed of two or more metallic segment-plates, rolled or bent into such shape as, when united, to present the cross-section herein shown and described—to wit, a central circle, ellipse, or polygon, having a series of segments of circles or polygons symmetrically disposed around its periphery, substantially as set forth.

142,202.—Billiard-Table.—ADAM BRAUN and FRIEDRICK BRAUN, Buffalo, N. Y. Application filed May 31, 1873.

Claim.—The frame of a billiard-table consisting of an inner upright railing, D, by which the weight of the bed is supported, and an outer beveled or cove-shaped casing, E, substantially as shown and described.

142,203.—Boot and Shoe Heel.—MELLEN FRAY, Newton, Mass. Application filed July 18, 1873.

Claim.—1. A boot or shoe heel, provided with a dovetail-shaped recess formed in the forward part of the upper surface, substantially as described, for the purpose specified.

2. In the manufacture of boots or shoes, an outer sole shortened at the heel, when said sole and heel are secured together to resist separation in the direction of the length of the shoe by dovetailing a portion of the rear end of the sole into the upper surface of the heel, substantially as described.

142,204.—Locomotive Head-Light.—JOSEPH BRIGGS, WILLIAM H. BRIGGS, and ARTHUR E. BRIGGS, Newport, Ky. Application filed January 29, 1873.

A hollow bolt with vertical oil-passage secures the reservoir and lamp necks together. The reservoir is secured to its neck by a similar bolt. Inside the reservoir, and surrounding the connecting-bolt, is a hollow perforated post, used to prevent collapse of the top and bottom in assembling the parts.

Claim.—1. The combination of the shouldered and internally screw-threaded part *h* a and perforated part *h'* of the neck with the tubular tightening-bolt I, substantially as specified.

2. In combination with the burner *e*, connecting-neck H, and reservoir D of a locomotive head-light, the perforated b lt R and post S, connecting and operated substantially as and for the purpose specified.

142,205.—Tooth-Plugger.—THOMAS L. BUCKINGHAM, Philadelphia, Pa. Application filed February 27, 1873.

The inner end of the ram is of elastic metal, and is provided with an offset or shoulder, against which projections from an operating-wheel impinge and carry the end of the ram upward for some distance and then let it off, when it is forced against the plugger by a spring. A set-screw regulates the force of the blow, and a worm-wheel upon the rotated shaft operates the wheel which carries the projections.

Claim.—1. In a tooth-plugging instrument, the combination of the ram with its elastic end *b*, and shoulder *m* with a wheel, A, or its equivalent, having a projection or projections adapted to the ram-shoulder *m*.

2. The combination of the above with the set-screw *d* or its equivalent.

3. The combination of the tubular stem D and its ram B, the wheel A and its projection *m*, and the worm *e* on a shaft *f*, arranged parallel to the said tubular stem, all substantially as set forth.

142,206.—Lubricating-Journal.—GEORGE A. CHAPMAN, Woonsocket, R. I., assignor to WOONSOCKET MACHINE COMPANY, same place. Application filed May 3, 1873.

Claim.—A removable oil-cup, E, with a journal-bearing having the inverted oil-elevating tube d^2 and vacuum chamber d^3, substantially as specified.

142,207.—Gaged Butter Cutter and Lifter.—THEODORE E. COLBURN, Cleveland, Ohio. Application filed June 7, 1873.

A sheet-metal cylinder is forced vertically into the solid butter. A follower within this cylinder has a rod ascending up into the tubular handle of the cylinder, where it is set to any desired depth by means of a pin-guide moving in a vertical slot with side notches. A fine wire across the mouth of the cylinder cuts the cake of butter when the follower rests upon the top and the cylinder is revolved.

Claim.—The cylinder A, wire cut-off B, hollow handle C, bail D, follower E, rod F, and gage G, when constructed, combined, and operating substantially as and for the purpose set forth.

142,208.—Apple-Butter Stirrer.—GEORGE W. COLLINS, West Lebanon, Pa. Application filed June 5, 1873.

To the top of a suitable vessel hinged covers are attached by a cross-piece and clamps. On the cross-piece is secured a shaft and gearing that revolve stirrers within the vessel.

Claim.—The combination of the arms *a*, provided with the corn-husk scrapers *c*, shafts *b* and *d*, wheel *e*, spring *e*, crank-shaft *h*, pinion *h*, and cross-piece L, all operating together as and for the purpose described.

142,209.—Car-Coupling.—JOHN CREST, Tiffin, Ohio. Application filed April 16, 1873.

The hook is held down by a spiral spring resting in a countersink on its upper side, and is raised either by a rod passing up through it and the spring, or by a cam operating upon an inclined surface in the bottom of the draw-head.

Claim.—1. The catch-bar B, having at about the middle thereof a countersunk hole, the countersunk being at the top, in combination with spiral spring C and lift-rod D, which passes through the catch-bar, and has bearing supports in the top and bottom of the draw-bar, as and for the purpose specified.

2. The combination of the vertical rod D, cam G, and spirally-inclined surface G' in the draw-head with the catch-bar B, as and for the purpose specified.

142,210.—Table-Hinge.—WILLIAM F. DALY, Peru, Ind., assignor of one-half his right to EDWIN D. OLIN, same place.—Case B. Application filed June 28, 1873.

Claim.—1. A hinge, the leaves A and B of which are provided with fixed and rigid segmental arms, in combination with an independent lock-bolt, with or without a spring, substantially as specified.

2. The combination, with the leaves A and B having segmental arms C and D, of the sliding bar F carrying the bolt E, and spiral spring G, substantially as specified.

142,211.—Thill-Coupling.—GEORGE R. DAVIS, Kingston, Mich. Application filed June 13, 1873.

The spring has a pin at its front end for locking the shackle-bar, which is prevented from vertical movement by the ledge and spring.

Claim.—1. The clip-plate A having an overhanging ledge, G, and studs E E, in combination with the slotted shackle-bar H having curved recesses F F on the sides of its reduced portion, all substantially as shown, for the purpose specified.

2. In combination with the detachable shackle-bar H and clip-plate A, the spring-rod K having a pin, I, at its front end, all substantially as described.

142,212.—Shirt-Front.—THOMAS M. DENHAM, New Bedford, Mass. Application filed July 17, 1873.

The unattached portion of the bosom allows it to bend freely at that point to avoid rumpling.

Claim.—A shirt-front without stiffening or lining, having the portion A B unattached to the body of the shirt, leaving a space between the bosom and said body, substantially as described, and for the purpose set forth.

142,213.—Paper-File.—P. WILLIAM DERHAM, New York, N. Y. Application filed August 19, 1873.

To preserve letters, documents, and the like without folding.

Claim.—The hereinbefore-described paper-file, consisting of the sides A and B, the back C, the edges D, F, and F, and the flaps E, G, and G, when said parts are constructed and combined in the manner and for the purpose substantially as specified.

142,214.—Combined Fender and Ash-Sifter.—WILLIAM C. DOBBINS, Zanesville, Ohio. Application filed July 28, 1873.

The ash-sifting attachment consists of a plate imperforate in front and grated in the rear. The grated portion is placed under the fire and receives the coals which fall from the fire-grate, while allowing the ashes to fall through. The sifter, to which the fender is immovably attached, can be lifted to throw the coals back upon the fire.

Claim.—The ash-sifting attachment B, combined with fender *d* and hearth-plate A, as and for the purpose specified.

142,215.—Nut-Lock.—H. WILLIAM DOPP, Buffalo, assignor of two-thirds his right to FERNANDO C. CANDEE, New York, N. Y. Application filed January 8, 1873.

The nut is screwed home and the post inserted in the mortised washer. A slight backward movement of the nut brings the corner in contact with the upward projection of the post, and covers the horizontal projection.

Claim.—In a nut-locking device the combination of a nut-washer with a post, B, constructed as described, and inserted in a hole of said washer after the nut is screwed up, and secured in place by a slight backward movement of the nut, substantially as described, and for the purpose set forth.

142,216.—Flame for Cutting Cigar-Lighters.—WILLIAM H. DRIPS, Cincinnati, Ohio. Application filed June 24, 1873.

The frame A is provided with a ledge, *a*, at one end to catch against a table or counter.

Claim.—As a new article of manufacture, the tool for cutting cigar-lighters, substantially as described.

142,217.—Filter.—JONAS B. ELLIS, Washington, D. C. Application filed July 17, 1873.

A cylinder of sand and clay baked is secured within another cylinder or case by means of heads having openings which communicate with water-pipes provided with suitable valves. The water is filtered by flowing from either the outer cylinder through and into the inner cylinder, or through the inner cylinder into the outer; or it may flow through the inner cylinder without being filtered, if desired.

Claim.—The outer case A and inner cylinder D, the latter constructed of a composition of sand and clay baked and burned,

and the heads or lids B B', having openings *d f* and *d' f'*, the whole being constructed, combined, and arranged to operate substantially as described.

142,218.—Earth-Auger.—STEPHEN EMERY, Cumberland, Me. Application filed May 3, 1873.

Two upright flat plates placed opposite each other, and two rings which connect the plates at top and bottom. The spaces between the flat plates are filled with curved plates, which are held to the bottom ring by catches and secured to the boring-bar at the top by loops on the bar passing through slots in the plates and keys inserted in the loops. A vertical center is attached to the bottom ring to cut the wall of the well or hole.

Claim.—1. The plates D and E, and rings B and C, constituting the frame of an auger, substantially as specified.

2. The auger-bit F with cutting-edge *f* and hole *f'*, and cutter G with vertical edge *g*, arranged substantially as specified.

3. The sheets H I, hasps *h i*, slots K K, wedges *k k*, eye-hooks *a c*, and bar A, combined and arranged substantially as specified.

142,219.—Car-Coupling.—JOHN M. ENOS, St. Joseph, Mich. Application filed May 21, 1873.

Spring-buffers to keep the coupled cars apart as far as the link will allow.

Claim.—1. The draw-head B, buffer C, draw-bar D, springs E F, and stirrup I, constructed and arranged to operate substantially as and for the purposes set forth.

2. The combination of the draw-head B, buffer C, draw-bar D, springs E F, and stirrup I, with the plates *a a'*, stops *b b'*, strap *d*, pin *c*, and slits A, substantially in the manner and for the purpose set forth.

3. The combination, with the slotted draw-head B, buffer C, stirrup I, and spring E, of the pin G, having the notch *f* and stop *g*, as set forth.

142,220.—Press.—RICHARD EMMONS, New York, N. Y., assignor to UNITED POWER-PRESS COMPANY. Application filed August 8, 1873.

Claim.—The disks *b b* or *b' b'*, having projecting hubs, and arranged loosely upon the endless screw H, and contiguous to the standard E or B B, and retained in place by stops, in combination with the toggle-levers F, traveling-nuts G, and follower, all constructed and arranged as herein shown and described.

142,221.—Apparatus for Washing Coal, Ore, &c.—MAXIMILIEN EVRARD, St. Etienne, (Loire,) France. Application filed March 21, 1873.

The washing-table is hermetically packed, so that it can remain stationary or rise and fall, being operated through a rod terminating in a piston inclosed within a cylinder located centrally of the receiving-vessel, forming a hydraulic lifter. Coal is charged through a grating which segregates the lumps, onto a washing-table, the water-level, raised by admission of steam to space above water in connecting-reservoir, floating off the dust. Then a jigging process is conducted by intermittent jets of steam, and the table gradually raised to discharge the several grades. A pipe, extending above and below the table, equalizes atmospheric pressure, avoiding a vacuum.

Claim.—1. The apparatus herein described for washing coal, minerals, &c., consisting of the receiving-vessel A and table B operated from a cylinder, D, the receiver G, float R, and a steam-generator, all connecting and operating substantially as set forth.

2. The combination of the washing-table B and hydraulic lifter, substantially as and for the purpose specified.

142,222.—Hitching-Machine.—JOHN W. FAUVER, Augusta county, Va. Application filed June 27, 1873.

A rotary spade is attached, by means of an arm, to the rotating axle of a carriage, so that at each revolution of the axle the spade cuts a slice of earth from the ditch, along the side of which the carriage travels. The spade has a reciprocating movement in the end of the arm, and, by means of gearing connecting with stationary segmental cogs on the frame of the carriage, the position is alternately changed during each revolution of the axle, so as to cause it to enter the earth properly, and to relieve itself of the slice of soil after it has passed above the level of the ditch, the earth being thrown to one side of the ditch. A spring-scraper is attached to the machine to clean the earth from the spade at each revolution.

Claim.—1. The combination of the hinged spade-arm B, spring V, arm S, and inclined surface T of the cam C, substantially as and for the purpose set forth.

2. The combination of the oscillating spade G, cams C and D, pulleys L and M, chain-band M, and wheels I and K, as set forth.

3. The combination, with the reversible spade G, of the spring-blade X, substantially as and for the purpose set forth.

142,223.—Signal-Lantern.—HENRY B. FERNALD, Washington, D. C. Application filed September 17, 1872.

The lantern-body, having sides of variously-colored glass, is inserted into its metallic case from the top, and secured thereto by a removable annular cap surrounding it. The metallic case screens the light on two opposite sides; and the lantern-body, being rotated within the case from the bottom, exposes a colored light on the open sides.

Claim.—1. The lantern A, having the ring D extending vertically downward from its lower end, and provided on its inside with the flange I for supporting the lamp, in combination with the case B, having the ring E extending downward from its lower end, and inclosing and protecting the ring D and the lamp, all these parts being arranged substantially as described.

2. The case E, combined with the detachable top H, in the manner specified.

142,224.—Pneumatic Signal Apparatus.—WILLIAM FOSTER, Jr., New York, N. Y. Application filed April 30, 1872.

A spring-alarm mechanism is arranged, when wound up, to be released or tripped by a detent-arm, operated by a bulb or expanding chamber at the end of a pneumatic tube. The pressure of the chamber on the transmitting-lever is regulated by a screw-nut on its connecting-link.

Claim.—The combination of the tripping or unlocking mechanism, constructed as described, signal-gearing, and adjusting nut *n*, spring-lever L, pneumatic valve H, and disk O, substantially as set forth, and for the purpose specified.

142,225.—Revolving Chimney-Top.—CHARLES L. GARFIELD, Albany, N. Y. Application filed May 6, 1873.

Within the smoke-pipe is arranged an air-pipe intended to be connected with a flue or pipe that is placed within the chimney, and communicates with the several rooms of a house to receive the impure air therefrom. The air-pipe and smoke-flue discharge in the same direction. A wind-passage in the upper part of the top facilitates the discharge of air and smoke.

Claim.—1. The combination, in a revolving chimney-top, of a smoke-passage, A, and an air-passage J, for ventilating purposes, discharging in the direction of the wind, substantially as herein described.

2. The flat wind-passage K, extending in width across the revolving top in its upper part, so as to leave unobstructed the entire width of the top for one or more flue passages discharging beneath the same, as herein set forth.

3. The combination, in a revolving chimney-top, of a smoke-passage, A, an air-passage, J, a wind-passage, K, and a discharge-orifice, I, common to all, substantially as herein shown and described.

4. The swivel-joint *s t*, formed and arranged substantially as set forth, in combination with the base-collar C, spindle E, and the revolving top proper, for the purpose specified.

142,226.—Car-Coupling.—EZRA N. GIFFORD, Cleveland, Ohio, assignor to himself, THEODORE B. STEVENS, and FRANCIS A. BRADY, same place. Application filed May 5, 1873.

The catch is guided and limited in its movement by a bolt which fits in a right-angled groove in one side of it. The link, striking the curved face of the catch, raises and forces it back, and passes under and beyond it, when it falls into the link, and coupling is effected.

Claim.—The catch-plate C, provided with the right-angled side slot or groove c^2 and a right-angled shoulder, c^3, in its forward edge, in combination with the short cross-bolt D and the draw-head A, whereby said plate is held in place when the cars are coupled and guided in its movements when being withdrawn, as set forth.

142,227.—Friction-Clutch.—JOHN J. GRANT, Greenfield, Mass. Application filed April 23, 1873.

Rigidly attached to the shaft, upon which the pulley-wheel runs loosely, is the collar or carrier, to which are fitted segmental friction-drivers, which slide in grooves cut for their reception. The said friction-drivers are retained in position and prevented from flying outward by means of spiral springs, which are fitted in recesses of cylindrical shape, cut for their reception, and screw-bolts, which compress and control the said spiral springs.

Claim.—1. In combination with the segmental friction-drivers D, sliding in grooves cut for their reception in the collar C, the spiral springs E, arranged in a recess cut for their reception in the said drivers, and the screw-bolts F, all operating together as and for the purposes described.

2. The shaft B, adjustable collar I, levers H, clutch K, drivers D, provided with projections *d*, collar C, and pulley A, all combined and operating as described.

142,228.—Water-Wheel.—ELISHA HACKETT, Ulysses, Pa. Application filed May 13, 1873.

The buckets of the upper wheel are end-curved and provided with inwardly and downwardly dipping flanges to keep the water from the sides of the case and direct it to the wheel beneath, which causes it to turn by the resulting force. Both wheels are provided with gears which work in pinions of different sizes on the same shaft.

Claim.—1. The buckets C end-curved at *c*, and provided with an inwardly and rearwardly dipping flange, *c'*, as and for the purpose specified.

2. The backwardly-curved working-faces *k* of wheel K, combined with the flares *c'* of bucket C, forming an oblique cavity running out near the hub D, as and for the purpose specified.

3. The combination of two water-wheels, one placed above the other, both revolving about the same center, and each provided with its own crown-wheel, of the unequal pinions *e f*, arranged and operating on the same shaft E', as and for the purpose set forth.

142,229.—Carriage-Window.—JOHN HENDERS, (for himself and as administrator of EDWARD KRUGER, deceased,) St. Louis, Mo. Application filed March 26, 1873.

The sash slides vertically between side guides, which also slide vertically in the body of the door. On the sash are lugs which catch against lugs on the side guides, and cause them to be drawn upward with the sash. The side guides consist each of two angle pieces, one of which is pivoted to the other so as to allow the necessary tilting outward of the bottom of the sash to engage with the lip on the top of the door.

Claim.—1. The combination of the carriage-door-lifting standards F, pivoted guides E, and sash D, all substantially as set forth.

2. In combination with the sliding guides or standards E F, sash D, and door B, the spring-catches G, substantially as and for the purpose set forth.

142,229.—Car-Coupling.—JOHN HIEBS, West Manayunk, Pa., assignor to himself and JOHN J. FOX, same place. Application filed March 25, 1873.

When the coupling-bar is introduced into the mouth of the draw-head it passes through the upper enlarged portion therein, and strikes and pushes back the pivoted retaining-dog, and then falls into position. Uncoupling is effected by means of a sliding frame, which, when raised, may be held in position by a pivoted lever engaging in a notch in its upper side.

Claim.—1. The pivoted dog E, attached to and sliding with the frame D, and acting as a retainer for the coupling-bar, as specified.

2. The combination, substantially as described, of the retaining-lever I with the sliding frame D, having a notch, *i*, substantially as and for the purpose described.

142,231.—Harvester.—PLINY F. HODGES, Macedon, Ohio, assignor of nine-twelfths his right to EDWIN RAYLINS, JAMES O. BROWN, and FRANCIS T. LOMONT, same place. Application filed March 19, 1873.

The cut grain that falls upon the endless-apron platform is carried to the elevator, by which it is delivered in the receptacle attached to the elevator-frame in convenient reach of the binders.

Claim.—1. An adjustable grain-receiver, M, pivoted to the elevator-frame, and adapted to permit the relative movement of the platform and main frame on their connecting-joints, as described.

2. The combination, with the elevator-sprocs H^2 K^2, operating as described, of the upper guide or deflecting roller L, substantially as and for the purpose set forth.

3. The binders' tables mounted on the main frame, the hinged platform and elevator-frame, the grain-receiver, and the driver's seat, arranged relatively to each other and to the main frame and driving-wheels, substantially as described.

4. The binders' tables mounted upon supports on the main frame, in combination with the hinged platform and elevator-frame and pivoted grain-receiver attached to said elevator-frame, substantially as described.

142,232.—Canvas-Stretcher.—HENRY W. HOLLY, Brooklyn, N. Y. Application filed January 15, 1873.

In connection with a rigid inner frame is a sectionally-constructed expanding and contracting outer frame operated by interposed springs, to which outer frame the canvas is secured, and which arrangement admits of the close fit of a back board to the inner frame and steady retention of the same during all adjustments of the outer frame.

Claim.—1. The combination of a rigid or unbroken inner frame with a sectional or expanding and contracting outer frame and springs interposed between the two frames, substantially as and for the purposes herein set forth.

2. The combination of the dowels *b* and springs *d* with the rigid or unbroken inner frame A and sectionally-constructed outer frame B B, essentially as herein described.

142,233.—Skein and Box for Vehicle-Wheels.—NATHAN L. HOLMES, Fond du Lac, Wis., assignor of one-half of his right to C. E. DE GROAT, same place. Application filed May 10, 1872.

The bearing-surfaces are parallel, lubrication is automatic, and dirt is excluded.

Claim.—The box D, formed with bearing-surfaces *d d*, inclined or conical recess d^2, and shoulder d^3, in combination with a spindle, B, having corresponding bearings and recess, and lubricating reservoir and channel, and a band, C, having flange c^2, substantially as specified.

142,234.—Hay-Loader.—HIRAM C. HOWLAND and THOMAS L. MOORE, Oxford, N. Y. Application filed June 28, 1873.

A semicircular frame or box has two endless aprons, moving on friction-rollers, to convey the hay through the box and deliver onto the wagon.

Claim.—1. The hay-loader herein described, having the upright ring-centers C with the semi-cylindrical coverings D E, the rollers F and J, and the endless aprons G and I, operating in the manner as shown, and for the purpose mentioned.

2. In a hay-loader, the construction and arrangement of the fluted propelling-rollers O and P, in connection with the fluted counter-rollers Q, and the endless aprons G and I, substantially as and for the purpose set forth.

3. In a hay-loader, the semi-annular frame, consisting of the parallel sides C and the concentric cylindrical coverings D and E, constructed and arranged in connection with the rollers and aprons, for the purpose of receiving and delivering the hay or grain on the same side, substantially as specified.

142,235.—Railway-Rail Chair.—WILLIAM HUFFMAN, Millgrove, Ind. Application filed July 21, 1873.

A recess in the fish-plate fits over a corresponding projection on the chair for the purpose of preventing the longitudinal movement of the rails termed "running."

Claim.—A rail-chair having a lip, C, in combination with a recessed fish-plate, *F f*, all applied to the rails in the manner and for the purpose set forth.

142,236.—Pruning-Knife.—ABRAHAM C. HULSE, Palmyra, Ill. Application filed July 14, 1873.

Claim.—1. The combination of the bifurcated handle A *a* and slotted hook-blade E with the bladed circle-plate C D, pivoted to both, as and for the purpose described.

2. The bladed circle-plate C D, having perforations, and adjustable in the handle to take up wear in the knife-edges, as set forth.

142,237.—Apparatus for Steaming Grain.—JOHN C. HUNT, Sioux City, Iowa. Application filed July 2, 1873.

Diaphragm divides the steam drum into two parts. The steam admitted in the upper part enters the perforations in the pipes and comes in direct contact with the grain; when admitted in the lower part merely circulates around the pipes, and heats the grain while passing through.

Claim.—The combination of the diaphragm E, dividing the steam-drum A into two compartments, the steam-induction pipes H and L, and the perforated pipes D D, through which the grain traverses, substantially as and for the purposes herein set forth.

142,238.—Sewer-Cleaner.—JEFFERSON H. JENINGS, Oquawka, Ill. Application filed July 22, 1873.

A mud-trap provided with a hinged bottom, operated by levers and keys, is placed below the level of the sewer to receive the precipitated matter from the running water. The inlet for water into the man-trap is provided with a valve, and the mud-trap is lifted by a crane.

Claim.—1. In combination with a man-trap for sewers, a removable mud-trap located at or below the level of the sewer or sewers entering said man-trap, for the purposes herein set forth.

2. The man-trap A, provided with a slide, B, at the mouth of each sewer entering the same, and an exit-opening, *b*, substantially as and for the purposes herein set forth.

3. The mud-trap C, provided with hinged bottom D D, keys *c c*, and levers *d d*, as and for the purposes herein set forth.

4. The combination of the man-trap A with slide or slides B, mud-trap C with bottom D D, and crane E, all constructed and arranged substantially as and for the purposes herein set forth.

142,239.—Jaw for Lathe-Chucks.—MOSES C. JOHNSON, New Bedford, Mass., assignor to MORSE TWIST DRILL AND MACHINE COMPANY, same place. Application filed February 17, 1873.

The end of the dog is chambered, and in it is pivoted a toggle, held to one side by a spring. When cylindrical work is grasped by the dog the toggles take a firmer hold and prevent slipping.

Claim.—1. The carrier A chambered, as described, and the toggle B formed and arranged within the chamber and pivoted to the carrier, all substantially as set forth.

2. The carrier A chambered, as described, and the toggle B and the spring *s* connected and arranged within the chamber of the carrier, in manner and to operate as set forth, the toggle being pivoted to the carrier, as explained.

142,240.—Apparatus for Corking Bottles.—AUGUST C. JORDAN, New York, N. Y., assignor to himself and CHARLES H. BOSSE, same place. Application filed January 15, 1873.

Four curved jaws united at their lower parts into a cylinder and attached to a stationary frame. These jaws are adjustable, to admit large or small corks or to permit a greater or less degree of compression. A reciprocating plunger attached to a sliding frame forces the cork between the jaws and thence into the bottles.

Claim.—1. The combination of the movable platform and spring-jaws D with the movable plunger F, all being arranged to operate substantially as herein shown and described.

2. The horizontal adjustable jaws D, arranged beneath the stationary platform A under the reciprocating plunger F, substantially as herein specified.

142,241.—Fire-Place.—WILLIAM M. KEPLER, Cincinnati, Ohio. Application filed May 7, 1873.

The back of the fire-place is corrugated horizontally. The top plate of the air-chamber at rear of the grate, which holds the back in position, can be so applied that its hot-air pipe can be made to fit a right-hand or left-hand flue.

Claim.—1. In an air-chambered fire-place, A B, constructed substantially as described, the corrugated fire-back C, when the corrugations are arranged horizontally, and formed by rising faces *e* and horizontal faces *e'*, as and for the purpose described.

2. In combination with the fire-back C, the reversible grooved top plate D E *d d'*, substantially as and for the purpose specified.

142,242.—Washing-Machine.—THOMAS F. KIVT, Cincinnati, Ohio. Application filed June 7, 1873.

A hollow ribbed cylinder revolves on self-adjusting spring-journals over a series of fluted rollers arranged in a cylindrical tub, which is held together by straight and curved rods.

Claim.—1. The tub A, fluted rollers H, ribbed open cylinder F, journal-boxes, and detachable springs, all combined and arranged as herein set forth.

2. The washing-machine hereinbefore described, with its curved bottom and flaring edges resting upon and secured to the legs by the straight and curved metallic rods E and E', as set forth.

3. The journal-boxes, with adjustable springs, inclosed in detachable disks and combined with the cylinder, as set forth.

142,243.—Pen and Pencil Case.—JOHN H. KNAPP, New York, N. Y. Application filed July 1, 1873.

Claim.—In combination with the pencil-case A, the reversible holder B, having at one end a pen-socket and at the other the pencil-tip D, said holder containing the sliding tubes *d e* and rigidly-fastened interior tube *b*, substantially as herein shown and described, for the object specified.

142,244.—Drill-Extractor.—DANIEL KUNKEL, Oregon, Mo. Application filed July 22, 1873.

Two jaws are pivoted between the lower ends of two straight bars. The upper ends of the bars are bent inwardly and a half-nut cut in each end, so that by pressing them together by a spring-catch a complete nut is formed. Each jaw has an arm extending upward and passing through the lower end of an interior frame, which serves as a guide. A screw-rod or shaft works in the nut formed as above stated, its lower end entering the above-described interior frame, and is, by a jointed arm, connected with the upper end of the exterior frame. By turning the screw-shaft to the right or left the jaws are closed and opened, respectively.

Claim.—1. The combination of the exterior frame A A, jaws B B with arms C C, interior frame D, and screw-shaft E, all substantially as and for the purposes herein set forth.

2. In combination with the interior frame D, screw-shaft E, and jaws B B, the ratchet-wheel *b* and pawl *d*, for the purposes herein set forth.

3. The combination, with the frames A D, jaws B B, and screw-shaft E, of the spring *f* and the bisected nut with latch *c*, for the purposes herein set forth.

142,245.—Bobbin for Spinning-Machines.—PERLEY LAFLIN, Warren, assignor to GEORGE DRAPER, Hopedale, Mass. Application filed June 2, 1873.

The stop is a wire, bent into circular form, applied in a groove in the bobbin-head or spindle-button, and having one end bent at a right angle to engage a rigid stud located on the button, (or in the bobbin in the other case,) so that the stop may yield and the spindle turn slightly, independently of the bobbin, when a strain is brought on the yarn.

Claim.—The yielding stop D, substantially as described, applied to the bobbin B, or to the stationary bobbin-seat C fixed to the spindle, all being and operating essentially as specified.

142,246.—Wire Fence.—GEORGE LAKIN, East Norwalk, and LESTER N. LAKIN, Toledo, Ohio. Application filed August 8, 1873.

An inclined brace is forked at its top to engage with a notch in the fence-post, the lower end of said brace resting on a bed-plate. One end of a horizontal rod is connected to the lower end of said inclined brace, with its opposite end passing through the post, threaded and provided with a nut. The intermediate posts are of flat metal, standing at right angles to the fence, and are split at their tops to clench the grooved ends of the cap-rail.

Claim.—1. The combination of the post *a*, the brace *c*, adjustable rod *g*, and stems *e*, substantially as shown and described.

2. The stays *d*, split at top, as shown at 5, and bent in opposite directions to clinch the grooved ends of the cap-rail, substantially as shown and specified.

142,247.—Milking-Stool.—GEORGE T. LINCOLN, Leominster, Mass. Application filed November 9, 1872.

Seat and pail-holder held to upright standard by thumb-screws.

Claim.—In combination with a milking-stool, a milking-pail holder, consisting of the rod A, having a projecting foot, as shown, and provided with the sliding and swinging brackets E and F, adjustable, either separately or together, in the manner and for the purpose set forth.

142,248.—Coffee-Package.—HENRY C. LOCKWOOD, Baltimore, Md. Application filed June 7, 1873.

The package is made of paper lined with tin-foil, and is formed on a block. The ends are opened after having been folded and the block withdrawn, and the package filled with coffee. The ends of the package are straightened by leather-board on the inside.

Claim.—The coffee-package A, made of paper, lined with tin-foil, having the protecting false bottom and top *a a'*, being closed at both ends air-tight, and glued in the seams, substantially as described.

142,249.—Sofa-Bedstead.—EDWARD LOVELL, St. Louis, Mo. Application filed February 11, 1873.

The back is hinged to the lower part of the frame, so that when dropped down it rests directly on the floor, without bearing upon its hinges, and the upper frame-section when opened rests by its arm or projecting head upon the prostrate back. A sliding leg is arranged to support the foot-end of the seat when opened.

Claim.—1. The rigidly-connected seat D and arm D', forming the upper member of the lounge, hinged at back to the armless lower member A, in combination with the back E hinged to the bottom of the frame A, so as to adapt it to lie flat on the floor and support the rigid arm D', without direct contact of the seat D, all as herein set forth.

2. In combination with the lounge sections A D and back E, constructed substantially as set forth, the sliding leg F, as and for the purpose set forth.

142,250.—Machine for Forming the Backs of Saws.—CHARLES MAJER, Brooklyn, E. D., N. Y. Application filed July 9, 1873.

Two bars or jaws lying parallel to each other, one operated toward the other by means of a cam-shaft, and a plunger of equal length, V-shaped in cross-section, presses the metal between them.

Claim.—The combination of a plunger, D, with two jaws, B B', and with a cam-shaft, E, all constructed and operating substantially in the manner herein shown and described.

142,251.—Spark-Arrester for Locomotives.—MATTHEW B. MASON, Kansas City, Mo., assignor to himself and JOHN S. MCCRUM. Application filed July 25, 1873.

Down-turned pipes are located in the exhaust-nozzles to create a draft for conveying the cinders arrested by a perforated petticoat-pipe into a receptacle. Said petticoat-pipe is protected in front of the fires by strips of metal.

Claim.—1. The down-turned spouts D D' from the exhaust-nozzles C *c c'*, arranged to discharge through apertures *e* in the smoke-arch into a hopper or receptacle, F, having a discharge-trap or valve, G.

2. The combination, with the petticoat-pipe I, of iron guards L to protect it from denting or breaking by coal or other fragments from the fires striking against it, as set forth.

142,252.—Moccasin.—ALEXANDER MAGNUSSON, Bangor, Me. Application filed January 3, 1873.

The vamp extends from the toe about half-way back toward the heel, and is then stitched to the quarters, one of which has the inner tongue and the other a lap for securing the shoe to the foot.

Claim.—The within-described moccasin, made in the manner set forth, from the patterns herein shown.

142,253.—Closing Gas-Retorts.—GEORGE A. MCILHENNEY, Washington, D. C. Application filed July 9, 1873.

Improvement on patent 137,704. A lip is formed around the mouth-piece, so that the part of the cover entering touches only a narrow surface. A receptacle below the mouth collects any tar.

Claim.—1. The retort having its mouth provided with the lip *d* or its equivalent, forming a narrow bearing for the lid, and leaving a space or clearance, *e*, around the same, inside of its line of bearing, as and for the purpose described.

2. The retort provided with a box or receptacle, D, substantially as and for the purpose described.

3. The cast-iron shoe E, constructed and applied as shown, to receive and hold the cutter-bar.

142,254.—Stove-Pipe Coupling.—HORACE A. MEARS, Pecatonica, Ill. Application filed January 24, 1873.

The collar on one section of the pipe is provided at one side with a short lug, and on the other side with a tapering head. The other collar has on its edge a notch, through which the lug passes, and on its inner surface a groove, within which the lug and head are brought in locking the sections together.

Claim.—The combination, with the pipes A and C, of the collar B, provided with lug *a* and head or flange *b*, and the collar D, having interior circumferential groove and a recess, *d*, all substantially as and for the purposes herein set forth.

142,255.—Washing-Machine.—HENRY H. MERCER and SAMUEL MENAFEE, Cambridge, Ohio. Application filed August 5, 1873.

A lower roller composed of independent polygonal rolls, and an upper roller having transverse grooves.

Claim.—The washing attachment described, consisting of the frame A A B B, rollers C D, boxes *d d*, with stems and inclosing springs *e f*, all constructed as set forth.

142,256.—Wind-Wheel.—GEORGE METCALF, Somonauk, Ill. Application filed July 11, 1873.

The wheel is mounted at the top of and within a revolving frame in the axis of the revolution of the tower or frame. The tower extends down into a permanent frame-work, in the top of which friction-wheels are set.

Claim.—1. The revolving tower B, constructed substantially as described, to support the wheel A between its shaft-bearings and above the step D, combined with the surrounding and supporting frame-work C, substantially as set forth.

2. In combination with the tower B, supporting the wheel A at its top between the shaft-bearings, and the surrounding and supporting frame-work or structure C, the step D and friction-rollers F, to enable said tower to revolve with freedom.

3. In combination with the wheel A, steady vane H, and hinged vane I, the flexible connection J, arm K, lever M, and weight L, all arranged substantially as set forth.

142,257.—Signal-Lantern.—SAM. H. MILLER, Brooklyn, N. Y., assignor to himself and JAMES E. FOLK, same place. Application filed May 6, 1873.

The exterior glass cylinder of the lantern is formed with two longitudinal grooves or flutes on opposite sides, which serve, by their interior projection, to support the edges of the curved colored glasses, while externally the whole is prevented from displacement or retention by webs from the frame fitting into the grooves.

Claim.—1. The glass globe or cylinder C, constructed with two or more internally-projecting longitudinal ribs, *b*, substantially as and for the purpose herein set forth.

2. The glass globe or cylinder C, provided with one or more longitudinal grooves, *c*, in its outside, for use in connection with one or more steps, *d*, essentially as described.

142,263.—Saw-Tooth.—WARREN P. MILLER, New York, N. Y. Application filed July 29, 1873.

The shanks of the teeth are compressed and inserted into a circular opening in the saw-plate.

Claim.—An insertible tooth for saws, when the shank is cut and separated at the back, as at *c*, for the purpose of springing the same laterally that it may be inserted into a circular socket comprising more than half of a circle, substantially as shown.

142,264.—Laundry-Stove.—JAMES H. MITCHELL, San Francisco, Cal. Application filed February 24, 1873.

Claim.—The stove A, having the sloping fire-box B smaller than the stove-shell, and provided with the flaring back and sides *f f*, so as to provide a jacket or space, *e*, between the two, when the only communication with cold jacket or space is through side openings *i i*, substantially as and for the purpose above described.

142,265.—Table-Leaf Support.—JOSEPH K. MOFFETT, Watertown, N. Y. Application filed July 12, 1873.

One end of a downwardly-projecting arm is pivoted to a jointed brace, the other end being pivoted to an ear projecting from the leaf. The lower part of the jointed brace is also connected to the table-leaf by a spiral spring.

Claim.—The combination, with a table, A, and leaf B, of the plate C with arm D, jointed brace G G', spring *d* acting directly on the jointed brace, and plate E with ear *c*, all substantially as and for the purposes herein set forth.

142,266.—Martingale.—FRANKLIN G. MOODY, North Monmouth, Me., assignor of one-half his right to GEORGE S. FAIRBANKS, same place. Application filed July 31, 1873.

A martingale constructed with rings and snaps, by which an additional martingale can be used extending to the bit.

Claim.—The combination of the martingale *a* with martingale *b*, both attached to the strap *d* by means of the ring *e* and hooks or snaps *g f*, substantially as shown and described.

142,267.—Removable Ceiling for Vessels.—WILLIAM F. MORGAN, New York, N. Y. Application filed July 31, 1873.

To the ribs of the vessel is attached a layer of ceiling-boards, over which strips of water-proof felt lining are laid, each edge lapping, and secured to the vessel by strips of wood for the protection of a cargo of grain.

Claim.—A removable water-proof lining for vessels, made up of a series of strips, as described, each strip overlapping the other, and secured in place upon a backing by strips C, as herein shown and described, for the purpose specified.

142,268.—Adjustable Bracket.—JAMES B. MORRISON, Brooklyn, E. D., N. Y. Application filed August 20, 1873.

Swinging bracket, which may be lengthened or shortened.

Claim.—1. The combination, with a swinging or stationary back-plate A, of the supporting-arms B B', having one or both of said arms provided with a curved slot, through which is inserted a locking-pin, C, whereby the altitude of the device carried by the outer ends of the said arms may be regulated as desired, substantially as herein specified.

2. The combination, with the said arms B B', of a stationary or swinging back plate A, provided with the curved slot *f*, substantially as and for the purposes herein specified.

3. The combination, with the said arms B B', of the sliding bar E, whether tubular or solid, substantially as and for the purpose herein set forth.

4. The combination of a wick or gas tube, N, with the sliding bar E and supporting-arms B B', substantially as and for the purpose herein specified.

5. The combination of the platform G, having sliding drawers *h*, with the sliding bar E, arms B B', and back plate A, substantially as herein specified.

6. The combination of the following elements: The back plate A, either with or without the slot *f*, the arms B B', one or both of which is provided with a curved slot, *c* or *d*, a locking-pin C, and a sliding bar, E, arranged and operating substantially as herein specified.

7. The combination, with the arms B B', of the head-block D and pin F, whereby the bar E, or the device supported by the pin F, may be revolved or swung around, substantially as herein specified.

142,269.—Packing for Hydrants, Pumps, &c.—JOHN W. MURRAY, Baltimore, Md. Application filed June 3, 1873.

The packing consists of a rubber ring having a flange tapering on the outside but cylindrical on the inside.

Claim.—The packing-ring C, cylindrical on the inside, and having a flange, *c*, tapering on the outside, as and for the purpose described.

142,270.—Lamp-Wick Trimmer.—SAMUEL NAYLOR and ASAHEL FAIRCHILD, Independence, Iowa. Application filed July 15, 1873.

Claim.—The upper handle A, formed with a bread cutting-edge, D, in combination with the lower handle B, formed with the frame C, and the two parts pivoted at the rear of the cutting-edge, thus exposing to view the wick as the same is being trimmed, as herein set forth.

142,271.—Windmill.—WILLIAM C. NELSON, Kentland, Ind. Application filed July 29, 1873.

A solid upright post having a tenon or pin in its upper end, upon which turns a beam carrying a wind-vane. At the other end of the beam is a bar running downward, and in this bar the wheel-shaft has its outer bearings, the inner bearing being in a short post on the under side of the beam. There is a regulating-vane attached to the front end of the lever, which is pivoted to the side of the beam; also, a rod connected with a brake-shoe. As the wind increases the lever turns on its pivot, thereby pulling the brake upward against the hub and lessening the speed of the wheel.

Claim.—1. The combination of the vane G, lever H, rod *e*, and brake I, substantially as and for the purposes herein set forth.

2. The combination of the wind-wheel shaft *b*, provided with crank or wrist pin, the pitmen J with ring *f*, and the pitmen K K, all substantially as and for the purposes herein set forth.

3. The combination, with the brake-lever H, of the rod and ring *h*, rod A, lever E, float F, and vessel O, connected with the pump-trough, as and for the purposes herein set forth.

142,272.—Rendering Fabrics Uninflammable.—DONALD NICOLL, London, England. Application filed January 28, 1873.

Claim.—The admixture with sulphate of ammonia preparations, for rendering woven and other fabrics uninflammable, of dextrine, as above described, whereby the sulphate of ammonia is fixed in the fabric.

142,273.—Washing-Machine.—WILLIAM PARKER, Rolla, Mo., assignor of one-half his right to ARTHUR COBB, same place. Application filed July 21, 1873.

Within the vessel the free end of the lower wash-board is suspended by rods, and the upper ends of the rods are connected to the side bars of the oscillating wash-board.

Claim.—The combination of the oscillating board and frame D D', the suspension-rods I, and bottom-board G, all arranged and operating substantially as set forth.

142,274.—Screw-Propeller.—NEWTON A. PATTERSON, Cleveland, Tenn. Application filed June 6, 1873.

Claim.—1. A helicoidal propeller-blade having a concave face with a curvature of equal or nearly equal radius in each direction from a point at or near the forward or cutting edge.

2. A concave-convex propeller-blade, a portion of whose concave surface has a curvature of equal or nearly equal radius in an inward, outward, and rearward direction from a point at or near the forward or cutting edge.

142,275.—Heating-Stove.—SEELY B. PATTERSON, Phillipsburg, N. J., assignor to PHILLIPSBURG STOVE WORKS, same place. Application filed June 16, 1873.

Claim.—The combination, in a stove, of a fire-pot having external recesses *c*, a chamber, F, surrounding the pot, and tubes K communicating at the lower ends with said recesses, as set forth.

142,276.—Rotating Blanket-Sluices for Washing Ore.—WILLIAM H. PATTON, Oakland, Cal. Application filed June 13, 1873.

Several sluices are arranged around a central axis, permitting free rotation, so that at intervals a clear blanket surface is presented to receive the material from a quartz-battery, while another surface will be brought to a position convenient for the removal of the concentrations by means of a stream of water thrown upon it from a hose. A free flexible apron at the lower end of the sluice, contracts the discharge and insures clear delivery into the tail-sluice.

Claim.—1. The sluice-boxes C, constructed with blanket-coverings, loose at the lower ends to allow the escape of air, as described.

2. The baffling-plate B, for protecting the blankets and distributing the material.

3. The flexible apron I at the discharge ends of the sluices, constructed to operate substantially as described.

142,277.—Belting.—WILLIAM P. POWERS, North La Crosse, Wis. Application filed August 3, 1872.

The base-wires are flattened at the sides, and the links are formed of one piece of wire having three or more coils.

Claim.—1. The construction of the link *a a*, formed by coiling a continuous piece of wire alternately around each of the two bases into three or more coils, substantially in the manner and for the purpose described.

2. The base-wires *c c*, flattened and made with an eye, as described, in combination with the inside wires *a a*, substantially in the manner and for the purpose described.

142,278.—Steam-Boiler.—THOMAS W. PRATT, Boston, Mass. Application filed July 11, 1873.

The boiler is placed at such an angle of inclination as to allow the sediment contained in the water to slide down the tube-sheets into the water-leg, where it is discharged through a blow-off cock. Ashes or cinders slide down the tubes into the furnace.

Claim.—1. A tubular steam-boiler placed at such an angle of inclination as to allow the sediment contained in the water to slide down the tube-sheets, and ashes or cinders to slide down the tubes, substantially as described, for the purpose set forth.

2. In combination with an inclined boiler, A, the fire-front *b*, provided with a furnace-door, substantially as and for the purposes described.

142,279.—Thill-Coupling.—RANDOLPH R. RAPP, Westchester, Pa., assignor to himself and WILLIAM H. LARMORE, same place. Application filed May 6, 1873.

Improvement on patent No. 134,189. The slip has an angular socket, into which a lever may be inserted to open the thill-coupling.

Claim.—The slip D, having a recess, *c*, for the reception of the end of a detachable lever, E, as and for the purpose set forth.

142,280.—Pontoon for Raising Sunken Vessels.—JOHN RICE, Buffalo, N. Y. Application filed August 7, 1873.

The pontoons have channels through them from top to bottom, through which chains are passed to the sunken vessel. The channels are at different angles from the center of the top of the pontoon to its lower side, some of them being vertical to accommodate the chain to the vessel when in deep water, and others at an angle, so that as the ship rises she is steadily supported by the pontoons on either side, and danger of the pontoons capsizing rendered less.

Claim.—The combination of the longitudinal deck-timbers B B with the lateral and timbers C C', having the iron-sheathed holes *c*, *c'*, *d'*, and *b*, and the A-braces D D, all being constructed and arranged so that the chains may be reeved at the ends of the pontoons, substantially as and for the purposes shown.

142,281.—Turpentine-Filter.—EMMANUEL G. REICHARDSON, Brooklyn, N. Y. Application filed December 17, 1872.

Twilled wire-cloth is used for the straining-web.

Claim.—As a new article of manufacture, the turpentine-filter constituted by the combination of the twilled wire-cloth web A and the circumferential rim B, substantially as and for the purpose specified.

142,282.—Eye-Glass.—MARTIN RESLEY, Springfield, Mass. Application filed May 19, 1873.

The rims of the glasses are open on the inner side to facilitate the insertion of the glasses, the separated ends of each rim being connected by an elastic loop forming the nose-rest, to which the usual bridge is attached.

Claim.—The eye-glass frames A A, constructed with the loops A' A', having the flanges or clips *b b* to secure the nose-band by swaging the same thereon, substantially as shown and described.

142,283.—Clothes-Line Support.—JAMES R. ROACH, New York, N. Y. Application filed July 16, 1873.

Two spring-jaws are pivoted together at the lower ends; one holds a pulley at the upper end, while the other is notched to receive a hook on the end of the pulley.

Claim.—A clothes-line support, consisting of the spring-jaws A and B, of which one carries the pulley C, and the other is notched to receive the hook of the pulley-arbor D, as set forth.

142,284.—Corset-Clasp.—JOHN B. ROBY, Cambridge, assignor to GEORGE R. TABER, Boston, Mass.—Case B. Application filed November 29, 1872.

A bread busk underlies the two steels to which the fastenings are secured.

Claim.—In combination with the springs *b c*, the stay *d*, said stay being attached to the body of the corset in such a manner as to leave the outer edge of the spring *c* free, and said stay *d* also covering wholly or partially the springs *b c*, substantially as above set forth.

142,285.—Log-Canting Machine.—ALEXANDER RODGERS, Muskegon, Mich. Application filed August 21, 1872.

Claim.—1. The canting-levers B, in combination with the lifting-bars C, the latter being provided with cog *e*, connection *e'*, and cross-head *a'*, substantially as described, and for the purpose set forth.

2. The bearing-plate *b'* provided with pulley-supports *k*, in combination with the guiding-posts D, cross-heads *a'*, bar C with its attachments *e e'*, and chain *f*, substantially as specified.

3. The canting-levers B and their operating mechanism, in combination with the series of carrying-rolls A or their equivalents, substantially as and for the purpose specified.

4. The canting-levers B, the lifting-bar C and its attachments, in combination with the chain *f* and the frictional gearing for operating the same, substantially as herein shown and described.

5. A log-canter composed of the elements herein set forth, all combined and arranged for joint operation, in the manner and for the purpose specified.

142,286.—Bee-Hive.—SOLOMON ROGERS and ALBERT J. MASON, Butler, Ind. Application filed April 14, 1873.

The honey-boxes are close except at their bases, where there are slits communicating with the brood-chamber. A hollow-partition between the honey-boxes, with minute perforations on its top, permits the air to ascend, and ventilated windows in the cap permit it to escape.

Claim.—The attachment or division-board B, with orifices *o o* and the apertures *n n*, in combination with the honey-board T and the cap X, substantially as and for the purpose set forth.

142,287.—Horseshoe.—JOHN ROWE, Jr., Wilmington, and FRANCIS B. BROWN, Boston, Mass. Application filed February 26, 1873.

The shoe is jointed at the toe, and each section is provided with outside flanges. A wedge-shaped screw is inserted in the joint, causing the flanges to compress the head.

Claim.—The improved horseshoe, made in two parts, united by a hinge at the toe, and secured to the heel of the horse by means of a wedge-shaped screw at the top, in combination with the flanges *c c* and bent wire *g*, substantially as described.

142,288.—Furrowing-Machine.—WILLIAM H. RUTLEDGE, Hamilton, Ohio. Application filed June 17, 1873.

Three frames, each having a furrowing-tool, are hinged to the rear side of the axle-tree. A seat, capable of being adjusted in case of longitudinal adjustment, has over the middle frame a plate in its front legs are friction-rollers which work [illegible] ally in other cases in plates projecting from the [illegible] tree. Attached to the foot of each rear leg is a block, having on each side a groove for the reception of a pin on the inner side of each outside frame, or a pin on each side of the middle frame. The blocks thus connect with any or all of the frames, and the seat being tilted the furrowers can be raised from the ground, or the operator from his seat can raise the outer frames by pressure on pedals thereon.

Claim.—1. The combination of grooved blocks J J with the tilting seat E and hinged plow-frames B C D, substantially as and for the purpose specified.

2. The combination of the slotted and notched bands *b b* with yoke A and seat E, substantially as described, for the purpose specified.

3. In combination with the tilting seat E and hinged frames B C D, the hinged adjustable brace I and cord *m*, substantially as described, for the purpose specified.

142,289.—Spike.—GEORGE H. SANBORN, Jr., New York, N. Y. Application filed August 6, 1873.

Claim.—The improved screw spike A B C D E with the projections, depressions, grooves, or notches F G H I J K L, the ridges A I, J B, and the connecting *g f* as the point, substantially as described, and for the purposes mentioned.

142,290.—Hand-Wagon.—SYLVESTER D. SCOTT, Eureka, Cal. Application filed April 7, 1873.

The driving-wheels turn independently, and each is provided with a crank to be operated by hand-power. A platform is provided for the operator to stand upon.

Claim.—The platform H, in combination with the frame, when arranged with reference to the independently-operating driving-wheels, substantially as set forth.

142,291.—Pump-Bracket.—SAMUEL SELDEN and OREN R. HANCHETT, Erie, Pa., assignors to SELDEN & GRISWOLD MANUFACTURING COMPANY, same place. Application filed July 24, 1873.

The endwise displacement of the pivots is prevented by first casting or otherwise constructing the pivot or pivot-block in the desired form, and then casting the U-shaped bracket thereon in such a manner as to cause the metal of the bracket to inclose the ends of the pivot.

Claim.—The pivot *a* in combination with the U-shaped bracket B, cast or otherwise formed upon or in one piece with the pivot or pivot-block, substantially as and for the purpose described.

142,292.—Alarm-Bell Attachment.—ALLEN SENEWOOD, Auburn, N. Y. Application filed March 31, 1873.

A spring-clasp fitted to a door-knob has a bell attached to its outer coil, so that it will sound an alarm upon the attempt of any person to enter the room by turning the outside handle.

Claim.—1. The clasp C, having the bell A connected thereto by suitable means, and arranged to be attached by clamping pressure to the knob D, substantially as and for the purpose specified.

2. The clasp C, spring B, and bell A, all constructed and arranged to be attached to a door-knob, substantially as and for the purpose specified.

142,293.—Shaft-Coupling.—WILLIAM J. SILVER, Salt Lake City, Utah Ter. Application filed August 4, 1873.

The inner circumference of a collar or nut in the form of a double screw-thread, one right and one left handed, to fit two corresponding right and left handed screw-threads of two compression-shells, so that by screwing the nut or collar the conical shells are simultaneously and equally drawn together.

Claim.—A shaft-coupling consisting of the nut E, having female right and left hand screw-threads, of the compression-shells D D, having corresponding male right and left hand screw-threads, and the split double conical sleeve B, all arranged substantially as described.

142,294.—Manufacture of Illuminating Gas.—ALFRED P. SOUTHWICK, Buffalo, N. Y. Application filed June 28, 1873.

Forms water-gas by passing superheated steam through hot carbon, condenses, carburets, reheats to fix, washes, and purifies.

Claim.—1. The combination of the steam-boiler A, decomposing-cupola B, governing-holder D, carbureting apparatus E F F, and the purifiers H H, all being arranged substantially as described, and for the purpose set forth.

2. The process herein described for making carbureted water-gas by alternately passing continued currents of superheated steam and free currents of atmospheric air through hot carbonaceous matter contained in the decomposing-cupola, the gas made from the steam being carbureted into a gas-holder, from which it is forced through a vessel containing liquid hydrocarbon as a few

temperature to be carbureted, and through one or more highly-heated retorts, in which it is fixed, and finally through one or more purifiers charged with hydrate of lime, by which the gas is freed of all its impurities.

142,290.—Trimming Attachment for Sewing-Machines.—WILLIAM A. SPRINGER, Marlborough, Mass. Application filed June 19, 1873.

The cutting-disk is on a shaft geared with another shaft beneath the table, and is carried by a pivoted plate depressed by a lever, so that the gears on the two shafts may be engaged with each other when the knife is to be operated. It cuts against a sharp shoulder on the throat-plate.

Claim.—In a sewing-machine trimmer, the combination of the fundamental plate H, having slot A, the hinged or pivoted presser-plate I, the depressing and locking cam-lever a, the rotating shaft J, the circular cutter K, and the shoulder P on the needle-plate, substantially as specified.

142,291.—Awning-Frame.—HENRY STEPHENS, New York, N. Y., assignor to JOHN BOYLE, same place. Application filed February 12, 1873.

A hollow frame slides upon a rod bent at right angles to the window-frame. The hinge is a knuckle-joint, one part of which is formed on the end of the rod, and the other upon a plate or foot which is secured to the window-frame.

Claim.—1. The combination of the rods or tubes C C and hollow frame D sliding upon them, substantially as and for the purpose set forth.

2. The combination of the knuckle-joint B with the rod or tube C and hollow frame D, all arranged to operate substantially as set forth.

142,292.—Device for Operating the Valves of Steam-Engines.—WILLIAM J. STEVENS, New York, N. Y., assignor to himself, DUDLEY S. STEELE, and NATHAN W. CONDICT, Jr., Jersey City, N. J. Application filed May 15, 1873.

Motion is first imparted to the valve by mechanism moved by the engine, and the stroke is completed by the action of springs in the steam-chest. The movement of the valve is limited in either direction by a cushion of steam in a chamber arranged within the steam-chest for that purpose.

Claim.—1. The combination, with a slide-valve, of an operating rock-shaft, D, springs G G, and devices whereby the movement of the shaft in either direction is first imparted from some moving part of the machine, and is continued and completed by the action of the springs, as set forth.

2. The combination, with the valve B, of the three-armed lever H, helical springs G G, and set-screws *e*.

3. The combination of the rock-shaft D, its arm F, having projections *f f*, and the loose lever E, connected to the piston-rod of the engine with an arm, *m*, for acting on the valve, and with springs for giving the rock-shaft to operate the valve, as set forth.

4. A valve, B, operated from some moving part of the engine, and limited in its movements by a piston acting against a cushion of steam in a chamber, substantially as set forth.

142,293.—Ball-and-Socket Joint.—MILTON W. ST. JOHN, Leonardsville, N. Y. Application filed August 9, 1873.

Claim.—1. In a ball-and-socket joint, the combination, with the spring, of the cap and its holding recess for connection with said spring, substantially as specified.

2. In combination with the socket B', open laterally and having the continuous lip *l*, the ball A, flanged concave D, and cap E, carrying the spring, substantially as specified.

3. The combination, in a ball-and-socket joint with the spring and concave bearing, of the socket and cap having a close joint between the lip and shoulder, substantially as specified.

142,294.—Sewing-Machine.—JOHN M. STOWELL, Milwaukee, Wis. Application filed July 17, 1873.

A gang of circular saws is arranged between a feeding-table and a feed-roll. The material to be cut by them is moved forward upon the table by a self-adjusting feed-roll, and is prevented from being thrown upward or backward after passing the saws by a series of serrated disks over the rear feed-roll.

Claim.—1. The corrugated or ribbed press-roll K, combined with the table B, and articulated upon the shaft J by means of the bearing-arms *h h*, substantially as described, for the purposes specified.

2. The guard saws M, capable of a movement with the feed, but not against it, substantially as and for the purpose set forth.

3. The adjustable wooden guard-blocks R, substantially as and for the purposes described.

4. The feed-rolls D D, having longitudinal peripheral grooves cast therein, in which the steel strips are inserted and held in place by a filling of soft metal, substantially as described.

5. The combination of the shaft E, wheels A' A^2, large wheel G, lever A, miter-wheels *g g'*, shaft F, spur-wheels *e' f*, and feed-rolls D D^1, connected together as described.

142,295.—Steam-Engine.—JOSEPH H. STRENLI, Cincinnati, Ohio. Application filed June 17, 1873.

By the use of the diagonal or step openings in the valve not only the positive amount of steam used can be regulated, but also the relative, thereby operating as a governor. The cylinder, valve-chamber, and intermediate chambers communicate with each other. The valve is balanced by steam admitted into recesses located opposite the cylinder A.

Claim.—1. The piston-valve C *e e*, adapted alone to control the ports of the cylinder A when made with diagonal or step openings *e'*, substantially as described, and so fitted to its operating-rod as that it may be rotated by a governor for the purpose of cutting off the steam automatically to govern the speed of the engine.

2. The combination of cylinder A, valve-chamber B, and intermediate chambers D D, communicating with each other by ports *s s' s''*, and operating in connection with a suitable valve, substantially as and for the purpose specified.

3. In the piston-valve C *e e*, the recesses I and pipe or opening J, substantially as and for the purpose specified.

142,296.—Boring-Machine.—JOSEPH STRICKLER, Columbiana, Ohio, assignor to WILLIAM W. WALLACE, Pittsburg, Pa. Application filed January 7, 1871.

The slide-frame E is elevated by the rod *a* being engaged with the notches in wheel *c*. The slide-frame E is released from the catch *g* by the pin *s* on the shaft D when revolved.

Claim.—1. The sash or gate E and vertical slide A provided with rack B, in combination with a loose pinion and latch or rod, *a*, substantially as herein described.

2. A spring-catch *g*, combined with the gate E and vertical slide A to hold the gate and automatically release it by the pin *s* on shaft D, as herein described.

142,297.—Machine for Making Boxes.—GEORGE W. SWAN, San Francisco, Cal. Application filed June 20, 1873.

The pieces of veneer from which the boxes are to be made are passed under a series of saws, which form grooves in the material at the points where the corners of the box are to be.

Claim.—1. The drum E, together with the pulley F and carrying-belts G, for the purpose of carrying the veneers to the saws, and to hold them so that they will all be channeled to the same depth, substantially as described.

2. The feeding-table I, with its gage J and the retracting spring K, in combination with the drum E and belts F, substantially as and for the purpose herein described.

3. A machine for channeling veneers, consisting of the adjustable saws D, in combination with the drum E, the carrying-belts G and pulleys F, and feeding-table I, substantially as herein described.

142,298.—Process for Softening and Toughening Blocks of Wood.—GEORGE W. SWAN, San Francisco, Cal. Application filed June 17, 1873.

Claim.—The process of boiling or steaming blocks of wood in a solution of ammonia and borax, substantially as and for the purpose above described.

142,299.—Fruit and Berry Basket.—GEORGE W. SWAN and WILLIAM FINCH, San Francisco, Cal.; said FINCH assignor to said SWAN. Application filed June 18, 1873.

One piece forms the outer sides, cut diagonally to give the form, and secured by a flap and nails. Two side-supports and bottom are formed from another piece and placed within, with an extended flap forming the cover. The bottom of the box is in arched form to allow free circulation of air between the corners.

Claim.—A fruit-box constructed of the blank A, having the bottom of each side portion concaved, as shown, in combination with the blank D, cut and inserted to form an elevated bottom, C, double sides, and a top, F, substantially as set forth.

142,300.—Bolt-Work for Sah-Doors.—HIRAM B. TRIPP, South Boston, Mass. Application filed July 12, 1873.

Two catches are pivoted to the door and connected, by means of two links and a bar, with the carrying-bar for the door-bolts. When both locks are locked the door-bolts cannot be withdrawn, but with either one or both unlocked the bolts can be thrown.

Claim.—A mechanism, K, consisting of bar *a*, link-bars *d* d^2, and lever-catches *g* g^2, arranged together and interposed between the door-bolts, and two locking mechanisms, to operate substantially as herein described, for the purpose specified.

142,301.—Knit Mitten.—OTHNIEL F. TRIPP, Battle Creek, Mich. Application filed December 31, 1872.

The hand portions of two mittens, knit in any known way, are combined by inserting one within the other, and their lower extremities joined and a single wrist knit in continuation thereof.

Claim.—A double knit mitten, the inner and outer hand portions of which are connected in several places by stitches, and joined together into a single web, forming the wrist, substantially as and for the purpose herein described.

142,302.—Car-Axle Box.—STEPHEN USTICK, Philadelphia, Pa. Application filed May 1, 1873.

The detachable oil-box is arranged in front of the journal, and oil is supplied from the box to a lubricating-pad, which is held against the journal by means of a shield, the edges of which are secured to the bearing.

Claim.—1. The detachable oil-box F, so constructed and arranged as to have its upper end in front of the journal-bearing, substantially in the manner and for the purpose above described.

2. The combination and arrangement of the shield D and pad E with the journal B and bearing C, substantially as and for the purpose set forth.

142,303.—Car-Axle Box.—STEPHEN USTICK, Philadelphia, Pa. Application filed June 12, 1873.

Each side of the upper surface of the bearing is cut away, and oil-boxes inserted between the bearing and box.

Claim.—The combination of the oil-boxes B B with the bearing A, substantially in the manner and for the purpose above set forth.

142,304.—Grain-Binder.—JAMES WADSWORTH, New Philadelphia, Ohio. Application filed April 29, 1873.

A wire connected to one of the clamping-arms and passing through an eye in the other serves to hold the gavel in the required position.

Claim.—1. The teeth G G, constructed as described, in combination with the wires A A, arranged, in relation to the teeth G, substantially as and for the purpose specified.

2. The combination of the frame A, shafts B B, pinions C C, levers D D, teeth G G, and wires A A, all substantially as and for the purposes herein set forth.

142,305.—Sash-Holder.—JOSEPH WARE, West Swanzey, N. H. Application filed June 2, 1873.

Claim.—The sash-supporter C, consisting of the elastic strip *b* and the two rabbeted flanking-strips *a c*, forming a single piece, the elastic substance projecting on either side, loosely fitting in lengthwise of the sash, all substantially as described and shown, for the purpose set forth.

142,306.—Folding Table.—CHARLES H. WHEELER, St. Louis, Mo. Application filed April 24, 1873.

The leg and table are connected together by a hinge arranged on the outside of the leg and table-frame, and the hinge has a projection on the lower part thereof. To the frame of the table is attached a flat metal spring in a horizontal position. Said spring has a notch near its free end that engages with the projection on the hinge, and locks the leg when opened out from the table.

Claim.—1. The combination of the hinge, of substantially the form shown, with the locking-spring, which fixes the leaves of the hinge rigidly in position both when closed and when open, as and for the purpose set forth.

2. The combination of the hinge and spring with the table and table-legs, in the manner and for the purpose substantially as herein before set forth.

142,307.—Boot-Lining.—HUGH WHITE, La Fayette, Ind. Application filed March 6, 1873.

Claim.—In the manufacture of boots in which the leg and vamp form two separate pieces united by stitching, the wide lining C extending high up on the instep, as described, and attached to the boot-leg A by stitching its edge *c*' to the flap *a*, and dispensing with the stitching to the vamp, substantially as shown and described.

142,308.—Spark-Arrester.—JAMES WHITE, South Amboy, assignor to himself and CHARLES S. WORTH, Jamesburg, N. J. Application filed July 25, 1873.

A spark-arresting perforated diaphragm is placed between the up-take and tube-sheet, and a tubular passage between said diaphragm and fire-box. The non-consumed products of combustion, other than smoke, are forced through this passage by a jet of live steam to the fire-box above the fire, where they are consumed, they and the steam being prevented from returning by means of the valve.

Claim.—1. The combination, in a locomotive-boiler, substantially as described, of a perforated or wire-gauze partition, *a*, in the smoke-box, a passage, *b*, between the smoke-box and fire-box, and a nozzle, *A*, directing a jet of live steam through the said passage *b* toward the fire-box.

2. The combination described of the passage *b* between the chamber *a* and the fire-box with a steam-nozzle, *A*, and a valve, *c*, opening toward the said fire-box.

142,309.—Bundling Kindling-Wood.—CHARLES B. WHITTEMORE, Arlington, Mass. Application filed June 2, 1873.

Brush-wood is compressed into bundles, tied, and sawed into suitable lengths for kindling-wood.

Claim.—The forks D D', applied upon a bench, A, and having combined with them compressing devices G *b* for compressing brush-wood preparatory to tying it and sawing it into bundles, substantially as described.

142,310.—Plow-Colter.—EDWARD WIARD, Louisville, Ky., assignor to BENJAMIN F. AVERY, same place. Application filed June 14, 1873.

The clamp is formed with curved projections *i i*, so as to permit only a limited vibration of the colter.

Claim.—1. The laterally-vibrating swiveling-clamp C, perforated, as described, for receiving the flattened end of the standard A below the shoulder *r*, for the purpose specified.

2. An open circular adjustable colter, B, constructed substantially as described.

142,311.—Flue-Casing for Forge-Chimneys.—HENRY S. WILCOX, Nevada, Ohio. Application filed August 2, 1873.

A plate with a hole surrounded by a flange, to be placed against the breast of the chimney, constituting the entrance to the flue.

Claim.—The flanged plate D having opening *a* and projecting convex flange G around said opening, and used in combination with a blacksmith's chimney, substantially as and for the purposes herein set forth.

142,312.—Half-Boot.—LYMAN U. WILLIAMS, La Fayette, Ind. Application filed October 29, 1872.

Claim.—A half-boot, having the quarters D and vamp A cut in one piece with the tongue B, forming the front of the leg, in combination with the gore C, substantially as specified.

142,313.—Washing-Machine.—ANDREW M. WILSON, White Pigeon, Mich., assignor of one-half his right to WILLIAM R. GILLETT, same place. Application filed May 31, 1873.

Claim.—The combination of the side pieces A A, having cleats *a a' a''* small rollers *c c* arranged above the large roller B, springs *f f*, and regulating-pins A A, operating in the manner as specified and shown.

142,314.—Lathe for Turning Spools.—ASA T. WING, Old Town, Me., assignor to GEORGE F. DILLINGHAM, same place. Application filed March 31, 1873.

A square stick is put in the machine, moved forward, rounded, and the spool turned, bored, and cut off automatically.

Claim.—1. A non-rotating reciprocating bit, K, in combination with the revolving head-piece T, intermediate supports D and E, and hollow center J, as specified.

2. The combination of the support C and tail-block D with their respective racks *c d* and gears *g* A, whereby the support D is kept under way between the tail-block and cutter-head.

3. The combination of the reciprocating center-head M with the lever *i*, ball-crank *k*, ratchet *l*, pawl *j*, shaft *e*, gears *g* A, racks *c d*, and support D, and tail-block C, as specified.

142,315.—Hinge.—ADOLF WIRTH, New York, N. Y., assignor to himself and CHARLES KOLB, same place. Application filed February 12, 1873.

Double hinge united by extensible shank, so that a box-cover may be turned over out of the way.

Claim.—A hinge composed of two parts, A B, united by an extensible shank, C, substantially in the manner shown and described.

142,316.—Rolling-Mill.—ALAN WOOD, Jr., Conshohocken, Pa. Application filed August 1, 1873.

A pair of segmental blocks, moving in corresponding recesses in the frame, the inner ends to operate to raise the carriage of the lower roll, when the connecting-bars, operating on their outer ends, are pressed down by the carriage of the upper roll, which is moved by a screw.

Claim.—In three-high rolls, the combination, substantially as described, of segmental blocks *e e*, or their equivalents, and bars *d d* with the bearings of the top and bottom rolls.

142,317.—Punching-Machine.—WILLIAM WOLCHESKI, Bloomington, Ill. Application filed July 3, 1873.

The L-shaped arm, bearing a die near its outer end, is arranged to receive a stove-pipe or other hollow cylinder and present the same under the punch.

Claim.—In combination with a punching mechanism operated by gearing, substantially as described, the revolving L-shaped post N, over which the pipe is placed and swung in under the punch, as set forth.

142,318.—Bee-Hive.—ALLEN T. WRIGHT, Oskaloosa, Iowa. Application filed June 26, 1872.

The comb-frames are chamfered on their outer edges and V-shaped inside, and have perpendicular or horizontal breeding-bars, which may be removed. A screen, adjustable at any desired position among the frames, has a reversible bar at top and bottom to open or close a bee-passage. The ends of the cases have these reversible bars. A frame on the same level contains feed-boxes, and has a screen with slide-bar above.

Claim.—1. The comb-frames C, the external bars of which are cut away or beveled about one-half the distance between the outer and inner faces, so that the frames may be placed edge to edge, and in opening them the bees will not be crushed, as set forth.

2. The combination of the comb-frames C, having external beveled edges, as set forth, the V-shaped comb-guides *i*, and one or more detachable intermediate bars, *b*, all as and for the purposes set forth.

3. The screen D, provided with the removable and reversible bar *h*, as and for the purposes set forth.

4. The end piece E, provided with the removable and reversible bar *h* and ear projections *m*, substantially as and for the purposes herein set forth.

5. The frame H for containing one or more feed-boxes, I, and provided with a screen, J, on its top and movable bar *n* on top of said screen, substantially as and for the purposes herein set forth.

142,319.—Rock-Drill.—SOLOMON H. YERDEN, Stone Mills, N. Y. Application filed June 7, 1873.

The main frame has attached thereto an auxiliary frame carrying the operating-lever, which is elevated or dropped by means of the cam upon the main gear-wheel.

Claim.—1. The combination, with the frame A, of the removable and adjustable frame A' supporting the trunnion-block J and operating-lever I, for the purpose specified.

2. The combination of the cog-wheel G, having the eccentric-cam K and operating-lever I, with the friction-roller *s* and the trunnion-block J, constructed substantially as and for the purpose described.

142,320.—Seed-Dropper.—FRANK W. YOUNG, Holden, Mo. Application filed July 19, 1873.

Arranging on a reciprocating slide a rotating dropping-wheel, provided with pawls for operating the same.

Claim.—The parts G K, arranged on the reciprocating slide F, as described, in combination with wheel C, blades I I, and keys *s s*, substantially as and for the purposes herein set forth.

142,781.—Mill-Pick.—MORGAN N. YOUNG, Kelseyville, Cal. Application filed June 27, 1873.

Claim.—The handle-head A with its dovetail slot *c*, which is also made tapering toward one side, in combination with the chisel D with its tapering double wedge-shaped base, substantially as and for the purpose above described.

REISSUE PATENTS.

5,546.—Steam-Trap.—JAMES H. BUNNING, Albany, N. Y., assignor to himself and FREDERICK TOWNSEND, same place.—Patent No. 123,670, dated February 13, 1872. Application filed April 30, 1873.

The water from the coils partly condenses the steam in the vessel, and then permits the pressure from the boiler to force it into said vessel, from which it flows into the boiler through gravity upon an equilibrium being obtained between the former and the latter. The vessel is pivoted so that if it should become surcharged, upon being depressed, through tripping devices a valve permits the entrance of steam to establish an equilibrium between it and the boiler, and gravity causes the water to flow into the latter.

Claim.—1. A receiving and discharging vessel, C, communicating with a steam-boiler by means of a steam-pipe, G', and inlet check-valve *x*, and with the same boiler by means of an outlet-pipe, J, and a valve, 2, and so arranged between or in respect to the two valves that the water is received and allowed to fall to the bottom of the vessel, and the steam following is not compelled to pass through the water, all for the purpose of automatically returning water of condensation to the said boiler from steam-heaters, substantially as described.

2. A vessel, C, of a steam-trap, which is sustained upon one arm of a lever, B, and counterbalanced by a weight, W, on the opposite arm of such lever, in combination with pipes G, G', and J, and an automatic tripping device for the valve g^2, substantially as described.

3. A vessel, C, valve-box D, and a valve-tripping device, which is connected by a rod, A', to a fixed arm, *d*, whereby the rising and descending movements of the trap will actuate the valve g^2, substantially as described.

4. The perforated distributing-plate Y, placed inside of the vessel C, and combined with the inlet steam passage *y* and water-passage *x'* of the trap, substantially as described.

5. A receiving-vessel, C, for the purpose of insuring the return of the water of condensation to the boiler, which rises and falls on centers, combined with a steam-heater and a steam-boiler, substantially as set forth.

5,550.—Machine for Hulling Cotton-Seed.—WILLIAM R. FIRE, Cincinnati, Ohio.—Patent No. 17,981, dated August 11, 1857; extended seven years. Application filed August 2, 1872.

Cylinder and concave provided with cutting edges, between which are furrows, the seed being split thereby, and not crushed.

Claim.—1. A series of cutting-edges with intervening furrows, for the purpose of hulling cotton-seed by a cutting action, which readily holds the screening process and the expression of the oil easy and complete, as set forth.

2. The employment, in a cotton-seed huller, of a series of cutting-edges to hull cotton-seed, each cutting-edge being separated by intervening spaces of sufficient dimension to afford the seed opportunity to turn over in passing from the cutting-edge to the next adjacent cutting-edge, substantially as set forth.

3. The employment of a series of cutting-edges to hull cotton-seed, such cutting-edges being placed at a sufficient distance apart to permit the seed to turn over in passing from one cutting-edge to the next adjacent cutting-edge, when such cutting-edges have a shearing action, substantially as specified.

5,551.—Packing for Journals and other Parts of Machinery.—CHARLES A. STEVENS, New York, N. Y., assignor to ISAAC D. CLIFT.—Patent No. 101,304, dated March 29, 1870. Application filed January 20, 1873.

By means of the central cord and outer binding-thread this packing is made strong enough to bear handling and ordinary strains. The embedding of the binding-threads in the fibers of asbestos protects them from heat or friction.

Claim.—1. A packing, composed of asbestos combined with internal strengthening fibers and with an outer binding, substantially as set forth.

2. A packing of asbestos having an outer binding-thread arranged so as to be concealed, or partly concealed, and overlapped by the mineral fibers, as set forth.

5,552.—Embroidering-Machine.—WILLIAM A. TANGEMAN, Lockland, Ohio.—Patent No. 65,548, dated January 5, 1869. Application filed October 28, 1872.

The space above the cams is for the reception of the butts of such needles as are elevated so as not to knit, but yet retain their stitches, while the others are at work knitting a fair extension of the sides to form the heel and toe. One side cam raises the needle so that its latch is above the loop, the center cam draws it down into position to receive a new yarn in its hook, and the other side cam lowers it to cast off the loop. The sliding bars regulate the height to which the side cams may be raised, and consequently the length of the loop, and the levers are for raising one of the side cams so that the look on one side of the machine shall be inoperative while the other is at work.

Claim.—1. A triangular needle-cam A, mounted on the cam-plate, with its base toward the hooks of the needles, and having a space, T, above its base-line for the reception of the heels of the needles, and arranged between movable cams also acting on the needles, in a machine capable of knitting a tubular fabric, substantially as described.

2. The graduated sliding bars K K', as and for the purposes described.

3. The levers G G', as and for the purposes described.

4. The combination, with a knitting-machine having two parallel straight rows of needles of a set of cams or lock, constructed and operating substantially as described, so that a portion of the needles may be elevated so as not to operate, and yet so as not to interfere with the proper working of the needles that are in operation for knitting the heels of stockings or other ourves.

5. The V-shaped cam A, constructed and arranged with reference to the wing-cams, as shown, for the purpose of permitting the needles to remain at rest, so that the slack of the yarn may be taken up, and power saved.

6. The devices herein described, arranged and operating as shown, to draw the needles down to such a point that they are in a proper position to receive the yarn without drawing them down so far that they would lose their stitches.

5,553.—Cotton-Bale Tie.—ANDREW J. GOING, Clinton, La.—Patent No. 137,301, dated April 1, 1873. Application filed July 12, 1873.

Claim.—A bale tie constructed with slots B and tongues D formed on opposite sides thereof, so that its ends may be locked together, substantially as shown and described.

5,554.—Cooking-Stove.—RICHARD M. HERRMANCK, Troy, N. Y., assignor, by mesne assignments, to JOSEPH B. WILKINSON, same place.—Patent No. 102,462, dated April 26, 1870. Application filed August 2, 1873.

Claim.—1. In a cook-stove a water-reservoir, located at the rear thereof, behind the ordinary rear flue-space, in combination with a flue or flues that first carry the products of combustion under and against the bottom and the back of the oven, completing the heating of the oven before they are brought in contact with the reservoir.

2. In a diving-flue cook-stove a water-reservoir, located at the rear thereof, behind the ordinary rear flue-space, and provided with a casing into which the products of combustion may enter, in combination with a flue or flues that carry the heated products of combustion into contact with the bottom and the back of the oven, and with the reservoir.

3. In a diving-flue cook-stove a water-reservoir, located at the rear thereof, behind the ordinary rear flue space, in combination with a flue through which the heated products of combustion may be made to pass from the top sheet-flue of the stove into contact with the reservoir, and thence to the exit-pipe, without being carried under the oven, substantially as described.

4. In combination with a cook-stove a water-reservoir, located at the rear thereof, behind the ordinary rear flue-space, and provided with a casing through which the products of combustion may be made to pass without heating the oven.

5. A water-reservoir, located upon the exterior of a cook-stove, above the top plate thereof, and provided with a casing into which the products of combustion enter on their way to the exit-pipe, after having heated the oven.

6. In combination with a cook-stove a water-reservoir, located at the rear thereof, and provided with a casing into which the products of combustion may enter, the front wall of such casing being formed by the rear end plate of the stove.

7. In a diving-flue cook-stove a water-reservoir, located at the rear thereof, in combination with a downward and upward draft-flue, through which the heated products of combustion descending behind the oven may change to an upward direction, and pass off to the exit-pipe, thus heating the reservoir without passing under the oven.

8. In combination with a cook-stove an inclosed water-reservoir supported directly upon the vertical walls of its casing, such casing in turn being attached to or cast as a part of the walls of the stove.

9. A water-reservoir, located behind the ordinary rear flue-space of a cook-stove, and provided with a hot-air casing, the top of which is formed by an extension of the top plate of the stove, which also serves to support the reservoir, substantially in the manner shown and described.

10. In combination with a cook-stove an inclosed water-reservoir, the top of which is closed by a cover hinged to the casing, substantially in the manner shown and described, so that it may be lifted up from the apertures in the top of the casing when it is desired to obtain access to the reservoir.

11. In combination with an inclosed water-reservoir upon a cook-stove a check-damper for admitting cool air to the hot-air chamber surrounding the reservoir, substantially as set forth.

12. The back plate of a cook-stove, provided with a reservoir chamber or casing upon its exterior face, the walls of such casing being cast continuous with the back plate itself.

13. A cook-stove provided with an inclosed water-reservoir, located at the rear thereof, the ordinary rear end plate of the stove forming one side of such casing, and being supplied with proper apertures above the lower oven-plate to admit the heated products of combustion into the reservoir-chamber.

14. In combination with a water-reservoir, located at the rear of a cook-stove, and behind the ordinary flue-space, an exit-pipe arranged in rear of such reservoir, substantially as described.

15. In combination with an inclosed water-reservoir partition-strips between the reservoir and its casing for guiding and controlling the movement of the heated products of combustion within the reservoir-chamber.

5,555.—Hand-Stamp.—HORACE HOLT, Brooklyn, N. Y., assignor, by mesne assignments, to SECOMBE MANUFACTURING COMPANY, New York city.—Patent No. 38,864, dated June 9, 1863. Application filed December 19, 1872.

Claim.—A cylinder, A, having attached to it two reels, D D', to which the ends of an inking-ribbon are secured, and provided at one end with type *t* and at the opposite end with a handle, B, all made to move together when an impression is taken, substantially as described.

5,556.—Elevator.—EDWIN T. HOPE, Philadelphia, Pa., assignor to SAMUEL I. THURSBY, Brooklyn, N. Y.—Patent No. 81,276, dated August 18, 1868. Application filed April 4, 1873.

Claim.—1. The combination of the cushions L L with the telescopic tubes.

2. The combination of the vertical ways K K, the platform H, the telescopic tubes, the three-way cock N, and the vertical rod M, with the arms *o o* for governing the action of the fluid upon the tubes automatically at prescribed points.

5,557.—Cultivator.—CICERO P. NORTON, Prairie City, Iowa, assignor to ITHAMAR P. PILSBURY, Monmouth, Ill.—Patent No. 106,384, dated October 18, 1870. Application filed July 22, 1873.

Claim.—The main frame A B and runners E, arranged, relatively to each other, so that either side of the main frame, together with its runner, may be advanced, and either plow-beam vertically or laterally oscillated without disturbing the parallelism of the runners with each other or with the line of progression, substantially as described, and for the purpose specified.

INDEX OF INVENTIONS PATENTED AUGUST 26, 1873.

	Class No.	Whole No.
Arithmetical frame, E. T. Curtis	146	142,151
Auger, earth, S. Emery	51	142,218
Awning frame, H. Stephens	4	142,291
Bale tie, cotton, A. J. Going, (reissue)	7	5,553
Ball and socket joint, M. W. St. John	87	142,283
Ballot box, registering, J. S. Savage	146	142,124
Basket, fruit and berry, Swan and Finch	63	142,289
Bathing apparatus, steam, W. Wolf	8	142,185
Bedstead, sofa, E. Lovell	62	142,240
Bee hive, Rogers and Mason	9	142,281
Bee hive, A. T. Wright	9	142,316
Bell attachment, alarm, A. Sherwood	24	142,287
Belting, W. D. Powers	81	142,273
Billiard table, A. and F. Braun	143	142,293
Blocks in triple chains, fastening, P. Hendrick	79	142,110
Bobbin winding machine, W. Atkinson	142	142,198
Boiler, steam, T. W. Pratt	146	142,272
Boiler, steam, C. Stewart	146	142,189
Boiler for warming buildings, steam, G. W. Blake	146	142,196
Bolt, floor, Chost and Rich	57	142,062
Bolt and rivet machine, N. Beauregard	14	142,193
Boot and shoe heel, M. Bray	16	142,203
Boot, half, L. U. Williams	16	142,312
Boot lining, H. White	16	142,307
Boots and shoes, rubber sole for, D. E. Hayward	16	142,161
Boring machine, J. Strickler	173	142,298
Bottles, apparatus for corking, A. C. Jordan	1	142,240
Boxes, machine for making, G. W. Swan	30	142,297
Bracket, adjustable, J. B. Merrison	62	142,263
Brick, J. Dennean	20	142,057
Brick machine, McLean and Bennor	20	142,114
Brush handle, J. Ames, Jr	32	142,137
Buckle, J. M. Bergheardt	23	142,076
Butter cutter and lifter, gaged, T. E. Colburn	45	142,207
Can opener and knife or fork, T. Kenderdine	88	142,109
Candlestick, S. D. Hill	90	142,102
Canvas stretcher, H. W. Holly	54	142,228
Car axle box, J. Hogan	122	142,104
Car axle box, S. Ustick	122	142,302
Car axle box, S. Ustick	122	142,303
Car coupling, L. D. Bennet	122	142,142
Car coupling, J. Crist	122	142,209
Car coupling, J. M. Enos	122	142,219
Car coupling, E. N. Gifford	122	142,226
Car coupling, J. Riera	122	142,280
Car replacer, A. Whittemore	120	142,135
Car roof, J. B. Stiehter	121	142,129
Card, playing, H. Billings	143	142,075
Carriage window, Henegen and Kruger	31	142,229
Cartridges, implement for uncapping, capping, and charging, W. M. Fowler	32	142,157
Case, packing or show, G. G. Bates	54	142,073
Cellars, water closets, &c., apparatus for emptying, R. Boeklen	118	142,200
Chair, spring rocking, F. Chichester	62	142,145
Chandelier center, J. Kintz	61	142,165
Chandelier, extension, L. Hull	64	142,107
Cheek runner, J. Haggerty	72	142,160
Chimney top, revolving, C. L. Garfield	100	142,225
Chimneys, flue casing for forge, H. S. Wilcox	60	142,311
Cheek, E. Horton	100	142,163
Churn, reciprocating, H. Hatch	45	142,102
Cigar lighters, plans for cutting, W. H. Dripa	174	142,216
Circuit closer for railway signaling apparatus, H. W. Spang	30	142,131
Clothes line support, J. E. Roache	91	142,278
Clutch, friction, J. J. Grant	67	142,227
Coal, &c., apparatus for washing, M. Evrard	3	142,221
Cock, H. S. Ross	167	142,188
Coffee package, H. C. Lockwood	58	142,243
Column, metallic, S. Brandels	21	142,201
Composition for coating wood and iron, E. F. Prentiss	35	142,117
Cooler, water, T. Smith	167	142,178
Corset clasp, J. B. Roby	60	142,279
Cotton seed, machine for hulling, W. R. Fee, (reissue)	41	5,550
Croquet wicket driver, E. A. Barker	143	142,072
Cultivator, C. P. Norton, (reissue)	43	5,557
Ditching machine, J. W. Fauver	51	142,220
Drill extractor, D. Kunkel	134	142,244
Drill, rock, S. H. Yerden	134	142,319
Drilling machines, cutter head for, E. Weicke	100	142,133
Elevator, E. T. Hope, (reissue)	118	5,556
Engine governor, steam, A. Matson	60	142,167
Engine, steam, J. H. Strobli	150	142,295
Engine valve, steam, W. J. Stevens	150	142,290
Eye glass, M. Risley	157	142,277
Fabrics uninflammable, rendering, D. Nicoll	35	142,257
Fan, automatic, J. D. Bush	165	142,091
Faucet, beer, O. T. Earle	167	142,090
Faucet, self-closing, W. H. Bate	167	142,199
Fence, wire, G. and L. N. Lakins	59	142,242
Fender and ash lifter combined, W. C. Dobbins	154	142,214
File, paper, P. W. Derham	146	142,213
Filter, J. B. Ellis	167	142,217
Fire arm, revolving, W. H. Philips	153	142,175
Fire escape, P. W. Barnes	70	142,141
Fire place, W. M. Kepler	154	142,241
Fishing rod holder, F. Senieur	143	142,126
Fruit crate, D. Crane	30	142,148
Fruit drier, I. B. Cottrell	48	142,147
Furnace, rotary puddling, melting, and heating, S. Danks	85	142,152
Furrowing machine, W. H. Rutledge	133	142,283
Gage, pressure, G. Sewell	148	142,128
Gas regulator, C. H. Edwards	64	142,155
Gas retorts, closing, G. A. Mollhenney	86	142,253
Gas, manufacture of illuminating, A. P. Southwick	64	142,288
Glass, ornamenting, C. Schliesler	54	142,125
Grain binder, J. Weddington	74	142,304
Grain drier, R. J. Williams	28	142,164
Grain steaming apparatus, J. C. Hunt	57	142,237
Grate bar, G. H. Clark	149	142,146
Griddle, S. Kennedy	154	142,164
Harness attachment, Croughwell, Tillman and Vanderburg	72	142,085
Harvester, P. F. Hodges	74	142,231
Harvester rake, J. K. Augspurger	74	142,139
Harvester rake, T. Murphy	74	142,171
Hay loader, Howland and Moore	77	142,234
Head band, D. McKinnon	161	142,169
Hinge, A. Wirth	24	142,315
Hinge, table, E. C. Brinser	24	142,077
Hinge, table, W. F. Daly	24	142,210
Hoe, J. H. Gould	141	142,159
Hoe, weeding, H. S. Crossland	141	142,149
Horse power, E. G. McMillan	159	142,115
Horseshoe, C. Goodenough	66	142,097
Horseshoe, Rowe and Brown	80	142,282
Hydrants, pumps, &c., packing for, J. W. Murphy	118	142,254
Indicator and alarm, low water, F. Strange	148	142,181
Journal, lubricating, G. A. Chapman	87	142,206
Journals, &c., packing for, C. Stevens, (reissue)	87	5,551
Knitting machine, W. A. Tangeman, (reissue)	89	5,552
Lamp, R. Hitchcock	90	142,103
Lamp bracket, L. Hull	90	142,106
Lamp chandelier, J. Aulback	90	142,189
Lamp wick trimmer, Naylor and Fairchild	90	142,265
Lantern, W. Westlake	90	142,134
Lantern, signal, H. B. Fernald	90	142,223
Lantern, signal, S. H. Miller	90	142,257
Lathe chucks, jaw for, M. C. Johnson	100	142,239
Lathe for turning spools, A. T. Wing	172	142,314
Lead, manufacturing white, E. A. Boehne	35	142,199
Locomotive head light, J., W. H., and A. E. Briggs	90	142,204
Log canting machine, A. Rodgers	126	142,280
Martingale, F. G. Moody	73	142,261
Mill, fanning, L. M. Boardman	139	142,197
Mill pick, M. N. Young	153	142,321
Mill, rolling, A. Wood, Jr	125	142,316
Mill for ores, stamp, G. S. Olin	99	142,172
Millstone dressing machine, diamond, F. S. Davenport	153	142,153
Mittes, knit, O. F. Tripp	89	142,301
Moccasin, A. Margeason	10	142,252
Motor, hydraulic, W. Walter	118	142,183
Mowing machine, W. A. Kirby	74	142,111
Nut lock, H. W. Dopp	14	142,215

	Class No.	Whole No.
Ore, flux for smelting, S. D. Young	35	142,186
Ore, rotating blanket sluice for washing, W. H. Patton	3	142,271
Pan, bake, W. B. Chamberlain	154	142,144
Pen and pencil case, J. H. Knapp	146	142,243
Piano forte, W. W. Bennett	112	142,194
Picture hanger, F. W. Ely	62	142,156
Pipe tongs, J. R. Brown	136	142,143
Pipes, cock for controlling discharge through two, J. and T. D. Richardson	167	142,120
Pipes, mold for earthen, P. McIntyre	20	142,168
Plow, J. F. Benton	114	142,074
Plow, E. Wiard	114	142,136
Plow colter, E. Wiard	114	142,310
Plow, gang, R. Coreth	114	142,084
Plow, rotary, C. T. Elliston	114	142,094
Plow scraper, H. Leach	114	142,113
Pot, coffee, Blaisdell and Estabrook	136	142,195
Press, R. Esmond	7	142,220
Presses, operating, Earle and Rider	7	142,003
Propeller, screw, N. A. Patterson	139	142,269
Pruning knife, A. C. Hulse	63	142,236
Pulley block, G. A. Ford	79	142,095
Pump, E. G. Russell	118	142,123
Pump bracket, Seldon and Hanchett	118	142,276
Pump, direct-acting steam, O. T. Earle	118	142,091
Pumps, attachment for direct-acting steam, O. T. Earle	118	142,092
Punching machine, W. Wolcesski	119	142,317
Purifier, middlings, J. H. Dedrick	57	142,086
Railway rail, R. Steel	120	142,179
Railway rail, Wales and Cushman	120	142,182
Railway rail chair, W. Huffman	120	142,235
Railway water crane, Cabberley and Mann	167	142,150
Refrigerator, A. Bardell	58	142,191
Regulator for cotton openers, &c., feed, D. Harding	95	142,101
Rice cleaner, D. L. Geer	57	142,158
Roofing cement, fire-proof, J. B. Slichter	126	142,130
Safe doors, bolt work for, H. B. Tripp	128	142,300
Safes, automatic fire escape for, L. Parke	128	142,174
Sash holder, J. Ware	24	142,305
Sauce for food, Agresta and Menoci	88	142,071
Saw teeth, W. P. Miller	131	142,258
Saw teeth, device for dressing, W. Rowe	131	142,176
Saws, machine for gumming, S. P. Olney	131	142,173
Saws, machine for forming backs of, C. Major	131	142,250
Sawing machine, J. Zachus	130	142,154
Sawing machine, J. M. Stowell	130	142,294
Sawing wood, machine for, I. G. Ringstad	130	142,121
Screw, wood, Ladd and Corning	171	142,112
Seed dropper, F. W. Young	133	142,320
Separator, seed, F. C. Miller	159	142,170
Sewer cleaner, J. E. Jennings	51	142,238
Sewing machine trimming attachment, W. A. Springer	134	142,290
Shaft coupling, W. J. Silver	87	142,288
Shafting, hanger for, J. Greenwood	67	142,100
Shingle machine, A. Anderson	174	142,138
Shirt front, T. M. Denham	38	142,212
Signal apparatus, pneumatic, W. Foster, Jr	158	142,224
Silk, reel for skeining, R. Simon	140	142,177
Spark arrester, J. White	94	142,308
Spark arrester for locomotives, M. B. Mason	94	142,251
Spike, G. N. Sanders, Jr	103	142,284
Spinning machine bobbin, P. Laflin	142	142,245
Stalk cutter, Ansley and Weaver	59	142,167
Stamp, hand, W. B. Gorham	146	142,099
Stamp, hand, H. Holt, (reissue)	146	5,556
Steam whistle, O. Kromer	148	142,166
Stirrer, apple butter, G. W. Collins	88	142,208
Stocking supporter, E. K. Rand	38	142,118
Stool, milking, G. T. Lincoln	62	142,247
Stone channeling machine, A. S. Gear	124	142,096
Stone facing machine, cobble, L. Dutertre	153	142,089
Stove, cooking, R. M. Hermance, (reissue)	154	5,554
Stove, heating, R. H. Brown	154	142,078
Stove, heating, R. H. Brown	154	142,079
Stove, heating, S. B. Patterson	154	142,270
Stove, laundry, J. H. Mitchell	154	142,259
Stove pipe coupling, H. A. Mears	154	142,254
Stove, reservoir cooking, R. H. Brown	154	142,080
Table, folding, C. H. Wheeler	62	142,306
Table leaf support, J. K. Moffett	134	142,260
Teeth plugger, T. L. Buckingham	46	142,205
Telegraph pole, J. L. Chapman	52	141,662
Thermoscope, Baker and Mayer	101	142,190
Thill coupling, G. R. Davis	31	142,211
Thill coupling, R. R. Rapp	31	142,274
Trap, steam, J. H. Blessing, (reissue)	150	5,549
Turpentine filter, F. G. Richardson	47	142,276
Vehicle wheel, H. A. Gore	31	142,098
Vehicle wheels, skein and box for, N. L. Holmes	31	142,233
Vehicles, adjustable stay spring for, A. A. Herne	31	142,105
Vehicles, rein guide for, A. D. Smith	31	142,127
Velvet, &c., apparatus for renovating, M. J. and J. T. Dewey	37	142,088
Ventilator, J. Ballou	166	142,140
Vessels, pontoon for raising sunken, J. Rice	82	140,275
Vessels, removable ceiling for, W. F. Morgan	137	142,262
Wagon, hand, S. D. Scott	31	142,285
Washing machine, T. F. Kiff	91	142,242
Washing machine, Marcar and Mehaffey	91	142,255
Washing machine, W. Parker	91	142,268
Washing machine, A. M. Wilson	91	142,313
Water wheel, E. Hackett	168	142,228
Weather threshold, J. P. Stark	30	142,132
Wheat, machine for separating cockle, &c., from, G. H. Rich	150	142,119
Windmill, Bodwell and Atwood	118	142,198
Windmill, W. Jones	118	142,103
Windmill, W. C. Nelson	118	142,265
Wind wheel, G. Metcalf	118	142,256
Wood, bundling kindling, C. B. Whittemore	174	142,309
Wood, machine for splitting, R. Murray	174	142,116
Wood, process for softening and toughening blocks of, G. W. Swan	35	142,296

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED AUGUST 26, 1873.

Agresta, A. P., and A. Menoci, Sauce for food 142,071
Allen, W., assignee 142,180
Amberg, M., assignee 142,076
Amea, J., Jr., Brush handle 142,137
Anderson, A., Shingle machine 142,138
Ansley, V., and J. W. Weaver, Stalk cutter 142,167
Atkinson, W., Bobbin winding machine 142,188
Atwood and Bodwell 142,198
Augspurger, J. K., Harvester rake 142,139
Aulbach, J., Lamp chandelier 142,189
Avery, B. F., assignee 142,310
Avery, B. T., assignee 142,136
Ballou, J., Ventilator 142,140
Bardell, A., Refrigerator 142,191
Barker, E. A., Croquet wicket driver 142,073
Barker, G. F., and A. F. Mayer, Thermoscope 142,190
Barnes, P. W., Fire escape 142,141
Bate, W. H., Self-closing faucet 142,192
Bates, G. G., Packing or show case 142,073
Bayliss, E., assignee 142,231
Beauregard, N., Bolt and rivet machine 142,193
Bennett, L. D., Car coupling 142,142
Bennett, W. W., Piano forte 142,194
Benner, S. T., assignee 142,201
Bennor and McLean 142,114
Benton, J. F., Plow 142,074
Billings, H., Playing card 142,075
Blaisdell, W. S., and E. Estabrook, Coffee pot 142,195
Blake, G. W., Steam boiler for warming buildings 142,196
Blessing, J. H., Steam trap, (reissue) 5,549
Boardman, L. M., Fanning mill 142,197
Bodwell, H. H., and E. A. Atwood, Windmill 142,198
Boehne, E. A., Manufacturing white lead 142,199
Boeklen, R., Apparatus for emptying cellars, water closets, &c 142,200
Boese, C. H., assignee 142,240
Borchardt, J. M., Buckle 142,076
Boyington, L. C., assignee 142,155
Boyle, J., assignee 142,201
Brady, F. A., assignee 142,202
Brandeis, S., Metallic column 142,201
Braun, A. and F., Billiard table 142,202
Briggs, J., W. H., and A. E., Locomotive head light 142,204
Brinser, E. C., Table hinge 142,077
Brown and Rowe 142,262
Brown, E., assignee 142,169
Brown, J. O., assignee 142,231
Brown, J. K., Pipe tongs 142,143
Brown, R. H., Heating stove 142,078
Brown, R. H., Heating stove 142,079
Brown, R. H., Reservoir cooking stove 142,080
Buckingham, T. L., Teeth plugger 142,205
Bush, J. D., Automatic fan 142,081
Candee, F. C., assignee 142,215
Chamberlain, W. B., Bake pan 142,144
Chapman, G. A., Lubricating journal 142,206
Chapman, J. L., Telegraph pole 142,082
Chichester, F., Spring rocking chair 142,145
Choat, D. T., and H. Rich, Flour bolt 142,083
Clark, P. J., assignee 142,165
Clarke, G. H., Grate bar 142,146
Clift, I. D., assignee, (reissue) 5,551
Colbrann, T. E., Gaged butter cutter and lifter 142,207
Collins, G. W., Apple butter stirrer 142,208
Comdict, N. W., Jr., assignee 142,232
Coreth, R., Gang plow 142,084
Corning and Ladd 142,112
Corse, A., assignee 142,262
Cottrell, I. R., Fruit drier 142,147
Crane, D., Fruit crate 142,148
Crist, J., Car coupling 142,209
Crossland, H. S., Weeding hoe 142,149
Crowell, E., A. Tillman, and E. L. Vanderburg, Harness attachment 142,085
Cubberley, H. S., and D. Mann, Railroad water crane 142,150
Curtis, E. T., Arithmetical frame 142,151
Cushman and Wales 142,182
Daly, W. F., Table hinge 142,210
Danks, S., Rotary puddling, melting, and heating furnace 142,152
Davenport, F. S., Diamond millstone dressing machine 142,153
Davis, G. R., Thill coupling 142,211
Dedrick, J. H., Middlings purifier 142,086
De Groot, C. H., assignee 142,233
Denham, T. M., Shirt front 142,212
Denzen, J., Brick 142,087
Durham, P. W., Paper file 142,213
Dewey, M. J. and J. T., Apparatus for renovating velvet, &c 142,088
Dillingham, G. F., assignee 142,214
Dobbins, W. C., Combined fender and ash lifter 142,214
Dopp, H. W., Nut lock 142,215
Draper, G., assignee 142,245
Dripa, W. H., Plane for cutting cigar lighters 142,216
Dutertre, L., Cobblestone facing machine 142,089
Eashus, J., Sawing machine 142,154
Earle, O. T., Beer faucet 142,090
Earle, O. T., Direct-acting steam pump 142,091
Earle, O. T., Attachment for direct-acting steam pumps 142,092
Earle, O. T., and T. J. Rider, Mode of operating presses 142,003
Edwards, C. H., Gas regulator 142,155
Ellis, J. R., Filter 142,217
Elliston, C. T., Rotary plow 142,094
Ely, F. W., Picture hanger 142,156
Emery, S., Earth auger 142,218
Esmond, R., Press 142,220
Estabrook and Blaisdell 142,195
Evrard, M., Apparatus for washing coal, &c 142,221
Fairbanks, G. S., assignee 142,261
Fairchild and Naylor 142,265
Feaver, J. W., Ditching machine 142,222
Fee, W. E., Machine for hulling cotton seed, (reissue) 5,550
Fernald, H. B., Signal lantern 142,223
Finch and Swan 142,199
Folk, J. E., assignee 142,257
Ford, G. A., Pulley block 142,095
Foster, W., Jr., Pneumatic signal apparatus 142,224
Fowler, W. M., Implement for uncapping, capping, and charging cartridges 142,157
Fox, J. J., assignee 142,230
Fuchs, J., assignee 142,200
Garfield, C. L., Revolving chimney top 142,225
Gear, A. S., Stone channeling machine 142,096
Geer, D. L., Rice cleaner 142,158
Gifford, E. N., Car coupling 142,226
Gillett, W. E., assignee 142,313
Going, A. J., Cotton bale tie, (reissue) 5,554
Goodenough, C., Horseshoe 142,097
Gore, H. A., Vehicle wheel 142,098
Gorham, W. B., Hand stamp 142,099
Gould, J. H., Hoe 142,159
Grant, J. J., Friction clutch 142,227
Greenwood, J., Hanger for shafting 142,100
Hackett, E., Water wheel 142,228
Haggerty, J., Check runner 142,160
Hanchett and Seldon 142,276
Harding, D., Feed regulator for cotton openers, &c 142,101
Hatch, H., Reciprocating churn 142,102
Hayward, D. E., Rubber sole for boots and shoes 142,161
Henagan, J., and E. Kruger, Carriage window 142,229
Hermance, R. M., Cooking stove, (reissue) 5,554
Hiers, J., Car coupling 142,230
Hill, S. D., Candlestick 142,162
Hitchcock, R., Lamp 142,163
Hodges, P. F., Harvester 142,251
Hogan, J., Car axle box 142,104
Holly, H. W., Canvas stretcher 142,232
Holmes, N. L., Skein and box for vehicle wheels 142,233
Holt, H., Hand stamp, (reissue) 5,555
Holt, H., assignee 142,159
Hoge, E. T., Elevator, (reissue) 5,552
Horne, A. A., Adjustable stay spring for vehicles 142,105
Horton, E., Chuck 142,164
Howland, H. C., and T. L. Moore, Hay loader 142,234
Huffman, W., Railway rail chair 142,235
Hull, L., Lamp bracket 142,166
Hull, L., Extension chandelier 142,167
Hulse, A. C., Pruning knife 142,236
Hunt, J. C., Apparatus for steaming grain 142,237
Hunteon, H. P., assignee 142,149
Jennings, J. H., Sewer cleaner 142,238
Johnson, M. C., Jaw for lathe chucks 142,239
Jones, J. R., assignee 142,239
Jones, W., Windmill 142,201
Jordan, A. C., Apparatus for corking bottles 142,108
Kanderdine, T., Combined can opener and knife or fork 142,240
Kendrick, P., Fastening blocks in triple chains 142,110
Kennedy, S., Griddle 142,164
Kepler, W. M., Fire place 142,241
Kiff, T. F., Washing machine 142,242
Kintz, J., Chandelier center 142,165
Kirby, W. A., Mowing machine 142,111
Kitsee, R., assignee 142,101
Knapp, J. H., Pen and pencil case 142,243
Kolb, C., assignee 142,315
Kromer, O., Steam whistle 142,166
Kruger and Henagan 142,229
Kunkel, D., Drill extractor 142,244
Ladd, A. S., and C. N. Corning, Wood screw 142,151
Laflin, P., Bobbin for spinning machines 142,245
Lakins, G., and L. N., Wire fence 142,246
Lawson, W. H., assignee 142,274
Leach, H., Plow scraper 142,113
Lee, C. A., assignee 142,148
Lincoln, G. T., Milking stool 142,247
Lockwood, H. C., Coffee package 142,248
Lomont, F. T., assignee 142,231
Lovell, E., Soda bedstead 142,249
Major, C., Machine for forming saw backs 142,250

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks) 6,500
SEWING-MACHINES and attachments 2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes 4,000
PRINTING; including presses, type, and printers' furniture 2,500
FELTING and HATS; including caps, bonnets, flock, &c. 1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments) 1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs 1,400
CARRIAGES and WAGONS 6,000
RAILWAYS, (in progress.)
BRIDGES, (in progress.)
CARDING, CLOTH CORDAGE, KNITTING, SILK, SPINNING, WEAVING, (in progress.)

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 600 pages of specifications, 300 of drawings; total of each volume about 1,000 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,000 pages per month: 2,000 pages of specifications, 3,120 pages of drawings—12,720 pages.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 10. TUESDAY, SEPTEMBER 2, 1873. PRICE { $5.00 per year—single. $4.00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DIGEST OF FOREIGN PATENT LAWS.

GRAND DUCHY OF BADEN.

REPORT BY E. P. M. BAILLIE, OF THE BRITISH LEGATION.

Every State belonging to the Zollverein possesses the power of granting, by letters patent, a privilege conveying to an individual or individuals specified therein the sole right to make, use, or dispose of some new invention or discovery for a certain fixed period.

This power, however, has been limited and defined by certain regulations agreed upon at Stuttgardt in 1841 between the Zollverein States. The object having been, on the one hand, to remove as far as possible all obstacles to the freedom of trade within the Zollverein States arising from patents or privileges, and, on the other, to establish uniformity in all essential points.

These regulations are accordingly in force in the Grand Duchy of Baden. They are as follows, some slight changes only having been introduced in regard to taxes and fees:

1. Patents may be granted for those things only which are really novel and peculiar. A patent, consequently, cannot be granted for inventions which have been already practiced, have been vendible, or in any way known within the Zollverein previous to the grant of the patent, especially inventions already described in native or foreign works, by drawings, or otherwise in such a way that they can be practiced by any competent person.

Each government is to be the judge whether any invention for which a patent is demanded is really novel or peculiar.

No patent shall be granted in one Zollverein State for an invention by a German subject who has obtained a patent for the same in another German State, except to the inventor himself or his legal successor.

2. With reference to the provisions laid down in Article 1—

A patent may nevertheless be granted for an improvement to an old invention, if the improvement constitutes something novel and peculiar; but the patent must be confined to the addition or improvement, and not injure the patent granted for the original thing. On the contrary, the right of using the addition or improvement in connection with the thing that has been improved must be specially acquired.

3. The grant of a patent shall henceforth never establish the right—

(a.) To prohibit or limit the importation of such articles as have to do with those for which a patent has been granted.

(b.) The sale and disposal in trade of such articles; nor can the holder claim in virtue of his patent the right—

(c.) To prohibit the use or consumption of articles of the above kind not procured by him or obtained elsewhere with his consent, machines and implements for manufacture and industry being alone excepted, these not being general articles of commerce destined for consumption by the public at large.

4. On the other hand, every Zollverein government in granting a patent may secure to the holder within their territory—

(1.) The right of the exclusive manufacture or practice of the invention in question.

(2.) The right to introduce—

(a.) A new process or method of manufacture; or,

(b.) To apply exclusively new machines or implements for manufacture, so that he is entitled to prohibit the use of the method or the use of the machines or implements by all those who have not acquired the right to do so from him, or procured the said machines or implements from him.

5. In every State of the Union the subjects of other States of the Union shall be treated on an equality with their own subjects, both in respect to grants of patents and protection in the enjoyment of the privileges acquired by the patent.

The grant of a patent, however, in one State shall

never be held as a valid reason for the non-refusal of a patent for the same thing in other States. On the contrary, every State within the limits agreed upon is the judge whether a patent ought to be granted or not, without reference to what may have taken place in the matter in any other Zollverein State.

Further, the grant of a patent does not convey in itself to the subject of another State the right of independent settlement, or of carrying on the trade or business in which the article for which a patent has been granted is used; on the contrary, such right must be specially acquired according to the provisions of the constitution of each State.

6. A patent becomes void if the invention eventually proves to be neither novel nor peculiar.

A patent granted for an invention previously known to certain individuals, but kept secret by them, remains in force, unless rendered void by other causes, except as regards those individuals.

7. When a patent is granted the invention must be specified with the name and domicile of the holder, the period of duration, and must also be notified in the official gazette.

Similarly, the prolongation of withdrawal of a patent before the termination of the originally-fixed period must be publicly made known.

8. All the Zollverein governments shall communicate to each other, before the end of every year, complete lists of the patents granted.

2. MODE OF APPLYING FOR PATENTS.

Persons applying for letters patent must send in a petition in writing to the Board of Trade (Handel's Ministerium.) The petition must contain accurately and fully the following particulars:

1. Christian and surname, profession, domicile, and present residence of the applicant.

2. Declaration and distinct statement of the nature of the invention.

3. The distinct statement of the grounds of the petition for an exclusive right—

(a.) To manufacture or introduce a new article; or,

(b.) To apply new instruments for manufacture (machines or implements;) or,

(c.) To apply a new method of manufacture.

4. The number of years for which the patent is demanded. This petition must be accompanied by an accurate and exhaustive description of the articles for which the patent is demanded, with drawings, models, and patterns necessary for the elucidation of the same.

These points must be especially noted in the description and its annexes which serve to make the distinction between the article for which the patent is asked and others already known or in use of a similar kind.

This description may be sent in with the petition, either open or sealed up.

If the patent is not demanded by the inventor himself, a power must be obtained from him in duly legalized form.

When the petition is for the privilege of introducing an article similar in kind to one already known, and for which a patent has already been obtained in a foreign country, such patent must be annexed in original or legalized copy.

Foreigners must send in a declaration in the form of a regular deed, drawn up by a solvent Baden subject, resident in the Grand Duchy, by which the latter renders himself responsible for the payment of the costs, taxes, and fees, and also for the transmission to the applicant of the ministerial decision.

3. FURTHER PROVISIONS RESPECTING METHOD OF APPLYING FOR PATENTS.

The receipt of the application will be acknowledged by the Board of Trade, if requested by the applicant.

Applications not in accordance with the above regulations will be returned.

Proper applications, on the other hand, will be submitted to competent persons for examination (generally to technologists in the polytechnic school.)

The persons intrusted with the examination are bound to keep the description and drawings of the invention secret. The object of the examination is to determine whether the proposed invention is—

(a.) A new (not yet known,) and whether a patent has already been granted for it or not in the Grand Duchy.

(b.) Peculiar.

(c.) Admissible on economical and sanitary grounds, and in harmony with the police regulations for the public safety.

The Board of Trade has to decide on the written report, whether the patent is to be refused or not.

A patent may be refused if the invention does not appear to be generally useful.

Patents in the Grand Duchy were formerly granted for periods up to fifteen years. They are now limited to three years, in consequence of a new code of regulations in preparation.

The penalties for violation of patents are regulated by the police code of 1863, and are as follows:

The violation of a patent is punished at the suit or the holder of the patent by a fine not exceeding 300 florins, [say $125.00,] together with the confiscation of the illegally-manufactured article.

Cases of this description are brought before the police courts and there decided.

The grant of a patent involves no guarantee beyond the practical value of the invention.

It can be coupled with the condition that the holder of the patent brings the article into use in the Grand Duchy within a fixed time from the day of the grant, and does not interrupt such use longer than a fixed time, on pain of the patent becoming void.

The applicant obtains from the Board of Trade a document certifying the grant of the patent, and a notification to that effect is issued in the government gazette.

Drawings and descriptions of the patents granted are sent under seal to be deposited in the general archives of the country for the time the patent is in operation.

The corresponding dues, according to the tax, fee, or stamp regulations, are charged on every act connected with the examination and granting of patents.

By a law of July 29, 1864, respecting stamps, fees, and taxes in matters connected with the civil and police administration, the stamp charged on petitions is fixed at 15 kr., [say 14 cents,] and the tax on a letter patent from 15 to 500 florins [$6.25 to $208.35.]

Besides this, the cost of the examination of the petitions for patents must be reimbursed to the treasury, generally 6 florins [say $2.50] a day for the time spent by a technologist.

4. TRANSFER OF A PATENT TO ANOTHER PERSON.

The holder of a patent can transfer the right which he acquires by the patent to others for the period of its duration, or admit others to participate in the enjoyment of the same.

On the death of a holder of a patent, before its expiration, the right passes to his heirs.

Notice must be given to the Board of Trade on every change of possession taking place, and this must be inserted in the government gazette.

5. PROLONGATION OF A PATENT.

A petition for the prolongation of a patent granted for less than fifteen years must be sent into the Board of Trade some months before its expiration. A decision is then passed after due investigation.

When granted the applicant obtains a fresh act, and notice is given in the government gazette.

The same taxes and fees have to be paid as before.

6. DISPUTES ABOUT PATENTS AND THEIR WITHDRAWALS.

Disputes respecting the possession of a patent depending on a private right, and claims for indemnification founded on the violation of a privilege, come before the ordinary judge.

The fines imposed by the police and the proceeds of the confiscated article fall to the treasury.

7. PUBLICATION OF EXPIRED PATENTS.

Models, drawings, and descriptions of expired patents are deposited in the polytechnic school.

Drawings and descriptions of expired patents may be published in the interest of the national industry.

The law in the Grand Duchy of Hesse is in the main the same as that in Baden.

It has, however, always been a fixed rule in Hesse never to grant a patent for more than five years. Applicants from foreign countries, such as Switzerland, Hamburgh, Mecklenburgh, &c., where patents are not granted, cannot obtain a patent in Hesse. The subject of any foreign state cannot obtain a patent in Hesse for a period longer than is legal in his own country, and never for more than five years.

In other respects foreigners are treated on an equality with Hessian subjects.

In Hesse, too, the practice with respect to taxes and fees differs from that in Baden and most other states in the Zollverein. The holder of a patent has only to pay once for all a stamp of 20 florins [$8.33] on his letter patent, whether the period of duration is one year or longer (up to five years.)

Patents guarantee the holder against the manufacture or application of his invention by others, but interfere, of course, in no way with the trade of such inventions.

I must add, in conclusion, that the opinion in this country entertained generally by the government and the manufacturing classes is that the institution of patents is one which has outlived itself, and has ceased to be generally useful.

No form of patent can be discovered by which the real inventors are effectually protected, without injury being done to the community. There is, therefore, every probability that the present system will shortly either be greatly modified or done away with altogether.

BAVARIA.

REPORT BY CHARLES S. SCOTT, OF THE BAVIAN LEGATION.

The law of Bavaria affecting inventions consists of—

(A.) General enactments providing for the issue of patents, and for the protection of the rights of patentees, and contained in Articles IX and XI of the commercial law of September 11, 1825, since confirmed by a law of January 30, 1868; and,

(B.) Of a code of rules, drawn up in accordance with the spirit of these enactments, contained in paragraph eight of the commercial instructions ("Gewerbe Instruktion") of April 21, 1862.

These rules have in all essential particulars been framed on the basis of an agreement concluded between the states of the Zollverein on the 21st of September, 1842. From them I have extracted the following information, which may be taken as embodying the chief points in the law at present in force in regard to patents in Bavaria.

The department by which patents and trade privileges are issued is that of the Bavarian Ministry of the Interior.

The longest term for the duration of a patent in Bavaria has been fixed at fifteen years, after the expiration of which term the discovery or invention becomes public property.

Infringements of the rights of patentees are punishable by fines varying from 100 to 500 gulden [$41.65 to $208.35,] one-half of which sums is allotted to the patentee, the other to the poor of the parish where the infringement may have been detected. The article or articles manufactured in violation of the rights of the patentee are confiscated for the benefit of the patentee.

For each patent issued a fixed fee is charged, the highest fee not to exceed 275 gulden [$114.63,] and the produce of the fees is devoted to the encouragement of trade and industry.

The following is the scale of fees:

For a privilege for a term of	1	year	25	florins, or	$10	41
"	"	2	years	35	"	or	14	58

All new inventions, discoveries, or improvements in all branches of industry, whether consisting of new articles, implements, or processes of manufacture, are eligible for patents in Bavaria, irrespective of the sex of the inventors, if they fulfill the following legal conditions:

The article for which a patent is solicited must be itself new and original, or the alteration to be effected contain something new and original.

It must be of sufficient importance to entitle it to be considered as likely to prove beneficial to industry, and it must be shown that neither the article nor the process to be employed in using it is illegal, dangerous, or injurious.

Inventions patented abroad are eligible for trade privileges in Bavaria if they fulfil the aforementioned conditions, and are still protected by their original patents; but the possession of a trade patent does not necessarily give the patentee a right to a trade privilege in Bavaria, the power to grant or to refuse such privilege remaining at the discretion of the Bavarian Ministry of the Interior. Such privilege will, moreover, only be conceded to the foreign patentee or to his legal successor. Foreign patentees cannot acquire a patent in Bavaria for a longer term than that of the duration of their original patent.

Foreigners, subjects of States according reciprocity of treatment, are placed on the same footing as native subjects in regard to the concession of patents, and to the protection of the rights flowing therefrom.

Applicants for patents must produce security for the newness and originality of their inventions. Should it transpire subsequently to the issue of any patent that the invention or improvement patented was not really new and original, or that (the case of inventions already patented abroad of course excepted) the discovery had already been made, applied, or in any way known elsewhere, or had been ever publicly exhibited or explained in such a manner that any professional person could have availed himself of it, then the patent shall be forfeited, and the inventor compelled to bear all losses and expenses resulting therefrom.

Applicants for patents must address a petition to the Minister of the Interior, and this petition must contain—

1. Their names in full, their position, residence, and domicile, and, in the case of foreigners, those of their authorized agent in Bavaria.

2. A general, but at the same time characteristic, description of the peculiar nature of the invention or improvement.

3. The term of years for which the patent is required.

The petition must be accompanied by the legal fee and stamp duty, as also by a thorough and detailed description in the German language (or with a German translation appended) of the object, discovery, or improvement, and of the process to be employed in applying or preparing it. If necessary for explanation, this description must be accompanied by drawings, sketches, models, or samples. Everything new and original in the article, implement, or process must be specially noted. The description and petition may be sent open or sealed, and every precaution will be taken to prevent undue or untimely divulgement of their contents. In the case of an application for a privilege for an invention already patented abroad, the patent itself, or an attested copy of it, must be sent with the petition.

On presentation of these papers the applicant will receive an official receipt, marked with the date and hour of presentation, and this receipt will afterward be admitted in evidence in any question of disputed priority.

Petitions which fail to fulfil the above conditions, or are unaccompanied by the required description, will not be taken any notice of, and the presentation of such petitions will give no claim to priority. But if the fee or stamp duty only is wanting, or the description simply deficient, the applicant is allowed a certain time to make good the deficiency without prejudice to his rights of priority.

The term of a patent or privilege may be prolonged if it has been originally issued for a shorter period than fifteen years, but no privilege can ever be made to extend over a longer period than that of fifteen years from the date of its original issue. Fees for prolongation will be charged in accordance with the scale given above.

The grant of trade privileges confers to the extent of the terms of the privilege a right to prevent the manufacture, preparation, or employment of the patented article by a third party, unless with the consent or license of the patentee, but it does not confer any right to restrict the introduction, employment, sale, or use of articles similar to the patented articles. In the case of a privilege granted to any process or means of manufacture, or to any new implement to be employed in manufacture or industry, such privilege gives an unrestricted right to prevent the employment or use by a third party of such process or implement, unless specially authorized to do so by the patentee, or unless the patented article has been acquired from him.

The acquisition of a patent for the improvement of an already-patented article does not necessarily give a share in the rights of the original patent, but the right to use the patented article must be acquired separately in the legal and usual manner.

Each holder of a trade privilege is at liberty to erect the necessary buildings and accommodation, take in operatives, and perform all other acts necessary to the exercise of the rights conferred upon him by his privilege, subject to due compliance with the laws, statutes, and police regulations of the country.

The privilege does not, however, entitle him to an independent exercise of the particular branch of industry to which the patented article applies, but, on the contrary, he must acquire that right in the usual manner prescribed by law.

Holders of trade patents and privileges may cede the same to others in the legally-prescribed manner, or may admit others to a partnership in the rights taken as a whole conferred by it, but no division of a patent with respect to the rights taken separately, or to the places where the privilege is to be exercised, is allowed.

In case of death the proprietorship of a trade privilege passes to the legal heirs.

Notice of death or change of proprietorship must be given to the Ministry of the Interior within three months of such event.

In case of two or more applications for exclusive privileges for the same invention, preference will be given to the applicant who can produce proof of priority of presentation in the forms already alluded to.

On the expiration of a trade privilege the description of the object shall be published, if it appear likely to prove advantageous to native industry.

Patents and privileges lose their effect in the following cases:

1. Should facts transpire subsequently to the issue of a patent which if known at the time would have constituted a disqualification.

2. In case of proof of previous knowledge, or of a want of originality, as already explained. Should it, however, appear that such knowledge was possessed by a few persons only, and had been concealed by them, then the patent is to remain in force, only without effect in regard to the said persons.

3. If the applicants have concealed or misrepresented in their description any important part of the discovery or improvement essential to its perfection.

4. If the holder of a patent fail to put the invention into execution or to notify the same to the Minister of the Interior within the space of three years; or, in the case of patents for shorter terms than six years, within the half of the term; or, in the case of an invention already patented abroad, within the space of one year from the date of issue of the patent.

5. In the case of privileges granted to foreign patentees or their successors upon expiration of their foreign patents.

6. In case of the execution having been abandoned for more than two years.

7. By resignation or failure to make use of the patent.

8. By omission to notify change of proprietorship to the Ministry of the Interior within the prescribed term.

9. Upon the expiration of the term of the patent.

A register is kept at the Ministry of the Interior of all applications for trade patents and privileges, in which the dates and particulars are carefully entered. A collection of all the descriptions, drawings, models, &c., connected with the articles and inventions patented is also preserved in the same department, to which the public can obtain access, and may inspect the descriptions and plans of the inventions whose patents have expired, and, if permitted by the patentee those of the inventions still under the protection of patents.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

25,640.—Steam-Boilers.—Granted to JOSEPH HARRISON, JR. October 4, 1859. Application filed June 30, 1873. Hearing September 17, 1873.

25,662.—Construction of Prisms.—Granted to EDWIN MAY, October 4, 1859. Application filed June 23, 1873. Hearing September 17, 1873.

25,672.—Machines for Lasting Boots and Shoes.—Granted to JAMES FOSDICK, October 4, 1859; reissued January 6, 1863. Application filed July 5, 1873. Hearing September 17, 1873.

25,683.—Hydrants.—Granted to CHARLES L. STACY, October 4, 1859; reissued June 6, 1865. Application filed June 20, 1873. Hearing September 17, 1873.

25,693.—Sewing-Machines.—Granted to KASPER VOGEL, October 4, 1859; reissued November 1, 1864. Application filed July 5, 1873. Hearing September 17, 1873.

25,701.—Skeleton Skirt.—Granted to JAMES DRAPER, October 4, 1859; reissued August 1, 1865. Application filed July 2, 1873. Hearing September 17, 1873.

25,726.—Hand-Machine for Wiring Hind-Rods.—Granted to EBRAM C. DAVIS, October 11, 1859. Application filed July 12, 1873. Hearing September 24, 1873.

25,736.—Double-Friction Couplings.—Granted to JOSHUA HENDY, October 11, 1859; reissued March 25, 1873. Application filed July 7, 1873. Hearing September 24, 1873.

25,747.—Method of Combining Honey with Sweet-cheese.—Granted to THOMAS J. MASAN, October 11, 1859. Application filed June 16, 1873. Hearing September 24, 1873.

25,767.—Cutting and Punching Cakes.—Granted to JOHN H. SHROTS, October 11, 1859. Application filed July 11, 1873. Hearing September 24, 1873.

25,784.—Mode of Manufacturing Barrels, &c.—Granted to GEORGE W. BARKER, October 11, 1859. Application filed July 9, 1873. Hearing September 24, 1873.

25,796.—Jacquard Machines.—Granted to AVERY RANDOLPH, October 18, 1859. Application filed June 30, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,797.—Harvesters.—Granted to ETHELBERT BALL, October 18, 1859. Application filed July 18, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,807.—Hem-Folders.—Granted to LEVERETT CLARK, October 18, 1859. Application filed July 18, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,814.—Sleeping-Cars.—Granted to JOHN DARRIN, October 18, 1859. Application filed July 12, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,842.—Cultivators.—Granted to THOMAS MCQUISTON, October 18, 1859; reissued May 16, 1871. Application filed July 11, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,869.—Weeding-Hoes.—Granted to JAMES M. ADAMS, October 18, 1859. Application filed July 18, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,867.—Machines for Covering Saddle-Trees.—Granted to JOHN MACLURE, October 18, 1859. Application filed July 14, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,874.—Breaking-Machines.—Granted to GEORGE H. BABCOCK, October 25, 1859. Application filed July 28, 1873. Testimony closes September 23, 1873. Hearing October 8, 1873.

25,883.—Construction of Steam Coffins.—Granted to JOHN R. CARSON, October 25, 1859. Application filed July 28, 1873. Testimony closes September 23, 1873. Hearing October 8, 1873.

25,936.—Out-Off Valves of Steam-Engines.—Granted to EDWARD R. ARNOLD, November 1, 1859. Application filed August 1, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

25,973.—Tackle-Blocks.—Granted to ISAAC R. PALMER, November 1, 1859; reissued September 8, 1863, April 11, 1865, and December 5, 1865. Application filed July 28, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

25,984.—Bit-Stocks.—Granted to WILSON STOUFFER, November 1, 1859; reissued April 23, 1867. Application filed July 28, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

26,002.—Telegraphic Machines.—Granted to GEORGE M. PHELPS, November 1, 1859. Application filed July 30, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

26,023.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,030.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,060.—Machines for Making Hon-Jolnts.—Granted to JAMES STURGEON, November 8, 1859. Application filed August 2, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,069.—Sleeping-Cars.—Granted to JOHN DARRIN, November 8, 1859. Application filed August 4, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,087.—Fastening Metal Hoops on Cotton-Bales.—Granted to JOHN T. BUTLER, November 15, 1859. Application filed August 7, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,090.—Machines for Folding Paper.—Granted to CYRUS CHADBURN, Jr., November 15, 1859; and reissued August 12, 1873. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,097.—Electro-Magnetic Telegraphs.—Granted to MOSES G. FARMER, November 15, 1859; and reissued December 16, 1872. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,125.—Billiard-Table Cushions.—Granted to GEORGE D. SHARP, November 15, 1859; and reissued April 8, 1873. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,126.—Portable Pumps.—Granted to WILLIAM T. VAIL, November 15, 1859; reissued February 26, 1861. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,136.—Mode of Advertising.—Granted to EDWARD WIRES, November 15, 1859. Application filed August 12, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,139.—Pumps.—Granted to WILLIAM WRIGHT, November 15, 1859. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,145.—Cocks for Water-Closets.—Granted to DARIUS WELLINGTON, November 15, 1859. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,147.—Machine for Bundling Kindling-Wood.—Granted to WILLIAM L. WILLIAMS, November 15, 1859; and reissued October 4, 1870. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,177.—Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 16, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,178.—Making Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 16, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,202.—Manufacture of Paper-Pulp.—Granted to JOHN B. PALMER and GARDINER HOWLAND, November 22, 1859; and reissued July 2, 1867. Application filed August 20, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,242.—Water-Closet Basins.—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 16, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,244.—Machines for Registering Music.—Granted to HENRY F. BOND, November 29, 1859. Application filed August 29, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,262.—Journal-Boxes for Saw-Mill Carriages.—Granted to WM. M. FERRY, November 29, 1859. Application filed August 29, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,276.—Manufacture of Rubber Hose.—Granted to THOMAS J. MATALL, November 29, 1859; and reissued October 28, 1873. Application filed August 13, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,291.—Molding for Metal Castings.—Granted to JOHN F. BROADSHADOW, November 29, 1859. Application filed August 15, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,297.—Nursing-Bottles.—Granted to FRANCIS J. LA FOREST, November 29, 1859; and reissued January 14, 1868. Application filed August 27, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,299.—Heel and Shoe Tips.—Granted to NEWMAN SILVERTHORN, November 29, 1859; reissued September 2, 1862, and August 4, 1868. Application filed August 28, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,320.—Water-Wheels.—Granted to JAMES P. COLLINS, December 6, 1859; reissued June 12, 1860, and May 13, 1873. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,401.—Mode of Applying Sulphurous-Acid Gas in the Defecation of Saccharine Liquids.—Granted to NANCY POINDEXTER BRASHEAR, executrix of ROBERT B. BRASHEAR, deceased, December 6, 1859, and reissued October 28, 1869. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,419.—Seed-Planters.—Granted to WILLIAM BLEMING, December 13, 1859. Application filed August 27, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,564.—Top-Props for Carriages.—Granted to GEORGE COOK and HANNIBAL I. KENDALL, December 27, 1859. Application filed August 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

27,539.—Manufacture of Gun-Barrels.—Granted to JAMES H. BURTON, March 28, 1860, and antedated to September 29, 1859; reissued December 28, 1871. Application filed July 1, 1873. Hearing September 16, 1873.

EXTENSIONS GRANTED.

25,239.—Improvement in Elastic Hose-Tubing, granted to JOHN C. BOYD, August 30, 1859. (ALEXANDER BOYD and SAMUEL WHEELWRIGHT, executors of the estate of JOHN C. BOYD, deceased.)

Claim.—The hose made of flexible tubes, the same consisting of a woven fabric of cotton, hemp, or other fibrous materials, lined with or fastened to a layer or sheet of vulcanized India rubber or gutta-percha, or of any other water-proof composition, and the whole secured by rivets, substantially as described.

25,243.—Improvement in Stoves, granted to EDWARD M. MANSEL, September 6, 1859.

Claim.—The arrangement of the series of distinct or unincommunicative hollow open air-chambers *f f*, or their equivalents, in combination with the cross-piece of the top plate B of a cooking-stove, substantially in the manner and for the purpose set forth and described, whether the said cross-piece A be either movable or stationary in the said top plate.

25,244.—Improved Machine for Wiring the Joints of Clothes-Pins, granted to ALVIN C. MASON, September 6, 1859.

Claim.—1. The intermittingly-rotating pliers E E, in connection with a clamping device formed of the jaws *l*, recess *o*', and lever R, or their equivalents, and shears L L, arranged to operate substantially as and for the purpose set forth.

2. In combination with the pliers E and shears L and clamping device, the sliding forks *p*', arranged for joint operation, as set forth.

3. The particular manner of opening and closing the pliers E E, and operating the arbors D, to wit, by means of the sliding cones F, in connection with the springs *f* and permanent bosses *g* on the arbors D, whereby the jaws of the pliers are opened and closed, and the arbors D shifted by a very simple mechanism.

25,373.—Improvement in Machines for Making Paper Boxes, granted to SILAS B. TERRY, September 6, 1859; reissued May 17, 1870, numbered 3,905.

Claim.—1. The combination, in a machine for making paper boxes, of a mandrel and a clamp rotating together, and carrying the disk of paper, substantially as described.

2. The combination, in a machine for making paper boxes, of a rotating clamp, a mandrel rotating with the clamp, and a flanged and grooved pressure-roller, substantially as described.

3. The combination, with the mandrel and the clamp, of the pressure-lever, substantially as described.

4. The combination, with the mandrel, of the guide-ring F, substantially as and for the purposes described.

5. The combination, with the mandrel of a socket in which the paper disk is adjusted upon the mandrel, substantially as described.

6. The combination, with the mandrel, the socket, and the guide-ring, of steps on the mandrel and in the socket, substantially as and for the purpose described.

7. The combination, with the clamp, the mandrel, the guide-ring, and the flanged and grooved pressure-roller, of a guide-way for the strip, substantially as described.

8. The pressure-roller, having a groove for the projecting edge of the paper disk, a flange to turn and smooth the projecting edge of the strip upon the disk, and a bearing-surface to close and smooth the strip, substantially as described.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date September 2, 1873.]

6,832.—Tailer's Goose.—JOSEPH HARSHAW, Cincinnati, Ohio. Application filed August 2, 1873. Term of patent 14 years.

6,833.—Fabric.—CHARLES H. LANDENBERGER, Philadelphia, Pa. Application filed June 13, 1873. Term of patent 3½ years.

6,834.—Chair-Frame.—JOSEPH H. TRAVIS, Charlestown, Mass. Application filed May 22, 1873. Term of patent 3½ years.

6,835.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—Q. Application filed August 9, 1873. Term of patent 3½ years.

6,836.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place. Application filed August 9, 1873. Term of patent 3½ years.

6,837.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—L. Application filed August 9, 1873. Term of patent 3½ years.

6,838.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—B. Application filed August 9, 1873. Term of patent 3½ years.

6,839.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—b. Application filed August 9, 1873. Term of patent 3½ years.

6,840.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—*f*. Application filed August 9, 1873. Term of patent 3½ years.

6,841.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—F. Application filed August 9, 1873. Term of patent 3½ years.

6,842.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—c. Application filed August 9, 1873. Term of patent 3½ years.

6,843.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—S. Application filed August 9, 1873. Term of patent 3½ years.

6,844.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—E. Application filed August 9, 1873. Term of patent 3½ years.

6,845.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—Y. Application filed August 9, 1873. Term of patent 3½ years.

6,846.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—D. Application filed August 9, 1873. Term of patent 3½ years.

6,847.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—Z. Application filed August 9, 1873. Term of patent 3½ years.

6,848.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—W. Application filed August 9, 1873. Term of patent 3½ years.

6,849.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—G. Application filed August 9, 1873. Term of patent 3½ years.

6,850.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—T. Application filed August 9, 1873. Term of patent 3½ years.

6,851.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—M. Application filed August 9, 1873. Term of patent 3½ years.

6,852.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—I. Application filed August 9, 1873. Term of patent 3½ years.

6,853.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—c. Application filed August 9, 1873. Term of patent 3½ years.

6,854.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—A. Application filed August 9, 1873. Term of patent 3½ years.

6,855.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—d. Application filed August 9, 1873. Term of patent 3½ years.

6,856.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—H. Application filed August 9, 1873. Term of patent 3½ years.

6,857.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—e. Application filed August 9, 1873. Term of patent 3½ years.

6,858.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—K. Application filed August 9, 1873. Term of patent 3½ years.

6,859.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—X. Application filed August 9, 1873. Term of patent 3½ years.

6,860.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—V. Application filed August 9, 1873. Term of patent 3½ years.

6,861.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—R. Application filed August 9, 1873. Term of patent 3½ years.

6,862.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—g. Application filed August 9, 1873. Term of patent 3½ years.

6,863.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—J. Application filed August 9, 1873. Term of patent 3½ years.

6,864.—Shawl-Pattern.—FREDERICK WINK, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place.—C. Application filed August 9, 1873. Term of patent 3½ years.

6,865.—Carpet.—JONATHAN CRABTREE, Philadelphia, Pa., assignor to LEEDOM, SHAW & STEWART, same place. Application filed May 5, 1873.

6,866.—Carpet.—JONATHAN CRABTREE, Philadelphia, Pa., assignor to LEEDOM, SHAW & STEWART, same place. Application filed May 5, 1873. Term of patent 3½ years.

6,867.—Lock Escutcheon-Plate.—WILLIAM GORMAN, New Britain, Conn., assignor to THE RUSSELL & ERWIN MANUFACTURING COMPANY, same place. Application filed August 11, 1873. Term of patent 14 years.

6,868.—Toy Rail-Car.—WILLIAM A. HARWOOD, Brooklyn, N. Y., assignor to THE MERIDAN MANUFACTURING COMPANY, Durham, Conn. Application filed July 9, 1873. Term of patent 7 years.

6,869.—Cape.—MARTIN LANDENBERGER, Philadelphia, Pa. Application filed May 6, 1873. Term of patent 3½ years.

6,870.—Veils.—SOLOMON M. MEYERBERG and ROBERT COLLINSON, Paterson, N. J. Application filed July 5, 1873. Term of patent 3½ years.

6,371.—**Oil-Cloth.**—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SIMPSON, New York, N. Y. Application filed August 19, 1873. Term of patent 3 years.

6,372.—**Gum.**—HENRY G. SHOOK, New York, N. Y. Application filed May 31, 1873. Term of patent 3½ years.

6,373.—**Bolt-Buckle.**—JOHN R. SMITH, Waterbury, Conn. Application filed June 4, 1873. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date September 2, 1873.]

1,430.—**Pencils.**—AMERICAN LEAD PENCIL CO., New York, N. Y. Application filed August 9, 1873.

"'Centennial.'"

1,431.—**Preparation for the Hair.**—MATTHEW T. CLACKNER, Baltimore, Md., assignor to MICHAEL KOHLENMAN, same place. Application filed August 20, 1873.

"'Nonpareil, or Cream of Discoveries.'"

1,432.—**Fertilizer.**—GEORGE DUGDALE & CO., Baltimore, Md. Case A. Application filed August 21, 1873.

"'Paragon Cotton Fertilizer.'"

1,433.—**Fertilizer.**—GEORGE DUGDALE & CO., Baltimore, Md. Application filed August 21, 1873.

"'Eclipse Soluble Phosphate.'"

1,434.—**Men's Furnishing Goods.**—FISK, CLARK & FLAGG, New York, N. Y. Application filed July 28, 1873.

"the head of Napoleon III in military uniform."

1,435.—**Steam-Packing, &c.**—JAMES GLANDING & COMPANY, Philadelphia, Pa. Application filed July 28, 1873.

"the figure of an eagle."

1,436.—**Steam-Packing, &c.**—JAMES GLANDING & CO., Philadelphia, Pa. Application filed August 23, 1873.

"the word 'Eagle.'"

1,437.—**Axle-Grease.**—THE PALM-OIL AXLE-GREASE COMPANY, Charleston, S. C. Application filed August 12, 1873.

"'Star Axle-Grease.'"

1,438.—**Varnish and Other Brushes.**—CORNELIA C. THUM, Philadelphia, Pa. Application filed August 15, 1873.

"an eagle with extended wings."

1,439.—**White Lead.**—BETNER, BAUMAN & CO., Pittsburg, Pa. Application filed June 21, 1873.

"'Reward' inclosed by the figure made up of curved lines."

1,440.—**Fertilizer.**—GEORGE DUGDALE & CO., Baltimore, Md. Case B. Application filed August 21, 1873.

"'Cotton States Soluble Phosphate!'"

1,441.—**Cleaning-Powder.**—J. A. WRIGHT & Co., Keene, N. H. Application filed June 18, 1873.

"'Red Star Cleaning-Powder,' and the figure of a star of a red color."

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date September 2, 1873.]

ORIGINAL PATENTS.

142,320.—**Paddle-Wheel.**—IRA ATKINS, Louisville, Ky., as signor of one-half his right to JOHN B. SWAN, same place. Application filed February 17, 1873.

Loosely-pivoted paddles are locked in position during a part of their revolution, and drawn down or away from the radial line during the remaining part by connecting links or rods. The locking-stops are operated by cams.

Claim.—The swinging hinged paddles, in combination with their connecting-rods, the cams, and locking-stops, the whole combined, arranged, and operating substantially as described.

142,322.—**Steam-Trap.**—JAMES H. BLESSING, Albany, N. Y. Application filed March 17, 1873.

When the basket has been filled by the condensed water from the steam-coils it is depressed and actuates trip-mechanism, which permits steam to enter and establish an equilibrium between said vessel and the boiler, the water from the former then flowing into the latter through force of gravity.

Claim.—1. The outer case A, long and short pipes b^1 b^2, valvular passages b b^1, and floating open-mouth vessel T, combined and operating substantially as described.

2. A tripping device combined with a steam-inlet valve, r, and a floating bucket, T, which is applied inside of a receiver, A, and valvular passages leading into and out of such receiver, substantially as described.

3. The inlet and outlet passages b b^1, provided with check-valves, and combined with a water-receiver containing a vertically-movable bucket, T, substantially as and for the purposes described.

142,324.—**Windmill.**—ALONZO T. BOON, Galesburg, Ill., assignor of one-half his right to TRUMAN O. JONES, same place. Application filed April 4, 1873.

Springs are arranged with each section of sails to regulate the velocity of the wheel.

Claim.—1. The springs P, when attached to the arms g'', and arranged to operate with a series of two or more sails, L, connected by a bar, *l*, substantially as described, and for the purpose specified.

2. The tubular shaft G, when arranged to operate with the connecting-rods d'' g' and crank-wheel d' of a wind-wheel shaft, and with the cranks g''' and h and connecting-rod h'', substantially as described, and for the purpose specified.

3. The three-armed or Y-shaped cranks g''' and h, when arranged to operate with the connecting-rod g' and the pump I, substantially as described, and for the purpose specified.

4. The levers T S', when connected as described, and arranged to operate with the weight W, vessel U, tank V, pump I, and connecting-rod S, substantially as and for the purpose specified.

142,325.—**Spring for Vehicles.**—HARVEY BOWLES, Trempealeau, Wis. Application filed June 21, 1873.

The ends of the springs, which are grooved, are inserted within a cap and secured by a bolt.

Claim.—The cap A A and bolt B, combined, constructed, and applied to vehicle-springs having grooves *a*, substantially as and for the purpose set forth.

142,326.—**Agricultural Boiler.**—CHARLES M. CLOUD, Grinnell, Iowa. Application filed May 26, 1873.

Claim.—The combination of the box and the heater, consisting of the draft-pipe 5, vertical pipe 3, cylinder 6, and chimney 7, substantially as shown and described.

142,327.—**Hammock-Lounge.**—J. CREW CRAFT, Baltimore, Md. Application filed April 11, 1873.

The lower frame is jointed to fold, has pivoted braces and stretchers, and rods to which the hammock is attached by cords.

Claim.—1. The combination of the jointed stripe A, levers B, stay-bars E, cross-bars O, hammock G, and cords H K, arranged and operating substantially as described.

2. The combination of the hammock G, flap F, pillow R, cords K, cross-bars O, levers B, stay-bars E, and jointed stripe A, arranged and operating substantially as specified.

142,328.—**Mop-Head.**—JAMES DAVIS, Chicago, Ill. Application filed May 8, 1873.

Is constructed with a nut working in the cross-head, having on its lower edge a projecting flange, and on its upper projections which furnish handles to turn it, to close or open the space between the bar and the outer holder, by which the mop is held.

Claim.—The part D, made in one piece, of malleable metal, and in a form substantially the same as shown and described, and rigidly attached to the adjustable jaw of a mop-head, in combination with the nut E, made in one piece, and arranged on the rigid screw C and within the part D, and provided with the ears *e* and *e'*, lapping the upper and lower face, respectively, of the part D, and with a screw-thread engaging the screw C, substantially as and for the purposes specified.

142,329.—**Fruit and Lard Press.**—WILLIAM H. DAVIS, Lexington, Ind., assignor to JOSEPH HARLAN, same place. Application filed May 17, 1873.

Claim.—1. A press-chamber composed of the outer perforated wall B, provided with an inner flange, and an inner perforated tube, C, bearing a perforated bottom, D, arranged to rest upon the above-named flange, in the manner as shown, and for the purpose specified.

2. In combination with the tube C, the fluted cone *c*, or its equivalent, operating substantially as shown, and for the purpose specified.

142,330.—**Steam-Boiler.**—WITHEROW DOUGLASS, Pittsburg, Pa., and JOSEPH H. BROWN, Youngstown, Ohio. Application filed March 13, 1873.

The boiler is suspended inside a cylinder, so that it is entirely surrounded by burning gases. A nozzle projecting from the boiler through the outside cylinder protects the steam and gage pipes from the fire. Air is admitted through ports in the cylinder to increase combustion.

Claim.—1. In combination with the upright cylindrical boiler *a* and its annular casing *d*, the opening *g* for the admission of heat from a puddling-furnace or other exterior fire, and the ports *r* for supplying air to the unconsumed gases in the annular flue *c*, all arranged substantially as set forth.

2. The boiler *a*, having a nozzle, h, in combination with the steam or gage pipes (n n', substantially as and for the purposes described.

3. The steam-generator consisting of the boiler *a*, steam-drum *b*, nozzle h, steam-pipe *i*, annular chamber *c*, and outer shell *d*, combined and arranged substantially as described.

142,331.—**Binder's Attachment for Harvesters.**—JOHN H. GARNHART, Madison, Wis. Application filed January 11, 1873.

Seats are provided for the binders, which are horizontally and vertically adjustable to allow the binders to face the grain-receptacle or the binders' tables.

Claim.—1. A grain-receiver made of two or more parts hinged to each other and to the elevator-frame, substantially as described, for the purpose specified.

2. A grain-receiver composed of two or more parts hinged together, the lower one of which is arranged to rest at each end upon the binders' tables, substantially as described, for the purpose specified.

3. A binder's seat, the inner end of whose standard is pivoted to the frame of the machine so as to swing laterally upon its pivot, to vary the distance horizontally of the binder's seat from the binder's table, substantially as described, for the purpose specified.

4. A swinging binder's seat pivoted to the outer end of its adjustable standard, substantially as described, for the purpose specified.

5. In combination with the pivoted binder's seat, the step A and the shoulders *b* upon the eye Z, so that the binder's seat shall turn or swing upon its standard and be stopped as it fronts the binder's table, substantially as described, for the purpose specified.

6. The adjustable slotted plate C, constructed with an eye, Z, as a means of connecting the binder's seat and its standard, substantially as described, for the purpose specified.

7. The binders' seats having their pivoted swinging standards connected to each other above the pivotal points, by means of a detachable rod, substantially as described, for the purpose specified.

8. Hinged or pivoted stirrups or foot-rests on the seat-standards, substantially as described.

9. Hinged or pivoted stirrups or foot rests made adjustable on the seat-standards, substantially as described, for the purpose specified.

10. The binders' seats, pivoted to the outer ends of their standards, made vertically and horizontally adjustable, and combined with the adjustable stirrups or foot-rests, substantially as described, for the purposes specified.

142,333.—**Insole for Boots and Shoes.**—JAMES GASCOIGNE, Rochester, N. Y. Application filed June 30, 1873.

Straw-board treated with boiled oil, turpentine, and shellac.

Claim.—An insole for boots and shoes, composed of the straw-board foundation D, made waterproof, as described, the cotton batting C, and the cotton covering A, provided with the paper stiffener B, as shown and described, for the purposes set forth.

142,333.—**Steam Air-Pump and Condenser.**—SAMUEL GIBSON, Freedom, Pa. Application filed December 26, 1872.

Air-pump has a float connected by a bent arm to the stem of a hollow rocking valve, and operates it, and by this valve a steam-moved piston-valve placed under the rocking valve, admits the uncondensed steam to pass through the piston-valve, and, by a bent pipe, back to the condenser. As soon as the steam is exhausted the steam from the rocking valve moves the piston-valve to its former position, and closes the communication with the air-pump until the pressure therein is too high again.

Claim.—1. The pump G, in combination with the hollow ball L, rod *f*, lever K, attached to the valve-stem *d*, the rocking valve J, steam-chest I, and piston M, constructed and arranged substantially as and for the purposes herein set forth.

2. The combination of the steam-chest I, having partition, with passages m, m', and n, the rocking valve J, with ports *a* a and *b* b, and the piston M, with ports *c* and *c'*, all constructed and arranged substantially as and for the purposes herein set forth.

3. The arrangement, with the condenser, pump, and steam-chest, of the pipes O and P, substantially as and for the purposes herein set forth.

142,334.—**Shield for Sad-Irons.**—JOEL GILBSON, Brooklyn, N. Y. Application filed February 4, 1873.

A protector for the hand, constructed with an iron frame, by which it is attached to the handle, and the inside of the frame fitted or covered with a non-conducting material for the protection of hand in using it.

Claim.—A shield for sad-irons, having an open outer frame surrounding and receiving the body of the shield, in the manner described, and adapted for attachment to the standards supporting the handle of an ordinary or other sad-iron, substantially as herein set forth and shown.

142,335.—**Lock.**—FRANK GORHM, Cleveland, Ohio. Application filed March 7, 1873.

Claim.—A screw-bolt, D, swiveled to the plate by which it is thrown and retracted, and received by means of a correspondingly-formed opening in the end of the lock-case and catch-plate, when operated by the key, substantially as described.

142,336.—**Meter for Measuring Liquids, Gases, &c.**—JOHN J. GRABNOUEN, Syracuse, N. Y. Application filed June 12, 1873.

There are two sets of inlet and outlet valves. The sets are arranged on opposite sides of the partitions which form the valve-seats, and are operated by suitable valve-shifting apparatus placed within the measuring-chambers. Each pair of inlet and outlet valves is connected through the valve-ports to act simultaneously, and an inlet and outlet valve of each measuring-chamber pulled together.

Claim.—1. The valve-shifting apparatus constructed and arranged substantially as herein specified, and for the purposes set forth.

2. The valve-shifting apparatus within the two separate measuring-chambers, when connected through the valve-ports, as herein set forth.

3. The induction and eduction passages and valve-seats, when constructed and arranged parallel with each other, as herein specified, so as to admit of the independent action of the inlet and outlet valves, as and for the purposes herein described.

142,337.—**Truss.**—JOHN F. GROVES, Whitefield county, Ga. Application filed July 8, 1873.

A hinge-plate is secured at one end to the pad-plate, and at the other to the slotted spring by means of a headed rivet. A coil-spring rests upon the pad, and also upon the outer end of the hinged plate.

Claim.—The pad F having springs E, and hinge C provided with button h, in combination with the slot *a* of the clasp A, substantially as and for the purpose set forth.

142,338.—**Dissected Map.**—CHARLES J. HIGGINS, Indianapolis, Ind. Application filed February 26, 1873.

Claim.—1. A "dissected map," in which the various subdivisions are capable of being separately secured to the frame in which they are supported, substantially as described.

2. The compound blocks of a dissected map made up of two or more sheets of material, substantially as described.

142,339.—**Machine for Sawing Clapboards.**—HIRAM A. HOLMES, Epsom, N. H. Application filed July 5, 1873.

A secondary frame, provided with means for rotating the log, is detachably secured upon the carriage of a circular-saw mill.

Claim.—The combination of the saw-mill carriage A, the clamps D, and the separate stationary cam *w*, with the main and auxiliary frames C E, arranged together and provided with mechanism, substantially as described, for adjusting the altitude of the auxiliary frame, and for supporting and intermittently revolving a log, all as and for the purpose specified.

142,340.—**Chemical Fire-Extinguisher.**—ALEXANDER E. HUGHES, Louisville, Ky., assignor of one-eighth his right to EDWARD FORD, New Albany, Ind. Application filed June 19, 1873.

The acid-reservoir has an annular groove for the reception of semicircular spring-clamps; these are attached to a cross-bar operated by a shaft, which, by its depression on the inversion of the extinguisher, removes the reservoir from a stationary stopper. A spring-trigger keeps the reservoir closed against the stopper or holds it open.

Claim.—1. A chemical fire-extinguisher wherein, on the inversion of the instrument and by the weight thereof, the acid-reservoir is removed from its cork or stopper while said stopper remains stationary, substantially as set forth.

2. The combination of the shaft B, cross-bar B', supports C, and semicircular clamps C' with the annular groove *a* upon the body of the acid-reservoir.

3. The combination of the annular groove b' upon the shaft B of the acid-reservoir, the retaining-trigger *c*, and the spring E, substantially as and for the purpose set forth.

142,341.—**Grain-Basket.**—HORACE C. JOHNS, Dowagiac, Mich. Application filed May 20, 1872.

A grooved central disk, in the groove of which the tapering ends of the staves are placed. An outside and an inside hoop are secured together by nails passing through them and the intervening staves.

Claim.—A basket made by the combination of the solid grooved disk A, hoops B, and tapered staves D, all substantially in the manner herein shown and described.

142,342.—**Grain-Basket.**—HORACE C. JOHNS, Dowagiac, Mich. Application filed February 8, 1872.

The side splints or staves are secured in the center of the bottom of the baskets by an upper concave-convex disk and a lower shouldered convex disk, the ends of the staves abutting against the shoulder.

Claim.—The combination of the shouldered convex disk B with the concave-convex disk A, in the construction of a basket, substantially in the manner and for the purpose described.

142,343.—**Basket.**—HORACE C. JOHNS, Dowagiac, Mich. Application filed May 20, 1872.

The outer series is composed of alternate long and short staves, the short staves reaching just inside of the bottom hoop. The inner series of staves meet each other edge to edge, and extend to nearly the center of the bottom of the basket.

Claim.—The combination of the short outer staves B with in-

side staves C and long outer staves A in the construction of a stave bucket, substantially as herein set forth.

142,344.—Axle and Thimble-Skein for Vehicles.—AUGUST KRAUSMANN, Springfield, Ill. Application filed May 3, 1873.

The thimble-skein has a square shoulder and lubricating orifice, and when worn on one side may be turned.

Claim.—1. The reversible thimble-skein B, provided with the squared portion B', and combined with the wooden portion D, substantially as and for the purpose shown.

2. In combination with the box axle A and thimble-skein B, the rod C, passing through the interior of said axle, and provided with the nuts *a*, substantially as and for the purpose set forth.

3. The hollow axle A, having the opening *s* and plug *s'*, in combination with the detachable and reversible axle-arms B, provided with the radial openings *b*, substantially as and for the purpose shown.

142,345.—Device for Building Cisterns.—JOSEPH KRUGER, Indianapolis, Ind. Application filed January 10, 1873.

The frame, constructed somewhat like an umbrella, is designed as a removable support or center for the arch or dome of a cistern while in process of construction.

Claim.—The arch-support herein described, when constructed with the tube l l, the rod h h, the nut *g*, the blocks *t* and *u*, the segments *w* *x* and *w'* *x'*, the arms *v* and *v'*, and the slots *t'*, and used for the purpose and in the manner substantially as set forth.

142,346.—Whip-Socket.—CORNELIUS LANG, Ypsilanti, Mich., assignor of one-half his right to ALBERT H. NIMOCKS, same place. Application filed April 14, 1873.

A coiled spring is attached to a perforated plate, which surrounds the upper section of the socket. By means of the spring, whips of different sizes are securely held within the socket.

Claim.—1. In a whip-socket, the coiled spring arranged around the socket, substantially as described.

2. In a whip-socket, the combination of the top *c*, perforated plate *l*, and spring *g*, substantially as shown.

3. In a whip-socket, the tapering socket-top, perforated plate, and coiled spring, when the various parts are arranged as set forth.

142,347.—Preserving and Drying Lumber.—JOHN OLIVER, Toronto, Canada. Application filed May 21, 1873.

The wood in a close tank is subjected to the action of steam which has passed through a vessel containing sulphate of zinc and alum.

Claim.—1. The subjecting of the lumber in a tank or vessel to the action of steam impregnated with sulphate of zinc and alum under a moderate pressure, in the manner specified and described, and for the purposes set forth.

2. The combination, with each other, of the longitudinal steam-heating pipes S S and draft-pipe E, as specified and described, and for the purpose set forth.

3. The combination, with each other, of the steam-chambers W W and steam-pipes S S inside the tank B, and draft-pipe E, the whole substantially as specified and described, and for the purposes set forth.

4. The combination, with the tank B, of the steam-chambers W W, substantially as and for the purpose set forth.

142,348.—Universal Jointer.—ERNST PAMÉ, Fort Wayne, Ind. Application filed May 17, 1873.

A lathe scroll-saw and molding-cutter are arranged upon one frame, and operated by the same treadle.

Claim.—1. The arrangement in the frame A B of the crank-shaft C, adjustable treadle D, pitman G, lathe H, shafts J M connected with the main shaft C, cutter-head *f*, slide L, and scroll-saw N, all as shown and described, and for the purposes herein set forth.

142,349.—Fireman's Ladder.—PAOLO PONTA, Milan, Italy, assignor to MICHELO UDA and MARY B. S. UDA, same place. Application filed March 13, 1873.

The sectional ladder is carried upon a truck, and so pivoted as to be capable of elevation to any desired angle by means of a windlass and cord acting upon a rigid angular lever-arm at the lower extremity. The sections are successively added, to the extent required, being connected by a joint constructed as per claim 5, and the stiffening-rods are then attached by means of the spurs *j* and hays *j'*. The stiffening system consists of uprights L' and diagonal tension-rods K K' having therefrom to the extremities of each next section, the tops of the uprights being connected by tie-rods K. Counterpoise-weights, attached to the ends of extensible arms, are used for controlling the position of the center of gravity to prevent overturning.

Claim.—1. In combination with a truck, A, a pivoted ladder, B, provided with a rigid angular lever-arm, B'—the lever-arm B' connected by a suitable cord to a crank-gearing, C D, attached to the truck—by means of which the ladder may be raised, lowered, or secured at any desired inclination, all substantially as set forth and shown.

2. In combination with a ladder, the bracing and self-sustaining system, substantially as set forth, of uprights L', tie-rods K joining the top ends of the uprights, and the diagonal straining-rods K K', &c., joining the upper end of each post with the base of the adjacent one eccentrically from the base to the top of the ladder.

3. For fastening the rods to the posts L', the spurs *j* and pins or hays *j'*, substantially as set forth and shown.

4. In combination with a truck and self-supporting ladder, counterpoise-weights G suitably adjusted, as set forth, for changing the position of the center of gravity, substantially as described.

5. The ladder-joint composed of the strap-hoops b halved into each other, and the fastened key-rung M, the latter forming the bearing of the ladder-frame, substantially as set forth and shown.

142,350.—Stop-Cock.—JOSHUA REDSTER and WILLIAM H. BOWEN, Baltimore, Md. Application filed April 11, 1873.

The plug is conical, and is fitted into a seat, which is raised from the sides of the plug-chamber.

Claim.—1. The conical valve of the cock A, in combination with the raised oblique elliptical seats *g g* and the chambers formed by said seats, substantially as and for the purpose described.

2. The combination, with the conical valve G and oblique elliptical raised seats *g g*, of the auxiliary raised seats *g' g'*, substantially as and for the purpose described.

142,351.—Salt and Pepper Dredge.—DANIEL C. RIPLEY, Pittsburg, Pa. Application filed June 27, 1873.

Claim.—A combined pepper and salt dredge having separate compartments *a* and *d*, and two caps, *c* and *f*, one of which shall have a slight rotary motion, and both having perforations so arranged relatively to each other that by the rotation of the cap *f* either compartment may be opened while the other is closed, substantially as set forth, and for the purposes described.

142,352.—Machine for Finishing Horseshoe-Nails.—ROBERT ROSS, Vergennes, Vt., assignor to THE NATIONAL HORSE-NAIL COMPANY, same place. Application filed July 14, 1873.

A cam-wheel on the feed-screw bears against a conical roll to give an intermittent longitudinal reciprocation to the screw, equal to the pitch of the thread, while the cutter is trimming the sides of the nail. A milling-cutter, fixed on a shaft having its bearings in an adjustable frame, cuts the metal from the end of the nail, after which the point is finished by a cylinder provided with blunt ridges and a drawing-roll.

Claim.—1. The combination, in a nail-machine, of the feed-screw, the cam H, and the friction-roll I, or their equivalents, by means of which a longitudinal reciprocating movement is imparted to the screw during a part of its revolution, substantially as and for the purpose set forth.

2. The milling-cutter D and supporting-die G, in combination with the feed-screw A, substantially as described.

3. The corrugated roll E and supporting-die F, in combination with the feed-screw A, substantially as and for the purpose set forth.

4. The auxiliary roll U, supported on the periphery of the roll E, substantially as and for the purpose described.

5. The combination of the auxiliary roll U, the milling-cutter D, and the screw A, substantially as set forth.

6. The combination, in a nail-machine, of a shearing-punch and die or dies, and a longitudinally-reciprocating feed-screw, the parts being arranged, substantially as described, so as to trim the nail before it passes off from the screw.

142,353.—Artificial Flower.—CHARLES A. SCHALLER, Philadelphia, Pa. Application filed July 21, 1873.

Claim.—An artificial flower made in two or more detachable sections, and provided with a receptacle or casket, D E, for holding and secreting articles of jewelry, miniatures, &c., substantially as described.

142,354.—Belt and Rod Cutter.—HUGO SCHMIDT, Chicago, Ill. Application filed May 21, 1873.

By sliding the guide-tube upon the rod and closing the levers together (the rod being revolved in the hollow spindle of a lathe) the rod is cut off to gage.

Claim.—The levers A A', carrying respectively the tube b and gage-stop c and the cutting-off tool c, constructed, arranged, and operating substantially as and for the purpose set forth.

142,355.—Cotton-Planter.—OSCAR L. SLATER, Wall Hill, Miss. Application filed August 2, 1873.

A seed-box in a horizontal frame, having a furrowing-tooth in front. The box may be a common barrel with a series of seed-dropping holes round the bilge, and a rolling circular flange on each side of the holes. The pins which fasten the flanges to the barrel project some distance into it, to regulate the flow of seed. There is a cover at the back of the frame.

Claim.—In a cotton-planter, the seeding-barrel B, constructed of the staves, heads, and follies D, the pegs *b* projecting through the follies into the barrel to form separating-teeth, and the tires serving to secure the said follies, and to prevent the pegs from being forced out, all constructed and arranged substantially as specified.

142,356.—Ratchet-Drill.—THOMAS J. SLOAN, Tuckahoe, N. Y. Application filed January 15, 1873.

The inserting-nut B is serrated, and is turned on the back motion by a pawl, *f*, connected to the handle; and the pawl is held from contact with the nut during more or less of the period of operation by an adjustable cam-ring, *j*, that surrounds the lower end of the nut, and an extension, E, of pawl *f*, that bears against it.

Claim.—1. The jointed pawl *f* E applied to the handle of a ratchet-drill for turning the nut B and feeding the drill during the motion of the handle, as specified.

2. The swiveled sleeve *j* and ring *l*, applied to the feed-nut B of a drilling apparatus, substantially as set forth.

3. The jaw *f*, pivoted to the swinging plate B, and provided with the spur *p*, substantially as and for the purpose specified.

142,357.—Apparatus for Burning Gas-Tar.—ANANIAS SHUTE, Niagara Falls, N. Y. Application filed April 28, 1873.

The reservoir being supplied with gas-tar, steam is admitted into a cluster of tubes, which heat the tar sufficiently to flow readily; it is then forced by steam to the burners through condensing-pipes, where it is made to commingle with steam.

Claim.—The combination of the reservoir C, having steam-rings D D and steam-tubes D' D', the tar-conducting pipe *c*, and the burner or burners G, substantially as shown and described.

142,358.—Purification of Illuminating-Gas.—WILLIAM H. ST. JOHN, New York, N. Y. Application filed July 25, 1873.

The vapors brought with the gas from the retorts are condensed in the hydraulic main and conveyed by a pipe into the lower part of a chamber, in the upper part of which is a horizontal partition, from which dip-tubes are suspended, and the seal of these tubes is increased or reduced by a valve on the side of the chamber. An exhauster draws the gas from the main and forces it through the dip-tubes in the chamber into the liquid below, from whence it passes through a pipe into a tank, and from thence into a gasometer.

Claim.—1. The process herein described of purifying illuminating-gas, by causing it to pass through liquids which flow forward from the destructive distillation of coal, oils, or other gas-making materials, substantially as herein specified.

2. The chamber B, constructed with the horizontal partition *b* and the dip-tubes *c*, in combination with the pipes C and D and the main A, substantially as and for the purpose specified.

3. The combination, with the chamber B, constructed and operating as set forth, of the tank I, substantially as and for the purpose specified.

4. The combination, with the main A and chamber B, constructed and operating as described, of the exhauster E, arranged to serve the double purpose of withdrawing the gas from the main and forcing it through the dip-tubes of the chamber, substantially as herein set forth.

142,359.—Railway-Rail Chairs.—LEVI BARTLETT TYNG, Lowell, Mass. Application filed July 23, 1873.

Claim.—The combination, in a combined chair and fish-plates made of wrought metal in one piece, of thick rigid side pieces to serve as fish-plates, and their elastic connections extending from the bottom of said side pieces entirely around the feet of the rails to support and secure said side pieces and to serve as a chair, being constructed with side-projecting lugs with splits-notches cut thereon, as and for the purpose described.

142,360.—Gas-Burner for Heating.—JOHN VAN, Cincinnati, Ohio. Application filed August 9, 1873.

An ordinary gas-burner is inclosed in a tube, which, below the burner, has an open mouth, and extending above the burner-branches horizontally. On each branch are affixed, at their centers, upright hollow cylinders having their lower ends closed and upper ends open. It results that the original flame is separated into several flames, and cash is fed by a current of air.

Claim.—The arrangement of gas-pipe A *a*, cock B, burner C, T-couplings D G H H', air-inlet E, mingling-chamber F, catch and equalizing chambers I I', and nozzles J J', for the purpose set forth.

142,361.—Scroll-Sawing Machine.—EDWARD A. WALKER, Minneapolis, Minn. Application filed May 13, 1873.

The central portion of the saw-table is provided with a hemispherical cup, and is made vertically adjustable.

Claim.—1. The removable rest F, constructed and arranged, with relation to the saw C, substantially as and for the purpose described.

2. The removable rest F, in combination with the adjustable sliding block E, in the manner and for the purpose described.

3. A hand sawing-machine in which is arranged an adjustable sliding block, E, having a friction disk-wheel, *g*, therein, and on which block is a conical removable rest, F, substantially as described.

142,362.—Animal-Trap.—JOHN M. WILKINSON, Bloomington, Texas. Application filed January 22, 1873.

A four-way self-setter trap intersects a central prison having four pronged entrances. Upon disengaging the bait-trigger the game is impelled by the stroke of a revolving flap through an exit-return gate and into immediate proximity to one of said pronged entrances.

Claim.—The box A, with openings or entrances *a a*, encircled by the cone of bars *a' a'*, and supplied with the mirrors C C, in combination with the boxes B B, having the spring trap-doors D D, notched bars or catches E, and inner doors H, substantially as and for the purpose specified.

142,363.—Air-Heating Furnace.—JOHN M. WILSON, Philadelphia, Pa. Application filed May 24, 1873.

Claim.—1. The openings *a' a'* through the base wall of the furnace, for the purpose of supplying the fresh air to the chamber A and the pipes D D separately and distinctly from the opening for supplying fresh air to the fire-chamber E, which is heated by the lime plates which inclose the fuel-box and the combustion-chamber C, substantially as and for the purpose hereinbefore set forth and described.

2. The deflecting-plates *a''*, the open spaces *a''* between *a''* and the upper edges of the side fire-bricks H H, the chambers *b'* communicating at their respective upper ends with the said spaces *a''* *a''*, and at their lower ends with the lower part of the chamber B through the openings *a'*, all constructed and arranged to operate as and for the purpose herein before set forth and described.

142,364.—Mode of Attaching Journals to Foot-Stirrups.—GEORGE M. ARMORY, South Boston, Mass. Application filed August 9, 1873.

Claim.—The securing the journals in the roller B by means of the latter on the conical portions C of the journals, and screwing of the tightening-nuts with said journals and rollers, either with or without a groove or splines in the journals, substantially as specified.

142,365.—Mechanical Movement.—JAMES ARMSTRONG, Toledo, Ohio. Application filed August 21, 1873.

To the end of a fixed shaft a pinion is rigidly secured. Upon the shaft is placed a pipe-box, to which are attached two pulleys and a pinion, the latter meshing with another pinion, through which the power is transmitted. Loosely secured to the fixed shaft is a frame, one end of which is weighted, while the other end carries two pulleys and a pinion, the latter engaging both with the fixed pinion on the shaft, and with the internally-geared flange of the transmitting-wheel.

Claim.—1. The combination of the loose pulley turning on the fixed central shaft, the loose pulley-frame, also turning on said shaft, the connected pulley and pinion mounted in said frame and revolved by a belt from the pulley on the central shaft, the fixed pinion and the loose transmitting-wheel, both mounted on said shaft, substantially as set forth.

2. The combination of the stationary pinion on the fixed central shaft, the loose transmitting-wheel on said shaft, and the pinion meshing with both the fixed pinion and transmitting-wheel, and turning both on its own axis and around the central shaft, substantially as set forth.

3. The combination of the fixed central shaft, the connected pinion and pulleys turning thereon, the frame also turning on said shaft, the connected pulley and pinion turning in the frame, the pulley mounted in a bracket on the frame, and the belt, these parts being constructed and arranged to operate substantially as set forth.

142,366.—Combined Chest-Protector and Shirt-Bosom Support.—JOHN A. ASTON and CHARLES C. MCGINTRY, Leavenworth, Kans. Application filed February 25, 1873.

Stiff pasteboard is covered with flannel or other suitable fabric, and suspended from the neck to protect the chest and give support to the shirt-bosom.

Claim.—As a new article of manufacture, the combined chest-protector and shirt-front supporter, constructed substantially as and for the purpose described.

142,367.—Rudder for Vessels.—JUAN B. BAPTISTA, New York, N. Y. Application filed July 5, 1873.

Claim.—The improved rudder formed of the plates A A attached to the cross-bars B, which are secured near their middle to opposite sides of the shaft C, so as to leave spaces for the passage of water, as and for the purpose specified.

142,368.—Machine for Turning Wagon-Axles.—GEORGE A. BOLSER, Indianapolis, Ind. Application filed June 21, 1873.

The cutting-tools revolve around the axle to be turned, and are guided by a pattern, which revolves on its own axis and also about the axle.

Claim.—1. The cutter feed-screw and pattern arranged to revolve around the work, and the pattern to revolve on its own axis, in combination with holders for the axle, substantially as specified.

2. The cutter-bar S, rod Q, spring X, and pattern T, combined and arranged substantially as specified.

3. The clamp-nut A', spring C', feed-screw F, intermediate piece B', and the cutter-bar S, combined substantially as specified.

4. The tube J, pulley K, face-plate L, feed-screw P, pattern T, wheel U, wheel V, stationary wheel E', wheel D', and the cutter-bar, combined and arranged substantially as specified.

5. The combination of the adjusting holder-piece K', clamp-screw R, lever F, and the center H with the tool and pattern, arranged and operating substantially as specified.

142,369.—Boot-Crimping Block.—HENRY BOWMAN and DENNIS SULLIVAN, Virginia City, Nev. Application filed April 5, 1873.

Claim.—The leg-block A, and vamp or foot-block B united by the joint *d e*, in combination with the screw *f* passing through the block A, and whose free end presses against the plate *e*, operating on the plate at different distances from the joint as the foot-block is raised, substantially as and for the purpose described.

142,370.—Picture and Card Exhibitor.—BENJAMIN F. BOSTIAN, New Columbia, Pa. Application filed July 22, 1873.

Movable plates or mounts, each holding several pictures, are arranged in the frame so as to be lifted healthy by one lever and let down singly by another, whereby the several series of pictures are exposed to view in succession.

Claim.—1. The box-frame A B with a series of movable plates, D D, inclosed therein, all constructed and arranged substantially as and for the purpose herein set forth.

2. The lever G and hooked bar E, arranged, in combination with the frame A B and plates D D, substantially as and for the purposes herein set forth.

3. The bar or pawl H, with spring *d*, rod *d*, and elbow-lever I, arranged, in combination with the plates D D and their projections *b b*, substantially as and for the purposes herein set forth.

4. The combination of the frame A B, plates D D with projections *b b*, hooked bar E, lever G, spring-pawl H, and elbow-lever I, all constructed and arranged substantially as and for the purposes herein set forth.

142,371.—Heat-Regulator.—HENRY BOYLE, London, England. Application filed May 5, 1873.

Mercury in a siphon shuts off heat by its expansion and overflow.

Claim.—1. The combination of the movable or pivoted tray for the lamps or burners with the automatic mercurial or heat regulator, substantially as shown and described, whereby said tray may be operated to vary the degree of heat transmitted to the regulating apparatus, as specified.

2. The direct siphon-tube *b b*, and connecting directly with vessel *a*, the vibrating tube *c* connected therewith, the springs *z*, and guide and stop *r*, all combined and arranged as shown and described.

142,372.—Machine for Rolling Round Tapered Bars.—CHARLES F. BROWN, Bristol, R. I. Application filed July 26, 1873.

Claim.—A machine with two disks, having cam or eccentric faces revolving in opposite directions on a central arbor or spindle, and beveled in such manner as to roll or straighten a taper-spindle or other article, substantially in the manner described.

142,373.—Loom-Shuttle.—JOSEPH BROWN, Brooklyn, E. D., N. Y. Application filed June 26, 1873.

The revolving bobbin of a "narrow-ware" shuttle is fitted upon a perpendicular hollow hub by means of tension-springs. For taking up the slack of the thread the hub is provided with a velute spring acting against the pull caused by the shuttle movement, the hub being held in position when the spring is wound up, but rotating back when the slack is sufficient to allow it.

Claim.—The combination of the bobbin A, hub B, and springs C D, all arranged and operating as and for the purpose described.

142,374.—Stopping Mechanism for Doubling and Twisting Machines.—WILLIAM COCKCROFT and REUBEN ACKROYD, Chester, Pa., assignors to themselves and JAMES MAHEW, same place. Application filed July 26, 1873.

For stopping the delivery of the strands when a break occurs the arrangement is such that the winding-spindle may be revolved to take up any slack between itself and the delivery-roll, and raise the weighted lever from engagement with the pins before the delivery-roll can turn to draw more strands from the spool.

Claim.—The combination, with the twisting-spindle D, and delivery-roll A, spindle E, pulley F provided with studs *P* on its upper side, and the pivoted weighted lever Q, of the pulley K, pinion J, gear I, drums H N, and belts G L, all constructed, arranged, and operating as shown and described, for the purpose specified.

142,375.—Brick-Machine.—PETER K. DEDERICK, Albany, N. Y. Application filed December 21, 1872.

Has a horizontal mixing-shaft, on which are parallel, oblique, and spirally-arranged blades, and oblique vanes, by which the clay is mixed and discharged into a press-box, and a tripping device, whereby the action on the mold can be suspended in case of obstruction or undue resistance.

Claim.—1. The combination, in a brick-machine, of a mixer having apertures V, bread arms W obliqued to axis of shaft, arms X parallel to said axis, oblique vanes Y, and spirally-arranged blades Z, with a press-box, R, arranged as described.

2. The loose-weighted latch L and hinged bar M combined with parts G H, as and for the purpose described.

142,376.—Revolving Fire-Arm.—BENJAMIN K. DORWART, Rockland, assignor to himself and IRA C. WINDSOR, Coventry, R. I. Application filed July 5, 1873.

Cartridges are pushed through the cylinder into the barrel before ignition by means of the reciprocating brush-block, operated by a slide beneath the stock through links and arms, and the cylinder is independently rotated by a hand-lever for convenience in loading, the hand-lever operating also as a gate to the passage for removing the cartridges.

Claim.—1. The bar K, slide J, bars N, rock-levers O, and link P, constructed and relatively arranged as described, to operate the pusher.

2. The oscillating lever V that actuates clutch-spring connected through links and swinging arms O to the pusher-operating mechanism, substantially as specified.

3. The gate *c'*, handle C, and ratchet mechanism combined with the cylinder, in the manner and for the purpose described.

142,377.—Spring Bed-Bottom.—CHARLES H. DUSKA, New York, N. Y. Application filed June 7, 1873.

Spiral springs are combined on a double-parallel line of cordage stretched on each supporting-bar. Along the top of each row of springs there is a strip of steel, on which the slats lie, two sustained by each spring.

Claim.—The combination in a bed-bottom, with longitudinal slats D, of transverse plate-springs C, supported upon coiled springs B, arranged between the slats, as and for the purpose described.

142,378.—Bridge.—JAMES B. EADS, St. Louis, Mo.—Case A. Application filed March 19, 1873.

The arches are composed of flexibly-jointed sections, and are united with the girders at their centers to give the latter rigid central support. Vertical struts extend from the girders to the flexible joints of the arches to brace the arches against vertical strains. The base is broadened by expansion toward the abutments.

Claim.—1. The combination of the horizontal girder G with an upright flexible-jointed arch, giving mutual support, substantially in the manner and for the purpose set forth.

2. The bridge-arch consisting of arches A A', expanding toward the abutments, substantially as and for the purpose set forth.

142,379.—Iron Bridge.—JAMES B. EADS, St. Louis, Mo.—Case B. Application filed March 19, 1873.

The arches and trusses are built out from the abutments in skeleton sections, and are supported therefrom by guys until they are joined in the center. The arch, when first thrown across, is but a small portion of the complete structure, but is afterward added to. The sections are formed so as to be expanded to their proper position either by screw or hydrostatic pressure. The curve can be raised from the center in this manner. Each additional member is expanded to place as it is put in position.

Claim.—1. The construction of a complete skeleton span of a trussed arch, constituting a part of the proposed bridge, when the arch and truss are built out together from the piers and abutments, substantially as described, to form the support for the remaining arches and trusses of the span.

2. The combination of expanding voussoirs with the arches of bridges, substantially as described, for the purpose of bringing such arches to their proper height, and to enable each arch in a lateral series composing a span to be extended to its proper length, which will insure its bearing its contemplated share of the load.

142,380.—Iron Bridge.—JAMES B. EADS, St. Louis, Mo. Application filed April 16, 1873.

Each arch of the bridge is composed of two sections or "half-ribs," which, with skeleton girders, are constructed on the shore or bank, and connected with the abutments by hinges, so that they can be swung around and connected to each other at the center, after which the several arches are connected by transverse and diagonal ties and braces, and the structure completed.

Claim.—1. The combination of bridge-piers, abutments, towers, or vertical struts, with half spans or ribs of a bridge and hinge or pivoted connections to connect the same together, for the purpose of facilitating the construction of the bridge by enabling the half-ribs to be swung around in detail and joined to corresponding half-ribs forming the other half of the span, substantially in the manner set forth.

2. The combination of two independent half-span girders with an arch pivoted at the center for the purpose of preserving the form of the arch when unequally loaded.

142,381.—Iron Bridge.—JAMES B. EADS, St. Louis, Mo. Application filed June 11, 1873.

Claim.—1. The within-described method of trussing or stiffening the upright arches of a bridge by securing to each arch of the bridge, by suitable vertical bracing, two inverted counter-arches of half the span, the inner ends of the counter-arches being fastened at the center of the main arch and their outer ends secured to the ends of the main arch at or near the abutments, in such manner as to enable the counter-arches to resist tensile and compressive strains in the direction of said counter-arches.

2. The bridge-pier composed of columns E E, inclined and joined together in pairs, the planes of said pairs being located in the line of or parallel with the thrust of the arch.

142,382.—Iron-Bridge Foundation.—JAMES B. EADS, St. Louis, Mo. Application filed May 14, 1873.

The abutments and piers of arched bridges are formed of iron pillars, anchor-plates, and braces, secured and embedded in masonry, the several parts being so connected and arranged as to oppose the entire weight of the abutment or pier to any horizontal force in the direction of the thrust of the arch. The projecting collars *c*, cast on the pillars and braces, are for the purpose of giving them a firm hold on the masonry in which they are embedded.

Claim.—1. The combination of the pillars C, diagonal braces F, connecting-straps G, and anchor-plates E, for the purposes described, and substantially as shown in the drawings, Figs. 1 and 2.

2. The arched rib H, pillar C, and diagonal F, connected together at *h*, in the manner herein shown and described.

3. The collars *c* on the pillars and diagonals, substantially as described, and for the purpose set forth.

4. The combination of the pillars C and diagonals F, substantially as and for the purpose set forth.

142,383.—Cut-Off Nozzle for Drawing Liquors.—FRANCIS C. E. WARDE, Chicago, Ill. Application filed June 30, 1873.

To a screw-threaded nozzle, provided with a shut-off, is attached, at the end which screws into the head of the barrel, a bent tube reaching to the side of the barrel, and at the outer end a coupler, by which it may be connected either to an ordinary faucet or to one of the several branches of the suction-tube of the pump.

Claim.—1. The bent pipe F, in combination with the nozzle B, constructed substantially as described, and provided with a shut-off, for the purposes set forth.

2. The combination and arrangement of the bent pipe F, nozzle B, constructed substantially as described, and provided with a shut-off, coupler D, and faucet E, all substantially as specified, and for the purposes set forth.

3. In combination, the bent pipe F, nozzle B provided with a shut-off, coupler D, tube H provided with a nozzle, branches I I, each provided with a shut-off, and the pipes K K, all arranged substantially as specified, and for the purposes set forth.

4. In combination, the bent pipe F, nozzle B provided with a shut-off, coupler D, pump G, branched tube H provided with stop-cocks, and with the pipes K K, all arranged substantially as specified, and for the purposes set forth.

142,384.—Harness-Maker's Clamp.—DANIEL EGGERS, Chicago, Ill. Application filed July 19, 1873.

Claim.—1. A clamping-machine constructed substantially as shown and described—that is, having a stand, B, jaws C C, opening-spring I, band G, springs N N, cross-head J, connecting-bar L, and foot-lever K, combined and arranged substantially as set forth.

2. A clamp as constructed that the jaws are opened by an upward movement thereof, and closed by a downward movement, substantially as and for the purposes shown and described.

142,385.—Steam-Lubricator.—REED A. WILKES, Cheshire, Mass. Application filed June 21, 1873.

The oil-holder has a hollow stem, conically-shaped at the lower end, screwing into a hollow standard on the steam-chest or journal-box, which has a conical projection extending upward, by means of which the flow of oil is regulated. The notched ring shows the extent of oil fed, and the spring-click holds the oil-holder in any position in which it is set.

Claim.—1. The combination of the oil-holder A and hollow standard C with the socket-stand E and the conical plug F, said standard C having a bell-mouth, D, and arranged to vary the opening of it, substantially as specified.

2. The chamber L in the stand E, and tubular extension M of the passage M, substantially as specified.

3. The escape-passage for condensed steam, arranged with the socket G and a cock or valve thereafter, said cock or valve being arranged to close the passage K or not, substantially as specified.

4. The combination of the notched ring H and spring-click I, substantially as specified.

142,386.—Piano-Truck.—CHARLES A. FRENCH, Davenport, Iowa. Application filed April 19, 1873.

The trucks are secured to the frame by means of adjustable braces, which allow them to be raised or lowered to correspond with the stairs.

Claim.—The trucks B B', in combination with the sliding braces C C, hinged to the bed A, for adjusting the trucks for the variation of different stairs, substantially as described.

142,387.—Combined Wardrobe, Bedstead, Chair, and Table.—WALKER GETCHELL, Bath, Me. Application filed February 15, 1873.

The front of the case, when detached, forms a table, the legs being folded on the inside. The top of the case, when detached, forms an independent chair, having a cushion to its back that slides down when the seat is folded down, so that the cushion will be out of the way when used as a cover. The case or cabinet can be opened also in sections, so as to form an invalid-chair or a lounge, and operated by means of jointed arms, cords, and a roller and crank.

Claim.—1. A cabinet comprising the table A B C, chair F G H, bed K L J O, and the wardrobe arranged in one article, substantially in the manner herein described.

2. The arrangement of the chair-back E and sides H, by which they comprise the said parts of the chair and the cover of the cabinet, substantially as specified.

3. The arrangement of the cushion H' and the seat F of the chair with the back, and each other to shift the cushion along the back, substantially as specified.

4. The arrangement of the sections K, L, J, and O of the bed, together with the parts A, B, and M of the cabinet, substantially as specified.

5. The combination of the head-piece O and jointed arms Q V with the sections K L and the case, substantially as specified.

6. The combination of the roller S with holding devices, and the cords R with the jointed arms Q and head-piece O, substantially as specified.

7. The detachable triangular pieces *d* combined with the sections K L of the bed, substantially as specified.

8. The combination of the detachable pieces *e* with the section L and the sides of the part M of the cabinet, substantially as specified.

142,388.—Hose-Coupling.—GEORGE S. GOBLE, St. Louis, Mo. Application filed June 24, 1873.

A piece of metallic pipe is inserted in the ends of the hose, to give them interior support against the pressure of the hinged sleeve or clamp, consisting of two semi-cylindrical pieces having interior ribs, and connected by hinges and compressed upon the hose by a wedge driven into a slotted lug upon the hose-clamp.

Claim.—The non-elastic hose-coupling consisting of the pipe A and the clamp D E G *g* H I (, made substantially as proposed, in combination with the hose B C, as set forth.

142,389.—Harvester-Reel.—CHARLES F. GODDARD, St. Anegar, Iowa. Application filed July 12, 1873.

The bonter-arms of the reel are changed from a parallel to an angular position with the reel-shaft by means of crank-arms connecting them to a sliding disk placed within recessed collars, connecting the adjacent ends of the divided shaft.

Claim.—1. The shaft A, made in two parts, provided with recessed flanged collars B, the grooved disk D, the rod E, and the lever F, in combination with each other and with the bent inner ends of the reel-arms C, substantially as herein shown and described.

2. The jointed reel-bars G and the connecting-rods H, in combination with the reel-arms C, hollow shaft A, made in two parts, one of which is hollow, provided with recessed flanged collars B, the grooved disk D, the rod E, and the lever F, substantially as herein shown and described.

142,390.—Saw-Tooth Gage.—CYRUS B. GRAMBY, Stafford Springs, Conn. Application filed June 7, 1873.

The sweep, composed of two parts adjustable longitudinally, one within the other, is centered and clamped to the saw-arbor, and is adjustable in relation to the saw by means of a tangent-adjusting-screw, and cross-arm. The cross-arm revolves in the sweep at an angle of ninety degrees, and has on each end two gages, (one to gage the front of the teeth and the other to gage the set of the teeth,) and on the other end a swage-holder.

Claim.—1. The spring-arms G and center screw I, combined with the sweep D E, the grooved collar, and the center socket in the saw-arbor, substantially as specified.

2. The combination, in a saw-tooth gage, of the templet O, adjusting-pin N, and adjusting-gage arm P, substantially as specified.

3. The combination of the saw-gage arm arranged in the sweep to revolve, the set-gage R on one side, and the angle and rounding gage T on the other side, substantially as specified.

4. The combination, with the sweep and gage-arm, of the angle and rounding gage plate T, arranged to shift so as to gage different and opposite angles, and provided with the scale W, substantially as specified.

5. A swage or upsetting-tool holder, Y, combined with the gage-arm, substantially as specified.

142,391.—Spring Bed-Bottom.—EGBERT B. HILL and EDGAR VAN VALKENBURG, Grand Rapids, Mich. Application filed March 7, 1873.

A wire-brace is inserted through, in, or attached to the under longitudinal bars, crossed, and extended to the transverse bars at the outer ends, to which it is made fast.

Claim.—The cross-wire brace E, in combination with the end pieces A and side bottom pieces B, when constructed and arranged substantially as and for the purposes herein set forth.

142,392.—Spring-Hinge.—WILLIAM HOAR, Floyd, Iowa. Application filed July 12, 1872.

To one leaf of the ordinary strap-hinge is attached a downwardly-projecting standard, the end of which drawn out into a rod, and, turned upward, forms a pintle-extension, which is encircled with a spiral spring attached at one end to the standard, and at the other to the hinge, near its lower knuckle.

Claim.—The standard B, attached to one leaf of the hinge, and provided with the pintle-extension *a*, encircled by the spring C, connected at its ends with both hinge and standard, all as shown and described.

142,393.—Corpse-Cooler.—JOHN HOFFMAN, Toledo, Ohio. Application filed April 19, 1873.

Air passes through tubes in a cooling-chamber into the casket at one end, and out at the other end through a tube. The apertures of the projecting tubes of the casket are covered with wire-gauze. If the cooler is not used the projecting tubes are closed by screw-caps or by valves.

Claim.—1. The casket A, having apertures *a b*, with wire-gauze *d e* and projecting connection-tubes, substantially as described.

2. The combination of casket A with cooler B, having coil E and pipes A, and tubes C, for cooling and ventilating the interior of the casket, substantially as and for the purpose described.

142,394.—Projectile.—JAMES G. HOPE, Wichita, Kans. Application filed April 19, 1873.

Projectile having bent or inclined tail, to cause it to describe other than a natural curved line, is provided with vanes at right angles with said tail to prevent rotation and gyrations during flight.

Claim.—An improved projectile for straight-grooved rifles, formed of a ball, A, having a stem, B, provided with the wings D D parallel to its axis, and with the wings C oblique thereto, and secured to its flat beveled end, as shown and described, whereby said ball is prevented from turning on its axis, but at the same time guided in a curve of greater or less radius, as specified.

142,395.—Car-Coupling.—FRANKLIN E. HOWARD, Genesee, N. Y. Application filed June 26, 1873.

One draw-head has a cavity similar to ordinary draw-heads, and is slotted to receive a coupling-block, which is operated by suitable levers and chains. The other draw-head consists of a bar recessed on its upper side, and having a block bolted to it near its front end, to engage with the sliding block in the opposing draw-head. Provision is made for the use of the ordinary link, the angle-bar on the draw-head serving to prevent the link from being jolted over the projection on its upper face.

Claim.—1. The draw-heads A B and the coupling-blocks C and D, constructed and arranged to operate in connection with each other, substantially as herein shown and described.

2. The combination of the chain I, roller J, and levers H K L

L with the draw-head A and coupling-block C, substantially as herein shown and described.

2. The right-angled bar H, in combination with the draw-head B and coupling-block C, to adapt them to receive an ordinary coupling-link, substantially as herein shown and described.

142,396.—Breech-Loading Fire-Arm.—DANIEL HUG, New York, N. Y., assignor to himself and WILLIAM H. SEIBS, Jersey City, N. J. Application filed January 6, 1873.

Claim.—The pivoted breech-block, having the spring-hook connected therewith and the cartridge-extractor arranged centrally beneath the barrel, combined as shown, to extract cartridges and throw them clear of the gun, as well as support the new one, in the manner described.

142,397.—Heater and Blower.—WILLIAM M. JACKSON, Woodland, Cal. Application filed February 26, 1873.

A fan-blower is arranged within a heater consisting of coiled plates arranged to form two passages; one receives at its inner end, from the fan, a current of air, which is discharged at its outer end into the furnace or fire-place; the other passage receives exhaust-steam from the engine, and this passes around the coil, imparting its heat to the air. The steam may be condensed in the last turn of the passage and used as feed-water.

Claim.—The coiled plates A, forming the passages G H, in combination with the internal blower D, all constructed, arranged, and operating as set forth.

142,398.—Compound Metal-Working Machine.—GEORGE L. JONES, Vanville, Wis. Application filed June 14, 1873.

An eccentric to operate a pair of toggle-levers, one of which carries a movable shear, and the other a carriage, to which is attached the movable part of the tire-shrinking apparatus and the punch. The tire-bending apparatus operates independently, and is attached to the front of the frame of the machine.

Claim.—The blacksmith's combination-tool for cutting and punching iron parts, tightening and bending tires, &c., consisting of frame A, with standards B, eccentric C, lever D, knee-joint lever E F, cutter F, carriage G, with punches A and socket H, standard G', blocks I I', plate L, and rollers O O' O², substantially as described.

142,399.—Reed-Organ.—WILLIAM J. KENT, Buffalo, N. Y. Application filed May 3, 1873.

The wind-chest top, instead of being screwed down, as usual, is held securely in place by clamps hinged to the wind-chest. The bellows are divided and arranged at the sides of the case, and they are provided with novel means for blowing them by the hand of an assistant.

Claim.—1. In a reed-organ, the two vertical bellows B B, in combination with the treadles C C, the straps *a a*, and springs *b b*, or their equivalents, when such parts are arranged to operate as and for the purposes specified.

2. In a reed-organ, the disk-wheel D, lever E, and straps *d d*, for blowing the bellows independently, and arranged to operate substantially in the manner specified.

3. In that class of reed-organs operated by an exhaust, the hinged top of the wind-chest or cover G, in combination with the swinging clamps *g g*, the thumb-screws A A to fasten and unfasten said top, substantially in the manner specified.

142,400.—Windmill.—OWEN B. KNAPP, Brandon, Wis. Application filed April 26, 1873.

The turn-table is supported on and secured to a bevel-gear, which meshes with a pinion on a shaft provided with a pulley. A belt connects the pulley with a pulley secured to the tower. To the last-named pulley is attached a notched disk, from which a weight is suspended to bring the wheel into the wind. The tendency of the weight to hold the wheel into the wind is made to increase as the wind presses the side vane back.

Claim.—The combination, with the wheel A, turn-table C, and vane I, of the gear I, pinion K, belt H, pulleys, notched disk N, and weight K, as shown and described, to operate as specified.

142,401.—Loom-Stopping Mechanism.—LUCIUS J. KENDALL, Worcester, Mass. Application filed June 17, 1873.

The shipping-lever at its lower end terminates in a rack, which takes into a gear on a crank-wheel to which is pivoted the shipping-fork lever, which lever is carried forward to ship the belt by the direct action of the shipping-lever, and also by a spring operating on the swinging arm to which it is attached. The crank-wheel has a stop-pin so arranged on its face as to strike the fork-rod, and, when in contact with it, to hold the shipper-lever in its forward position. The shipper-lever is actuated positively, through the whole movement, by a knocking-off lever loosely pivoted within a grooved bracket under the breast-beam, and having a curved side bearing against the side of the groove, so that when acted upon by the finger on the lay its fulcrum is shifted, and, thereby, the movement of the shipper-lever is accelerated. In place of a crank-wheel a crank may be used.

Claim.—1. The combination, with the shipper-lever E and rod K, of rack *f* upon the end of the shipper-lever, gear *g*, and wheel A, substantially as and for the purposes set forth.

2. The combination, with the shipper-lever E, bell-arm L, rod K, rack *f*, gear *g*, and wheel A, of pin *i*, spring *k*, and hinged arm J, substantially as and for the purposes set forth.

3. The combination, with bell-arm L and rod K, of wheel A, or its described equivalent, provided with a stop-pin, substantially as and for the purposes set forth.

4. The combination of the loosely-pivoted knocking-off lever *c*, having its side curved with the grooved bracket *d* on the loom-frame, shipper-lever, and dog *e*, substantially as and for the purpose set forth.

142,402.—Machinery for Crimping Boot and Shoe Uppers.—ALISON KNOWLTON, Boston, Mass., assignor to KNOWLTON & JAMES, same place. Application filed June 7, 1873.

The clamps receive and crimp the leather under the press, and are then removed and put aside to allow it to set while still held upon the form.

Claim.—The herein-described crimping implement or clamp, consisting of the parallel wooden bars A, united by pressure, and adjusting-bolts B, one at each end of the bars, and provided on their contiguous faces, between said bolts, with pressure-pads C, the whole constructed and arranged as shown and set forth, and adapted for use with a former or shaping-plate, D, of any suitable configuration, as specified.

142,403.—Punching-Machine.—JOSEPH M. LAUGHLIN, Boston, Mass. Application filed November 18, 1872.

To prevent the metal from spreading, and to hold it in place during the punching operation, the presser-foot on one side of the punch are provided with lips or projections, against which the edge of the metal abuts.

Claim.—In combination with the stock-holder *g f f* and the spring *d*, the lip *i*, one or more, for the purpose as herein set forth and described.

142,404.—Movable Cloth-Plate for Sewing-Machines.—ROBERT L. LEECH, Winterset, Iowa. Application filed July 14, 1873.

The levers are disengaged from the posts through the thumb-piece.

Claim.—The movable cloth-plate A connected with the corner-posts *a* by means of the pins *b*, levers *c*, spring *d*, and thumb-piece *f*, substantially as described, and for the purposes specified.

142,405.—Letter-Envelope.—JOHN D. MCANULTY, Brooklyn, N. Y. Application filed May 17, 1873.

Flaps so shaped that by folding the tongue, inserting it into the slit, and then unfolding it, a lock is formed.

Claim.—An envelope having T-slit A in one flap and tapered tongue B in another, to lock in the manner described.

142,406.—Joint for Iron Ships and Tanks.—DANIEL E. MERRICK, Milwaukee, Wis., assignor of one-half his right to J. B. SMITH, same place. Application filed May 8, 1873.

The grooves in the surface of plate B are to be filled with cement.

Claim.—1. A seam or joint of metal made with a strip of metal, B, with a raised tongue, D, in its center riveted to sheets A, and tongue D headed down even with sheets A, and the heads of the rivets countersunk on the smooth side of sheets A, substantially as described.

2. A seam of metal when made with sheets A, strips B, rivets C, and grooves E, all combined substantially as described.

3. A seam or joint of metal when made with sheets A and strips B, one of the strips B running lengthwise of the sheets A, and the other strip B running crosswise of the ends of sheets A, with tongue D headed down even with the surface of sheets A, the strip B running across the ends of sheets A being let into the side of the other strip B, so that its end shall strike tongue D, and both strips B riveted to sheets A, substantially as described.

142,407.—Manufacture of Dies for Punching.—ROBERT J. MULLIN, Providence, R. I., assignor to himself and MICHAEL R. HANLEY, same place. Application filed July 12, 1873.

A tapering hole is first made in a block of wrought-iron, extending nearly but not quite through, and into this is welded a conical steel plug, through which a hole is afterward drilled.

Claim.—The process of manufacturing dies for cold-punching, as herein set forth.

142,408.—Medical Compound.—SELVIN E. PADDOCK, Delaware, Ohio. Application filed August 6, 1873.

Twenty parts of burdock and one part of mandrake root, steeped for fourteen days in alcohol reduced one-fourth with water.

Claim.—The medical compound herein described, composed of the ingredients in substantially the proportions and for the purposes set forth.

142,409.—Fire-Escape Ladder.—WALTER W. PARSONS, Stanstead, Canada. Application filed July 19, 1873.

To confine the rungs to the ropes of the ladder holes are bored for the passage of the rope; a wedge-shaped slit is then made, the end is slightly tapered, and a conical ferrule is driven on, which compresses the wood tightly upon the rope so as to prevent it from slipping. The ferrule is secured by a rivet.

Claim.—The method of fastening the bars to the ropes by the holes E, slits O, and tapering ferrules P, substantially as specified.

142,410.—Auger-Handle.—FRANKLIN B. PEASE, Ontario Centre, N. Y. Application filed June 26, 1873.

The concave clamp *a*, bearing always upon two corners of the bit-shank, forces it solidly against the angular bearing and secures it firmly thereto.

Claim.—The combination of the square shank-receiving openings in the cylinder with the circular-faced clamp *a*, substantially in the manner and for the purposes shown and described.

142,411.—Quilling-Frame.—GILMAN PHILLIPS, Biddeford, Me. Application filed May 14, 1873.

The rollers are adjustable by clamps and thumb-screws working in the slots in the frame.

Claim.—The clamps K K, the slots I I, and rollers E E, all combined and arranged to operate substantially as and for the purposes set forth.

142,412.—Beer-Mall.—WILLIAM M. PRESTON, Roxbury, N. Y. Application filed March 22, 1873.

Two hammers are fixed to the same hub, with suitable stops, forming, in effect, a split hammer, for allowing independent adjustment on either side, the double hammer being designed to strike the inside of the ball on opposite sides, or with a double stroke.

Claim.—The double hammer D, having the two stems and two hammers, the cylinder C, having stop *a*, and base-plate A, provided with the stops *b b*, all constructed and arranged for operation as and for the purpose specified.

142,413.—Subterranean Irrigation.—WILLIAM H. PUGH, Chicago, Ill. Application filed January 9, 1873.

Pipes, the under half being impervious to water, while the upper surface is porous or perforated, are laid, water level, over given areas of cultivated land. Water, liquid-fertilizers, hot air, or steam, are introduced through elevated pipes reaching the surface, the fluid finding a common level and imparting moisture to the earth by absorption.

Claim.—A tile, tube, or pipe, perforated or porous on the upper side, and impervious on the under side, as described in the foregoing specification, or a series of such tiles, tubes, or pipes, said pipes to be made of any material, and of any size, shape, and thickness, and either with or without the dew-tubes D and waste-pipe E, as and for the purposes desired.

142,414.—Lemon-Squeezer.—EDWARD M. SAMMIS, Babylon, N. Y. Application filed July 19, 1873.

The lower part of the squeezer has a cavity in its upper face, in which a knife is arranged in an inclined position. The upper part is provided with a projection or knob, having a slit or notch formed therein, to receive the knife. The upper part has projecting flanges that extend over the lower part when the device is operated.

Claim.—1. The knife D, secured in the cavity of a lemon-squeezer, substantially as herein shown and described.

2. The arrangement of the knife D, in the cavity of a lemon-squeezer, in an inclined position, substantially as herein shown and described.

3. The combination of the notched knob or projection F with the knife D, arranged as specified.

4. The flanges G, in combination with the parts A E of a lemon-squeezer, substantially as herein shown and described, and for the purpose set forth.

142,415.—Check-Hook for Harness-Saddles.—ABRAHAM V. SARGEANT, Newark, N. J. Application filed May 28, 1873.

Claim.—A check-hook, A, provided with a fixed guard, B, which curves outward at the bottom and inward at the upper end, substantially as and for the double purpose herein specified.

142,416.—Boring and Drilling Machine.—JOHN J. SHERIDAN, New York, N. Y. Application filed June 28, 1873.

The drill-shaft slides perpendicularly, and is fed by means of a feed-screw, entering its upper end, which may be adjusted to a slow or rapid feed. The frame is, in shape, a segment of a truncated cone, and its flanged base-plate is adjustably fastened to a flanged table by means of set-screws and bolts. The operative mechanism is two belt-pulleys and two gear-wheels, (either being set on by means of a ratchet-clutch,) to give opposite motions. The cutter is adjustable, for a larger or smaller bore, by means of a pivoted lever working within the stock, one end of which engages with teeth in the upper side of the cutter, and the other works over a swiveled screw.

Claim.—1. The combination of the flanged table A B, flanged base B D, set-screws C and G, and bolts F with each other and with the frame H of the machine, substantially as herein shown and described.

2. The frame H, made in the form of a segment of a truncated cone, and made in two parts, provided at their adjacent ends with flanges I to receive the bolts by which said parts are secured to each other adjustably, substantially as herein shown and described.

3. The combination of the sliding tool-shaft J, the swiveled gear-wheel L, the small gear-wheel M, the gear-wheel and head-pulley Q R, the driving-gear-wheel band and head-pulley T R S, the double clutch W and V, the three-armed clutch-lever X with each other and with the frame H and driving-shaft U, substantially as herein shown and described.

4. The combination of the studs E', cross-bar F', swiveled screw G', gear-wheels H' I', shaft J', gear-wheel M', pin N', and bar O' with the sliding tool-shaft J, frame H, and driving mechanism, substantially as herein shown and described.

5. The combination of the crank P' and pin Q' with the swiveled screw G', the sliding tool-shaft J', and gear-wheel L, substantially as herein shown and described.

6. The tubular piece E', the pivoted lever S', the swiveled screw T', the notched cutter U', and the set-screw V', in combination with each other and with the sliding tool-shaft J, substantially as herein shown and described.

142,417.—Harvester-Cutter.—WILLIAM E. SHEARER, Sherburne Four Corners, N. Y. Application filed July 16, 1873.

The cutters are made to oscillate on a pivot at the rear end of their shanks by means of pins on the reciprocating cutter-bar, fitting in slots in the shanks. The cutters are held down by clamps on the shanks, fitting in grooves in the finger-bar. The grooves are notched at the ends, so that the cutters may be removed, when desired, without detaching pins or screws.

Claim.—1. The combination, with the recesses in bars of fingers A and the headed pins G set in the finger-bar B, of the shanks F of the cutters, provided with a curved flange at their forward ends and a rabbeted notch at their rear ends, as shown and described.

2. The curved flange formed upon the forward end of the shanks F, in combination with the curved, grooved, and notched recess formed in the base of the fingers A at the forward side of the groove in the finger-bar B, substantially as herein shown and described.

142,418.—Combined Chair and Secretary.—GEORGE C. TAYLOR, Thibodeaux, La. Application filed July 16, 1873.

The arm-chair and secretary are both made on one frame, and the secretary is provided with folding leaves on top, and drawers and pigeon-holes in the body thereof, and the chair has drawers underneath the seat.

Claim.—The combined chair and secretary, consisting of arm-chair A, case B, table D, portfolio F, and drawers *d f*, and *g*, arranged and constructed substantially as and for the purpose described.

142,419.—Manufacture of White Lead to Collect the Dust.—MICAIAH TOLLE, St. Louis, Mo. Application filed July 19, 1873.

The spout from the separator conveys the mixture of dust and non-corroded lead to a tank, where the dust is precipitated.

Claim.—The apparatus for utilizing the lead-dust generated in white-lead factories by the separation of the corroded from the uncorroded lead, consisting of tank A, elevator B, with troughs B E', and spout F, constructed and arranged substantially as and for the purpose described.

142,420.—Machine for Making Window-Sash.—JAMES TRAVERS, Roslyn, N. Y. Application filed August 16, 1873.

Sash-stuff, by this template, is fed to a circular saw, whereby the various joints in the stiles and rails are cut without "laying off."

Claim.—1. The guide A, for sawing the dovetails of the stiles and rails of window-sashes, substantially as shown and described.

2. The strip B, in combination with the guide A, as and for the purpose described.

142,421.—Method of Securing Letters to Stone.—JOHN VENERALI, Boston, Mass. Application filed March 21, 1873.

Letters, of metal or other plastic material, are secured in recesses of the same shape cut into stone, by first drilling oblique holes in the bottoms of these cavities, and then driving the letters into the cavities. The outer surface is then smoothed and finished.

Claim.—The method of securing letters to marble or stone surfaces by making them of a plastic metal or material and driving them into corresponding cavities in the marble, so as to fill oblique holes in the bottoms thereof, substantially as and for the purpose herein specified.

142,422.—Fire-Proof Building.—JOSEPH H. WALKER, Worcester, Mass. Application filed June 13, 1873.

Claim.—A fire-proof building constructed substantially as herein described—that is to say, with double walls, leaving a space between them, and recesses from top to bottom of the house, and partially divided by horizontal partitions, provided with overflow-partitions *e f g*, &c., combined with a reservoir on the top of the house, supplied with water from a convenient source, and arranged to communicate with said space formed between the walls of the house, valves for regulating the supply of water, and drain-pipes, being also provided, the whole under the arrangement substantially as shown and set forth.

142,423.—Cards for Social Games.—PEMBURY WEST and GEORGE S. LEE, Worcester, Mass. Application filed May 24, 1873.

Claim.—A pack of cards composed of a series of pairs or companion cards, one of each pair having a picture representing some natural or other object with its name, while the other contains a brief description of said object, substantially as shown and described.

142,424.—Boot.—PEMBURY WEST and GEORGE S. LEE, Worcester, Mass. Application filed June 20, 1873.

Claim.—A boot, the side seams of which are closed upon the outer side, and formed by means of metal fastenings, substantially as shown and described.

142,425.—Lamp.—JOHN C. WHARTON, Nashville, Tenn. Application filed February 6, 1873.

A column of water is maintained between the small quantity of oil at the burner and the flame. A plug closes the orifice in the bottom of the flame, when the same is inverted after filling, for the purpose of adjustment. The stem of this plug works

through the vent-tube, which reaches nearly to the bottom of the flask.

Claim.—1. The combination of the oil-reservoir E, having vent-tube T, the nozzle N, pipes I H C, and the water-reservoir A having burner B on top thereof, as and for the purpose described.

2. The ping G and cap Q, applied in connection with the reservoir E, as and for the purpose specified.

142,426.—Coal-Breaker.—RUFUS A. WILDER, Cressona, Pa. Application filed October 26, 1872.

Consists in casting teeth on both sides of a rack-plate composing the cylindrical breaker, so that the plate can be reversed and used on the other side when the teeth on one side are worn.

Claim.—The cylinder sections or plates d, provided with teeth e, projecting on opposite sides and made reversible, as and for the purpose specified.

142,427.—Apparatus for Combing and Mixing Tampico and Bristles.—GEORGE WILLETT, Burlington, assignor to ENOCH B. WARTINE, St. Albans, Vt. Application filed June 7, 1873.

The mixed stock is laid on endless carrier-belts just in front of the endless-chain holders, and spread and mixed as evenly as possible. The stock is so presented to the holders that about one-half of its length projects from the side as it is carried along past a comb that combs out said projecting portions. Two of the movable holders and combs are arranged in one machine in connection with carrier-belts that take the partly-combed stock from the first holders and reverse it and transfer it to the second holders, so that the uncombed portion is presented to the second comb to be completed by it.

Claim.—1. The combination described of rolls B, endless chain-holders A, and guides D to hold the stock in position while the projecting portion is combed.

2. The combination of two endless feed-belts, I J, the belt I passing between rolls B, but the belt J passing over a roll, K, to cause a part of the stock to project over the side of holders, in the manner set forth.

3. The vertical pulleys Q, belts O P, and horizontal pulleys R Z, combined to receive and reverse the stock in the manner specified.

142,428.—Process for Preserving Beer.—ANTON ADAMITZ, New York, N. Y. Application filed August 15, 1873.

Claim.—The process herein described for purifying the atmosphere before its entrance into a beer-barrel or other vessel, by causing the same to pass through lime-juice, in the manner substantially as herein shown and described.

142,429.—Set-Up Device for Knitting-Machines.—HORACE L. ARNOLD, Ottawa, Ill. Application filed February 19, 1873.

The controlling-plate, while it allows sufficient movement to the hooks to pass down inside the cylinder, prevents them being bent out of proper position.

Claim.—The several hooks, arranged in the form of an inverted cone, and secured at their bases in and to the cup *a*, in combination with the slotted controlling-plate B and the weight-eye, substantially as described.

142,430.—Needle-Threader for Sewing-Machines.—CHARLES T. BEARDSLEY, Ansonia, Conn., assignor to himself and GEORGE O. CATLIN, same place. Application filed May 28, 1873.

A pair of jaws th clamp the needle on opposite sides.

Claim.—The combination of the two arms A D E D and connecting-spring C for closing them, one arm being provided with the block E grooved vertically to receive the needle and horizontally to guide the thread, and the other arm with the auxiliary arm F having a point in line with the groove for guiding the thread, all constructed and operating as described.

142,431.—Sash-Fastener.—GEORGE W. BISHOP, Saratoga Springs, N. Y., assignor of one-half his right to L. E. WHITING, same place.—Case C. Application filed April 12, 1873.

A hinged dog cast with the plate, to dispense with hinge-pin, and operated by a spring, is seated in a recess of the window-frame. A flat curved arm pivoted to the toe of the dog acts as a double latch, being curved upward and forward and extending through a slot in the catch-plate, which is let into the face of the sash-strip. This arm is notched, and has a head or thumb-piece so constructed as to engage with an angular recess or indentation in the catch-plate, thus serving to hold it securely in place, whether the dog is locked in its sash or disengaged.

Claim.—The sash-lock consisting of the hinged dog D, the slotted catch-plate G, and the curved double latch F pivoted to the dog, and passing through the slot of the catch-plate, substantially as specified.

142,432.—Lamp.—WILLIAM S. BLANDELL and CHARLES K. YOUNG, Factory Point, Vt. Application filed July 26, 1873.

The lamp has two concentric cylindrical chimneys and a base closing the space between the lower end of the outer chimney and the lamp-collar. A perforated cap fits upon both chimneys by downward flanges. The air which feeds the flame must pass into the perforations of the cap downward between the chimneys, and under the inner chimney to the flame.

Claim.—The combination of the exterior and interior chimneys C B, closed base D, and cap G, arranged to fit on both chimneys by downward-projecting flanges, substantially as and for the purpose set forth.

142,433.—Apparatus for Propelling Street-Cars by Compressed Air.—WILLIAM H. H. BOWERS, Franklin, Ky. Application filed July 30, 1873.

The tanks are divided into compartments which communicate with each other and with the working cylinder through check-valves. The working cylinder has a pressure-valve which connects with the valve in the supply-pipe.

Claim.—1. The tanks or cylinders A and B, arranged, as described, in compartments, and provided with valves and pipes, substantially as and for the purposes herein set forth.

2. The combination of the supply-tanks A B and working-tank C, constructed, arranged, and connected together substantially as and for the purposes herein set forth.

142,434.—Rivet-Setting Machine.—MYRON D. BROOKS, Boston, Mass. Application filed August 1, 1873.

Mechanism designed to hold a hollow rivet, carrying it forward and inserting it in the material to be riveted, when it is simultaneously released by the clamps, and headed upon the work by the action of the plunger and anvil.

Claim.—1. In a machine for setting rivets, the combination of a reciprocating plunger for heading or clinching the rivet and a pair of clamping-jaws connected therewith, and arranged to reciprocate with said plunger during a portion of its stroke, and to move laterally to clamp the rivet and guide it to the work and release it again at the proper time when said motions are imparted to said jaws by the reciprocating plunger, substantially as described.

2. In combination with the reciprocating plunger of a rivet-setting machine, a pair of clamping-jaws, *b b*, provided with hooks at their upper ends, the shoulders *g* and A, and a cam-shaped surface between said shoulders upon their outer edges, to be acted upon by the pins *i i*, to limit their endwise motion, and impart thereto the desired lateral motion to clamp and release the rivet, or their mechanical equivalents, substantially as described.

3. The combination of the plunger C, provided with the pins *f*, with the clamping-jaws *b b*, provided with the shoulders *g* and *e*, or their equivalents, arranged and operating as described, for the purpose specified.

142,435.—Billiard-Table Cushion.—JOHN E. CAME, Boston, Mass. Application filed May 13, 1873.

The embedded wire or band has a fibrous covering previously woven tight about it. Upon being then placed in the cushion-mold and the cushion vulcanized, the wire and covering adhere perfectly to the cushion, and the irregularity of action due to unequal separation of wire or band from the cushion is avoided.

Claim.—An India-rubber billiard-cushion constructed with an embedded spring-band, *a*, having woven about it a tight and close-fitting fibrous casing or covering, *b*, all substantially as described, for the purpose specified.

142,436.—Windmill.—GEORGE A. CARTER, Princeton, Ill. Application filed July 23, 1873.

A weighted lever is arranged between the hand-lever used for throwing the sails out of the wind and the self-regulating devices, so that the hand-regulating device will in no way interfere with the self-regulating devices when the wheel is in motion.

Claim.—1. The lever N and rod O, when arranged to operate between the governor of a windmill and the hand or automatic furling devices thereof, substantially as described, and for the purpose specified.

2. The adjustable stops *n' n'*, when arranged to operate with the rod O and levers M and N, substantially as described, and for the purpose specified.

142,437.—Machine for Making Horseshoe-Nails.—ALEXANDER H. CARYL, Groton, Mass. Application filed September 25, 1872.

Two vibrating arms, pivoted at their outer ends and operated by a horizontal reciprocating bar, carry dies that operate to spread and bevel the point of a blank fed between them, and at the extremity of the forward movement release the nail, which slides down an inclined chute to a punch and die, where the sides are trimmed and the nail finished.

Claim.—1. In combination with the segmental vibrating dies, the stop *r*, actuated automatically by the die-arm *e* to let a blank into the dies, and automatically assuming its normal position to retain the next blank as the arm moves forward.

2. In combination with the segmental dies *m n*, the stop or gage against which the head of the nail strikes when it enters the dies, and whereby the nails are successively and uniformly held to the same proper position for the action of the dies.

3. In combination with the swinging dies *m n* and the inclined grooved conductor *o*, on which the blank is supported and slides, the punch and die *y z*, arranged in relation to the dies *m n* and operating substantially as shown and described.

142,438.—Strainer for Ship's Bilge-Pumps.—SAMUEL J. CHAPMAN, Baltimore, Md. Application filed August 8, 1873.

A strainer-box, provided with an adjustable door to permit easy cleansing, and with waste-cocks, is placed between two sections of the suction-pipe to catch floating refuse, which would otherwise choke the valves of the pump.

Claim.—The strainer-box A, having the adjustable door E and fastenings, and provided with induction and eduction bilge-ports, separated by a strainer-plate, B, the induction-port being supplied with the valve *a* and guard *b*, substantially as and for the purpose specified.

142,439.—Manufacture of Carpet.—HENRY A. CLARK, Boston, Mass. Application filed February 1, 1873.

Claim.—In the manufacture of floor-carpeting composed of burlap, uniting to the burlap by a suitable cement a backing of paper, and then printing on the face of the burlap suitable patterns or figures.

142,440.—Steam-Superheater for Evaporating Salt, and for other purposes.—LEWIS R. CORNELL, Brooklyn, N. Y. Application filed July 16, 1873.

Within a suitable furnace are arranged, one above another, a number of rings, having a series of bulbs upon them, in such a manner that the steam is made to pass around each ring before it is admitted to the one above.

Claim.—1. A series of rings, A A' A'' A''', or any number thereof, placed one above another, provided with bulbs, for the purpose specified, and communicating with each other by connections inside the furnace, substantially as shown and described.

2. The elements of the first claim, constructed and arranged as therein specified, in combination with a reverberatory furnace.

3. The series of rings A A' A'' A''', or any number thereof, communicating by direct connections, on opposite sides inside the furnace, and provided with the bulbs a, substantially as specified.

4. The reverberatory furnace D, having a spiral, or substantially spiral, flue, H, built into the wall thereof, substantially as hereinbefore set forth.

5. The combination of the series of rings A A' A'' A''' A''', or any number thereof, connected, as hereinbefore described, with a reverberatory furnace having a draft-flue leading from the lower part thereof, substantially as hereinbefore set forth.

142,441.—Shuttle-Box Mechanism.—GEORGE CROMPTON, Worcester, Mass. Application filed July 10, 1868.

Any shuttle-box in a series may be selected and brought in such position opposite the shuttle-race that the shuttle contained therein may be shot through the shed.

Claim.—1. The combination of an oscillating or rocking shaft with sets of pawls proper for oscillating it in both directions, when said oscillating shaft is acted upon by each set of pawls at different distances from its center of oscillation, substantially as herein described, the combination being substantially such as hereinbefore set forth.

2. The combination of an oscillating or rocking shaft and sets of pawls, each set actuating it at different distances from its center of oscillation, with a pattern mechanism, the combination being and acting substantially as described herein.

3. The combination of an oscillating shaft and sets of pawls actuating it at different distances from its center of oscillation with a series of shuttle-boxes, by means of proper mechanical connections, as described, in such manner that sets of pawls one less in number than the boxes in the series of shuttles are effective in selecting any box of the series.

4. The combination, with an oscillating shaft and sets of pawls actuating it at different distances from its center of oscillation, and with a series of shuttle-boxes having proper mechanical connections, as described, in such manner that sets of pawls one less in number than the boxes in the series of shuttles are effective in selecting any box of the series, of a pattern mechanism, the combination being and acting substantially as described.

5. The combination of an oscillating shaft and sets of pawls actuating it at different distances from its center of oscillation with a series of shuttle-boxes, by means of a tappet or cam having two sides of varying inclination, in such manner as described, so that sets of pawls two less in number than the boxes in the series of shuttles are effective in selecting any box of the series.

6. The combination of an oscillating shaft and sets of pawls actuating it at different distances from its center of oscillation with a series of shuttle-boxes, by means of a tappet or cam having two sides of varying inclination, in such manner as described, so that sets of pawls two less in number than the boxes in the series of shuttles are effective in selecting any box of the series, and with a pattern mechanism, both these combinations being and acting substantially as described.

7. An oscillating shaft the axis of which extends across a loom-frame, and is acted upon by sets of pawls actuating it at different distances from its center of oscillation, in combination with two series of shuttle-boxes, by means of proper connections, substantially as described, so that sets of pawls one less in number than the boxes of either series shall select corresponding shuttle-boxes of both series, as described.

8. An oscillating shaft the axis of which extends across a loom-frame, and is acted upon by sets of pawls actuating it at different distances from its center of oscillation, in combination with tappets or cams having sides of different inclination on both sides of the loom, and two series of shuttle-boxes moving in unison, in such manner that sets of pawls two less in number than the boxes of either series shall select corresponding boxes of both series, as described.

9. In combination with a pattern mechanism, an oscillating shaft the axis of which extends across a loom-frame, and is acted upon by sets of pawls actuating it at different distances from its center of oscillation, combined with two series of shuttle-boxes by means of proper connections, substantially as described, so that two sets of pawls one less in number than the boxes of either series shall select corresponding shuttle-boxes of both series, as described.

10. In combination with a pattern mechanism, an oscillating shaft the axis of which extends across a loom-frame, and is acted upon by sets of pawls actuating it at different distances from its center of oscillation, and tappets or cams having sides of different inclinations on both sides of the loom, and two series of shuttle-boxes moving in unison, in such manner that sets of pawls two less in number than the boxes of either series shall select corresponding boxes of both series, as described.

142,442.—Sewing-Machine.—CYRUS S. CUSHMAN, Philadelphia, Pa., assignor to HENRY D. STOCKS, same place. Application filed July 7, 1873.

The reciprocating presser-foot bar has a horizontal socket, in which the foot is moved longitudinally by levers. The grooved cam-wheel, actuated by the U-shaped lever, engages a pin on an arm projecting from the upper end of the presser-bar, and moves the foot in the arc of a circle when it is desired to feed the material laterally. The presser-foot also feeds the material forward.

Claim.—1. The combination of the presser-foot bar D, having an arm, *e*, provided with a pin, *f*, and the cam-wheel J, for giving a reciprocating partial turn of the bar and a corresponding swinging lateral movement to the presser-foot, substantially in the manner and for the purpose above set forth.

2. The combination of the needle-arm K, U-shaped lever M, and pawl N, with the cam-wheel J, having a ratchet, O, for giving a partial turn to said wheel at each upward movement of the needle-arm, for producing a swinging lateral movement of the presser-foot, substantially as described.

3. The combination of the adjustable inclined spring L and screw P with the lever M, for regulating the movement of the latter to vary the length of the stitches, substantially as set forth.

4. The combination of the levers R M, socket I, pin *j*, presser-foot bar D, and presser-foot F, for giving a forward movement to the latter, substantially as specified.

142,443.—Car-Propeller.—JUSTUS DAY, Holley, N. Y. Application filed May 31, 1873.

A windlass, having anchor-ropes which pass through the handles of a clamp, is mounted upon a hand-car, the strain upon the ropes causing the clamp to act upon the rails.

Claim.—1. In combination with the windlass C having the divisions *i i' i''*, the draft-cord E, and anchor-cords D D, the whole adapted to a hand-car, substantially as and for the purpose described.

2. In combination with the windlass C and anchor-cords D D, the clamps G G, or equivalent, arranged to clamp the rails, the whole adapted to a car, as set forth.

142,444.—Concrete Pavement.—GEORGE W. DEAN, Stamford, Conn. Application filed June 5, 1873.

Claim.—A pavement for roads, walks, and floors, composed of blocks of coarse concrete, veneered on their faces and sides or edges with fine concrete, and separated one from the other, substantially as herein shown and described.

142,445.—File.—HENRY DISTON, Philadelphia, Pa. Application filed April 16, 1873.

Claim.—1. The method of shaping saw-file blanks, by making therein longitudinal indentations, as herein set forth.

2. As a new manufacture, a saw-file having the within described longitudinal indentations.

3. A saw-file, having at the outer end a tip, *c*, secured to or forming part of the file, as set forth.

142,446.—Compound for Filling Wood.—JAMES B. DUTTENHAVER, Napoleon, Ohio. Application filed July 29, 1872.

Claim.—White wax dissolved in hot oil and compounded with starch, magnesia, turpentine, and Japan drier, as and for the purpose described.

142,447.—Clasp for Pocket-Books.—JOHN F. DUBOIS, Brooklyn, N. Y. Application filed July 25, 1873.

Jaws, provided with openings through their line of contact, are brought together to embrace a stud by action of an U-shaped spring, to the inner ends of which they are rigidly attached.

Claim.—The jaws *b b*, having the cavities *c c*, and separately connected with the branching arms of the spring-wire *a*, in combination with each other and with the loop A and pin *d*, substantially as and for the purpose herein specified.

142,448.—Manufacture of Pipe.—GEORGE L. HAGAN, San Francisco, Cal. Application filed May 29, 1873.

Pitch, asphaltum or bituminous matter, thickened with pulverized earth to render it plastic, is pressed by means of rollers into the pores of sheets of cloth, paper, or similar substances, or into holes made in the cloth or paper. After the sheets are thus prepared they are wound around a mandrel so as to form a tube of any required thickness.

Claim.—The process of forming pipes by the application of the non-liquid plastic compound, as set forth, of putty-like consistency, to the cloth or other material, and its compression into the pores of the same, or into perforations made therein, so as to adhere firmly thereto, substantially as described.

142,449.—Sliding-Gage.—JOHN EATON, Atlanta, Ill. Application filed August 2, 1873.

The spring B is made adjustable to or from the holding-bar A by the screw-rod D.

Claim.—The combination of the bar A, spring-bar B C with slot *b*, nut thumb-screw D, all constructed and arranged substantially as and for the purposes herein set forth.

142,450.—Wire Fabric.—WILLIAM C. ESSEX, Newark, N. J.—Case B. Application filed June 25, 1873.

Each loop of the wire is passed through two loops of the fabric.

Claim.—A wire fabric constructed with each loop *a* passing through two loops, *b* and *d*, substantially as herein shown and described.

142,451.—Door-Knob.—HENRY H. ELWELL, South Norwalk, Conn., assignor to THE NORWALK LOCK COMPANY, same place. Application filed July 2, 1873.

Claim.—The barrel B as a base upon which to form a composition knob, when the said barrel is constructed with the flange *d* and with the screw-socket *c*, substantially as set forth.

142,452.—Air-Compressor.—HADLEY P. FAIRFIELD, Boston, Mass., assignor to JAMES W. BROOKS, trustee, same place. Application filed July 24, 1873.

The valve through which air is forced into the reservoir is raised by a cam and lever connection with the driving-shaft, and is seated by the force of a spring before the piston commences its return stroke. The piston is provided with a relief-valve.

Claim.—1. In combination with the compressor-pump and piston, a valve, *h*, positively raised by connection with the driving-shaft, substantially as described.

2. In combination with the pump-piston, a relief-valve, *i*, operating substantially as described.

142,453.—Compound for Preserving Wood.—LEVI S. FALES, Monmouth Junction, N. J. Application filed May 6, 1873.

Raw petroleum, waste acid, linseed-oil, slaked lime. The whole is put into a kettle and boiled, adding common resin, gum shellac, extract coal-tar. The articles to be saturated are then immersed in the liquid while at a temperature of about 300° Fahrenheit.

Claim.—The composition consisting of the ingredients stated, in about the proportions set forth, and for the purposes specified.

142,454.—Fertilizer-Distributer.—MATTHIAS WALLS FAUBION, Parrottsville, Tenn. Application filed December 21, 1872.

A farm-wagon utilized for fertilizing by attaching a shaft on bearings in pendent arms affixed to each side between the wheels. On this shaft there is a cylinder between and two outside the bearings. A hopper in the box supplies the cylinders with the fertilizer through hinged lids. Rotation being given to them through an endless belt from the wagon-wheels, the fertilizer passes out through longitudinal slots.

Claim.—In a fertilizer-distributer, the cylinders E E E, constructed in sections and having partitions *d* and the removable slides L, arranged for attachment to the wagon, as shown and described.

142,455.—Tire-Upsetting Machine.—ROBERT GIBBS, Spring Hill, Mo., assignor to himself and SARAH E. GIBBS, same place. Application filed April 21, 1873.

A base-plate A, having mortised side flanges on which a tire previously bent may be clamped by wedges and beaten down; also, a hooked stirrup, E, and separate clamp *f*, which, used in conjunction with the base-plate and wedge, will upset an unbent part of the tire by a draw movement.

Claim.—The base A, having flanges with slots *a a*', the key C F, key-clamps *f f'*, and the slide-bar gage E *e e*', combined and constructed substantially as and for the purpose set forth.

142,456.—Butter-Bucket.—JAMES GILBERDS and MILO HARRIS, Jamestown, N. Y. Application filed July 25, 1873.

The clamping device encircles the top or cover, and also a portion of the bucket itself. The bucket is rabbeted to receive said clamping device. Between the bucket and cover-edge and the encircling clamping device is interposed an elastic band.

Claim.—In combination with the package C, the cover B, the clamping-hoop A, and an elastic packing placed beneath said hoop to pack the joint, as described.

142,457.—Inking Apparatus.—GEORGE P. GORDON, Rahway, N. J. Application filed December 26, 1871.

The bed and the inking-roller frame reciprocate in opposite directions, whereby a greater number of inking-rollers may be used.

Claim.—In combination with the bed and roller-carriage M, constructed and arranged, to operate as described, the segmental cylinder J, having a portion of its surface cut away, as and for the purpose set forth.

142,458.—Valve-Guide.—ROSCOE J. GOULD, Newark, N. J. Application filed June 30, 1873.

Claim.—The construction of the valve-stem or the adjacent surfaces with angular ridges or knife-edges to form the guiding contact, so as to avoid the chance of retaining sand or other foreign matter, as herein specified.

142,459.—Steam-Carriage for Tram-Ways.—JOHN GRANTHAM, London, England. Application filed November 2, 1872.

Claim.—1. The arrangement of the boilers and their appurtenances in chambers at the opposite sides of the central passage-way of the carriage, so that a clear passage-way from end to end of the carriage is afforded, notwithstanding the presence of the boilers and their appurtenances within said carriage, substantially as before set forth.

2. The combination and arrangement of the coal-feeder for the boiler, the end platform of the carriage, the handle for controlling said coal-feeder, and the rod extending from said handle to the coal-feeder, whereby the engineer, while on the front platform, can control the supply of coal to the boiler in his rear within the carriage, substantially as before set forth.

142,460.—Planing-Machine.—WILLIAM H. GRAY, Boston, Mass., assignor to SOLOMON A. WOODS, same place. Application filed March 5, 1873.

The upper feed-roll boxes are lifted coincidently to maintain the parallelism of the rolls, and said boxes are connected by a rock-shaft to the counter-weights to insure uniform pressure.

Claim.—1. In combination with the presser-roll, supported by or upon independent boxes, the connecting-levers *i i*, to secure uniform pressure, substantially as described.

2. The combination of rods for guiding and supporting the upper roll-boxes with weighted levers connected by links to a rock-shaft, substantially as and for the purpose described.

3. As a means for connecting each box A and its lever *p*, the combination of the rods *m m*, jointed to the box, the bar *o*, rods *s s*, screws *v*, and yoke *r*.

142,461.—Ferrule.—CHARLES E. GERER and JOHN H. BODWELL, Newark, N. J. Application filed February 11, 1873.

This ferrule has corrugations running circumferentially, internally, and externally.

Claim.—As a new article of manufacture, a corrugated sheet-metal ferrule for paint or varnish brushes, constructed as herein shown and described.

142,462.—Thrashing-Machine.—ANDREW G. HAGENSTRÖM, Red Wing, Minn. Application filed November 22, 1872.

Elements arranged with a view to compactness. Belt-tightener also carries the fan-belt.

Claim.—1. The relative arrangement of the beater, concave, transfer-carrier, grain-sieves, and fan, when constructed to operate substantially as and for the purpose shown.

2. The pulley Q', journaled within the pivoted lever B', and, in connection with said lever, combined with the frame of the machine and with the beater and fan-belts, substantially as and for the purpose shown and described.

3. The means employed for connecting the horse-power frame-bars A'' to or with the frame of the machine, consisting of the hooked rods B'' and *b''*, the link D'', and the key E'', when the same are combined with said parts, substantially as and for the purpose specified.

142,463.—Cinder-Plate for Blast-Furnaces.—SAMUEL W. HARRIS, Albany, N. Y., assignor to THEODORE F. MINER, same place. Application filed July 24, 1873.

Claim.—1. The flanged or hollow water cinder-plate B, substantially as and for the purpose herein set forth.

2. The combination of the water-supply pipe *b* and waste-pipe *c* with the flanged or hollow water cinder-plate B, essentially as shown and described.

142,464.—Blast-Furnace for Smelting Iron and other Ores.—SAMUEL W. HARRIS, Albany, assignor to BENJAMIN RAY, Hudson, and IRA JAGGER and THEODORE F. MINER, Albany, N. Y. Application filed July 24, 1873.

Swinging doors or lids for closing the furnace automatically, whereby increased facility is afforded for charging.

Claim.—The combination, with the cover B B' of the vertically-swinging doors C C', arranged to rock on intermediate pivots or centers *e e*, and to open outwardly and inwardly in relation with the openings D D' against closing-weight applied to the upper portions of the doors, substantially as and for the purposes herein set forth.

142,465.—Smut-Mill.—JOHN HISSEY, Peoria, Ill., assignor to NICHOLS, BURR & Co., same place. Application filed March 17, 1873.

The grain is thrown against the interior of a cylinder composed of vertical rods, having spaces between them for the escape of smut, &c., which is blown into an exterior chamber by a fan or fans on the arms which carry the revolving beating-rods, whence a suction-fan draws it away, and at the same time extracting the light grain by a suction-spout.

Claim.—1. The combination of the cylinder G, plates F *m*, shaft K, arms A A, fans *q q*, rods H H arranged to operate with the fan-box N, fan O, separating or blast box P P^1 P^2 P^3 Q, air-draft R, hopper *t*, spout Z, pendent doors *f f*, frame A A B B D D D, casings S S, air-passages *s s*, as described.

142,466.—Railroad-Gate.—ALBERT HOUTS, deceased, (ELIAS HOUTS, administrator,) Salona, Pa. Application filed May 17, 1873.

The weight of the locomotive upon the jointed rails depresses them and thereby moves the right-angled weighted levers, the upright arms of which operate the sliding gates through the levers C.

Claim.—The compound lever, consisting of the vertically-vibrating weighted branch G having the upright arm *b* and the rail-rest and the horizontally-vibrating branch C, in connection with the slotted link *x*, the sliding gate B, and the rails I, pivoted together to form the rising joint Z at some distance from said gate, substantially as specified.

142,467.—Cooking-Stove.—HERBERT A. HUMMER, Frenchtown, N. J. Application filed April 12, 1873.

Claim.—1. The combination of the suspended sliding fire-box E, having the outwardly-extending flanges *d*, resting upon the ledges *n* of the stove-wall, and the slide-damper G, having the forked arm H and pivoted lever *k*, extending through the stove-wall, for regulating the opened flue F between the rear wall of the fire-box and the oven-wall, operating substantially as specified.

2. The fire-box E, having the fixed front grate *b*, with short fingers *d* and long arms *b'*, and the longitudinally-sliding bottom grate *c*, pivoted in rear, in combination with the hinged bar *s* and the lever *r*, substantially as specified.

3. The arrangement of the air-chambers *m m* at each end of a fire-box only, next to the stove-wall, and having the deflecting flanges or partitions *l* and communicating-passages, in connection with the register-openings *v* and hot-air pipes *z*, for the purpose mentioned.

4. The arrangement of the hot-air pipes *z* immediately under the ledge of the top plate of a stove, and extending around the sides and rear and thereof, and communicating with the air-chambers *m* and pipe L, for the purpose mentioned.

142,468.—Oil-Burning Boiler-Furnace.—FAIRTH HUNGERFORD, Rochester, assignor to AMOS CARLTON STEARNS, Corning, N. Y. Application filed April 8, 1873.

Two shallow pans running the entire length of the boiler, one above the other, and surrounded by water: the pans contain oil to be burned as fuel, and communicate with each other by a head outside the boiler.

Claim.—1. The combination of the pans B B' with the ports *f f'* and the water-sheet *d'* between them, arranged as herein shown and described, for the purpose specified.

2. The arrangement of the boiler A, pans B B', flues *d d'*, ports *f f'*, and head E when used in connection with the oil and water pipes *i k*, in the manner and for the purpose specified.

142,469.—Refrigerator.—FRANCIS W. HUNT, East Orange, N. J. Application filed February 5, 1873.

Claim.—A reversible rim or frame, A, for the ends of a refrigerator, open or struck up from sheet metal or cast, having suitable recesses *a* and *b* on the outside for the reception of the outer and inner linings, and also suitable projections or steps *c* and *d* on the inside for the support of the lids and ice-chamber, all substantially as and for the purposes shown and described.

142,470.—Vise.—JOSHUA HUNT, Richmond, Ind., assignor of one-half his right to JOSHUA FOULKE, same place. Application filed April 22, 1873.

The jaw F, by reversing the screw-shaft, is released so that it can be moved in or out to any extent as, ease for clamping large or small work.

Claim.—1. In a vise of the character described, the combination of the screw-threaded sleeve B, turning in a tap in the fixed jaw, shaft or stock C of the movable jaw having a toothed feather and fitted in the sleeve B, and an adjustable dog automatically operated to connect and disconnect the sleeve and stock, substantially as and for the purpose specified.

2. The arrangement of the tubular nut B, the stationary jaw A, pawl D, spring D', and stop E, whereby the movable jaw is removed from the article clamped, by the backward turning of the screw-shaft, previous to the liberation of the nut from the screw-shaft, substantially as set forth.

142,471.—Grate-Bar.—REUBEN A. HUTCHINSON, Bergen, N. J. Application filed August 4, 1873.

The supporting-bar is provided with as many wings on each side as there are sections required to fill the same. Each section has lugs on it, made to correspond with the angle of the wings on the bar to secure them to it.

Claim.—The combination of the wings *a a* on the bar, the correspondingly-formed wrings *d d* on the face-pieces, and the stops *b b*, substantially as and for the purposes herein set forth.

142,472.—Illuminating Reading.—THEODORE HYATT, New York, N. Y.—Case A. Application filed August 21, 1873.

Claim.—As a new article of manufacture a reading-plate composed of asbestus board or paper, and provided with glazed illuminating openings, substantially as and for the purpose specified.

142,473.—Illuminating Reading.—THEODORE HYATT, New York, N. Y.—Case B. Application filed August 21, 1873.

Claim.—An illuminating metal reading-plate having its lower surface covered and protected by means of asbestus board or paper, substantially as and for the purpose specified.

142,474.—Wall for Buildings.—THEODORE HYATT, New York, N. Y. Application filed August 21, 1873.

Claim.—A wall composed of plastic material, consisting of asbestus combined with earthy matter, placed upon both sides of corrugated wire-gauze, substantially as and for the purpose specified.

142,475.—Building-Block.—THEODORE HYATT, New York, N. Y., Application filed August 21, 1873.

Claim.—A building-block composed of plastic material, consisting of asbestus combined with earthy matter, formed over and within a frame of wire-gauze, or its equivalent, and either with or without central openings, substantially as and for the purpose specified.

142,476.—Fire-Proof Safe.—THEODORE HYATT, New York, N. Y. Application filed August 21, 1873.

Claim.—In a fire-proof safe, a book-case constructed from sheets of asbestus paper or board, substantially as and for the purpose specified.

142,477.—Nasal Respirator.—EDMUND W. JAMES, Philadelphia, Pa. Application filed March 8, 1873.

The respirator is formed of two parts, each one of which is inserted in one side of the nose. The two parts are held together, and also in position, by a spring-connection.

Claim.—A nasal respirator, consisting of a clip, A, constructed for attachment to the nose, substantially as described, and carrying screens B B adapted to the interior of the nostrils, as specified.

142,478.—Embroidery Attachment for Sewing-Machines.—ALBERT W. JOHNSON, New Haven, Conn. Application filed July 24, 1873.

Claim.—The combination, with the reciprocating thread-carriers, of the elastic tension-plates C, bent and slotted at their ends, and adjusted by means of a screw and thumb-nut, as and for the purpose described.

142,479.—Windmill.—MOSES J. KAUFFMAN, Arcola, Ill. Application filed April 11, 1873.

From a cross-head, which is connected with the fans of the wheel, extend rods that are connected with two levers. On the outer end of these levers are pivoted weighted governor-wings, made in two parts, to increase or diminish the surface, as may be desired.

Claim.—The arrangement, with the wings D, pivoted to the disk E by the arms *c* and socket *b*, as described, of the loops *f*, rods *e*, disk G, sleeve *d*, cross-head H, chains *i*, levers *k*, springs *m*, and governor-wings J, all substantially as and for the purposes herein set forth.

142,480.—Pen-Wiper.—JAMES H. KIDDER, Lawrence, Mass. Application filed April 16, 1873.

Brushes, opposite to and in a line with each other, are suspended upon shelves in a water-box attached to the inkstand, said box being provided with an aperture through which the pen is inserted between the brushes.

Claim.—The water-box B having the supporting-shelf B', in combination with the plates *d d* having the throat *f*, and the brush-heads D E, all constructed and arranged as herein shown, for the purpose specified.

142,481.—Compensating Spring-Balance for Safety-Valves.—VALDEMAR F. LARSON, Brooklyn, assignor to VALDEMAR FREDERIK LARSON and GEORGE FREDERIK METTER, New York, N. Y. Application filed June 5, 1873.

By the employment of the bell-crank lever and link with ordinary spring-balance for safety-valves a regular resistance is offered to the valve as it is raised from its seat, and the resilient action of the spring is not subject to variance on this movement.

Claim.—The quadrant or bell-crank lever F, connected by a link, H, with the lever D of a safety-valve, and combined with the spring-balance E, which connects with both levers D and F, substantially as and for the purpose herein shown and described.

142,482.—Blast and Cupola Furnace.—FRANKLIN LAWRENCE, Philadelphia, Pa. Application filed July 2, 1873.

A sort of damper-plate is arranged in the upper part of the stack in such a manner that it can be turned and set in any position, so as to control the exit of the gases.

Claim.—1. The disk A, arranged in a furnace, and adjustable, so as to be secured in either a horizontal or a vertical position, as specified.

2. The combination of the flanged disk A and its guided rod *f* with the arm *m* hung to the interior of the chimney, all substantially as set forth.

142,483.—Supplementary Oven for Cooking-Stoves.—CORNELIA O. LEE, Indianapolis, Ind. Application filed July 1, 1873.

Claim.—1. The stove-oven E and the attached oven C, in combination with the steam-generator H, its pipe I, and the pipes J and Q, interchangeable with the kettle-pipe I, to put steam into either oven through the medium of the attached oven, as described.

2. The combination of the valve M in the oven-door N with the attached oven C, having a surrounding flue, D, and the smoke-flue F of the stove, as and for the purpose set forth.

142,484.—Transmitter and Receiver for Automatic Telegraphs.—GEORGE LITTLE, Rutherford Park, N. J. Application filed March 5, 1872.

Circuit closer and breaker like Little's patent, 122,699. Brush and pressure-roller controlled by hinged arm. Pen in receiver attached to permanent magnet, vibrating between cores of electro-magnets. Other details in claims.

Claim.—1. The plate k connecting the binding-screw 4 with the insulated screw upon which the axis of the drum *s* or *f* turns, as set forth.

2. The roller or bar 15 upon the lever m, in combination with the lever r, incline 16, roller 6, drum c, and circuit-screw 6, substantially as for the purposes set forth.

3. The slotted lever-arm p upon the axis of the detaining-brush o connected with the lever m of the contact-roller, as and for the purposes set forth.

4. The electro-magnets u and w with the four poles 26, 27, 28, and 29, in combination with the polarized armature w, substantially as set forth, to oscillate the same by changing the polarity of the electric pulsations, as set forth.

5. The double inclined bed made of metal, and insulated at the points of connection, substantially as and for the purposes set forth.

6. A pen moved by an armature and electro-magnet, in combination with a condenser or accumulator introduced in the main line or a branch at either or both sides of the electro-magnet.

142,485.—Perforator for Automatic Telegraphs.—GEORGE LITTLE, Rutherford Park, N. J. Application filed March 5, 1873.

Depression of key closes circuit to magnet, actuating proper punches for desired character. Releasing key breaks such circuit and closes one to magnet, withdrawing punches.

Claim.—1. The lever c hinged to the keys a, in combination with the punch-slides e and mechanism for actuating the same, substantially as set forth.

2. The electro-magnet n, bar t, and pins l, in combination with the keys a, levers c, and slides e, substantially as set forth.

3. The magnet r and lever t, in combination with the slides e and punches h, for returning the punches to a normal position, as set forth.

4. In combination with punches and finger-keys, for perforating or embossing telegraphic paper, two magnets and their connections, substantially as set forth, for projecting and withdrawing the punches, substantially as set forth.

142,486.—Telegraph Apparatus.—GEORGE LITTLE, Rutherford Park, N. J. Application filed October 3, 1872.

Permanent magnet, provided with adjustable keeper, withdraws armature of electro-magnet. Condenser or coil, applied in a branch circuit to electro-magnet, to neutralize effect of induced current.

Claim.—1. The adjustable keeper k, made of soft iron, and mounted upon the support or axis l between the poles of the magnet A, in combination with the armature and electro-magnet, substantially as and for the purposes set forth.

2. A condenser or helix connected to the main line upon both sides of the electro-magnet, substantially as and for the purposes set forth.

142,487.—Car-Coupling.—HARVEY C. LOWRIE, Fort Wayne, Ind. Application filed May 2, 1873.

Suspended barbed couplers are arranged for automatic coupling by a lateral movement from the side of a lever by means of a chain.

Claim.—1. A barbed coupler-head, which is secured to a car, and arranged to couple with another head of the same form by a lateral movement, and to uncouple therefrom by a downward movement, in combination with a sustaining coupling-lever and suspending-link connection, substantially as described.

2. The combination of the pendent draft-lever and the coupler-bar with an abutting shoulder, which is connected to, or forms a portion of, the car, and is located in front of and between the upper end of the draft-lever and the point of connection with the coupling-bar, substantially as described.

3. The combination of the spring draw-head with the pendent draft-lever and the coupling-bar, substantially as described.

4. The guiding-frame with one or two vertical guiding-plates and their actuating springs, substantially as described.

5. The double-barbed couplers, having angular faces a' on the front edges and sides, substantially as described.

142,488.—Device for Thawing Ice from Water or Gas Pipes.—ORRIN R. MASON, Binghamton, N. Y. Application filed May 16, 1873.

The drum upon which the flexible pipe is wound has a hollow shaft, to which the inner end of the pipe is coupled. A revolving coupling-joint is used to attach the force-pump at the projecting end of shaft. The flexible pipe is used to introduce heated water or steam into frozen pipes.

Claim.—The combination of the flexible pipe C with the reel or drum B, having the hollow shaft b and coupling c, through which the fluid is delivered to the pipe, substantially as described.

142,489.—Lath-Belting Machine.—JAMES C. MCINTYRE, Fort Edward, N. Y. Application filed July 10, 1873.

The pressure-rolls are adjusted by a pair of treadles, to which they are connected by chains; and the lumber is prevented from being drawn back upon the saws by a series of pawls.

Claim.—1. The pressure-rollers of a belting-machine, hung in bearings in the frame thereof, and adjusted independently of each other by means of levers connected with said bearings by chains passing over pulleys, substantially as described.

2. The combination, in a belting-machine, of the pressure-rollers adjusted independently of one another, in the manner and for the purpose described, with the dogs or pawls for preventing the strips from being drawn back by the saws, substantially as set forth.

142,490.—Harvester-Rake.—JAMES B. MCMILLAN, North Vernon, Ind. Application filed January 21, 1871.

A reciprocating sweep-rake is pivoted to a vertical standard by a bent arm having a slotted projection, with which is connected a crank-arm, also pivoted on the standard, and tripped by steps on the platform, to depress and lift the rake at the beginning and end of its stroke. A connecting-rod joins the standard with a foot-lever or a crank on the main axle, for causing the rake to vibrate.

Claim.—The combination and arrangement of the rake-post C, the rake-arm E, the trip-lever F, the front trip G, and the rear trip H, and the foot-lever A, the connecting-rod B, and iron D, when used as a foot or self rake.

142,491.—Governor Cut-Off Gears.—HERMAN H. MEYER, Denver, Colorado Territory. Application filed April 9, 1873.

The eccentric-rod and valve-rod of the engine are connected with opposite ends of a vibrating beam, with which the governor is also connected, and which is hung in a frame vibrated by the action of the eccentric-rod, so that, when the governor raises or lowers its connection with said beam, the vibratory motion imparted to the valve-rod will be varied, as desired, by moving the connection nearer to, or further away from, the pivot of the beam. The weight of eccentric and valve rod is balanced by the governor, and therefore requires very little force to alter the cut-off.

Claim.—The combination of the eccentric-rod I, slide D, beam F, and slide E with the valve-rod J and governor-connection L, when the beam F, connecting with the slides D E, is hung in a vibrating frame, A B, for operation, substantially as described.

142,492.—Car-Coupling.—ALLEN MIDDLETON, Jr., Philadelphia, Pa. Application filed JANUARY 2, 1872.

When draft is applied the strain is transmitted to the spring of the draw-head on the opposite end of the car through the medium of a rod extending through both draw-heads, that the strain on the cars attendant upon the starting of the train may be avoided.

Claim.—The combination of the draft-rod J, extending from end to end of the car, with spring-boxes D and D', and draw-bars B and B', the draft-rod extending through both boxes and through their fixed and movable plates b' and b, and having at its opposite ends heads d adapted to the draw-bars, all substantially as and for the purpose specified.

142,493.—Planing-Machine.—FREDERICK B. MILES, Philadelphia, Pa., assignor to himself and OSCAR C. FERRIS, same place. Application filed August 4, 1873.

An ordinary cross-head, balanced, or nearly so, by means of ropes or chains and pulleys, to admit of being easily adjusted perpendicularly.

Claim.—1. A metal-planing machine in which a balanced or nearly balanced cross-head is adapted to guides on the frame, substantially as described.

2. The combination of the cross-head A, guided on the frames G G', the pulleys D D, and weighted ropes or chains.

142,494.—Automatically-Operating Shafts.—FREDERICK B. MILES, Philadelphia, Pa., assignor to OSCAR C. FERRIS and FREDERICK B. MILES, same place. Application filed August 4, 1873.

The feed-wheel is hung loosely on the screw-shaft carrying the arm, the handle of which is connected to both arm and wheel by a bolt having a head fitting within the annular groove in the wheel, so that when the nut is loosened the wheel can revolve, and when the nut is tight the arm and handle become part of the wheel.

Claim.—The combination of the shaft B, feed-wheel A, and its annular groove s with the arm D, handle E, and bolt G, or its equivalent.

142,495.—Planing-Machine.—JAMES MILLER, New York, N. Y., assignor of one-half his right to CORNELIUS H. DELAMATER, same place. Application filed August 4, 1873.

A stationary cross-head frame and sliding bed, said bed carrying another cross-head frame and tool, to operate in conjunction with an adjacent stationary bed.

Claim.—The combination, with a planing-machine, of the stationary work-bed D, arranged in proximity to the shears of the traveling bed, and the tool-holder L, carried by said traveling bed, substantially as and for the purpose herein set forth.

142,496.—Boat-Detaching Device.—WILLIAM F. MORGAN, New York, N. Y. Application filed May 24, 1873.

To the strap of an ordinary double-fall block is suspended a frame, to which is pivoted two double hooks, nearly in form of the letter *f*, connected at their center by a hub, within which is a coiled spring to hold them in position on the hooks. Through the frame are pivots to regulate their action while the boat is suspended, which is released upon its striking or resting upon the water.

Claim.—The combination of the hooks A A and their springs D with the guards B B, constructed and operating substantially as herein shown and described.

142,497.—Heating Air for Use in the Arts.—JAMES A. MORRELL, New York, N. Y., assignor to himself, JAMES H. WHEATLEY, L. P. WILLIAMS, and GEORGE H. BAXTER, same place. Application filed July 16, 1873.

Claim.—Heating a current of air by forcing it through a pipe or closed chamber containing diverse metals, such as are capable of inducing voltaic action, substantially in the manner set forth.

142,498.—Granulating Sugar.—JAMES A. MORRELL, New York, N. Y., assignor to himself, JAMES H. WHEATLEY, L. P. WILLIAMS, and GEORGE H. BAXTER, same place. Application filed July 16, 1873.

Claim.—The introduction into the mass of syrup undergoing granulation of an induced current or currents of electricity, such induced current not entering with a current of air, as covered by my Letters Patent of September 16, A. D. 1871.

142,499.—Medical Compound for Liniments.—MAURICE P. MUNDEE, Baltimore, Md. Application filed August 8, 1873.

Claim.—A compound consisting of laudanum, saltpetre, spirits of ammonia, crude petroleum, turpentine, spirits of camphor, and oil of cassafras mixed in substantially the proportions specified.

142,500.—Street-Lamp.—HENRY MANE, Brooklyn, N. Y. Application filed August 20, 1873.

The name-plates on the cases of street-lamps are prevented from being obscured or receiving injury from rain by a gutter, which projects over them and has discharge-pipes passing downward along the corners of the lamp-case.

Claim.—The gutter D, with descending discharge-pipes E fastened to the corners of the frame A, in combination with the name-plates H and main panes G resting against strengthening-strips F, which retain the name-plate and the pane on each side of the lamp in one and the same plane, all as herein shown and described.

142,501.—Cotton-Cultivator.—EDMUND H. NELSON, Gainesville, Ala. Application filed April 19, 1873.

A cross-bar is hinged to the frame of a cotton-chopper, and carries two shovels, one made adjustable laterally, and to which the draft-pole is attached.

Claim.—In a cotton-cultivator of the character described, the supplemental frame G linked to the forward end of the main frame and carrying a laterally-adjustable shovel, F, and a fixed shovel, E, the latter standing directly in line with the trend of the single driving-wheel B, all substantially as and for the purpose specified.

142,502.—Galvanic Battery.—ANDREW L. HOLT, New York, N. Y., assignor to himself and VICTOR BARJON, same place. Application filed June 6, 1873.

A tube, provided with a stop-cock, enters the bottom of the cell, and is connected with a force-pump for the purpose of injecting air into the cell when thought desirable. The tube may also be used for replenishing or withdrawing the fluid.

Claim.—1. In combination with the cup of a galvanic battery, a pipe communicating with the same, substantially as described, for injecting air or ozone through the liquid in the cup, for the purpose of agitating the same, as set forth.

2. The pipe D, having a branch pipe, a, and cocks or valves b c, for alternately introducing and regulating the supply of liquid into the cup of a battery, or for injecting air or ozone through the liquid, substantially as and for the purpose described.

142,503.—Fruit-Can.—MICHAEL O'CONNOR, New Brunswick, N. J. Application filed August 15, 1873.

A tin can is provided with a zinc cover to prevent oxidation at the junction of can and cover.

Claim.—In combination with the tin body of a can, the removable flanged zinc cover or top G, substantially as and for the purposes specified.

142,504.—Mode of Regulating Speed in Machinery.—LEVERETT H. OLMSTED, Brooklyn, N. Y. Application filed April 9, 1873.

The conical pulleys are actuated by the idle-pulley between them, to which motion is communicated from the treadle by a forked and slotted lever, moving in a frame in a plane transverse to the axis of the idle-pulley, to regulate the speed.

Claim.—1. The combination of the laterally-adjustable treadle L with the idle-pulley D, the power-shaft B, the tapering driving-pulley C, and the reversely taper driven pulley E, substantially as specified.

2. The combination, with the conical pulleys C E, the idle-pulley D, and the lever I, of the frame K, arranged to rock in a plane which is transverse to the axis of the idle-pulley, and to move in a direction parallel to the axis thereof, essentially as and for the purposes herein set forth.

142,505.—Cotton-Bale Tie.—WILLIAM J. ORR, Charlotte, N. C. Application filed August 15, 1873.

Claim.—A metal-strap bale-tie having the eye-piece D d set to one side of the strap A, open nearly the width of the strap in front of the face *d'*, and having the incline *d'*, in combination with the loop C, as and for the purpose described.

142,506.—Manufacture of Horseshoe-Nails.—JOHN C. PAIGE, Stoneham, Mass. Application filed July 24, 1873.

The punch and die are so constructed that a fin is left between the heads of two contiguous nails as they are punched from a plate, to secure a straight cut on the side of the nail-head.

Claim.—The improvement in punching horseshoe-nail blanks, substantially as described.

142,507.—Machine for Skiving and Feather-Edging Boot and Shoe Soles.—EDWARD P. PIERCE, Boston, Mass. Application filed April 5, 1873.

By removing the lower cutter-block the upper may be brought into play for action upon a different piece of soles, one cutter skiving or reducing without regard to the thickness of the edge left, and the other with special reference to that edge.

Claim.—In a feather-edging and skiving machine, means, substantially as described, for interchangeable attachment and operation of a cutter for gaging the thickness of skiving removed, and of another cutter for gaging the thickness of edge left upon the sole.

142,508.—Lamp-Extinguisher.—DAVID PIKE and OTIS B. GRAHAM, Bridgeport, Conn. Application filed February 8, 1873.

A metallic plate is secured upon one side of the wick-tube, against which the extinguisher closes. A friction-stud bears upon the shaft of the extinguisher to hold it in any desired position.

Claim.—1. The plate B, in combination with the cap C, substantially as shown and described.

2. The stop F, in combination with the rod E, arranged and operating substantially as shown and described.

142,509.—Top Roll for Drawing-Frames, &c.—HENRY T. POTTER, Norwich, Conn. Application filed May 15, 1873.

The leather covering is applied loosely—that is, without being glued or cemented to the roll, so that any looseness or pucker in the covering will run ahead of the point where the upper and lower rolls are in contact.

Claim.—A top drawing-roll having its leather or other soft covering fitted loosely upon it, so as to form a free soft band or ring, substantially as and for the purposes herein set forth.

142,510.—Lifting-Jack.—DELOSS PUTNAM, Stockton, assignor of one-half his right to A. C. PICKARD, Busti, N. Y. Application filed July 21, 1873.

Claim.—1. A lever and cam-catch, when combined for operation, as shown and described.

2. The combination, substantially as herein shown and described, of a lever, a cam-catch, and the notched standard, for the purposes specified.

142,511.—Machine for Tapping Nuts.—SALMON W. PUTNAM, Jr., Fitchburg, Mass. Application filed July 5, 1873.

The oil-conveyer and the overflow-pipe act as standards or guards to prevent the nut-holders for the two outer taps turning. Each tap-socket has an educt-opening over the table, with a perpendicular branch therefrom, stuffed with some porous substance, to allow the escape of a small quantity of oil to lubricate the bearings below the table.

Claim.—1. The tubes K' K', the force-pump r, the upper and lower reservoirs B C, the series of intermediate standards K, and the socketed heads I, (provided with operative mechanism, as specified,) arranged as explained, the said tubes K' K', under the arrangement, performing the functions as set forth.

2. The oil-educt *d'*, arranged and combined with the escape-passage i, so as to discharge oil upon the rest d, in manner and for the lubricating certain of the parts, as explained.

142,512.—Printer's Rule.—CONRAD REUTER, Cincinnati, Ohio. Application filed July 3, 1873.

In consequence of the adjustable cap or clamp B being held by friction only, the leads or rules A A may be shortened by cutting them at any point, and the clamp may be readjusted without further preparation.

Claim.—The combination of the adjustable clamps B B with the leads or rules A A, by which the type are secured between the leads or rules by frictional contact of the clamps, substantially as and for the purpose set forth.

142,513.—Draft-Tube for Soda-Fountains.—RICHARD B. ROGERS, Adrian, Mich. Application filed April 21, 1873.

A tapering tube has a valve seated on its upper end, the rod of which extends through and projects beyond the tube, so that, by pressing a glass against the end of the rod, the valve is raised. The flow of water is regulated as desired, by an adjustable ball or equivalent on the end of the rod.

Claim.—The tube a, valve and valve-stem, and adjustable ball, or its equivalent, when combined to operate substantially as shown and described.

142,514.—Fire-Place Grate.—JOHN S. RUNYAN, Columbus, Ohio. Application filed May 27, 1873.

Claim.—1. In combination with the grate A, the fire-place, constructed with the recess G formed in the back wall back of the grate, and the vertical recesses or flues H H, extending therefrom, terminating within the coal-space below the level of the upper front edge of the basket, substantially as set forth.

2. The combination of vertical portions D of the grate, the brackets E E, and the hearth F, substantially as and for the purpose set forth.

142,515.—Apparatus for Distilling Heavy Oils.—HENRY RYDER, Somerville, Mass. Application filed January 24, 1873.

A still consisting of a fire-chamber or furnace having sloping sides above its grate; the still extends on opposite sides of the furnace down below the fuel-chamber, or down alongside of the ash-pit.

Claim.—1. The still or oil-evaporating vessel A, provided with the deposit-receiving spaces d d, arranged with the fire-place L and ash-pit e, as described, and the fire-place inclined at its opposite sides, c d, with reference to such spaces d d, all as specified.

2. The partitions F G and the flues E C, the fire-place L, ash-

pit *c*, and the still or oil-evaporating vessel A, arranged and combined substantially as explained.

142,516.—Apparatus for Ironing and Pressing Garments.—ROBERT B. SAMSON, London, England. Application filed July 14, 1873.

Claim.—1. In combination with the swivel-frame *e* and reciprocating bar *f* carrying the smoothing-iron, the anti-friction rollers W, as and for the purpose described.

2. The employment, in connection with the presser-board and treadle, of the two sets or series of operating levers and links, arranged as described, for the purpose of securing parallelism of said presser-board in its vertical movement, as set forth.

3. In combination with the iron G, the ventilator *n*, when arranged in the manner and for the purpose substantially as described.

4. The ironing and pressing apparatus, consisting of the several parts described in the foregoing claims, when constructed and arranged to operate substantially as described and shown.

142,517.—Cotton-Press.—MICHAEL M. SCHENKEL, Batesville, Ark. Application filed June 20, 1873.

The lint-chamber, wherein the cotton is received as it comes from the gin, has a vertically-sliding gravitating cover. When the cover is brought to the limit of its downward movement a space is left under said cover that is filled with packed cotton, ready to undergo compression into the bale-form.

Claim.—1. The lint-room A having a vertically-sliding gravitating cover, B, in combination with the door and press-box, of which latter, during the pressing operation, the gravitating cover forms a part, substantially as described.

2. The combination of the windlass, ropes, and pulleys with the gravitating cover B of lint-room A, as and for the purpose specified.

3. The follower C supported at its end outside the press-box by wheeled carriages in combination with the windlass for moving the follower in a backward and the toggle-levers for moving it in a forward direction, substantially as described.

4. The bale-box composed of the fixed hinged top and bottom and hinged end pieces, the latter being fastened by metal frames on the door fitting over the lower ends of the end pieces, and the whole locked together by the hinged metal straps, as and for the purpose specified.

142,518.—Wash-Boiler.—EDWIN SCHOFIELD, Worcester, Mass. Application filed July 19, 1873.

The circulating-tube is connected to the plate carrying the valves, the whole device being attached to the false bottom by means of buttons, and can be removed.

Claim.—The combination, with a wash-boiler, A, of the false bottom C soldered to the boiler and provided with a central aperture, the detachable plate D, center tube E with cap G, cam-vas valves *d d*, and guards *f f*, all constructed and arranged substantially as and for the purposes herein set forth.

142,519.—Hemmer for Sewing-Machines.—LOUIS SCHULTZ, College Point, N. Y. Application filed July 9, 1873.

The oblique ledge and bar act to crowd the material into the scroll, and the edge of the slotted plate is bent down between the scroll and ledge to bear on and smooth the hem.

Claim.—The slotted plate B, having the scroll C and its edge turned at K, in combination with the adjustable stock E, with oblique ledge H and bar I, with free end J parallel with the ledge, all constructed and operating as described.

142,520.—Decorative Lantern.—CHARLES C. E. SCHWARTZ, Philadelphia, Pa., assignor of one-half his right to CHARLES BOHM, same place. Application filed July 18, 1873.

A lantern, for use at decorations, has a body with an open top, and has in its bottom an opening, into which fits a tray containing the combustible material. Both the tray and the fuel-cake are furnished with wire-handles to lower them into the body.

Claim.—1. The body A, formed of transparent or semi-transparent material, in combination with the bottom B with the opening C, and with the tray or holder D suspended from said bottom, substantially as and for the purpose set forth.

2. The conical tray D and conical cake E, in combination with the body A, substantially as and for the purpose set forth.

142,521.—Regulating-Cock.—CHARLES E. SEAL, Winchester, Va., and EDWIN F. BROOKS, Baltimore, Md. Application filed June 20, 1873.

A waste-valve is held against the lower side of the chamber by a spring. When the plug is pressed down to close the cock it forces the waste-valve open and allows the water in the lower part of the chamber to escape.

Claim.—The combination, with an upwardly spring-pressed waste-valve, K, and a downwardly spring-pressed main valve, G, the latter opening the former on its downward movement, of the sliding stem F, connection M, and lever N, arranged and applied as and for the purpose described.

142,522.—Hanging Gate.—ELI SECOR, Niles, Mich. Application filed June 17, 1873.

An adjustable bifurcated block, carrying at its lower end a large friction-roller, is arranged astride the upper bars of the gate, and is adjusted vertically by means of a pin passing through it and into or beneath one of the bars of the gate.

Claim.—The adjustable bifurcated block A, in combination with the friction-roller B and spiral inclined plane C, substantially and for the purposes hereinbefore set forth.

142,523.—Washing-Machine.—JOHN Q. A. SMITH, Lee's Summit, Mo. Application filed April 9, 1872.

In a suitable vessel is arranged a rank of ribs, behind which are curved metallic plates acting as valves, against which a swinging beater operates through the medium of arms and levers.

Claim.—The combination of the stationary socks *d d*, forming angular receptacles, the hinged and curved metallic plates or valves D D placed in said receptacles, and the rocking beater E *f e'*, all constructed and operated substantially as set forth.

142,524.—Suppository-Mold.—PETER I. STEINER, Cleveland, Ohio, assignor to DANIEL MYERS, same place. Application filed June 18, 1873.

Claim.—1. In combination with the hinged jaws A and A', provided with the slots C and C', the bolt D, provided with the nut *d*, pivoted within the slot C, and capable of engagement with the jaw A', substantially as and for the purpose specified.

2. The cut-off cap E, constructed as shown, provided with the filling openings *e* and the semicircular recess *f*, and combined with the hinged jaws A and A' and screw F, when the several parts are constructed substantially as and for the purpose shown.

142,525.—Apparatus for Carbureting and Regulating the Pressure of Gas.—THEODORE G. STRINGER, New York, N. Y. Application filed August 28, 1873.

Hydrocarbon gas passes from the retort-pipe into a valve-chamber under pressure, and, escaping downward in a pipe leading to a gasometer, induces a flow of gas from the city mains through a second pipe connected with the same valve-chamber. Pivoted to the top of the retort is a lever, long enough to be struck by the rising gasometer, having its short end bent so as to catch under a weighted lever, also pivoted to the retort, and connected by a rod with a cock in the gas-pipe, which supplies the heating-flame. The rise of the gasometer carries up the lever, gradually decreasing the heating-flame.

Claim.—1. The process described of inducing the flow of gas from the city mains into a holder, and regulating the pressure thereof by the escape of hydrocarbon vapor under pressure, said hydrocarbon mingling with the gas and increasing its illuminating power, substantially as specified.

2. The combination of the gas-pipe 6 with a suction-chamber, *g*, and a retort or coil in which the hydrocarbon fluid is vaporized, substantially as described.

3. The valve 9, provided with the opening 1 for the passage of the vapor, and arranged to cut off the gas and vapor simultaneously, substantially as specified.

4. The T-valve 9, having ribs or flanges upon its under side, in combination with the springs *j* and set-screws *k*, substantially as shown.

5. The combination of the valve 9, connecting-rod *m*, crank *n*, lever *o*, rock-shaft 4, and spring 5, when arranged to operate substantially as specified.

6. The manner described of regulating the movement of the rock-shaft by attaching an air-piston to it, substantially as shown and described.

7. The rotary valve 8, having the openings 9 1' for the passage of both vapor and gas, and held to its seat by a set-screw, substantially as shown.

8. In combination with the gasometer and weighted lever *o*, a device, 7, for stopping the descent of the gasometer in case the light should become extinguished, substantially as described.

9. The combination of the jacket *a*, retort or coil, weighted lever *c*, and connecting-rod *d* for operating the cock *e*, all substantially as set forth.

10. The valve 8, having both ends solid and a chamber in its center, and a small opening for the vapor, an elongated opening for the gas, and a circular discharge for both the vapor and gas, substantially as specified.

142,526.—Blind-Slat Fastener.—THEODORE G. STRINGER, New York, N. Y. Application filed August 29, 1873.

A metal rod is rigidly fixed upon the lower end of the upright rod, which turns the slats. The lower end of this metal rod is bent, and works in a curved slot, in which it is secured in any desired position by a clamp, thus holding the slats at any desired angle.

Claim.—The combination, with the blind-frame and blinds A B C, of the rod D with its lower end bent at right angles, the slotted plate G, and the pivoted cam-lever *e*, all substantially as and for the purposes set forth.

142,527.—Cotton-Bale Tie.—HENRY D. STARR, Texas, Tex. Application filed July 26, 1873.

Claim.—A pair of tie-plates, each consisting of a catch-bar, *d*, and a strap-bar, *c*, connected at their ends by side bars *g* surrounding a slot, *b*, and having extending from the catch-bar, on opposite sides, a tongue or hook, *a*, adapted to engage with the catch-bar of the opposite plate, forming a double lock, as shown and described.

142,528.—Cement-Lined Pipe.—MELVIN STEPHENS, Brooklyn, N. Y. Application filed July 24, 1873.

Metallic socket or branch connection fastened to a cement-lined pipe in peculiar way, and then lined with cement.

Claim.—1. The metallic socket attached to the sheet-metal tube of a cement-lined pipe, and combined with the tapering or cone-shaped end of the tube that enters the recessed end of the next tube, and around which the packing is embedded within the socket, substantially as set forth.

2. The conical or tapering thimble *l*, with its flange inside of and connected with the sheet-metal tube, and lined with cement, as set forth, for forming the connection to the branch pipe, as specified.

142,529.—Permutation-Lock.—ENOCH STOCKWELL, Stamford, Conn. Application filed November 16, 1872.

The arbor upon which the dial-tumblers are mounted is adjustable by means of the knob-spindle, so that, by pressing the knob inward, the inner wheels of the tumblers will be disconnected from the outer rings, when the combination may be changed or set as desired. After this, by drawing the knob outward, the wheels and rings will be again connected, and at the same time a latch is made to engage in a notch in the arbor for the purpose of holding it in position.

Claim.—1. In a permutation-lock, an arbor carrying the permutation-wheels, and adjustable by means of the spindle in changing the combination, substantially as described.

2. The combination of the adjustable arbor, carrying the permutation-wheels, a spring-latch for retaining it in position, and means for releasing said catch, substantially as described.

3. The combination of the inner permutation-wheels, outer rings, and inner and outer furrings, with an adjustable arbor carrying the inner wheels, and with a spring-latch and means for holding said latch and the outer rings and furrings in position while changing the combination, substantially as set forth.

4. The combination of the revolving bolt, carrying the fence-lever, with the arbor, adjustable by means of the spindle, and with the permutation-wheels, all arranged and operating substantially as described.

5. The combination of the spindle, arbor, spring-latch, permutation-wheels, revolving bolt, and fence-lever, and a case provided with an interior curb and external stump or boss adapted for the attachment and adjustment of the dial-disk and sleeve, the arbor being adjustable by means of the spindle, and all the parts arranged and operating substantially as specified.

6. In a permutation-lock, the stump on which the sleeve of the dial-ring screws and the threaded spindle on which the dial is screwed, having a proportionate number of threads to the inch thereon and provided with key-seats, substantially as and for the purpose described.

7. In a permutation-lock, the zero-mark on the dial-ring, adjusted to coincide with the gatings of the lock-tumblers, when said tumblers are set in accordance with the combination, by means of the arranging of the key-seats in the stump and dial-sleeve to receive the key *m*, substantially as described.

142,530.—Gudgeon or Bearing for Ore-Washers.—SAMUEL THOMAS, Catasauqua, assignor to JAMES W. MICKLEY, Hokendauqua, Pa. Application filed July 31, 1873.

The gudgeon is made in two parts, each provided with a flange. One part forms a band surrounding the end of the wooden shaft, and the other constitutes the journal. The two are united by bolts passing through the flanges.

Claim.—The journal or bearing C and cap or band B, in combination with the shaft A, substantially as shown and described.

142,531.—Carriage.—GEORGE K. TICHENOR, Wayland, N. Y. Application filed May 13, 1873.

The springs are supported on the shafts, and the head-block and reach are dispensed with.

Claim.—1. The combination of the carriage-body E, spring D, links *b b*, fifth-wheel *d*, and the shafts C C, as and for the purposes specified.

2. The combination of the carriage-body E, springs H H, bar *f*, links *b' b'*, braces A A, and hind axle A', all substantially as and for the purposes herein set forth.

142,532.—Hair-Wash.—ROBERT TRAVIS, Elkton, Ky., assignor of one-half of his right to JESSE RUSSELL, same place. Application filed March 25, 1873.

Claim.—As a wash for the human hair, a mixture composed of rain-water, sal-soda, hickory ashes, whisky, unslaked lime, and cooking-soda, in the proportions as herein described.

142,533.—Corpse-Cooler.—FREDERICK N. TROLL, Baltimore, Md. Application filed June 25, 1873.

The casket is lined with rubber, and a tube extends from the body-receptacle through the casket for exhausting the air.

Claim.—1. A body-receptacle, D, provided with the rubber pipe *d*, tube *d'*, and stopper *d''*, extending through the casket A, so that the air may be exhausted, in the manner described.

2. The casket A and cover B, lined on the inside with rubber to exclude the air, in the manner set forth.

142,534.—Steam-Generator.—WILLIAM P. TROWBRIDGE, New Haven, Conn. Application filed March 26, 1873.

A pipe filled with liquid is coiled through a furnace, conducted to and coiled through the boiler. The two ends of the pipe are joined in a pump which circulates the liquid.

Claim.—In an apparatus for generating steam or evaporating, consisting of a coil or succession of connected pipes, or a chamber, arranged so that heat may be applied thereto, the said coil or chamber in connection with a second coil or succession of pipes leading from the upper portion of the first and returning into the lower portion of the first, a pump, E, in connection with or between the said heating-chamber or coil and the second coil, whereby a forced circulation of the liquid from the first chamber through a circuit embracing the second coil is maintained through both, and not dependent upon the evaporation in the first or condensation in the second, substantially as and for the purpose described.

142,535.—Washing-Machine.—GEORGE S. WALKER, Erie, Pa. Application filed May 31, 1873.

A pair of wooden rollers with grooves, in which are placed elastic rings, alternating with the wooden grooves, operating with an upper corrugated roller in a suitable metallic frame, having a bed-piece with screw-bolt and other means of fastening to a tub.

Claim.—1. The rollers B B, of wood, with circumferential grooves, into which are placed projecting elastic rings *b b*, forming alternate elastic projections and wooden grooves, the elastic rings of one roller lying in the wooden grooves of the other roller, in combination with the corrugated roller A, all substantially as set forth.

2. The metallic bed-piece D with notched flanges N N, as and for the purposes set forth.

3. The combination of the bed-piece D with points G G, the screw-bolt L with point H, nut M, and thumb-screw K, and the castings I J with countersunk holes, all substantially as and for the purposes set forth.

4. The within-described washing-machine, consisting of the metallic frame D C C, the corrugated roller A, springs F F, and the rollers B B with elastic rings *b b*, all the parts constructed, arranged, and operating substantially as herein set forth.

142,536.—Combined High and Low Water Indicator.—GEORGE WALTON, Cincinnati, Ohio, assignor to POST & CO., same place. Application filed June 26, 1873.

A weighted lever, operated by two yoked floats, is fulcrumed between two escape-valves, one of which is arranged to permit the escape of steam when the water is below the water-line, and the other in the event of the water being above it. Said lever passes through the slotted or stirruped ends of the valve-rods, and operates the valves connected therewith by the rising or falling of the floats.

Claim.—1. In combination with the lever B, the valve-rods A *l m'*, provided with adjustable slotted or stirrup ends *m*, substantially as and for the purposes set forth and described.

2. In combination with the lever B and floats F, the slotted and adjustable hinged yoke D, substantially as set forth and shown.

3. The floats F provided with screw ends by which they may be suitably adjusted, in combination with the slotted hinged yoke D and lever B, substantially as and for the purposes described.

4. The lever B, fulcrum *b*, slotted alarm-valve rods A *l*, stop piece *a*, adjustable weight C, hinged and slotted yoke D, and adjustable floats F, all arranged, constructed, and combined substantially as and for the purposes set forth.

142,537.—Bee-Hive.—NATHANIEL W. WALTON and JAMES L. CUNNINGHAM, Pennsborough, W. Va.; said WALTON assignor to said CUNNINGHAM. Application filed JANUARY 20, 1873.

A bee-hive having the upper bars of comb-frames in two pieces, the top piece pivoted to raised ends upon the lower, and an adjustable and detachable moth-drawer provided with a sliding metal cover, the front end of said drawer projecting to form an alighting-platform for the bees.

Claim.—1. The adjustable and detachable moth-trap composed of the receptacle A', with the alighting-platform *a*' for the bees, and of the sliding or adjustable cover *a*', substantially as shown and described, and for the purpose set forth.

2. In combination with a comb-frame, the pivoted cap *c*, substantially as shown and described, and for the purpose specified.

142,538.—Manufacture of Boots and Shoes.—PRESTON WARE, Jr., Boston, Mass. Application filed May 10, 1873.

Claim.—A boot or shoe having the flat sole *b* produced by means of a last corresponding in shape to that assumed by the foot when a portion of the body rests thereon, as herein shown and described, for the purpose specified.

142,539.—Last for Boots and Shoes.—PRESTON WARE, Jr., Boston, Mass. Application filed May 23, 1873.

Claim.—A last for boots and shoes made with a flat sole, *a*, and corresponding in shape to the shape of the human foot, which the same assumes when a portion of the body rests thereon, as shown and described, for the purpose specified.

142,540.—Air-Cushion for Doors.—JEROME W. WETMORE, Erie, Pa. Application filed January 6, 1873.

An air-cushion or brake to prevent the slamming of doors is formed by attaching a valve-piston to the door and a suitable cylinder to some portion of the casing.

Claim.—The air-cylinder C and piston D, attached one to the door or gate and the other to the casing, to form an air-brake, all constructed, arranged, and operating substantially as and for the purpose set forth.

142,541.—Apparatus for Printing on Solid or Inflexible Surfaces.—AMÉDÉE WILBAUX, Paris, France. Application filed March 10, 1873.

A swinging frame or platen operates, with a sheet of caoutchouc, with a stationary frame and a system of pipes which exhaust the air, by their connection with a vacuum-chamber, upon any type or pattern. The sheet of caoutchouc receives and transfers the impression from the type to glass, metal, porcelain, &c.

Claim.—The movable frame E, with its attached yielding sheet or covering W hung by a cross joint or hinge, K, to a vertical pivot, in combination with the stationary frames B B', the three-way cock T, and pipes for alternating the pressure of the atmosphere to opposite ends of the table, essentially as herein described.

142,542.—Weather-Guard for Doors.—CLARK A. WOOD, Kentland, Ind. Application filed July 21, 1873.

A sheet-metal trough affixed to the lower front edge of a door for collecting and conveying away drip, said trough being provided with a perforated guard of wood to prevent the wind blowing the water out of the receptacle.

Claim.—The weather-strip composed of a gutter, A C, and perforated guard B b, substantially as and for the purpose specified.

142,543.—Ruffler for Sewing-Machines.—CHARLES M. WOOLWORTH, Ottumwa, Iowa. Application filed June 4, 1873.

The lower end of the elbow-lever is connected with the slide; an adjustable arm with a pointer is secured to the elbow-lever, and the lever or link connected with the gate strikes projections on the elbow-lever and arm and moves the ruffler-blade. The guides retain the gate steadily in position.

Claim.—The combination, with the guides C C, of the gate D, lever E, elbow-lever G, arm A, slide I, ruffling-arm J, and spring K, all constructed and arranged to operate substantially as and for the purposes herein set forth.

142,544.—Mode of Operating Sewing-Machines.—EDMUND WRIGHT, Chicago, Ill. Application filed July 23, 1873.

Claim.—1. The combination of the treadles H, the cord K, the pulleys L and L, and the journaled friction clutches E, G, and F, with the driving-wheel D, provided within its hub with the grooves *d*, substantially as and for the purpose specified.

2. In combination with the grooved hub or pulley *d* of the driving-wheel D, the journaled disks E, provided with the pivoted pawls F, which fit into the grooves of said pulley *d*, and are held in engagement therewith by means of the springs G, substantially as and for the purpose shown.

3. The relative arrangement of the driving-wheel D, cord K, pulleys L, and treadles H, substantially as and for the purpose set forth.

4. The brake M N, constructed as shown, and combined with the driving-wheel D, in the manner and for the purpose described.

5. A sewing-machine brake operated by means of a sidewise movement of one of the treadles, substantially as and for the purpose specified.

142,545.—Carburetor.—JAMES F. LOCKWOOD and GEORGE E. LOCKWOOD, Taylorville, Ill. Application filed June 3, 1873.

The regulator is placed over the perpendicular end of the air-pipe, and is so constructed that it will not entirely close the mouth of it. In case of too great a flow of gas or air it rises and moderates its pressure. The hood attachment to the inside cylinder extends obliquely downward and outward, causing the gas or air to pass through the hydrocarbon fluid.

Claim.—In a gas generator or carburetor, the governor or regulator *a*, provided with the apertures *c*, in combination, with cylinder B, having attachment *b* relatively arranged within the filled casing, as shown and described.

142,546.—Paper File and Binder.—LAWSON P. KEECH, Brooklyn, N. Y., assignor to JAMES PHELAN, same place. Application filed February 1, 1873.

Claim.—1. The hinge-bars *d*, united by the hinge plates *g* to the covers *a b*, and applied at the top, bottom, and back of the paper-file, as and for the purposes set forth.

2. The strips *m*, perforated with holes for the binding-cord, and coated near one edge with adhesive material for attaching the letters or papers, as set forth.

REISSUE PATENTS.

5,558.—Shade-Fixture.—STEWART HARTSHORN, New York, N. Y. Patent No. 68,502, dated September 3, 1867. Application filed March 20, 1873.

The pawl or detent and ratchet or notched hub are arranged upon the roller and journal thereof.

Claim.—In a shade-roller, provided with a spring for rolling up the curtain, and having a pawl or detent and ratchet or notched hub, constructed and operating substantially as described, for holding the shade in any position or at any height, the arrangement of each pawl or detent and ratchet or notched hub upon and to the roller, instead of attaching one of such parts to the bracket, or to a part separate from the roller, substantially as and for the purposes set forth.

5,560.—Sash-Holder.—ROBERT B. HUGUNIN, New York, N. Y. Patent No. 137,692, dated April 8, 1873. Application filed July 14, 1873.

A balance friction-lever works inside the roller-arm upon a pivoted bearing. This friction-lever bears upon the rubber only when the weight of the sash rests upon it, leaving the sash free to be elevated.

Claim.—1. In combination with a sash-holder having a roller and an arm operated by a spring, a double-arm balance-clamp, C C', substantially as set forth.

2. The combination of a roller and arm operated by a spring with the double-armed balance-clamp C C', being an independent piece working on a bearing in the rear of the roller, substantially as and for the purposes specified.

3. The projecting end K of arm B, in combination with the projection L on plate A, substantially as and for the purposes specified.

4. The combination of spring G, pin F, and spring-holding projection H on plate A, substantially as and for the purposes specified.

5. The combination of a projection, I, on plate A with a projection, I'', and a bearing, M, on arm B, substantially as and for the purposes specified.

5,559.—Body-Bolsters for Railroad-Cars.—ARMOUR WARD, Altoona, Pa. Patent No. 24,512, dated June 21, 1859; extended seven years. Application filed July 2, 1873.

The body-bolster is constructed on the truss principle. The bearing-plates have concentric flanges, which support the weight of the car. The outside upper flange turns within the two outer flanges of the lower plate. The space between the lower flanges forms an oil-receptacle.

Claim.—1. In body-bolsters for railroad-cars, the combination and arrangement of the trusses F, center plate D, sills G, and tension rod or rods I, as described, and for the purposes set forth.

2. The combination of the bearing-plate B, having the flanges *d b*, which form an oil-receptacle between them, with the bearing-plate D, having the flange *d'*, all substantially as and for the purpose set forth.

5,561.—Machine for Channeling Soles of Boots and Shoes.—MARTIN WESSON, Springfield, Mass., assignor to GORDON MCKAY, trustee of THE MCKAY SEWING-MACHINE ASSOCIATION. Patent No. 24,162, dated May 24, 1859; reissue No. 1,586, dated December 1, 1863; extended seven years. Application filed August 26, 1873.

Claim.—1. The combination of one or more feed-rolls, E F, knife or knives *b b'*, and guide R, or its mechanical equivalent, when operating substantially in the manner and for the purpose herein set forth.

2. The combination of lever L, sliding piece *h h'*, and knives *b b'*, when arranged and operating as described, and forming a knife-holding arrangement for the purpose specified.

3. The mode of determining the action of the cutter or cutters in machine channeling or edging the soles of boots and shoes, consisting in the employment of the perimeter of the sole-edge as a pattern.

5,562.—Non-Conducting Tablets, Platforms, or Mats.—HENRY L. PALMER, New York, N. Y., assignor of one-half interest to CHARLES C. SHILTON, same place. Patent No. 141,312, dated August 12, 1873. Application filed August 29, 1873.

A tablet or mat composed of layers of veneers and a sheet of metal on top surrounded and attached to a molding or border of wood, all glued or otherwise put together.

Claim.—1. As a new article of manufacture, a tablet, platform, or mat composed of a body made of thin sheets of wood or veneers, and of a sheet of metal secured thereto.

2. In a tablet, platform, or mat, a body composed of veneers or thin sheets of wood and a sheet of metal placed thereon, with its edge turned under the same to secure the body and sheet of metal together.

3. In a tablet, platform, or mat, a body composed of veneers or thin sheets of wood, glued or otherwise secured to each other, and a sheet of metal placed thereon, surrounded by and attached to a bead, border, or molding of wood, substantially in the manner shown.

4. In a tablet, platform, or mat, a body of wood covered by a sheet of metal, and cut out in the center under the sheet of metal, whereby an air-space is created between the metal and the resting-place of the tablet, platform, or mat.

5,563.—Tourmure.—AMOS W. THOMAS, Philadelphia, Pa. Patent No. 114,634, dated May 9, 1871; reissue No. 4,903, dated May 14, 1872. Application filed June 20, 1873.

Claim.—1. A bustle standard or support constructed with a base to rest against the person of the wearer, and with an outer extremity or brace arranged to sustain superincumbent weight exerted in the direction of its length without yielding in said direction, and at the same time capable of yielding to lateral or outward impact or pressure, substantially as described.

2. A series of braces, two or more, for sustaining superincumbent weight on a bustle, exerted in the direction of their length, each of which affords support to the bow to which it is attached, without direct connection of said braces with the waistband or other bows, substantially as described.

3. A series of braces, two or more, for sustaining superincumbent weight upon a bustle, arranged so that the bows, or waistband and bows, are kept at a proper relative distance apart, no one of said braces being connected at its outer extremity with more than a single bow, substantially as described.

4. A bustle standard or support for sustaining superincumbent weight exerted in the direction of its length, having its base resting upon or supported by the person of the wearer while its outer extremity is crossed by and secured to a bow, substantially as described.

5. A bustle standard or support for sustaining superincumbent weight exerted in the direction of its length, without yielding in said direction, having a base which rests against the person of the wearer, an outer extremity secured to the bow or bows, and a support proceeding from said base to the waistband, substantially as described.

6. A bustle standard or support for sustaining superincumbent weight, exerted in the direction of its length, having a base which rests against the person of the wearer, an outer extremity secured to the bow or bows, and a brace for keeping said base a fixed distance from the waistband, substantially as described.

7. A series of bustle-braces, two or more, forming a support for sustaining superincumbent weight, without yielding, in the direction of their length, said braces being made flaring, or so arranged relatively that, while their outer extremities are separated by the distance between the points to which said outer extremities are respectively attached, their opposite or inner extremities are in substantially the same plane, or are secured to a common base.

8. A bustle-standard for supporting the bows beneath superincumbent weight, having braces formed of single lengths or pieces of wire bent at or near their middle part, and having their ends secured by suitable means to the bows of a bustle, or to the waistband and a bow, substantially as described.

9. A bustle standard or support for the bows, having a series of braces, two or more, the extremity of each of which is attached substantially as described, and which are united where they come together.

10. A bustle support or brace for sustaining superincumbent weight, exerted in the direction of its length without yielding in such direction, having a base which rests against the person of the wearer, its outer extremity being secured to the bow, so constructed and arranged that when it or the bow to which its said outer extremity is attached is compressed inwardly or toward the person of the wearer, said brace will assume a more nearly vertical position than when sprung.

11. In a bustle, the upper bow or bows of which are supported by a standard whose base rests against the person of the wearer, substantially as described, the employment of an auxiliary bow, suspended by means of hangers or equivalents.

12. A bustle standard or support for sustaining superincumbent weight, composed of two or more braces, capable of yielding to outward impact or pressure to the same, and at the same time having a tendency to spring or return to their normal position when released from such pressure.

INDEX OF INVENTIONS PATENTED SEPTEMBER 2, 1873.

	Class No.	Whole No.
Air compressor, H. P. Fairfield	13	142,420
Auger handle, F. B. Peace	99	142,410
Axle and thimble skein for vehicles, A. Kesenberger	31	142,344
Axle, wagon, G. A. Bolser	31	142,360
Bale tie, cotton, W. J. Orr	7	142,505

Flower, artificial, C. A. Schaller	54	142,353
Furnace, air heating, J. M. Wilson	154	142,363
Furnace, blast and cupola, F. Lawrence	85	142,468
Furnace, oil burning boiler, F. Hungerford	149	142,402
Furnace for smelting iron and other ores, blast, S. W. Harris	85	142,464
Furnaces, cinder plate for blast, S. W. Harris	149	142,463
Gage, sliding, J. Eaton	99	142,440
Garments, apparatus for ironing and pressing, R. B. Sanson	29	142,516
Gas, purification of illuminating, W. H. St. John	68	142,382
Gas tar, apparatus for burning, A. Smith	149	142,367
Gate, hanging, E. Secor	98	142,529
Generator, steam, W. P. Trowbridge	148	142,534
Governor cut-off gear, H. H. Meyer	69	142,491
Grate bar, R. A. Hutchinson	149	142,471
Hair wash, E. Travis	35	142,538
Harness maker's clamp, D. Higbee	72	142,394
Harness saddle, check hook for, A. V. Sargeant	72	142,415
Harvester, binder's attachment for, J. H. Garnhart	74	142,331
Harvester cutter, W. B. Sheldon	74	142,417
Harvester rake, J. B. McMillan	74	142,400
Harvester reel, C. F. Goddard	74	142,389
Heater and blower, W. M. Jackson	19	142,397
Heating air for use in the arts, J. A. Morrell	154	142,477
Hinge, spring, W. Hear	94	142,396
Horseshoe nails, manufacture of, J. C. Paige	69	142,506
Horseshoe nails, machine for finishing, R. Ross	69	142,535
Horseshoe nails, machine for making, A. H. Caryl	69	142,427
Hose coupling, G. S. Goble	61	142,333
Indicator, combined high and low water, G. Walton	146	142,330
Inking apparatus, G. P. Gordon	117	142,427
Irrigation, subterranean, W. H. Pugh	68	142,413
Jack, lifting, D. Putnam	78	142,510
Joiner, universal, R. Passé	173	142,348
Journals to feed rollers, attaching, G. M. Amsden	57	142,364
Knitting machines, set up device for, H. L. Arnold	69	142,369
Knob, door, H. H. Elwell	88	142,451
Ladder, fire escape, W. W. Parsons	30	142,499
Ladder, firemen's, P. Porter	30	142,349
Lamp, Blaisdell and Young	90	142,372
Lamp, J. C. Wharton	90	142,425
Lamp extinguisher, Pike and Graham	90	142,508
Lamp, street, H. Hahn	90	142,392
Lantern, decorative, C. C. E. Schwartz	90	142,520
Lath belting machine, J. C. McIntyre	174	142,489
Lead to collect the dust, manufacture of white, M. Tolle	85	142,470
Leaven squeezer, E. M. Samuels	98	142,414
Leak, F. Gerrie	83	142,335
Lock, permutation, E. Stockwell	98	142,530
Loom shuttle, J. Brown	85	142,373
Loom stopping mechanism, L. J. Knowles	96	142,401
Lozenge, facemask, J. C. Craft	69	142,369
Lubricator, steam, R. A. Filkins	87	142,385
Lumber, preserving and drying, J. Oliver	35	142,347
Map, dissected, C. J. Higgins	146	142,338
Mechanical movement, J. Armstrong	67	142,365
Medical compound, M. P. Munder	98	142,404
Medical compound, S. E. Paddock	98	142,408
Metal working machine, compound, G. L. Jones	69	142,398
Meter for measuring liquids, gases, &c., J. J. Greenough	149	142,336
Mill, sawk J. Hinsey	57	142,445
Mop head, J. Davis	28	142,380
Nasal respirator, B. W. James	156	142,477
Nozzle for drawing liquor, cut off, F. C. Edwards	1	142,382
Nuts, machine for tapping, S. W. Putnam, Jr.	14	142,511
Oils, apparatus for distilling heavy, H. Ryder	47	142,515
Ore washers, gudgeon or bearing for, S. Thomas	3	142,536
Organ, reed, W. J. Kent	108	142,399
Paddle wheel, L. Atkins	139	142,368

	Class No.	Whole No.
Pavement, concrete, G. W. Dean	110	142,444
Pen wiper, J. H. Kidder	146	142,459
Piano trunk, C. A. French	91	142,389
Picture and card exhibitor, B. F. Bostian	84	142,370
Pipe, cement lined, M. Stephens	20	142,526
Pipe, manufacture of, G. L. Regan	167	142,449
Pipes, device for thawing ice from water or gas, O. E. Mason	167	142,458
Planing machine, W. H. Gray	173	142,466
Planing machine, F. B. Miles	160	142,482
Planing machine, J. Miller	160	142,485
Planter, cotton, O. L. Slater	133	142,395
Pocket books, clasp for, J. F. Dubber	149	142,447
Press, cotton, M. M. Scherer	7	142,517
Press, fruit and lard, W. H. Davis	19	142,389
Printer's rule, C. Reuter	117	142,513
Printing on solid or inflexible surfaces, apparatus for, A. Wilbanx	117	142,541
Projectile, J. C. Hope	166	142,394
Pump and condenser, steam air, S. Gibbons	12	142,332
Pumps, strainer for ships' bilge, S. J. Chapman	116	142,490
Punching machine, J. M. Laughlin	119	142,469
Punching, manufacturing of dies for, R. J. Mutlin	60	142,497
Quilting frame, G. Phillips	30	142,511
Railroad gate, E. Houte	190	142,466
Railroad rail chair, L. B. Tyng	190	142,399
Refrigerator, F. W. Hunt	50	142,469
Regulator, heat, H. Boyle	154	142,371
Rivet setting machine, M. D. Brooks	14	142,484
Roofing, illuminating, T. Hyatt	198	142,475
Roofing, illuminating, T. Hyatt	198	142,478
Rolling round tapered bars, machine for, C. F. Brown	125	142,373
Rudder for vessels, J. B. Bogtion	137	142,307
Rod iron, shield for, J. Gleason	91	142,334
Safe, fire proof, T. Hyatt	198	142,476
Salt, &c., steam superheater for evaporating, L. R. Cornell	192	142,440
Sash fastener, G. W. Bishop	94	142,421
Seah holder, R. B. Hagunin, (reissue)	94	5,509
Saw teeth gage, C. E. Grandy	131	142,330
Sewing clapboards, machine for, H. A. Holmes	130	142,339
Sewing machine, cavell, E. A. Walker	130	142,301
Sewing machine, C. S. Cushman	134	142,448
Sewing machine hemmer, L. Schultz	134	142,519
Sewing machine needle threader, C. T. Beardsley	134	142,430
Sewing machine ruffler, C. M. Woolworth	134	142,543
Sewing machines, embroidery attachment for, A. W. Johnson	134	142,478
Sewing machines, mode of operating, E. Wright	134	142,544
Sewing machines, movable cloth plate for, E. L. Leach	134	142,464
Shade fixture, S. Hartshorn, (reissue)	99	5,508
Shafts, automatically operating, F. B. Miles	67	142,484
Ships and tanks, joint for iron, D. E. Merrick	119	142,486
Shuttle box mechanism, G. Crompton	95	142,441
Soda fountains, draft tube for, R. B. Robbins	1	142,513
Speed in machinery, regulating, L. H. Olmsted	67	142,504
Stove, cooking, H. A. Hammar	154	142,457
Stoves, supplementary oven for cooking, C. O. Line	154	142,463
Sugar, granulating, J. A. Merrell	135	142,466
Superheatery mold, P. L. Spencer	156	142,564
Table, platform, or mat, non-conducting, H. L. Palmer, (reissue)	86	5,502
Telegraph apparatus, G. Little	158	142,466
Telegraphs, perforator for automatic, G. Little	156	142,465
Telegraphs, transmitter and receiver for automatic, G. Little	156	142,464
Threshing machine, A. G. Hagerstrom	159	142,468
Tire upsetting machine, R. Gibbs	69	142,455
Tweezers, A. W. Thomas, (reissue)	69	5,503
Trap, animal, J. M. Wilkinson	142	142,302
Trap, steam, J. H. Blessing	156	142,303
Truss, J. F. Groves	156	142,337
Valve guide, R. J. Gould	138	142,459
Velvet, compensating spring balance for safety, V. F. Lanese	158	142,461
Vehicle spring, H. Bowles	31	142,365
Vise, J. Hunt	89	142,470
Wardrobe, bedstead, chair, and table, combined, W. Gotchell	98	142,367
Washing machine, J. O. A. Smith	91	142,393
Washing machine, G. R. Walker	91	142,530
Whip socket, C. Lang	78	142,346
Windmill, A. T. Bean	118	142,304
Windmill, G. A. Carter	118	142,435
Windmill, M. J. Kaufmann	118	142,470
Windmill, O. B. Knapp	118	142,460
Window sash, machine for making, J. Travers	30	142,518
Wire fabric, W. C. Edge	170	142,450
Wood, compound for filling, J. B. Dittenhaver	35	142,445
Wood, compound for preserving, L. S. Fales	107	142,453

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED SEPTEMBER 2, 1873.

Ashcroyd and Cockcroft 142,374
Adamolis, A., Preserving beer 142,430
Amsden, G. M., Feed roller, attaching journals to 142,384
Armstrong, J., Mechanical movement 142,385
Arnold, H. L., Set up device for knitting machines 142,429
Aston, J. A., and C. C. McMurphy, Combined sheet protector and shirt bosom support 142,366
Atkins, I., Paddle wheel 142,382
Baptista, J. E., Rudder for vessels 142,389
Barjon, V., assignee 142,502
Baxter, G. H., assignee 142,497
Beardsley, C. T., Sewing machine needle threader 142,430
Bishop, G. W., Sash fastener 142,421
Blakslee, W. S., and C. K. Young, Lamp 142,438
Blessing, J. H., Steam trap 142,303
Bodwell and Green 142,461
Bolser, G. A., Machine for turning wagon axles 142,398
Bone, A. T., Windmill 142,324
Bordner, H., and D. Sullivan, Boot crimping block 142,369
Born, C., assignee 142,329
Bostian, B. F., Picture and card exhibitor 142,370
Bowen and Rogester 142,350
Bowers, W. H. H., Propelling street cars by compressed air 142,433
Bowles, H., Vehicle spring 142,365
Boyle, H., Heat regulator 142,371
Brooks and Seal 142,324
Brooks, J. W., assignee 142,402
Brooks, M. D., Rivet setting machine 142,484
Brown, C. F., Machine for rolling tapered bars 142,373
Brown, J., Loom shuttle 142,373
Brown and Douglass 142,329
Came, J. E., Billiard table cushion 142,435
Carter, G. A., Windmill 142,436
Caryl, A. H., Machine for making horseshoe nails 142,457
Catlin, G. O., assignee 142,430
Chapman, S. J., Strainer for ships' bilge pumps 142,438
Clark, H. A., Manufacture of carpet 142,439
Cloud, C. M., Agricultural boiler 142,386
Cockcroft, W., and R. Ackroyd, Doubling and twisting machine 142,374
Cornell, L. R., Steam superheater for evaporating salt, and for other purposes 142,440
Craft, J. C., Hammock lounge 142,369
Crompton, G., Shuttle box mechanism 142,441
Cunningham and Walton 142,537
Cushman, C. S., Sewing machine 142,442
Davis, J., Mop head 142,388
Davis, W. H., Fruit and lard press 142,389
Day, J., Car propeller 142,443
Dean, G. W., Concrete pavement 142,444
Dederick, P. K., Brick machine 142,375
Delamater, C. H., assignee 142,495
Dietsch, H., File 142,445
Dittenhaver, J. B., Compound for filling wood 142,446
Dorwart, R. K., Revolving fire arm 142,376
Douglass, W., and J. H. Brown, Steam boiler 142,330
Dubber, J. F., Clasp for pocket books 142,447
Dunks, C. E., Spring bed bottom 142,377
Eads, J. B., Bridge 142,378
Eads, J. B., Iron bridge 142,379
Eads, J. B., Iron bridge 142,380
Eads, J. B., Iron bridge 142,381
Eads, J. B., Iron bridge foundation 142,382
Eagan, G. L., Manufacture of pipe 142,449
Eaton, J., Sliding gage 142,449
Edge, W. C., Wire fabric 142,450
Edwards, F. C., Cut off nozzle for drawing liquor 142,383
Eighme, D., Harnessmaker's clamp 142,384
Elwell, H. H., Door knob 142,451
Fairfield, H. P., Air compressor 142,439
Fales, L. S., Compound for preserving wood 142,453
Fashion, M. W., Fertilizer distributer 142,454
Ferris, O. C., assignee 142,494
Filkins, R. A., Steam lubricator 142,385
Ford R., assignee 142,349
Foulke, J., assignee 142,479
French, C. A., Plane truck 142,388
Garnhart, J. H., Binder's attachment for harvesters 142,331
Gascoigne, J., Heel and shoe incole 142,333
Gotchell, W., Combined wardrobe, bedstead, chair, and table 142,367
Gibbons, S., Steam air pump and condenser 142,332
Gibbs, R., Tire upsetting machine 142,455
Gilbreth, J., and M. Harris, Butter basket 142,456
Gleason, J., Rod iron shield 142,334
Goble, G. S., Hose coupling 142,369
Goldsmith, C. F., Harvester rod 142,369
Gordon, G. F., Taking apparatus 142,457
Gorris, F., Lock 142,335
Gould, R. J., Valve guide 142,459
Graham and Pike 142,388
Grandy, C. E., Saw teeth gage 142,330
Grantham, J., Steam carriage for tramways 142,460
Gray, W. H., Planing machine 142,466
Green, C. E., and J. M. Bodwell, Furnace 142,461
Greenough, J. J., Motor for measuring liquids, gases, &c. 142,336
Groves, J. F., Truss 142,337
Hagerstrom, A. G., Threshing machine 142,468

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

Healy, M. R., assignee 142,477
Herlan, J., assignee 142,389
Harris, S. W., Cinder plate for blast furnaces 142,339
Harris, S. W., Blast furnace for smelting iron and other ores 142,484
Harris and Gilbreth 142,458
Hartshorn, S., Shade fixtures, (reissue) 5,508
Higgins, C. J., Dredging machine 142,340
Hill, E. B., and E. Van Valkenburg, Spring bed bottom 142,391
Hinsey, J., Sweet mill 142,392
Hoar, W., Spring hinge 142,393
Hoffman, J., Corpse cooler 142,339
Holmes, H. A., Machine for sewing clapboards 142,339
Hope, J. C., Projectile 142,394
Houte, A., Railroad gate 142,466
Howard, F. E., Car coupling 142,395
Hug, D., Breech loading fire arm 142,396
Hughes, A. R., Chemical fire extinguisher 142,340
Hugunin, R. B., Sash holder, (reissue) 5,509
Hummer, H. A., Cooking stove 142,457
Hungerford, J., Oil burning heller furnace 142,468
Hunt, F. W., Refrigerator 142,469
Hunt, J., Vise 142,470
Hutchinson, E. A., Grate bar 142,470
Hyatt, T., Illuminating roofing 142,471
Hyatt, T., Illuminating roofing 142,473
Hyatt, T., Wall for buildings 142,474
Hyatt, T., Building block 142,475
Hyatt, T., Fire proof safe 142,476
Jackson, W. M., Heater and blower 142,397
Jaggar, L., assignee 142,464
James, R. W., Hasel regulator 142,477
Johnson, A. W., Sewing machine embroidery attachment 142,478
Jones, G. L., Compound metal working machine 142,398
Jones, H. C., Grain basket 142,341
Jones, H. C., Grain basket 142,342
Jones, H. C., Basket 142,343
Jones, T. C., assignee 142,394
Kauffmann, M. J., Windmill 142,470
Keech, L. P., Paper file and binder 142,344
Kent, W. J., Reed organ 142,399
Kesselgrew, A., Axle and thimble skein for vehicles 142,344
Kidder, J. H., Pen wiper 142,459
Knapp, O. B., Windmill 142,460
Knowles, L. J., Loom stopping mechanism 142,471
Knowlton, A., Machine for crimping boot and shoe uppers 142,400
Knowlton and James, assignees 142,400
Kruger, J., Device for building sisterns 142,345
Lang, C., Whip socket 142,346
Lanese, V. F., Compensating spring balance for safety valves 142,461
Laughlin, J. M., Punching machine 142,469
Lawrence, F., Blast and cupola furnace 142,400
Lee and West 142,401
Leech, R. L., Movable cloth plate for covering machines 142,464
Line, C. O., Supplementary oven for cooking stoves 142,463
Little, G., Transmitter and receiver for automatic telegraphs 142,464
Little, G., Perforator for automatic telegraphs 142,465
Little, G., Telegraph apparatus 142,466
Lockwood, J. F., and G. E., Carburetor 142,345
Lowrie, H. C., Car coupling 142,467
Mason, O. E., Thawing ice from water or gas pipes 142,458
Massey, J., assignee 142,374
McAnulty, J. D., Letter envelope 142,485
McIntyre, J. C., Lath bolting machine 142,469
McKay, G., assignee, (reissue) 5,501
McMillan, J. R., Harvester rake 142,399
McMurphy and Aston 142,366
Merrick, D. E., Joint for iron chips and fenks 142,486
Meyer, G. F., assignee 142,401
Meyer, H. E., Governor cut-off gear 142,401
Mickley, J. W., assignee 142,399
Middleton, A., Jr., Car coupling 142,402
Miles, F. B., Planing machine 142,482
Miles, F. B., Automatic operating shafts 142,484
Miller, J., Planing machine 142,485
Miner, T. F., assignee 142,451
Morgan, W. F., Boot detacking device 142,403
Morrell, J. A., Heating air for use in the arts 142,487
Morrell, J. A., Granulating sugar 142,466
Mullin, R. J., Manufacture of dies for punching 142,497
Munder, M. P., Medical compound 142,488
Myers, D., assignee 142,324
Nabe, H., Street lamp 142,489
National Horse Nail Company, assignee 142,332
Nelson, E. H., Cotton cultivator 142,501
Nicholl, Barr & Co., assignees 142,405
Nimocks, A. H., assignee 142,345
Nolf, A. L., Galvanic battery 142,502
Norwalk Lock Company, assignee 142,451
O'Connor, M., Fruit can 142,503
Oliver, J., Preserving and drying lumber 142,347
Olmsted, L. H., Regulating speed in machinery 142,504
Orr, W. J., Cotton bale tie 142,505
Paddock, S. B., Medical compound 142,506
Paige, J. C., Manufacture of horseshoe nails 142,507
Palmer, H. L., Non-conducting tablet, platform, &c., (reissue) 5,502
Parsons, W. W., Fire escape ladder 142,469
Pasel, R., Universal joiner 142,349
Pease, F. B., Auger handle 142,510
Phelan, J., assignee 142,508
Phillips, G., Quilting frame 142,511
Pickett, A. C., assignee 142,350
Pierce, S. P., Machine for shaving and chamfer edging boot and shoe soles 142,377
Pike, D., and O. B. Graham, Lamp extinguisher 142,352
Porter, P., Fireman's ladder 142,509
Post & Co., assignees 142,509
Potter, H. T., Top rail for drawing frames, &c. 142,509
Preston, W. M., Door bell 142,509
Pugh, W. H., Subterranean irrigation 142,513
Putnam, D., Lifting jack 142,510
Putnam, S. W., Jr., Machine for tapping nuts 142,511
Ray, R., assignee 142,454
Rayerson, J., and W. H. Bowen, Step cook 142,369
Reuter, C., Printer's rule 142,513
Ripley, D. C., Safe and package indicator 142,351
Robbins, R. B., Draft tube for soda fountains 142,513
Rose, E., Machine for finishing horseshoe nails 142,352
Runyan, J. S., Fire place grate 142,514
Russell, J., assignee 142,515
Ryder, H., Apparatus for distilling heavy oils 142,515
Sammis, R. M., Lemon squeezer 142,414
Samson, R. B., Apparatus for ironing and pressing garments 142,516
Sargeant, A. V., Check hook for harness saddles 142,415
Schiller, C. A., Artificial fewer 142,352
Scherer, M. M., Cotton press 142,517
Schmidt, H., Belt and rod cutter 142,354
Schofield, E., Wash boiler 142,518
Schultz, L., Sewing machine hemmer 142,519
Schwartz, C. C. F., Decorative lantern 142,520
Seal, C. H., and E. F. Brooks, Regulating cock 142,521
Sears, E., Hoeing gage 142,522
Sheldon, J. J., Boring and drilling machine 142,416
Sheldon, W. R., Harvester cutter 142,417
Shilton, C. C., assignee, (reissue) 5,505
Shuter, A. L., Cotton planter 142,523
Sloan, T. S., Retainer drill 142,356
Smith, A., Apparatus for burning gas tar 142,357
Smith, J. E., assignee 142,403
Smith, J. C. A., Washing machine 142,403
Speer, W. H., assignee 142,523
Spencer, P. J., Suppository mold 142,564
Springer, T. G., Apparatus for carbureting and regulating the pressure of gas 142,525
Springer, T. G., Blind slat fastener 142,526
Starr, H. D., Cotton bale tie 142,527
Stearns, A. C., assignee 142,403
Stephens, M., Cement lined pipe 142,529
St. John, W. H., Purification of illuminating gas 142,530
Stockwell, R., Permutation lock 142,531
Stopps, N. D., assignee 142,449
Sullivan and Bordner 142,369
Swan, J. R., assignee 142,532
Taylor, G. C., Combined sled and conveyor 142,416
Thomas, A. W., Tourneau, (reissue) 5,503
Thomas, S., Gudgeon or bearing for ore washers 142,536
Thompson, G. E., Carriage 142,351
Tolle, M., Manufacture of white lead to collect the dust 142,410
Travers, J., Machine for making window sashes 142,409
Trewin, R., Hair wash 142,538
Trull, F. H., Corpse cooler 142,539
Trowbridge, W. P., Steam generator 142,354
Tyng, L. B., Railway rail chair 142,399
Ude, M., and M. B. S., assignees 142,540
Van, J., Gas burner for heating 142,540
Van Valkenburg and Hill 142,391
Vennell, J., Method of securing letters to stone 142,481
Walker, R. A., Scroll sawing machine 142,541
Walker, G. S., Washing machine 142,542
Walker, J. H., Fire proof building 142,355
Walker, G., Combined kick and low water indicator 142,536
Walton, R. W., and J. L. Cunningham, Bee hive 142,537

The following abbreviated terms of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Alkaloid liquor apparatus	1	Leather	92
Air and gas engines	2	Locks and latches	93
Amalgamators, ore-mills	3	Locomotives	94
Architecture	4	Looms	95
Artificial limbs, &c.	5	Manures	96
Baking	6	Mathematical instruments	97
Baling-presses	7	Medical compounds	98
Baths, closets, &c.	8	Metallurgic processes	99
Bee-hives	9	Metal working	100
Bell and brass founding	10	Meteorological instruments	101
Bleaching, dyeing, &c.	11	Musical instruments	102
Blowers	12	Nails and spikes	103
Boats	13	Needles, pins, &c.	104
Bolts, nuts, rivets	14	Ordnance	105
Bookbinding	15	Organs	106
Boots and shoes	16	Paints and varnishes	107
Braid, thread, &c.	17	Paper-making	108
Breech-loaders	18	Paper manufactures	109
Brewing, cider, &c.	19	Paving	110
Bricks	20	Photography	111
Bridges	21	Pianos	112
Brushes and brooms	22	Plaiting	113
Buckles, buttons, &c.	23	Plows	114
Builders' hardware	24	Pottery	115
Butchering	25	Poultry, care of	116
Candles, soap, &c.	26	Printing	117
Carburetors	27	Pumps	118
Carding and roving	28	Punching and shearing	119
Carpenters' tools	29	Railroads, (the "Way")	120
Carpentry	30	Railroads, (rolling stock,) A	121
Carriages and wagons	31	Railroads, (rolling stock,) B	122
Cartridges and bullets	32	Revolvers	123
Casting	33	Rock-drilling and blasting	124
Casting soft metals	34	Rolling metals	125
Chemical processes	35	Roofing	126
Clocks and watches	36	Rope and cordage	127
Cloth-dressing, &c	37	Safes and vaults	128
Clothes-making	38	Salt	129
Coffins	39	Saw-mills	130
Coopering	40	Saws	131
Cotton	41	Scales and weights	132
Counting and registering	42	Seeders and planters	133
Cultivators	43	Sewing-machines	134
Cutlery	44	Sheep, care of	135
Dairy apparatus	45	Sheet metal working	136
Dental instruments	46	Ship-building, (the hull)	137
Distilling and rectifying	47	Ship-building, (masting, &c)	138
Drivers	48	Ships, propulsion of	139
Edge tools	49	Silk	140
Electrical apparatus	50	Spades, shovels, &c.	141
Excavating and grading	51	Spinning	142
Fences and gates	52	Sports	143
Files and rasps	53	Stabling, stalls, &c.	144
Fine arts	54	Starch	145
Fire-arms	55	Stationery	146
Floor-cloths	56	Steam-heaters, &c.	147
Flour-mills	57	Steam-boilers, (construction)	148
Food, preservation of	58	Steam-boilers, (furnaces, &c)	149
Food for stock, preparing	59	Steam-engines	150
Forging	60	Steam-pistons, &c.	151
Fuel	61	Steam-valves	152
Furniture, &c.	62	Stone, lime, and cement	153
Garden and orchard tools	63	Stoves and ranges	154
Gas, distribution of	64	Sugar and molasses	155
Gas-heaters	65	Surgical instruments	156
Gas, manufacture of	66	Surveying and optical instruments	157
Gearing	67	Telegraphs	158
Glass	68	Thrashing, &c.	159
Governors	69	Tobacco	160
Grinding and polishing	70	Toilet articles	161
Gunpowder	71	Trunks and satchels	162
Harness and saddlery	72	Tube and wire	163
Harrows, rollers, &c.	73	Type and stereotype	164
Harvesters, A	74	Umbrellas, fans, &c.	165
Harvesters, B	75	Ventilators	166
Hats and felting	76	Water, distribution of	167
Hay-tedders, &c.	77	Water-wheels	168
Hemp and flax	78	Willow and rattan	169
Hoisting machinery	79	Wire-working	170
Hoop-skirts and corsets	80	Wood-screws	171
Hose and belting	81	Wood-lathes	172
Hydraulic engineering	82	Wood-working, (machine-tools)	173
Ice-making	83	Wood-working, (special machinery, A)	174
India rubber	84	Wood-working, (special machinery, B)	175
Iron and steel	85	Wood-working, (special machinery, C)	176
Jewelry	86		
Journals, bearings, &c.	87		
Kitchen and table utensils	88		
Knitting, netting, &c.	89		
Lamps and lanterns	90		
Lasting apparatus	91		

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographic; from January 1, 1870, to the present time, they have been photo-lithographic.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of those classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)..... 6,500

SEWING-MACHINES and attachments..... 2,000

FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes..... 4,000

PRINTING; including presses, type, and printers' furniture. 2,500

FELTING and HATS; including caps, bonnets, flock, &c..... 1,200

WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)..... 1,000

STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs..... 1,400

CARRIAGES and WAGONS..... 6,000

RAILWAYS, (in progress.)

BRIDGES, (in progress.)

CARDING, CLOTH CORDAGE, KNITTING, SILK, SPINNING, WEAVING, (in progress.)

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited and the invention therein described will become public property, as against the applicant thereafter, unless he shall make a new application within two years from the date of notice of the original allowance.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 11. TUESDAY, SEPTEMBER 9, 1873. PRICE { $5,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DIGEST OF FOREIGN PATENT LAWS.

BELGIUM.

REPORT BY MR. J. G. KENNEDY, OF THE BRITISH LEGATION.

In drawing up the following report I have divided the subject into two parts. In the first part I have endeavored to point out (taking my information from official sources) the difference between the new law of 1854 and the previous law of 1817, and to give some statistical information relating to the number of patents obtained under each law. In the second part my intention has been more particularly to examine the practical interpretation and working of the new law of 1854.

Patents for invention are delivered in Belgium by virtue of the law of May 24, 1854. This law and the royal decree of the same date—copies and translations of which are annexed to this report—determine the rights and the obligations of inventors.

The said law has remained unchanged since the date of its publication, with the exception of two slight and unimportant modifications, both favorable to inventors, introduced in 1857, in articles seven and twenty-two, and, taken as a patent law, it appears to have given general satisfaction on most points.

It may perhaps be stated that a majority of the manufacturing classes in Belgium are in favor of the entire abolition of patent laws, but no decided public expression has yet been given to this feeling, and no immediate step in this direction is, I am informed, contemplated by the legislature.

By the provisions of the law of 1854 patents for inventions are granted without previous examination either of the novelty or of the merit of the invention, and at the risk and peril of the inventor. It is the substitution of the repressive for the preventive system which formed the basis of the old law of January 25, 1817.

The new law has also introduced special modifications with respect to the taxation of patents. By the old law of 1817 the tax, which varied from $60.25 to $265.00 and upward, had to be paid at once on delivery of the patent. The general effect of this condition was the exclusion of all poor inventors. Now that patents cost only $1.90 for the first year, $3.80 for the second, with a yearly increase of $1.90, and that the previous examination is suppressed, the number of inventors has greatly increased, as proved by the following statistics:

The old law of 1817 was applicable to both Holland and Belgium up to the year 1830, the date of the separation of the two countries. During this period of fourteen years, 417 patents, or an average of 29 patents a year, were delivered.

From 1830 up to the 24th of May, 1854, the same law continued in force in Belgium, and during this period of twenty-four years 7,600 patents were granted—*i. e.*, an average of 310 patents a year.

From 24th May, 1854, up to December 31, 1870—*i. e.*, during a period of sixteen and a half years—28,644 patents, or an average of 1,736 patents a year, were delivered in Belgium.

In granting patents the duty of the government is simply to ascertain that the formalities prescribed by the law and the royal decree have been fulfilled. In this case, provided the invention is a licit one, the patent is granted at the risk and peril of the patentee. In the contrary case the patent is refused.

The government also interferes in questions of annulment of patent, first, for default of payment of the annuity tax within the time prescribed; and, secondly, in the event of the invention not being worked ("exploitée.") Excepting in the above two cases, all disputes concerning the exclusive rights of inventors must be decided by the ordinary civil tribunals.

The chief cause of the annulment, or rather of the lapse of patents, is default of payment of the annuity

within the time prescribed. More than ninety-five one-hundredths of the patents become public property in this way.

The following table showns the number of patents granted yearly from 1854 to December, 1870:

Statement of patents from 1854 to 1870, inclusive.

Year of delivery.	No. of patents.	Year of delivery.	No. of patents.
1854	1,028	1863	1,857
1855	1,788	1864	1,548
1856	1,578	1865	1,655
1857	1,516	1866	1,767
1858	1,529	1867	2,012
1859	1,551	1868	2,026
1860	1,719	1869	2,048
1861	1,774	1870	1,516
1862	1,724		

It is hardly necessary to mention the number of patents annulled for omission to work them. Of such annulments there are but two or three a year at the utmost.

The number of patents which cease only at the expiration of the period for which they were granted is very limited. This period varies according to the nature of the patent, whether it is one of invention or of importation.

In the case of a patent of invention this period is twenty years, but the time for which a patent of importation is granted must not exceed the period which the original patent has still to run in the countries where it was first delivered.

The action of government with regard to the concession of patents is very simple, and is defined in the second part of this report and in the law and royal decree of May, 1854. In the case of the canceling of a patent for default in payment, the Finance Department transmits to the Home Department a statement of non-payment drawn up by the tax-receiver ("receveur") of the Finance Department, and thereupon the annulment and of the patent is pronounced and published by royal decree.

In the second part of my report I propose to investigate, summarily, some of the clauses of the Belgian law of 1854, in order to illustrate the practical working of the different sections of the said law and the nature of the privileges conferred, and the obligations incurred by patentees in Belgium.

Article I enacts that three kinds of patents may be granted—a patent of invention, of importation, and of improvement. A patent of invention is granted to the inventor who takes out his Belgian patent before obtaining letters patent in any other country. In that case he is entitled to protection for twenty years.

A patent of importation is granted to an inventor who, previously to lodging his demand in Belgium, has applied for letters patent in any other country. The patent of importation is limited to the term for which the previous foreign patent is granted, and expires with it. Thus a Belgian patent of importation for an invention already protected in Great Britain would be granted for fourteen years, and if the invention were patented in France the Belgian patent would be for fifteen years.

Belgian patents of importation may be taken out in the name of the inventor or his assign duly appointed. It has been decided by the courts in 1858-59, in the cause of *Delloye Masson* vs. *Tremoureux and De Burlet*, that a simple power from the inventor authorizing a party to take out a Belgian patent in his own name suffices for the purpose, said power being stamped and registered.

A patent of improvement may be obtained by a patentee for an improvement on or addition to his previous invention. The patent of improvement must be for improvement of the same nature as the original invention, otherwise it would not be held to be legally valid. No tax is required for a patent of improvement which forms part of the original patent, and expires with it.

In article second the government declines all responsibility as to the value of the patent or of the invention. In case of legal proceedings the patentee may be obliged to lodge a certain sum previously to the case being brought before the courts. When the patentee is a foreigner he is always obliged to make a deposit, but said deposit rarely exceeds $95.00.

Article XVII. In applying for a Belgian patent the inventor or his attorney, having paid the first year's tax, presents himself at the office of the provisional government or "Commissariat d'Arrondissement," where he lodges a receipt for the tax and a petition to the Minister of the Interior, praying that letters patent may be granted to him, and also a sealed packet containing two copies of the specifications and drawings illustrating the invention. The specification may be in any form, and written either in French or Flemish; the drawings may be made on paper of any size. The patent clerk registers the hour and date of the demand in a book kept for the purpose, and signed by the inventor or his attorney and by the head of the office.

Article XXI treats of transfers. All transfers of patents are subject to a registration tax, fixed by the law at $1.90, but, in practice, a few francs more are charged for additionals; and the deed of transfer has to be stamped according to the size of the paper upon which the deed is drawn up. The transfer is then notified to the Minister of the Interior, who has it recorded in the patent office and published summarily in the "Recueil des Brevets d'Invention."

Article XXII of the law of 1854 prescribes that a patent should be null and void in case the annual tax should not be paid within a month of its becoming due. In 1857 this article was modified, and a delay of six months was allowed to pay the tax, with an additional fine of $1.90; and the government is now obliged to call the attention of the inventor to the fact that the tax is due, by a registered letter to that effect. This duty devolves on the delegates ("receveurs") of the ministry of finance. It gives a great deal of trouble without adequate results, for the great majority of inventors who intend to continue their patents pay the annuities as they become due.

Article XXIII enacts that all patentees shall work their invention, or cause it to be worked, within a year of its having been worked in any other country. Commentators have endeavored to give the exact meaning of the word "exploiter," to work, *i. e.*, to construct, use, and vend the patented article. The question whether the manufacture or construction of the article must take place in Belgium has been answered in various ways. It has been argued that, as the Belgian law does not (like the French law of 1844) distinctly forbid the introduction or importation of the patented article from abroad, it may be assumed that such importations are allowed, and that all that is required is to import and sell, or use the patented article in Belgium; and, as a patentee cannot be compelled to find a purchaser, and cannot himself oblige others to purchase, it would be sufficient to import the article and endeavor to sell it.

Others contend that the obligation to work the patent was prescribed expressly in order that the national industry should derive some advantage from the manufacture or construction of the patented article in the country; and this was stated by several members of the Chamber of Representatives and Senate in 1853, during the debates on the proposed new law.

The law has, however, left this matter entirely to the discretion of the government, which alone has power to decide what is to be understood by the working of an invention, and to judge in each case whether the requirements of the law have been complied with. The courts decline all competency in this matter, and assume that a patent has been worked according to law until it has been annulled by the government.

The views of the government in respect of working an invention may be inferred from divers cases in which patents have been annulled. It would appear that it is not considered sufficient to import the patented articles from abroad and put them on sale in one or more shops or warehouses, even if large numbers were sold in the country by this means. It is not even considered sufficient to have a certain number of the patented articles made and sold in Belgium, the same articles being imported also from abroad and sold in Belgium. The mere fact of importing the patented articles into Belgium, excepting a very limited number to serve as models, seems to be considered as quite contrary to the spirit of the law, while a patentee having his invention manufactured in Belgium, and so badly made, owing to the lack of skill or tools or means of the workmen he employed, that no purchaser could be found to buy it, would, in all probability, be held to have complied with the law, from his having manufactured in the country, and thus favored the "national industry."

The government seldom or never interferes as regards the working of a patented invention, unless called upon to do so by any party having an interest to overthrow the patent. The head of the department there states the case to the patentee or his agent, and requests him to say when and where the patent has been worked. Every facility is afforded him to explain his case and prove that he has complied with the law; and it is only if he fail to do so to the satisfaction of the department that his patent is annulled.

The second clause of article twenty-three provides that the government may grant an extension of the term for working a patent. Practically, this seeming act of condescension is valueless; for to obtain such an extension of time the inventor is required to state in his petition the day on which he should have his invention at work, in order to comply with the law—*i. e.*, one year from the date of its having been worked in any other country; which date it is often extremely difficult to be proved against the patentee unless he himself gives it, as in the case under consideration. The inventor's petition is then referred to the different chambers of commerce, and they would not hesitate, in some cases, to give their opinion unfavorably to the patentee, should the invention be valuable and likely to be of advantage to their fellow-countrymen.

(*a.*) The courts may annul a patent if the invention should have been worked commercially in the kingdom by a third party before the demand of the patent.

This alludes to the working commercially by a third party; but if the real and true inventor shall have commercially worked his invention before applying for a patent, such commercial working has no influence on the validity of his patent.

(*b.*) The intentional omission of part of the inventor's secret, or an erroneous specification given in intentionally, also invalidates a patent.

(*c.*) If the complete specification and exact drawings should have been printed and published previously to the demand of the Belgian patent, unless such publication should have been prescribed by law—thus, for the publication of an invention to invalidate a subsequent Belgian patent the complete specification and exact drawings must be published—an abridged specification would have no influence on the Belgian patent. And, as regards patents of importation, an especial exception is made for such publications as the Blue Book, printed specifications of English patents by order of the commissioners of patents.

It may be interesting to mention a further peculiarity connected with Belgian patents of importation, showing what importance is attached by the Belgian law to the patentee being the first and real inventor.

A foreign patentee, though his foreign patent may be several years old, may, should his invention not come under any of the stipulations of article twenty-four, take out a valid Belgian patent, and his Belgian patent will have priority over any patents for the same invention taken out by others between the date of his foreign patent and that of his Belgian patent of importation.

APPENDIX A.

PATENT LAW OF BELGIUM.

[Abstract Translation.]

ARTICLE I. Exclusive and temporary rights shall be granted under the name of patents of invention, of improvement, or of importation, for all discoveries or all improvements capable of being employed as articles of industry or of commerce.

ART. II. Patents shall be granted without previous examination at the risk and peril of the demander, without guarantee as to the reality, or the novelty, or merit of the invention, or to the accuracy of the specification, and without prejudice to the rights of other parties.

ART. III. The duration of patents is fixed at twenty years, save the case provided for in article fourteen, and shall take effect from the date on which the *procès verbal* shall have been made, as mentioned in article eighteen.

For each patent yearly and progressive dues shall be paid, as follows, viz:

First year, $1.90; second year, $3.80; third year, $5.70; and so on to the twentieth year, for which the tax shall be $38.00. These dues shall be paid in advance, and shall not in any case be reimbursed.

No payment of dues shall be required for patents of improvement when granted to the proprietor of the original patent.

ART. IV. The patents guarantee to their possessors or assigns the exclusive right—

(*a.*) To make and sell to their profit the patented article, or cause or license it to be made or sold by other parties.

(*b.*) To sue in the courts of law such persons who may infringe on their rights, either by making the patented article, or by employing the means comprised in the patent, or retaining, selling, or exposing for sale, or introducing into the Belgian Territory one or more counterfeited articles of the same.

ART. V. If the persons sued invirtue of article four (*b*) shall have knowingly infringed, (the patent right,) the courts of law shall pronounce, to the profit of the patentee or of his assigns, confiscation of the articles made in contravention of the patent, or the instruments, tools, or utensils especially destined for executing the same, or award the payment of a sum equal to the price of the articles which may have been already sold.

If the persons sued are of good faith, the court shall prohibit them, under penalty as above stated, from commercially making use of the machines or apparatus of production proved as counterfeits, or to make use of, with the same intent, tools and utensils for making the patented articles.

In either case, damages and interest may be awarded to the patentee or his assigns.

ART. VI. Possessors of patents or their assigns may obtain, by request, authorization from the president of the tribunal of the first instance, to name one or several persons as experts, in order to inspect and make an inventory of the machines, apparatus, or articles supposed to be counterfeited.

The president may by the same ordinance forbid the holders to part with the said articles, and permit the patentee to appoint a guardian, or even to place the articles under seal.

The ordinance of the president shall be communicated by a bailiff *ad hoc*.

ART. VII. The patent shall be joined to the request, which shall contain the address where the inventory is to be made. The examiners named by the president of the court shall be sworn by him, or by a magistrate specially authorized by him, prior to the proceedings.

ART. VIII. The president may bind the patentee to deposit a sum as caution money.

In this case his ordinance shall not be delivered unless proof be given that the caution money has been deposited. The caution money shall always be required from foreigners.

ART. IX. The plaintiff may be present at the inventory if he should be specially authorized by the president of the court.

ART. X. If the doors shall be closed, or access refused, proceedings shall be adopted conformably to article five hundred and eighty-seven of the code of civil procedure.

ART. XI. A copy of the *procès verbal* of the inventory made by the examiners shall be left by the detainer of the articles prescribed.

ART. XII. If in eight days the inventory is not followed by a summons before the tribunal of the district where the inventory was made, the ordinance delivered conformably to article six will lose its effect, and the detainer of the articles described may reclaim the original *procès verbal*, and prevent the patentee from making use of its contents, and render public the same, without prejudice to all damages and interest.

ART. XIII. The courts shall consider patent affairs to be summary and urgent.

ART. XIV. The author of an invention already patented in a foreign country, or his assigns, may obtain a patent of importation in Belgium. The duration of such patent shall not exceed the term of the patent previously granted in another country for the longest term, and in no case exceed the limit fixed by article three.

ART. XV. In case of modification of an invention a patent of improvement may be obtained, the term of which shall end at the expiration of the original patent.

If, nevertheless, the possessor of the new patent is not the principal patentee, he shall not, without the consent of the latter, make use of the original invention, and reciprocally the principal patentee shall not make use of the improvement without the consent of the holder of the new patent.

ART. XVI. Patents of importation and of improvement confer the same rights as patents of invention.

ART. XVII. Any person desirous of obtaining a patent shall be bound to deposit, under seal, in duplicate, at the *greffe* (office) of one of the provisional Governors of the Kingdom, or at the office of a "Commissariat d' Arrondissement," observing the formalities which shall be determined by a Royal Decree, an exact and complete specification, in one of the languages used in Belgium, and an exact drawing made to a metrical scale of the invented article.

No deposit shall be received without the production of a receipt showing that the first annuity tax shall have been paid.

A *procès verbal*, drawn up free of cost by the provisional *greffier*, or by the district commissary, in a special register, and signed by the demander, shall authenticate each deposit and express the day and hour of the delivery of the document.

ART. XVIII. The legal date of the invention is established by the *procès verbal*, which shall be drawn up when the demand of the patent is deposited.

A duplicate of this *procès verbal* shall be given to the depositor free of expense.

ART. XIX. A decree of the Minister of the Interior, proving that the described formalities have been accomplished, shall be delivered forthwith to the depositor, and shall constitute his patent. An extract of this decree shall be published in the "Moniteur."

ART. XX. The specifications of patents granted shall be published *verbatim*, or in substance, under the care of the administration, in a special collection, three months after the grant of the patent. When a patentee shall require a complete publication or extract furnished by himself, such publication shall be effected at his expense.

After the same term the public shall be admitted to inspect the specifications, and copies of them may be be obtained on payment of the expenses.

ART. XXI. All legal transfers of patents between persons, or by will, shall be recorded on payment of a fixed fee of ten francs ($1.90.)

ART. XXII. If the tax fixed by article three of the law of May 24, 1854, shall not have been paid in the month when due, the patentee, after previous notice, must pay before the expiration of six months, under penalty of forfeiture of his rights, a sum of ten francs, ($1.90,) besides the usual annuity.

Holders of patents granted since the enforcement of the above law who may not have paid within the legal delay the annuity tax, conformably to article three, will be relieved of the forfeiture incurred by payment, within three months of the publication of the present law, of the sum of ten francs, ($1.90,) besides the annuities due.

The forfeiture of patents shall be published in the "Moniteur." The same shall happen in case the patentee shall have been, at his own request, relieved of the forfeiture.

ART. XXIII. The proprietor of a patent must work, or cause to be worked, in Belgium, the patented article within a year from the date of its having been worked or used in a foreign country.

The government may, however, by an explanatory decree, inserted in the "Moniteur" before the expiration of this term, grant a prolongation of one year, at most.

At the expiration of the first year, or of the delay which shall have been granted, the patent shall be annulled by a royal decree.

Annulment shall also be pronounced when the patented article, made use of in a foreign country, shall have ceased to be worked in Belgium during one year, unless the possessor of the patent shall be able to justify the motives of his inaction.

ART. XXIV. Patents shall be declared null and void by the courts for the following causes:

(*a.*) When it shall be proved that the patented object has been worked or made use of for commercial purposes by other parties prior to the legal date of its invention, or importation, or improvement.

(*b.*) When the patentee shall have intentionally omitted to explain in the specification joined to his demand any part of his secret, or shall have inaccurately specified the same.

(*c.*) When it shall be proved that the complete specification and accurate drawings of the patented object have been published in a printed work prior to the date of the deposit, unless, as regards patents of importation, this publication should be a case for legal prescription.

ART. XXV. A patent of invention shall be declared null by the courts if the object for which it was granted shall have been previously patented in Belgium or in a foreign country.

Nevertheless, if the demand has the quality required by article fourteen, the patent may be maintained as a patent of importation on the terms of the said article.

These dispositions shall be applicable, should the case arise, to patents of improvements.

ART. XXVI. When forfeiture or extinction of a patent shall have been pronounced, according to articles twenty-four and twenty-five, by judgment or decree, having acquired the force of a case judged, the annulment of the patent shall be proclaimed by a royal decree.

ART. XXVII. Patents which have not expired nor been annulled at the time of publication of the present law shall continue to be governed by the law as it existed at the time they were granted.

Their proprietors, however, shall be at liberty, in the year following the present publication, to make a new demand for a patent, conformably to the form that shall be determined by a royal decree.

In this case the patent may continue to run its course during all the time necessary to complete the period of twenty years, save what is said in article fourteen.

The patents for which the benefits of this disposition shall have been claimed shall be governed by the present law, yet the procedures commenced prior to its publication shall be terminated according to the old law.

The proprietors of patents, who shall have paid the whole amount of the primitive tax, shall pay, after the expiration of the term which had been assigned to their privilege, the taxes due to the subsequent years, agreeably to article three.

With regard to proprietors of patents who shall not have paid the full dues fixed as the acquisition cost of the primitive patent, an account shall be kept of the sums they may have already paid, and the annuities shall be regulated according to the payments made, conformably to article three.

APPENDIX B.

ROYAL DECREE FOR THE EXECUTION OF THE LAW OF MAY 24, 1854.

ARTICLE I. Any person desirous of obtaining a patent of invention, of improvement, or of importation, must deposit a demand to this effect in the office ("greffe") of one of the provincial governments of the kingdom, or in the office of one of the "Commissariats d' Arrondissements" situate out of the chief town of the province.

To this demand must be joined, under sealed cover—

1. The specification of the article invented;

2. The drawings, models, or patterns which may be necessary for the comprehension of the specifications;

3. A duplicate certified copy of the specification and drawings; and

4. A list of the documents and objects deposited.

ART. II. The deposit of the documents mentioned at article one shall not be received without the production of a receipt showing the payment of 10 francs, ($1.90,) forming the first annuity of the tax.

This receipt shall be joined to the other papers.

ART. III. The demand must be written on stamped paper, and indicate the name, surname, occupation, ("possession,") and the real or elected abode of the inventor in the kingdom. It must express a title, including a summary and precise designation of the object of the invention. Each demand shall comprise only one sole principal object, with the details and applications relative thereto.

When a patent of importation shall be demanded the petition shall make known the date and duration of the

original patent, and the country where it has been granted. If the petitioner is not the owner of the foreign patent, but his attorney, ("ayant cause,") he must justify his title by means of an act in due form.

The specification must be written in the French, or German, or Flemish language.

The specification must be written without alterations or interlineations; the words erased as null shall be counted and verified; the pages and references must be initialed, ("paraphés.")

The specification shall explain the invention in a clear and complete manner, and conclude with a clear enunciation of its component parts.

ART. V. The drawings shall be traced in ink, and to a metrical scale; they must represent as near as possible the article to be invented, by plans, and sections, and elevations, and those parts of the drawings which specially characterize the invention must have a different tint from the other parts.

ART. VI. All the documents must be dated and signed by the inventor or his attorney, whose power, duly legalized, shall remain annexed to the demand.

ART. VII. A *procès-verbal* drawn up by the "Greffier" of the provincial government, or by the district commissary, shall be evidence of each deposit, stating the day and hour of the said deposit. The invention shall be designated by the summary and truthful title which the demander shall have indicated.

This *procès-verbal* shall contain the name, surname, quality, and residence of the demander or his attorney, ("mandataire.") It shall also indicate, when a patent of importation is asked for, the date and duration of the original patent, and the name of the patentee. It must make mention of the payment of the first annuity.

This *procès-verbal* shall be signed by the depositor and by the writer of the same, and shall be affixed on the cover of the package containing the documents relative to the demand of the patent.

A copy of the *procès-verbal* shall be delivered free of cost to the depositor.

ART. VIII. The legal date of the invention is confirmed by the said *procès verbal*.

ART. IX. The officers of the provincial "Greffiers" and those of the "Commissaires d'Arrondissement" shall be open for the demand of patents every day from 10 A. M. to 2 P. M., excepting Sundays and fête days.

ART. X. All the documents relating to demands of patents shall be transmitted within five days to the Department of the Interior.

ART. XI. On the arrival of these documents at the above department the demands shall be enrolled, in the order of their date of admission, in a special register, which the public may inspect any day, excepting Sundays and fête days, from 10 A. M. to 2 P. M.

ART. XII. In case of omission or irregularity of form the demander shall be required ("invité") to make the necessary rectifications.

A note of these rectifications shall be made in the special register mentioned in the preceding article.

ART. XIII. Patents demanded in a regular manner shall be delivered without delay.

A decree of the Minister of the Interior, stating the accomplishment of the prescribed formalities, shall be delivered to the demander, and shall constitute his patent.

ART. XIV. The patent shall expressly state that the grant of the same is made without previous examination, at the risk and peril of the demander, and without guarantee as to the reality or the novelty, or the merit of the invention, or to the accuracy of the specification, and without prejudice to the rights of other parties.

ART. XV. The first delivery of patents shall be made free of expense, but all future deliveries demanded by the patentee or his assigns shall be subject to the reimbursement of the expenses.

ART. XVI. The specifications of patents shall be published verbatim or in substance, under the care of the administration, in a special collection three months after the grant of the patent.

When the patentee shall require a complete publication of his specification, or of an extract of the same furnished by himself, he must inform the administration of his desire one month at least before the expiration of the term fixed by the preceding paragraph, and consign the amount requisite to cover the cost of this publication.

ART. XVII. After the said term of three months the public shall be admitted to examine the specifications, and may obtain copies thereof on reimbursement of the expenses.

ART. XVIII. The patentee who may desire to obtain a prolongation of the delay, as provided for by article twenty-three of the law, for putting into activity the patented article, must address his demand to the Minister of the Interior two months at least before the expiration of the delay fixed by the said article.

This demand must contain sufficient motives and indicate within the legal limit the term necessary for putting into activity the invention.

ART. XIX. All cessions or mutations, total or partial, of a patent shall be notified to the Department of the Interior.

The notification of the cession or any other act involving mutation must be accompanied by an authentic extract of the act of cession or of mutation.

ART. XX. Proprietors of patents not expired or annulled at the time of the publication of the law of the 24th May, 1854, may have their rights placed under the administration of this law on forming their demand before the 25th May, 1855.

A patentee who shall not have paid, when the benefit of his disposition shall be demanded, a sum equal to the amount of the annuities due according to article three of the law, shall be bound to effectuate this payment and justify the same by a receipt joined to their demand; otherwise the demand shall be of no avail.

A declaration stating that the patent is placed under the administration of the new law shall be sent to the interested party.

ART. XXI. The grants of patents, the acts of cession or of mutation, as also the declarations mentioned in the preceding article, shall be published in a special collection of patents. The decrees pronouncing annulment of patents, or their having been given up to the public, shall likewise be inserted in the same collection.

ART. XXII. At the expiration of patents the original drawings and specifications shall be deposited in the Museum of Industry.

ART. XXIII. The Minister of the Interior is charged with the execution of the present decree.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

25,726.—Hand-Machine for Wiring Blind-Beds.—Granted to BERAH C. DAVIS, October 11, 1859. Application filed July 16, 1873. Hearing September 24, 1873.

25,733.—Double-Friction Couplings.—Granted to JOSHUA HENDY, October 11, 1859; reissued March 25, 1873. Application filed July 7, 1873. Hearing September 24, 1873.

25,747.—Method of Combining Emery with Caoutchouc.—Granted to THOMAS J. MAYALL, October 11, 1859. Application filed June 16, 1873. Hearing September 24, 1873.

25,767.—Cutting and Pressing Cakes.—Granted to JOHN H. SEBOTH, October 11, 1859. Application filed July 11, 1873. Hearing September 24, 1873.

25,784.—Mode of Manufacturing Barrels, &c.—Granted to GEORGE W. BARKER, October 11, 1859. Application filed July 8, 1873. Hearing September 24, 1873.

25,796.—Jacquard Machines.—Granted to AVERY BARNETT, October 18, 1859. Application filed June 30, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,797.—Harvesters.—Granted to EPHRAIM BALL, October 18, 1859. Application filed July 16, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,807.—Horse-Pulleys.—Granted to LEVERETT CLARK, October 18, 1859. Application filed July 19, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,814.—Sleeping-Cars.—Granted to JOHN DANNER, October 18, 1859. Application filed July 19, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,843.—Cultivators.—Granted to THOMAS MCQUISTON, October 18, 1859; reissued May 16, 1871. Application filed July 11, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,862.—Weeding-Hoes.—Granted to JAMES M. ADAMS, October 18, 1859. Application filed July 16, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,867.—Machines for Covering Saddle-Trees.—Granted to JOHN MACLURE, October 18, 1859. Application filed July 14, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,874.—Reaming-Machines.—Granted to GEORGE H. BABCOCK, October 25, 1859. Application filed July 25, 1873. Testimony closes September 23, 1873. Hearing October 8, 1873.

25,883.—Construction of Glass Ceilings.—Granted to JOHN R. CANNON, October 25, 1859. Application filed July 22, 1873. Testimony closes September 23, 1873. Hearing October 8, 1873.

25,936.—Cut-Off Valves of Steam-Engines.—Granted to EDWARD R. ARNOLD, November 1, 1859. Application filed August 1, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

25,978.—Tackle-Blocks.—Granted to ISAAC E. PALMER, November 1, 1859; reissued September 8, 1868, April 11, 1865, and December 8, 1868. Application filed July 26, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

25,984.—Bit-Stocks.—Granted to NELSON STOFFORD, November 1, 1859; reissued April 23, 1867. Application filed July 26, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

26,003.—Telegraphic Machines.—Granted to GEORGE M. PHELPS, November 1, 1859. Application filed July 30, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

26,028.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 9, 1869. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,030.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 9, 1869. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,039.—Shackles for Hanging Saw-Spindle.—Granted to JAMES SOMERVAL, November 8, 1859. Application filed August 2, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,062.—Sleeping-Cars.—Granted to JOHN DANNER, November 8, 1859. Application filed August 4, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,067.—Fastening Metal Hoops on Cotton-Bales.—Granted to JOHN T. BUTLER, November 15, 1859. Application filed August 7, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,090.—Machines for Folding Paper.—Granted to CYRUS CRAMMOND, JR., November 15, 1859; and reissued August 12, 1873. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,097.—Electro-Magnetic Telegraphs.—Granted to MORSE G. FARMER, November 15, 1859; and reissued December 16, 1872. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,126.—Billiard-Table Cushions.—Granted to GEORGE D. SEARS, November 15, 1859; and reissued April 8, 1873. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,135.—Portable Pumps.—Granted to WILLIAM T. VAIL, November 15, 1859; reissued February 28, 1871. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,136.—Mode of Advertising.—Granted to EDWARD WIRES, November 15, 1859. Application filed August 12, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,139.—Pumps.—Granted to WILLIAM WRIGHT, November 15, 1859. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,145.—Cocks for Water-Closets.—Granted to DARIUS WELLINGTON, November 15, 1859. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,147.—Machine for Bundling Kindling-Wood.—Granted to WILLIAM L. WILLIAMS, November 15, 1859; and reissued October 4, 1870. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,177.—Rubber Belting.—Granted to DARIUS C. GATELY, November 22, 1859. Application filed August 16, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,178.—Making Rubber Belting.—Granted to DARIUS C. GATELY, November 22, 1859. Application filed August 16, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,202.—Manufacture of Paper-Pulp.—Granted to JOHN B. PALMER and GARDINER HOWLAND, November 22, 1859; and reissued July 2, 1867. Application filed August 20, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,242.—Water-Closet Basins.—Granted to WILLIAM BOCH, SR., November 29, 1859. Application filed June 10, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,244.—Machines for Registering Music.—Granted to HENRY F. BOND, November 29, 1859. Application filed August 22, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,262.—Journal-Boxes for Saw-Mill Carriages.—Granted to WM. M. PERRY, November 29, 1859. Application filed August 30, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,276.—Manufacture of Rubber Hose.—Granted to THOMAS J. MAYALL, November 29, 1859; and reissued October 22, 1872. Application filed August 19, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,291.—Molding for Metal Casting.—Granted to JOHN P. BRADENBAUGH, November 29, 1859. Application filed August 15, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,397.—Nursing-Bottles.—Granted to FRANCIS J. LA FORME, November 29, 1859, and reissued January 14, 1868. Application filed August 27, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,329.—Boot and Shoe Tips.—Granted to NEWMAN SILVERTHORN, November 29, 1859; reissued September 2, 1862, and August 4, 1868. Application filed August 26, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,399.—Water-Wheels.—Granted to JAMES P. COLLINS, December 6, 1859; reissued June 12, 1860, and May 13, 1873. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 12, 1873.

26,401.—Mode of Applying Sulphurous-Acid Gas in the Defecation of Saccharine Liquids.—Granted to NANCY POINDEXTER BRASHEAR, executrix of ROBERT B. BRASHEAR, deceased, December 6, 1859, and reissued October 22, 1869. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,419.—Seed-Planters.—Granted to WILLIAM BLESSING, December 13, 1859. Application filed August 27, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,454.—Dispensing with Switches on Railroads.—Granted to WILLIAM WHARTON, Jr., December 13, 1859, and reissued April 3, 1860. Application filed September 13, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,484.—Platform-Scales.—Granted to THADDEUS FAIRBANKS, December 20, 1859. Application filed September 12, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,486.—Pipe-Melding.—Granted to JOHN FERTH and JOHN INGHAM, December 20, 1859, and reissued April 28, 1863. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,513.—Nail-Plate Feeder.—Granted to JOHN NEWELL, December 20, 1859. Application filed September 16, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,564.—Top-Props for Carriages.—Granted to GEORGE COOK and HANNIBAL I. KIMBALL, December 27, 1859. Application filed August 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

27,539.—Manufacture of Gun-Barrels.—Granted to JAMES H. BURTON, March 29, 1860, and antedated to September 29, 1859; reissued December 26, 1871. Application filed July 1, 1873. Hearing September 16, 1873.

EXTENSIONS GRANTED.

15,861.—Improvement in Machines for Making Nuts, granted to WILLIAM E. WARD, October 7, 1856; reissued January 1, 1867.

Claim.—1. I claim the two punches, arranged side by side and operated substantially as described, for punching the central hole, cutting off the blanks from the bar, and discharging the same, substantially as described, in combination with the two holes or two dies, so that a hole is punched in the bar for another nut during the continued motion of the punch to discharge the nut which was cut off during the previous part of the same motion.

2. I claim the punching and cutting mechanism, or either, and with the mandrel, or its equivalent, for entering the central hole of the nut-blank, the employment of the spring-jaws, or the equivalent thereof, for transferring the nut-blank from the die to the mandrel, and there holding it until the mandrel enters the hole, substantially as described.

3. I claim the mandrel for holding the nut-blank, in combination with the swaging-surfaces, by which the faces of the nut are formed, substantially as described.

4. I claim the mandrel for holding the nut-blank, substantially as described, the hammers for hammering or swaging the edges of the nut, substantially as described.

5. I claim the swaging-surfaces for forming the faces of the nut, with the hammers for forging the edges of the nut, substantially as specified, and for the purpose set forth.

25,434.—Improvement in Cotton-Scrapers, granted to JONATHAN H. MITCHELL, September 13, 1859.

Claim.—1. The combination and arrangement of the beam *d*, chair *c*, mold-board *a*, and share *b*, when operating substantially as herein set forth.

2. The adjustable and changeable share *b*, when constructed, arranged, and operating substantially as and for the purpose set forth.

25,395.—Improvement in Hooks for Boots and Shoes, granted to SIMEON DODGE, Jr., and BENJAMIN POTTER, Jr., September 13, 1859.

Claim.—A heel having a concave seat and a flat tread, with its rises united by cement, as set forth.

25,442.—Improvement in Portable Furnaces, Boilers, and Steamers, granted to DANIEL R. PRINDLE, September 13, 1859; reissued December 13, 1859, numbered 864; reissued October 8, 1872, numbered 5,095.

Claim.—1. An apparatus in which one of its parts is capable of use either as an open caldron, or as part of a boiler for generating steam, substantially as and for the purpose specified.

2. An apparatus composed of two metallic vessels which, when combined, shall form a boiler for the generation of steam, and when separated shall be capable of use as cauldrons, substantially as and for the purpose shown.

3. The means employed for securing together the flanges of the sections, consisting of the clamps D, *d*, and *d'*, embracing the same and bearing upon the inclines of the flanges *b'*, substantially as set forth.

4. In combination with the steam-generator A and B, the supporting-casing and fire-box C, substantially as and for the purpose shown and described.

Disclaimer filed September 12, 1873.

Disclaims fourth clause of claim, as above set forth.

25,473.—Improvement in Scales, granted to ANDREW TURNBULL, September 13, 1859.

Claim.—1. The combination of the beam-lever F, with scoop-platform C attached, with the spring K, rack J, adjustable or fixed pinion *s* with index or indexes N attached to its arbor *d*, and traversing over a graduated plate or plates, M, substantially as and for the purposes set forth.

2. Attaching or suspending, loosely, the rack J to the beam-lever F by means of a pivot, *f*, and having a spring, *g*, acting on said rack in order to keep the same in gear with the pinion *s*, for the purpose set forth.

3. Attaching the lower end of the spring K to the traverse-bar *h*, by means of the screw L and nut *i*, in order to regulate the tension of the spring and preserve its uniformity, substantially as and for the purpose set forth.

4. In combination with the beam-lever F, spring K, and indexes N, connected with the beam-lever, the stop *j* on the arbor B*, for the purposes specified.

DISCLAIMERS FILED.

24,442.—DANIEL R. PRINDLE.—Portable Furnace, Boiler, and Steamer.—Reissue No. 864, dated September 13, 1859; reissue No. 5,095, October 8, 1872. Disclaims:

"That part of the claim which is in the following words, to wit: '4. In combination with the steam-generator A and B, the supporting-casing and fire-box C, substantially as and for the purpose shown and described.'"

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date September 9, 1873.]

6,874.—Sad-Iron Handles.—JOSEPH HARGRAVE, Cincinnati, Ohio. Application filed August 2, 1873. Term of patent 14 years.

6,875.—Chairs.—GROVE M. HARWOOD, Troy, and ROBERT WOOD, West Troy, N. Y., assignors to "THE HENRY I. SEYMOUR CHAIR MANUFACTORY," same place. Application filed July 26, 1873. Term of patent 7 years.

6,876.—Lamp-Stand.—WILLIAM H. PERKINS, Meriden, Conn., assignor to EDWARD MILLER & Co., same place. Application filed June 4, 1873. Term of patent 3½ years.

6,877.—Fire-Place Stove.—SAMUEL B. SEXTON, Baltimore, Md. Application filed August 4, 1873. Term of patent 14 years.

6,878.—Inkstand.—BLOOMFIELD BROWER, New York, N. Y. Application filed August 9, 1873. Term of patent 3½ years.

6,879.—Inkstand.—BLOOMFIELD BROWER, New York, N. Y. Application filed August 5, 1873. Term of patent 3½ years.

6,880.—Ruche-Holder.—DAVID KIRCH, New York, N. Y. Application filed August 4, 1873. Term of patent 3½ years.

6,881.—Monument.—MARTIN VAN BUREN MITCHELL, Zanesville, Ohio. Application filed August 20, 1873. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date September 9, 1873.]

1,442.—Licorice-Paste.—DANIEL V. ARGUIMBAU, Brooklyn, N. Y. Application filed August 30, 1873.

"G. C."

1,443.—Whisky.—DERBY & DAY, St. Louis, Mo. Application filed August 30, 1873.

"A five-pointed star in the center of the barrel-head, intersected by the name 'Derby and Day,' and having a red or dark colored outer border surrounding a light-colored ground."

1,444.—Watch-Cases.—JOHN C. DUERER, Cincinnati, Ohio. Application filed August 27, 1873.

"An inclined anchor upon a shield."

1,445.—Hat.—J. S. FARNUMBATHER & Co., Danbury, Conn. Application filed August 27, 1873.

"the fac-simile signature 'J. M. Bailey' and the appended words 'The Danbury News Man,' and the portrait."

1,446.—Medicines.—FENTON MANUFACTURING COMPANY, Cleveland, Ohio. Application filed August 28, 1873.

"the arms of the Isle of Man surrounded by the garter, upon which is inscribed the words 'Fenton Manufacturing Company.'"

1,447.—Goods.—D. M. FERRY & Co., Detroit, Mich. Application filed July 14, 1873.

"A square and inclosed circle, within which is printed the name of the vegetable."

1,448.—Whisky.—WILLIAM M. FLIESS & Co., New York, N. Y. Application filed August 23, 1873.

"the words 'Gold Seal Whiskey' and the letter 'F.'"

1,449.—Hosiery.—SMITH & Co., Balbriggan, Ireland. Application filed September 2, 1873.

"the figure of a stocking-leg on a shield."

1,450.—Gold Rings.—THE DUERER WATCH-CASE MANUFACTURING COMPANY, Cincinnati, Ohio. Application filed August 27, 1873.

"A numeral indicating the fineness of the gold, and an inclined anchor upon an oblong hexagonal shield in panel.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date September 9, 1873.]

ORIGINAL PATENTS.

142,547.—Sectional Horseshoe.—JOHN D. ABBOTT, Manchester, N. H., assignor to AARON W. SMITH, same place. Application filed May 6, 1872.

The side plates are hinged together and kept in position and the pressure distributed by a toe-piece with tenons.

Claim.—1. The combination of the side plates of a jointed horseshoe with a toe-plate having the curved tenons *e* loosely fitted to corresponding recesses in the ends of the side plates, whereby the strain may be communicated from one side plate to the other, substantially as described.

2. The improved sectional horseshoe composed of side plates, which are fitted and adjusted to each other at heel and toe, substantially as described, and which are limited in their capacity for movement, in the manner and for the purpose specified.

3. The matched tenons and mortises *e* and *f*, in combination with the side plates of a sectional shoe, substantially as and for the purposes specified.

142,548.—Cutter-Head for Molding-Machines.—JOHN ALLOWAYS, Decatur, Ill. Application filed July 30, 1870.

The cutting-tools are secured in the head by means of a groove in the spindle, into which one edge of the tool enters, the other edge being held in a corresponding groove in an adjustable collar.

Claim.—The combination of the grooves *f f* in the spindle F with the movable collar I, grooves *i i*, and nut H, so as to secure the knives K K in said grooves, substantially as described.

142,549.—Bed-Bottom.—PETER ANDERSON, Chicago, Ill. Application filed March 14, 1873.

To prevent the sagging of the springs and upper portion of the bed-bottom, cables of wire or cord are stretched diagonally from top to bottom, crossing one another, at which point, as also at the sides and ends, they are tightened by rubber springs.

Claim.—The frames A B and springs D, in combination with the cables E and springs *a*, substantially as and for the purposes specified.

142,550.—Process of Disintegrating Woody Fiber for Paper-Pulp.—THOMAS B. ARMITAGE, New York, N. Y. Application filed July 13, 1872.

The chips are first saturated with an alkaline liquor. The superabundant liquor having been poured off, they are then put into a rotating closed vessel, and, steam being introduced, the same by its pressure permeates the wood, disintegrates the same, and by rapidly drying the fiber prevents discoloration.

Claim.—The within-described process of disintegrating woody fiber, wherein the alkali-saturated mass, in a revolving vessel, is subjected to the direct action of steam under pressure, substantially as and for the purposes set forth and described.

142,551.—Motor for Driving Sewing-Machines.—RICHARD H. ATWELL, Baltimore, Md. Application filed June 14, 1871.

An oscillating piston is connected through its main shaft, by a lever, to a fly-wheel, which, at the completion of each stroke, reverses an oscillating valve, causing a fluid under pressure to act alternately upon either side of the piston. The valve-rod is constructed in two parts in such manner as to take up or allow for the excess of motion in the fly-wheel over that which may be used to operate the valve.

Claim.—A combination of piston-chamber, piston, valve, valve-box, piston-shaft, lever, connecting-rod, and valve-gear, to produce a motor, substantially as and for the purpose specified.

142,552.—Device for Sharpening Needles.—RUSSEL S. BARNUM and HARRY C. GOODRICH, Chicago, Ill.; said BARNUM assignor to said GOODRICH. Application filed January 6, 1873.

A friction-wheel is secured to a hollow spindle, in which is placed the article to be sharpened. The spindle revolves on bearing attached to the handle. Motion is given to the wheel by holding it against a moving surface.

Claim.—The device herein described, consisting essentially of the handle C, hollow spindle *d*, and wheel *b*, constructed and arranged to operate substantially as and for the purpose herein specified.

142,553.—Shook-Holder.—JOHN I. BERRY, Williamsport, Pa. Application filed August 23, 1873.

The cross-bars are provided with screws which are driven into the shooks after they are arranged side by side in confluent numbers to form one side of a box or the head of a cask, thus holding them together while being reduced to the form required.

Claim.—The shook-holder described, wherein the several parts are constructed and arranged substantially as set forth.

142,554.—Ornamenting Felt Skirts, &c.—JOB W. BLACKMAN, Brooklyn, N. Y. Application filed July 27, 1872.

Claim.—The improved process of ornamenting felt skirts and analogous goods, consisting in printing or otherwise impressing upon the same figures of any desired pattern in color, whereby the surfaces so printed are rendered non-absorbent, then printing figures on the ground so formed with sizing, and, finally, flocking the sized figures with flock, substantially as described, and for the purpose set forth.

142,555.—Elevator.—ERASTUS BOYDEN, Lowell, Mass. Application filed June 3, 1873.

The elevator is provided with a table and trough to receive the cotton laps, and remove therefrom the metal lap-roll on which the lap is formed, and insert the wooden bar which supports the laps while being transported on the elevator, which is provided with an automatic starting and stopping device, thereby dispensing with hand-labor for this purpose. A set of double or reverse hooks or carriers is provided, so that the rods or bars which support the laps may be transported down opposite the ascending laps, to be again used.

Claim.—1. In combination with the elevator A, the automatic stopping device, consisting of the arm *a* and belt-slipper *c'*, connected by the rod *c'''*, substantially as described.

2. In combination with the elevator A, the automatic starting device, consisting of the trough *c'*, rod *c''*, rod *c'''*, provided with its arm *c* and belt-shipper *c'*, substantially as described.

3. In combination with the elevator A, the table C for receiving the lap while the lap-roll is being removed therefrom, substantially as described.

4. The trough *c'*, in combination with the table C, placed at a proper height to receive the lap-roll from the lap upon the table, substantially as described.

5. The double or reverse hooks *e e*, attached to the elevator A, so as to transport the rods *a* on the opposite side from the laps, substantially as described.

142,556.—Axle-Box for Vehicles.—WILLIAM A. CLARK, New Haven, Conn. Application filed December 6, 1872.

Claim.—1. A wrought-iron steel-lined box for carriage-wheels, constructed substantially as described.

2. The collar D, composed of a separate piece and secured upon the enlarged end of the box, substantially as set forth.

142,557.—Try-Square.—WILLIAM H. COOPER, Lowell, Mass. Application filed June 9, 1873.

A detached straight-edged blade is arranged to be set in various positions along the blade of a common try-square, by means of a yoke and clamp-screw.

Claim.—The combination of the supplementary blade C, provided with the yoke D and thumb-screw E, with a square, A B, as and for the purpose herein described.

142,556.—Elevated Oven Attachment for Stoves.—GEORGE CRAIGE and JOHN W. BLOSS, Fairfield, Iowa. Application filed February 1, 1873.

By means of pipe thimbles in its lower and upper sides, this oven can be readily attached to a stove-top. It has an upper and a lower chamber, the one opening in front and the other opening in the rear, and both provided with suitable doors. The heat can be regulated by the dampers.

Claim.—The hereinbefore-described supplemental oven, consisting of the external casing A, the compartments C and D, the doors E and H, and the dampers F, F', and I, substantially as and for the purpose specified.

142,559.—Rotary Engine.—JOSEPH E. CASE, Charlestown, Mass. Application filed May 26, 1873.

Two cylinders on and at right angles to the shaft receive and exhaust steam through a rotary valve. Friction-wheels on each end of each piston-rod bear on stationary cams placed vertically around the cylinders to revolve them.

Claim.—1. The combination of the cylinders A A', arranged at right angles with each other and forming part of the main shaft G, the bearings F F' with valve-seat, pistons A'' A'', cams B, cylinder-head c, and valves D E, all substantially as and for the purposes herein set forth.

2. The valve D E made in two parts, united as described, and provided with an annular passage, O, between them, and with an uneven number of inlet and exhaust passages, all as and for the purposes herein set forth.

3. The combination of the valves D E, jam-nuts *m m*, lever and handle D', studs I I, and projections I' I' with the cylinder and its parts, substantially as and for the purposes herein set forth.

4. The combination of the valve-seat, the stud S, valve D, valve E, friction-bar N, and the jam-nuts *n n*, substantially as shown, and for the purposes set forth.

142,560.—Machine for Threading Screw-Blanks.—EDWARD CROFT, Waterbury, Conn. Application filed August 12, 1873.

The screw-blanks are threaded by being rolled between the two die-faces, the configuration of which is that described in the claim, the increased pitch of the grooves corresponding to the elongation of the blank.

Claim.—1. The combination of two converging dies having longitudinal indenting-ridges of progressively increasing pitch, substantially as before set forth.

2. The combination of two converging dies having longitudinal ridges of progressively increasing pitch, and also profiles which are concave at the sides which correspond with the point of the screw, substantially as before set forth.

142,561.—Wool-Drying Frame.—EDWARD DUFFEE, Haverhill, Mass., assignor to himself and HENRY M. BRAGG, same place. Application filed May 5, 1873.

Claim.—As an improved article of manufacture, the above-described wool-drying frame, consisting of the bars A, A^1, A^2, and A^3, grooved longitudinally, and having thin strips of wood or rattan reeved through the same, and crossed or interlaced in manner substantially as shown.

142,562.—Hand-Lever Attachment for Steam-Pumps.—OSCAR T. RAMER, Norwalk, Conn. Application filed March 3, 1873.

Claim.—The combination of the detachable hand-lever for direct-acting steam-pumps, arranged horizontally between the two cylinders and the tappet-arm, substantially as described.

142,563.—Fire-Proof Shutter.—ABRAHAM GOTTLIEB, Chicago, Ill. Application filed July 15, 1873.

A double-walled ventilating iron shutter, divided into vertical flues by channel-bars, and perforated to allow of the circulation of air.

Claim.—1. A double-walled iron shutter divided into cells by vertical channel-bars, substantially as herein described and shown.

2. In a exterior double-walled shutter, constructed substantially as herein described, the perforations *a* in the bottom bar, the vertical channel-bars, and the covering-plates, when arranged in different horizontal planes, substantially as described.

142,564.—Friction-Clutch.—JOHN J. GRANT, Greenfield, Mass., assignor to himself, SOLON L. WILEY, and CHARLES P. RUSSELL, same place. Application filed August 16, 1873.

The segmental friction-pads are contracted or expanded by means of shafts, upon the ends of which are cut right and left hand screws; these screws are fitted to work in screw-holes cut in the expansible friction-pads; to these shafts are secured curved levers, which are operated by a sliding conical hub.

Claim.—1. The rim *e* of the pulley, expansive frictional pads *a*, and shafts *i*, when combined together, as and for the purposes described.

2. The shafts *i*, upon the ends of which are cut right-handed and left-handed screws, when combined, as herein described, with the segmental drivers or frictional pads *a*, as herein described.

3. The combination of cylindrical shaft *i*, lever *l*, and set-screw *f*, whereby the position of the shaft *i* may be accurately adjusted.

4. The combination of the carrier *f*, provided with ears *h*, levers *l*, frictional pads *a*, spring *p*, and pulley B, as and for the purposes described.

142,565.—Strap-Fastening for Trunks, &c.—WILLIAM GRINGTED, Washington, D. C. Application filed February 4, 1873.

Claim.—The lever B, in combination with the straps D D, attached at C C, and the buckles attached at E E, substantially as and for the purpose set forth.

142,566.—End-Gate for Wagons.—FRED. GRUNDY, Morrisonville, Ill. Application filed March 19, 1873.

The hooked ends of an arched rod are secured by vertical rods, and a snap-hook is attached to the sides of the wagon-body.

Claim.—In combination with an end-gate of a wagon, the rods D D, having hooks *e e e e*, rods G A, and spring-catch B, substantially as and for the purpose set forth.

142,567.—Stove-Pipe for Vessels.—JOHN HALL, Quincy, Mass., assignor to LOUISE I. HALL, same place. Application filed July 23, 1873.

The pendent tubular weight is suspended in the section of pipe immediately beneath the deck from the diametric cross-bar in the section above. This upper section stands on the flange of a tubular supporter, which passes through the deck and makes connection between the section above and that below. When the upper section is accidentally deflected by the wind the sliding tubular weight tends to restore it to its proper position.

Claim.—The pendent tubular weight B and its supporting-chain *g*, and the perforated diametric bars *b c*, arranged and combined with the two sections of stove-pipe and the supporter A thereof, all substantially as and to operate as specified.

142,568.—Tool-Handle.—WALTER B. HILL, Battle Creek, Mich. Application filed June 24, 1873.

The handle is secured to the tool by clips and straps fastened by gib and key.

Claim.—1. The combination of the clip H, the tool A, provided with a recess, *a*, upon its inner side, and the strap C having its head constructed to fit into said recess, substantially as described and shown.

2. The combination of the clip H, the tool A, the strap C and the blocks G and E, the latter provided with the lips *f' f'*, substantially as described and shown.

142,569.—Cut-Off for Cisterns.—GEORGE W. HOWELL, Covington, Ky. Application filed June 19, 1873.

The valve is formed of two pieces of metal joined at their upper ends and open at the bottom to rest upon each side of a ledge between the branch pipes, upon which they turn as the valve is opened or closed, making a water-tight joint at the bottom of the chamber.

Claim.—The triangular shell or casing A, having the radiating pipes B C D and slot or opening *b*, as shown, in combination with each other and with the valve F, composed of the plates I H and handle E, and the vertical ledge or rib Y, all constructed and arranged for operation substantially as described.

142,570.—Wrench.—WILLIAM J. INNS, Oil City, Pa. Application filed April 18, 1873.

The lower portion of the collar that supports the operating-screw is provided with openings to allow its compression into the recesses of the main bar where it is held by an additional ferrule.

Claim.—1. The collar D *d*, having one or more openings, H, for the purpose of reducing the diameter of the same, so as to firmly clasp bar A, as set forth.

2. The collar D, ferrule E, bar A, in combination with handle B, for the purpose set forth.

142,571.—Furnace for the Manufacture of Oxide of Zinc.—JOHN G. LANG, Pittsburg, Pa. Application filed August 16, 1873.

The arrangement of the fire and working chamber is such that the heat is applied first to the under side of the spelter and then to the upper surface.

Claim.—The furnace, hereinbefore described, consisting of the fire-chamber E, the working-chamber C provided with work-holes *f* and flue D, and the condensing-chamber B having a collecting and condensing cylinder, M, the several parts being combined and relatively arranged as and for the purpose specified.

142,572.—Self-Acting Coal-Car Brake.—JOHN D. LEONARD, Cleveland, Ohio, assignor of one-half his right to RICHARD R. HOTT, same place. Application filed June 26, 1873.

One axle of the truck is secured to pillar-blocks, which slide on friction-rollers. The brake-rubber is arranged between the forward and hind wheel. The movable axle is held out of contact with the brake-rubber by means of a lever and ratchet, while on a descending grade the lever is released, the weight of the car forces the wheels of the forward axle against the brake-rubber, and stops the car.

Claim.—The combination and arrangement of the pillar-block D, having slots *d d*, the bar *f*, having friction-rollers *g g*, the brackets A A, the lever K, push-bar L, brake-blocks I I, and bar J, ratchet *m*, with the axles B B, wheels C C, and body A of the car, substantially as shown and described, and for the purpose set forth.

142,573.—Method of Treating Glass-Molds.—JAMES LYDIATT, Montreal, Canada, assignor to NEW ENGLAND GLASS COMPANY, Boston, Mass. Application filed May 26, 1873.

Applies plumbago to formative surface, which is then polished.

Claim.—The application to the formative surface of a glass-forming mold of one or more coatings of plumbago, and subsequently treating each in the manner and for the purpose set forth.

142,574.—Machine for Making Staples.—WESLEY MALICK, Erie, Pa. Application filed September 1, 1873.

A hook at the lower end of a curved arm, attached to and reciprocating with the movable cutter, supports the wire at a point between the feed-rolls and the cutter. A cam, secured to the stationary cutter-block, prevents, by its square edge, lateral displacement of the wire while being severed; and the bending-hook is made to ascend after drawing the blank downward between the walls of the die.

Claim.—1. The rod-carrier M N, when attached to the movable knife W, as shown and described.

2. The combination of the plunger I, movable knife W, rod-carrier M N, with the bed-knife D, and guide-cap C, as shown, and for the purposes named.

3. The combination of the bending-plunger F, eccentric P, pin X, and slot Y, and finger-pin G, with the jaw K and bed-piece B, as shown, and for the purposes mentioned.

142,575.—Jeweler's Show-Case.—MORRIS MARTIN and JOHN A. STUDNS, Pittsburg, Pa. Application filed July 3, 1873.

Claim.—1. A ring-case, *a*, the ring-slots of which are formed by a rigid and an elastic slat, substantially as and for the purposes described.

2. The arrangement, under each cross-series of ring-pockets, of a slide, *g*, provided with hooks *r*, and a spring, *s*, which causes it to spring forward so that the hooks shall engage and secure the rings in their pockets, substantially as described.

142,576.—Tile-Machine.—CALVIN J. MERRILL, Upper Alton, Ill. Application filed August 4, 1873.

The faces of the wheels have a series of molds. In the bottom of each mold, in the lower wheel, is placed a metallic plate of the same form as the die, whereby the pressed article is released from the die by the raising of said plate.

Claim.—1. In tile-machines, in the wheel C, the combination of a steam-chamber, *a*, tube *b*, and a hollow shaft, G', and the dies G, substantially as and for the purpose set forth.

2. The tongue I', rod d, bar H, in combination with the die G and cam B, substantially as and for the purpose set forth.

3. In a wheel carrying molds or dies, the combination of a hollow cylinder-shaft and connecting-pipes and chambers for heating such molds or dies, substantially as and for the purpose set forth.

142,577.—Dredger.—JOHN F. MOSES, Oshkosh, Wis. Application filed February 24, 1872.

The bow of the vessel is of a ram-shape, the concavity being upward. Upon this are mounted the dredging-wheels, which are of fan-propeller form, rotated by means of steam-machinery carried on the vessel.

Claim.—The dredging-vessel A, formed with upward-receding concave bows, in combination with two or more propeller-blade wheels adapted to be mechanically rotated, as described, for the purpose of removing sand-bars, substantially as specified.

142,578.—Mechanical Movement.—WILLIAM OLIVER, Haynesville, La. Application filed July 21, 1873.

A shaft bears eccentrics, which are set directly opposite and are provided with straps that connect with the ends of a rocking lever, to which pawls are attached. As the lever rocks the pawls alternately catch in the links of the chain.

Claim.—A mechanical movement consisting of the eccentrics D D, straps E E, lever F, pawls I I, and chain J, when the same are combined and arranged to operate as and for the purposes described.

142,579.—Wagon-Brake.—WILLIAM F. OSBORN, Burlington, Kans. Application filed March 29, 1873.

The brakes can be applied to the front and hind wheels at the same time, and are operated by the movement of the wagon-body.

Claim.—The combination of the bar A, connected to the reach by the rods *g*, the bar A', connected to the bolster by the rods E, the reach D, and bolster C, the whole adapted to lock the fore wheels and the hind wheels at the same time, substantially as set forth.

142,580.—Vegetable-Cutter.—GEORGE W. PARKER, Bellaire, Ohio, assignor of one-half his right to C. L. POORMAN, same place. Application filed May 1, 1873.

The hopper is divided into sections by radial partitions, meeting at a central shielding-tube for the cutter-shaft.

Claim.—1. The combination of the bottom or ring A, standards C C C, radially-armed top frame D, sectional hopper E, and radially-armed bearing F, constructed and arranged substantially as and for the purpose herein specified.

2. The shaft-shielding tube I and radial partitions M M M, in combination with the hopper or cutting-box E and cutter-wheel K, substantially as and for the purpose herein specified.

142,581.—Revolving Horse-Rake.—GEORGE PHILLIPS, Sr., Buchanan, assignor to JAMES M. PERRINE, Sobiesky's Station, Ohio. Application filed May 26, 1873.

A spring-clasp attached to a hand-lever, and which spans either of two teeth, causes the revolution of the rake.

Claim.—The spring clasping-fingers L for embracing the rake-teeth, and curved extension M for lifting the rake, in combination with the lever F and pivoted draft-connection O, all constructed and arranged as and for the purpose specified.

142,582.—Machine for Mining Coal.—FRANCIS M. WRIGHT, Danville, Ill. Application filed February 21, 1873.

The slide bearing the drills has lateral reciprocating motion by means of the cam, connected with the driving-wheel, which gives to the sleeves holding the drills rotary motion at the same time, thus cutting a long groove in the coal.

Claim.—1. In the machine for mining coal or other minerals, a slide, carrying a gang of drills, which receive a reciprocating and a rotary motion by the action of the cam, substantially as set forth.

2. The sleeves 5 6 in combination with operating mechanism for feeding the drills forward, substantially as shown.

3. The combination of the slide 4, carrying the drills, with the eccentric and shaft 1, substantially as described.

4. The castings *c*, having the slots *a* for the adjustment of the drills, in combination with the castings *g*, substantially as specified.

5. The combination of the shafts 1 *a*, wheels 1 *u u u'*, eccentric 3, rod 4, slide 2, and gearing to communicate motion to the drills, substantially as set forth.

6. A mining-machine in which the various parts are arranged and combined for operation, substantially as shown and described.

142,583.—Coupling for Connecting Cradles to Rocking-Chairs.—JAMES REEVES, Cincinnati, Ohio. Application filed May 31, 1873.

One socket is attached to the cradle and another to the chair. A straight rigid bar is pivoted to the cradle-socket so that when the chair and cradle are disconnected it can be turned to a perpendicular position; the other end of the bar is detachably connected to the socket of the rocking-chair by means of a removable pin.

Claim.—The within-described coupling device for attaching rocking-chairs to cradles, which device consists of the sockets C D *d d' G g g'* H, rigid bar or link E *e*, and removable pin F, substantially as herein described and set forth.

142,584.—Splitting-Gage.—THOMAS RICE, Boston, Mass. Application filed March 6, 1873.

The material is severed by a rotating knife, C, on the end of the spindle *c*, inserted in a gage-bar, B. The fence D regulates the depth of cut.

Claim.—As a new article of manufacture, the splitting-tool, as described, consisting of the revolving knife C, the adjustable vertical gage-plate D, the rectangular bar B, cleat E, block G, and handle A, all constructed and arranged substantially as and for the purpose set forth.

142,585.—Saw Filing and Setting Machine.—NOBLE G. ROSS, Mitchellville, Iowa. Application filed January 27, 1873.

Every revolution of the file will sharpen the teeth on one side and at the same time move the saw so that every alternate tooth is brought under the striking-hammer. To file and set each side of the saw a right-and-left-hand file is used.

Claim.—The combined saw filing and setting machine composed of the frame *a a a*, the file *b b*, the shaft *s s*, the cam *g*, the driving mechanism *d f*, the adjustable rest *h h*, the holders *m m*, and the hammer B, substantially as described, and for the purposes specified.

142,586.—Extension-Table.—JOHN M. SACKMAN, Ridgeville, Ind., assignor to himself and JOSEPH D. MAHON, same place. Application filed June 7, 1873.

Claim.—An extension-table composed of two semicircular tables with intervening removable leaves supported by detachable side-rails fastened by means of dovetail locks, said semicircular tables being each self-supporting, whereby they may be used independently as side-tables or together as a center-table, substantially as described.

142,587.—Car-Wheel.—JOHN K. SAX, Pittston, and GEORGE W. KEAR, Kingston, Pa. Application filed December 16, 1872.

Improvement on patent No. 68,743, April 6, 1869; reissued (No. 3,954) May 3, 1870.

Claim.—A car-wheel having a cast-iron body welded directly, and without any intervening band of wrought-iron or the like, to a cast-steel tire, substantially as described.

142,588.—Compound Metal-Working Machine.—HIRAM B. SEVEY, Vienna, Me. Application filed July 16, 1873.

A movable carriage, to which are attached the movable portions of a horseshoe-bender, a vise, a metal-bender, an axle-tree bender, rod-cutter, shears, angle-iron bender, and gearing of gumlines, operated by a combination of levers.

Claim.—The movable carriage *f'* operated by means of the hand-lever *a*, connecting-rod *b*, cam *d*, and spring *e*, as herein described, in combination with the vise, the horseshoe-bender, the metal bender, the axle-tree bender, the round or bolt iron cutter,

the shears, the bender to bend iron into a V or square shape, and the punchers, as herein set forth.

142,589.—Heater for Steam Fire-Engines.—WILLIAM F. SHAW, Boston, Mass., assignor to himself and DAVID SHARP, same place. Application filed August 12, 1873.

The water-jacket is surrounded by a chamber containing heated air, supplied from the combustion-chamber, at the bottom of which there is attached an annular trough for intercepting sparks or cinders.

Claim.—1. The combination of the external heating-chamber K and one or more pipes, b, with the coil F and water-holding vessel or space E, arranged and connected, as described, all being for use and to operate essentially as set forth.

2. The water-heater, as provided with the intercepting-trough L arranged in it, as and for the purpose substantially as specified.

142,590.—Horseshoe.—AARON W. SMITH, Manchester, N. H. Application filed February 19, 1873.

A metallic wearing-sole is attached to a permanent shoe with an elastic cushion interposed. The cushion is provided with marginal flanges to protect the edges of the shoe and prevent injury by interference. The calks are attached to the shoe by countersunk screws, which turn into wood or metal nuts to facilitate removing them in case of fracture.

Claim.—1. The main shoe A, supplemental shoe or wearing-sole B, and interposed elastic cushion C, when the same are united by screws e and bosses g, in combination with countersunk perforations p, receiving the said bosses, so as not to obstruct the yielding movement of the sole, as set forth.

2. The combination of a flexible shoe, A, a slotted supplemental shoe, B, and an interposed cushion, C, as herein described.

3. The edge-guard r, combined with the cushion C, as described, for the purposes specified.

4. The plugs x, constructed and employed substantially as described, in combination with screws y for attaching the calks.

5. The combination of the flanges w, bosses v, countersunk screws y, and plugs x, substantially as described, for the purpose set forth.

6. The rivet-shanks z of the calk D, headed on the upper side of the removable supplemental shoe B, as described, for the purpose specified.

142,591.—Machine for Cutting Veneers.—JOHN A. SQUIRES, New York, N. Y. Application filed June 21, 1873.

The knife C is securely fastened in the binder B B', which, with the knife, can be removed for the purpose of grinding.

Claim.—The knife-bed A, provided with a groove, E, in combination with a knife-binder, B B', to which the knife is attached, as and for the purposes shown and described.

142,592.—Loom-Picking Mechanism.—WILLIAM STEARNS, Manchester, N. H. Application filed July 28, 1873.

A lug cast on the rail extends up from the rail through an opening in the rocker, and a lug from the rocker down through the rail, the latter lug being made to embrace and support the lower end of the picker-stick, which is extended below the rail. The stick is brought back by a coiled spring placed under the rail, and the stud which carries the spring is provided with a cup-flange to protect it from dust and dirt.

Claim.—1. The combination and arrangement of the lug H, cast on the rail and entering the hole in the rocker, with the lug J on the rocker working in the hole in the rail, the whole being constructed and operating as described, and for the purpose set forth.

2. In combination with the picker-staff extended down through the rail, the lug J on the rocker D, extended through the rail and embracing and supporting the picker-staff I, substantially as described.

3. In combination with the coiled spring P and the picker-staff I, the stud Q, provided with the cup-flange, as and for the purpose specified.

142,593.—Harrow.—REUBEN L. TAYLOR, Golden Prairie, Iowa. Application filed July 2, 1873.

Constructing harrows by placing straight bars side by side and securing them by interposing short pieces; it is further secured by placing a diagonal bar across the frame.

Claim.—The combination and arrangement of the main bars A A, diagonal cross-bars B B, with the short bars C C and the main diagonal bar D, carrying teeth at each end, substantially as described.

142,594.—Paving Composition.—ALBERT THIELE, Tickfaw, assignor of one-half his right to LOUIS SCHORMANN, New Orleans, La. Application filed May 14, 1873.

Bituminous or asphaltic clay, four hundred parts; coal-tar, fifteen parts; resin, ten parts; chalk, twenty parts; gravel, forty parts; sharp sand, sixty parts. Mixed and combined by heat, and applied in a plastic condition.

Claim.—The improved composition pavement, composed of the ingredients and about in the proportions stated, for the purposes set forth.

142,595.—Composition Mastic.—ALBERT THIELE, Tickfaw, assignor of one-half his right to LOUIS SCHORMANN, New Orleans, La. Application filed July 3, 1873.

Compound of forty parts clean sharp sand, one hundred parts of chalk, fifteen parts tallow, and six parts of tar.

Claim.—The composition herein described, when composed of the ingredients combined in and about the proportions stated, for the purposes set forth.

142,596.—Railroad Cattle-Guard.—ISAAC C. TURNBOW, Roodhouse, and ANDREW REEVE, Pike county, Ill. Application filed April 29, 1872.

The beams L L', hinged at one end and free to move at the other, support a platform, which, when depressed, operates a self-closing gate.

Claim.—The series of beams L L', in combination with each other and the gate-opening devices, as described, the beams being hinged at one end, and free to move at the other to transmit motion to open the gate, as described.

142,597.—Manufacture of Horseshoe-Nails.—DAVID TURBAYNE, Boston, Mass., assignor to GLOBE NAIL COMPANY, same place. Application filed July 24, 1873.

A conductor extends downward from the dies and conveys the nail to a pair of rolls, by which its shank is drawn out.

Claim.—1. The combination and arrangement of the gripping-dies e f, upsetting-die g, conductor d', and die-rolls d' f', operating substantially as described.

2. The process of forming a nail or blank by cutting from a plate of uniform thickness a blank with a shouldered head, upsetting the head to impart the requisite shape thereto, and drawing the shank by rollers, all substantially as described.

142,598.—Ventilating Buildings.—LAWRENCE B. VALK, Brooklyn, N. Y. Application filed May 24, 1873.

A double tube located between the roof and ceiling of the building, having trap-doors and ventilating-sashes worked by wires from the floor of the room. The space between the tubes is heated by the gas-burners, which causes an upward draft and draws the foul air off.

Claim.—The tube A B, provided with ventilating-sash K, in combination with the tube G, trap-doors P, and tubes R, all constructed and arranged to operate substantially as set forth.

142,599.—Seed Drill and Planter.—WILLIAM F. WEST, Haverstraw, N. Y. Application filed July 27, 1871.

Claim.—In combination with the detachable axle A, the couplings E F, spring G, cam H on the transverse roller I, and hand-lever J, for the purpose of throwing the wheels in and out of gear with the axle by a to-and-fro motion of the lever J by the driver, substantially as described.

142,600.—Railroad-Car Brake.—GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Application filed March 8, 1873.

A truss-brake-bar, the tie-rods of which are headed and attached to the shoe-holder, preventing them from spreading outwardly, while the ends of the braces are inserted in a recess in the inside of the holder and prevent them from being forced inwardly. An extra triangular brace secures the tie-rods and braces together and further strengthens them.

Claim.—1. The combination of the tie-rods a a, each having upset heads a', the shoe-holders b b having lateral recesses for the insertion of the tie-rods, and the braces b' b' bearing against the inside of the shoe-holders, whereby the parts named are held in place solely by the tightening of the braces, substantially as described.

2. A shoe holder having one or more recesses, c c, each recess having a lateral opening of proper size to admit the tie-rod, but not the head, and also having a seat, c', for the heads a', such that the heads cannot be removed laterally therefrom, substantially as described.

3. The shoes g, having grooves which are closed at their outer ends, as shown at c c', and also each having a lug, g', in combination with holders b, each provided with a rotating hook, h, substantially as described.

4. The lug c', on the rear face of the shoe, suitably arranged to enter the recess c and hold the lower end or eye of the hanger in place, substantially as described.

5. The hanger w, having a connection at or from its lower end to the middle of the brake-bar, and at its upper end being connected to a spring which leads from a fixed part of the truck or car, substantially as and for the purposes set forth.

6. The clamp device, consisting of a hand, o, and block b, arranged in combination with the tie and brace rod or rods of a truss brake-bar, substantially as set forth.

142,601.—Composition for Pavements.—SAMUEL J. WHITING, Philadelphia, Pa. Application filed August 20, 1873.

A composition for paving and other purposes, consisting of trinidad bitumen, twenty parts; balata gum, one part; asphaltic oil, five parts; granulated shells or coral sand, forty parts; granulated granite, ten parts; pulverized carbonate of lime, fifteen parts; resin, three parts; sand, six parts.

Claim.—The within-described composition, formed of the ingredients, in the manner and of about the proportions set forth.

142,602.—Kettle and Pan Scraper.—EMMA J. WHITMAN, Oakland, Cal. Application filed June 2, 1873.

To the lower part of the stem are secured two blades, on opposite sides of the same, and bent to an acute angle with said stem.

Claim.—The culinary scraper with handle A, stem B, and blades C and D, constructed and operated in the manner and for the purposes set forth.

142,603.—Last-Block Fastener.—LUTHER S. WRIGHT, Groton, N. Y. Application filed July 25, 1873.

A vertical post, having lateral arms near its top, is pivoted to the last, and moves back and forth in a longitudinal groove. When the post or bolt is moved forward the arms fall into slots in the end of the block and hold it in place.

Claim.—1. The pivoted clasp C, or its equivalent, for the purpose specified.

2. The combination of the pivoted clasp C, last A, and block B, substantially as and for the purpose specified.

142,604.—Sash-Balance.—LUTHER S. WRIGHT, Groton, N. Y. Application filed July 25, 1873.

A single pinion-wheel is loosely journaled in the window-frame. Ratchet-bars are applied to each sash, and two springs cause the pinion to gear with both the ratchet-bars.

Claim.—The combination of the pinion D and movable shaft E with the springs G G' and ratchet-bars C C', operating in the manner substantially as and for the purpose specified.

142,605.—Pneumatic-Railway Cars.—HENRY G. YATES, Kalamazoo, Mich. Application filed April 18, 1873.

The wheels are connected by a cylinder, within which is a smaller cylinder, in which it is intended the freight shall be transported. The car is specially adapted for use in pneumatic tubes.

Claim.—The railway-car C, connected with its wheels D D by the independent journals c' c' and cylindrical connection d, constructed substantially as and for the purpose described.

142,606.—Feed-Box for Envelope-Machines.—EDWIN ALLEN, Norwich, Conn., assignor to THE ALLEN MANUFACTURING COMPANY, same place. Application filed February 10, 1873.

The feed-box is hinged to the table so as to swing forward, whereby its blank-holding toes are raised, to facilitate refilling, by means of rods riding over cam-faced supporting-hangers.

Claim.—1. The combination and arrangement of the frames F, guides G e e, and adjustable pointed plates E, when applied to the feed-box of an envelope-machine for the purpose of separating the blanks, substantially as described.

2. The combination, with the frames F having guides and adjustable points, of the pins H and fixed cams K, substantially as and for the purpose herein set forth.

142,607.—Inking Apparatus for Rotary Printing-Presses.—EDWIN ALLEN, Norwich, Conn., assignor to THE ALLEN MANUFACTURING COMPANY, same place. Application filed April 19, 1873.

Claim.—The combination and arrangement of two tracks, D D, straight and parallel, each side of the type-bed A, but crooked each side of the distributing-surface B, with two or more rollers, C, having flanges e e on their alternate ends, so that, on the straight tracks, these rollers ink the form, and on the crooked tracks vibrate to distribute the ink, substantially as herein set forth.

142,608.—Machine for Dressing Wood Rails.—HORATIO G. ANGLE, Chicago, Ill. Application filed March 15, 1873.

Rotary cutters, moving vertically and horizontally, are placed on a traveling frame which moves over the wooden rails of a railway, and which are dressed on the top and to an even gage by said cutters.

Claim.—1. The combination of the horizontal and vertical rotary cutters and driving mechanism therefor with a truck adapted to run on the rails to be dressed, the said cutters being arranged to act upon the rails as the truck is moved along on them, substantially as specified.

2. The combination of the adjusting-screw K with the truck B and cutters M M, as and for the purpose specified.

3. The combination of the adjusting-screw J with the truck B and cutters P P, as and for the purpose specified.

142,609.—Lamp.—LOUIS BEHNE, Middletown, N. Y. Application filed July 19, 1873.

A loose drip-cup is placed in a recess formed in the pillar of a lamp and inclosed by brackets, between which the drip-cup may be passed.

Claim.—The combination, with a loose drip-cup, of the sections H H of a lamp-column connected by intermediate rods I, wide enough apart to allow the insertion and removal of drip-cup, as described.

142,610.—Fastening for Railway-Rail Joints.—BERNARD W. BUCHHOLT, East Liverpool, Ohio. Application filed March 27, 1873.

Claim.—The combination, with the rails to be united and their fish-plates, of the pairs of wedge-shaped keys C C, inserted into them from opposite sides back to back, and clinched over against the plates, substantially as and for the purpose herein set forth.

142,611.—Pitman.—JACOB H. CAROTHERS, Lewisburg, Pa. Application filed April 2, 1873.

A rubber block or cushion encircled by a spring which unites the two parts of the pitman, the spring rendering the pitman susceptible of elongation and contraction, and the cushion preventing concussion by interposing between the two parts of the pitman. Also, a sleeve fitted to one part of the pitman, having a slot which receives a pin or projection fastened to a ring or cylinder, confining the opposite end of the coiled spring to the other part of the pitman.

Claim.—The combination of the pitman A A' with the spring B, cushion C, sleeve D d, and pin or projection f, substantially as and for the purpose specified.

142,612.—Can for Holding Paint, &c.—GEORGE H. CHEMBOCK, Brooklyn, N. Y., assignor to LEONARD RICHARDSON, same place. Application filed July 21, 1873.

The screw that draws the head inward has its lower end secured to a false bottom, whose upper surface bears against a rib near the lower end of the can.

Claim.—1. The can constructed with the outlet d, the sliding head E, and the screw C, the latter having its point of attachment at the lower part of the can, and the whole arranged substantially as herein set forth, whereby, during the expulsion of the contents of the can from the outlet d, the strain upon the head and bottom portion of the can is in an inward direction, substantially as and for the purpose specified.

2. The false bottom B, provided within the can, covered by the true bottom D, and arranged to provide the means of attachment for the lower end of the screw C, substantially as herein set forth, for the purpose specified.

3. The internal circumferential rib a, formed in the can and arranged to support the false bottom B against the inward strain exerted by the screw during the downward movement of the head, substantially as herein set forth.

142,613.—Can for Oil, &c.—GEORGE H. CHEMBOCK, Brooklyn, N. Y., assignor of one-half his right to LEONARD RICHARDSON, same place. Application filed July 21, 1873.

The nozzle and air-vent are closed by a removable plunger operated by a thumb-screw, and resting on an annular shoulder secured to the inner lower end of the neck.

Claim.—1. The combination of the plunger, working snugly in the shell B, with the outlet m and the air-inlet n', substantially as and for the purpose specified.

2. The combination, with the plunger movable in the shell B, and arranged, as set forth, with reference to the outlet m, of the annular shoulder b and screw d, operating to hold the plunger lightly against the said shoulder, substantially as herein set forth.

3. The shell B extended above the outlet m, in combination with the plunger, whereby, when the plunger is brought to the upper part of the shell, it is sustained against lateral displacement and caused to act as a stop or valve to prevent the outflow of liquid from the top of the shell, when the can is tilted in pouring from the outlet m, substantially as set forth.

4. The shell B, opened or capable of being opened at the top, in combination with the plunger having a vertical movement in the said shell by means of a screw, d, whereby, when required, the removal of the the plunger is made to provide an opening for the subsequent filling or refilling of the can, substantially as herein set forth.

5. The combination, with the plunger and the shell B, of the thumb-and-finger piece g', provided upon the upper surface of the plunger and arranged to come below the upper edge of, and be protected by, the shell B when the plunger is forced down to close the passage to and through the shell, substantially as herein set forth.

142,614.—Powder-Flask.—MATTIAS CILIX, Chicago, Ill. Application filed July 28, 1873.

A hollow tube or cylinder arranged, in connection with an ordinary flask and discharge tube or nozzle, so as to be turned upon trunnions or in a case, whereby a predetermined charge is readily poured out. The amount of the charge is regulated by a movable diaphragm.

Claim.—1. The combination of the cylinder B and tube C with the cylinder D and heads E, substantially as specified.

2. The combination and arrangement of the cylinder B and D, heads E, spring c, spring-lever F, and the tube C with the flask A, substantially as and for the purpose set forth.

142,615.—Sewing-Machine Caster.—ELIAS R. CLARK, Marshfield, Ind. Application filed May 3, 1873.

The caster of a sewing-machine table is attached to a hinged or movable foot, which has projecting pins fitting in a socket to hold it more firmly.

Claim.—The combination of the movable hinged foot D, casters G, cross-bars C C C, guide B, pins d, and socket F, all constructed, arranged, and operating as shown and described, for the purposes set forth.

142,616.—Mode of Connecting Pitmen with Shafts.—RUDOLPH CLEAVELAND, Covington, Pa. Application filed April 19, 1873.

Claim.—The bar N slotted at both ends, in combination with spring catch-pin O and end-slotted end-flattened shaft I, to enable power to be applied to the latter, as described.

142,617.—Fountain Hand-Stamp.—FRANCIS J. COUTANT, New York, N. Y. Application filed July 5, 1873.

The shaft of a hand-stamp is provided with a fountain containing ink, in which the ribbon is immersed, the stripping-pieces preventing too much ink flowing out.

Claim.—1. A ribbon-stamp so constructed that the ribbon is passed through a fountain of ink, substantially as shown and described.

2. The ribbon shafts I and J, on which the ribbon is wound,

arranged in the fountain H so as to be immersed in the ink, as shown and described.

3. The packing-pieces m m and compressing-plates N N, in combination with the fountain H and ribbon G, as and for the purposes described.

4. The rollers P P and Q Q, in combination with the ribbon G and fountain K, as and for the purposes described.

5. The combination of the ink-ribbon G, ink-fountain H, type-plate E, and movable pad S, as and for the purposes described.

142,618.—Lever for Drawing Framed Timber Together.—JOHN M. RAMEY, Wilmington, assignor to himself, JOHN WADSWORTH, Newton, and LUCIUS TURNER, Reading, Mass. Application filed March 25, 1873.

Claim.—A lever for drawing timbers, &c., together, provided with a ratchet-plate, *b*, and claw-hook *c*, in combination with a yoke, *d*, and an adjustable reversible clasp-hook, *h*, all arranged and operating as described, and for the purposes specified.

142,619.—Standard Jack-Post for Drilling and Pumping Machinery.—WILLIAM W. EASTMAN and WILLIAM H. H. MORSE, Meadville, Pa. Application filed May 27, 1873.

Claim.—An extension jack-post provided with a socket-cap and journal-box combined, and the manner of securing the same to the vertical standard E and holding and bracing the same by the rod-bolts B B and tension-rods F F, substantially as shown and described, for the purposes herein set forth.

142,620.—Combined Water-Cooler and Filter.—WILLIAM J. ENGLISH, Providence, R. I. Application filed August 16, 1872.

Claim.—1. A filter comprising an outer case of *papier-maché*, or other non-conducting material, A, an inner case of sheet metal, B, a partition, D, and a filter, G, all arranged and combined substantially as specified.

2. The filter having a descending top wall, I, between the inlet-passage G and the exit-passage Q, the latter being at one side of the filter, substantially as specified.

142,621.—Traveling Threshing-Power.—RICHARD W. FARR, Murfreesborough, Tenn. Application filed May 17, 1873.

Power-gear for driving a thresher, so that the thresher can be driven in passing from one sheaf of grain to another.

Claim.—The combination of the gear-wheels G H J K, or equivalent gearing, the shafts I L, and band-wheel M, with the wheels and box of a wagon for driving a thresher mounted upon the wagon, substantially as herein shown and described.

142,622.—Tube-Welding Mandrel.—HARVEY K. FLAGG, Boston, Mass., assignor to THE NATIONAL TUBE WORKS COMPANY, same place. Application filed August 22, 1873.

A hollow mandrel, with its conical head slotted longitudinally and having longitudinal grooves in its periphery to allow the passage of the cinder through and beyond the mandrel.

Claim.—A welding ball or mandrel formed of longitudinal grooves E, and having its head perforated with triangular or other shaped apertures D, substantially as specified.

142,623.—Sled-Brake.—PETER GABLE, Elizabeth, Ill. Application filed March 1, 1873.

The brake-dog is pivoted to the end of runner. A toggle-jointed lever connects the brake-dog with a rod so formed that the brake may be vertically adjusted. To one arm of the toggle-lever an arm is secured, to which is pivoted the rod which is connected to the operating lever.

Claim.—In combination with a dog, A, pivoted to the runner of a sled or sleigh, the toggle-levers *c e*, pivoted to a support, D, connected by a rule-joint, and one of them provided with an arm, I, the rod E, and lever G, substantially as and for the purpose specified.

142,624.—Chair Seat or Back.—GEORGE GARDNER, Glen Gardner, N. J., assignor of two-thirds his right to OLIVER L. GARDNER and WILLIAM GARDNER. Application filed February 6, 1873.

Claim.—A seat or back for chairs composed of one or more layers each of paper and canvas, or other textile material, substantially as shown and described.

142,625.—Chair-Frame.—GEORGE GARDNER, Glen Gardner, N. J., assignor of one-half his right to OLIVER L. GARDNER. Application filed March 10, 1873.

The back-standards are braced by the hind legs, which are mortised into said standards. The back-standards and hind legs are let into the seat-frame. The back-standards are extended downwardly below the point of connection with the seat-frame and hind legs, and are let into diagonal braces, which abut at one and against the seat, and at the other end against the hind legs.

Claim.—The combination of the back-standards D D, seat-frame C, hind legs E, and braces E', substantially as and for the purpose specified.

142,626.—Sandpapering-Machine.—HERBERT L. HASCOM, Athol, Mass. Application filed July 3, 1873.

Claim.—1. In a sandpapering-machine, the combination of a tube of sand-paper, or equivalent material, with a core or foundation thereof made of rubber or other suitable elastic material, arranged to be compressed endwise, and thereby expanded laterally, substantially as described, for the purposes specified.

2. The combination of the shaft K, the collars J J, the nut N, the rubber tube L, and the tube of sand-paper, or equivalent material, arranged as described, for the purposes specified.

142,627.—Carriage-Spring.—GEORGE W. HARLAN, Cincinnati, Ohio. Application filed January 9, 1873.

The tension is regulated by the bolts C C.

Claim.—The combination of the adjustable scroll-springs B B', links I I, pivots *f f*, coupling-rod H, standards or support *a*, bearings D D, and bolts C C, all constructed and arranged to operate substantially as described.

142,628.—Turbine Water-Wheel.—ANGUS A. HERRIMAN, Greensborough, N. C. Application filed June 14, 1873.

Adjustable wings are hinged to one side of the openings in the gate, which correspond with the buckets of the wheel, which wings guide the water, in connection with curved chutes firmly set between plates extending, in part, along the circumference of the wheel.

Claim.—The rotary gates, chutes F, and hinged wings E combined, to admit of the adjustment described.

142,629.—Rotary Engine.—FRANCIS J. HOLLENWEGER, New Rochelle, assignor to himself, JOSEPH MANTIN, and CHARLES F. SPAULDING, New York, N. Y. Application filed May 24, 1873.

The piston revolves between two side pieces. The sides and piston are recessed around their faces. The recesses in the sides are made to communicate by means of a passage and the recesses in the piston, thus using the steam expansively.

Claim.—The steam-chests C, provided with induction-passages F, one or more series of cavities, K J, one or more series of conduction-passages, E S, and eduction-passages G, in combination with the rotary piston D, provided with one or more series of cavities, I H, substantially as herein shown and described.

142,630.—Burglar-Alarm.—HARRISON P. HOOD, Indianapolis, Ind., assignor of one-half his right to NELSON B. COOPER, same place. Application filed May 5, 1873.

Claim.—In a burglar-alarm operated by a friction ratchet-wheel, the combination of the frame B with the standard or frame C, substantially as and for the purpose set forth.

142,631.—Clothes-Reel.—DENNIS L. HUFF, Bay City, Mich. Application filed July 26, 1873.

The radial arms on a spider are arranged on a post, and above these are fastened the braces to keep the arms in position.

Claim.—The combination of the tie-rods or bars B with the arms D and spider C of a clothes-reel, substantially as herein shown and described.

142,632.—Harvester-Rake.—JAMES IRVINE, Parkersburg, Iowa. Application filed August 4, 1873.

The rake, pivoted to a rotating arm journaled near the center of the platform, is guided by a pin on the rake-arm traversing a groove in the platform, the groove being provided at its rear angle with a spring-gate, to prevent the rake from returning in the same path.

Claim.—1. The inclined platform D, having the peculiarly-shaped groove Q, provided with a spring-gate, T, formed in it, substantially as herein shown and described.

2. The rigid arms L M, pivoted rake N, spring-bar O, and guide-pin P, in combination with the platform D, having groove Q and gate T, and with gearing for connecting them with the drive-wheel C, substantially as herein shown and described.

142,633.—Tire-Tightener.—MILO B. JACOBS, Winnebago, Ill. Application filed May 24, 1873.

Claim.—A tire having its ends halved, and provided with inwardly-projecting flanges or face-plates D, whereby it is adapted to be applied to a divided felly and adjusted by a screw, E F, as and for the purpose specified.

142,634.—Car-Coupling.—PETER KENDRICK, Trenton, N. J. Application filed February 1, 1873.

One end of the link in each draw-head is held by a headed bolt, which works in slots in its top and bottom, so that when the link is struck by an approaching draw-head with the pin in plate, instead of being crushed and injured, will be forced back out of the way.

Claim.—1. The link H, provided with the central cross-stud I, in combination with the double-headed bolt E and draw-head, provided with opposite longitudinal slots D D, whereby the link and bolt may be pushed back together into the draw-head, as set forth.

2. The combination of the link H, having the cross-stud I, with the bolt E, pin G, and draw-head A provided with the slots D and holes F, whereby said link may be sustained in a position for automatic coupling, when the pin G is inserted in its proper place, as set forth.

142,635.—Hay-Elevator.—CYRUS H. KIRKPATRICK, La Fayette, Ind. Application filed May 21, 1873.

Claim.—An elevator trip-catch provided with the elbow M N to avoid wear of rope by supporting the weight while being transferred horizontally to the place of discharge, in the manner described.

142,636.—Windmill.—OWEN B. KNAPP, Brandon, Wis. Application filed March 8, 1873.

Claim.—In a windmill having a wheel with fixed vanes, a fixed vane for shifting it edgewise to the wind, and an oscillating regulating-vane, the said regulating-vane arranged on an oscillating shaft, as herein specified.

142,637.—Fire-Extinguisher.—FINLEY LATTA, Cincinnati, Ohio. Application filed January 6, 1873.

The generating-tank has a projecting head and flange, and is hung upon journals in the supporting-frame of the carriage to adapt the tank to serve as a reel, so that while unreeling the hose it will agitate the contents of the tank. The acid-receptacle is so supported that it may be detached from the exterior, and has a chain fastened near its bottom so that when detached will fall nearly to the bottom of the tank and be inverted.

Claim.—1. The acid-receptacle R, supported beneath the cap I, by devices which enable it to be detached by manipulation from the outside end, having a chain or other flexible connection, V, applied at or near its bottom, so that when detached the said acid-receptacle will fall bodily nearly to the bottom of the tank, and will then be inverted.

2. A generating-tank hung upon journals, and constructed, substantially as herein described, with a projecting head, B, and flange H, or equivalent devices, to adapt said tank to serve as a reel, so that the act of unreeling the hose will agitate the contents of the tank, as explained.

142,638.—Sling for Loading and Unloading Hay, &c.—GEORGE W. LONG, Delaware Centre, Iowa. Application filed June 21, 1873.

Two bars are connected and disconnected by means of lever-hooks and string attachment.

Claim.—The bar A, provided with recess *b* and cross-pins *d*, in combination with the bar A', pivoted hooks B, sliding bar C, spring *n*, trip-rope D, and ropes *f* and *f'*, as and for the purpose specified.

142,639.—Needle-Case.—WILLIAM J. MARCHANT and HARRIS B. HANT, Philadelphia, Pa. Application filed June 26, 1873.

Claim.—1. The perforated cap D of the needle-case A, when formed with a slot, *F*, to prevent binding.

2. The cap D, when constructed, as described, with a soft packing or surface to prevent injury to the points of the needles.

3. In combination with the emery cells B, the cloth cover *c* and perforated cap *c'*.

4. In combination with the case A and cap D, the oil-stone E and spring *c'*, so arranged that when the cap is removed from the case the oil-stone will be forced partially out of its cell.

142,640.—Metallic Piston-Packing.—JAMES MASSEY, Chester, Pa. Application filed June 14, 1873.

A continuous coiled beveled ring, located within two flanged rings of equal diameter, and set out by centering-blocks and set-screws.

Claim.—A piston-packing formed of head A, centering-block B, set-screws C, coil D, open rings E, and follower F, constructed and arranged as described.

142,641.—Metallic Roof.—ISAAC S. METTLER, Jersey City, N. J. Application filed June 21, 1873.

Claim.—A roof formed of three metallic sheets, A B C, the middle one corrugated and forming open-ended descending channels, so that the air will pass on both sides of said middle sheet, and against each of the others, in the manner and for the purpose described.

142,642.—Centering-Check.—GEORGE H. MILLER, Binghamton, N. Y. Application filed July 12, 1873.

The dogs are operated to grasp the article by means of four sliding rack-bars, (one end of each being attached to the under side of a dog,) by means of a pinion attached to a tubular hand-wheel, through the center of which the punch is driven to mark the center on the article held between the dogs.

Claim.—The combination, with the punch N and slotted arms B, of a ratchet mechanism, crank-wheel I, and the central pinion-racks J, lugs L, dogs K, tube I, and cap E, substantially as shown and described.

142,643.—Gage for Gang-Saws.—NORMAN C. MOODY, Manistee, Mich. Application filed June 21, 1873.

The gage-blocks are arranged upon a rod in such a manner that they may be turned back and removed without disturbing the saws.

Claim.—The arrangement of the gage-blocks B C of a gang of saws on rods D E, in the manner described, for changing them without disconnecting the saws, substantially as specified.

142,644.—Harvester-Rake.—JOHN L. OWENS, Cambria, Wis. Application filed May 21, 1873.

The switch for changing the path of the rake-arms is operated at different intervals of time by means of a horizontally-sliding tappet-wheel having two or more series of teeth on its periphery, which engage with a tappet on the shaft to which the switch is attached.

Claim.—1. The combination of the tappet-wheel V with the shaft of the plate Q and the tappet thereon, substantially as specified.

2. The said wheel arranged to slide on its shaft, and connected with the adjusting-lever *j* by the fork *k*, crank *d*, rod *e*, arm *f*, and rod *i*, the rod *e* being arranged in the hollow standard A, substantially as specified.

3. The standard A, arms C, rim B, standards *a*, and arms B', constructed and arranged substantially as specified.

4. The rake-arms, composed of two members, *p*, arranged and pivoted to the rim B, substantially as specified.

142,645.—Ironing-Table.—ARDEBAH J. PALMERO, Boston, Mass. Application filed June 4, 1873.

A frame, sliding on the under side of the table, has a raised support for two ironing-boards at right angles, which, when used, can be lowered to a convenient height by turning up centers hinged to the table-legs. The whole is arranged to be taken apart and packed for transportation.

Claim.—1. The combination, with an ironing-table, *a a*, of the sleeve-boards *p r*, rests *o h*, and the bars *k k*, with the thumps *l* and its screw *m n*, for the purpose of being easily detached from the ordinary ironing-table, as herein shown and described.

2. The combination, with the sleeve-boards *p r* and their connecting parts, the table *a*, and standards *o c*, of the hinged centers *w v u v*, for the purpose of lowering the board when the said sleeve-boards are used, as herein shown.

3. In an ironing-table, the combination, with the supports *a c*, of the cross-bar *d*, provided with T-headed lugs *e e* and the slotted fastening-plates *f f*, as and for the purpose set forth.

142,646.—Ore-Concentrator.—JOHN A. PERRY, Grass Valley, Cal. Application filed June 16, 1873.

The tailings are led into the perforated trough and distributed over the table. The table having an oscillatory motion, longitudinally and from side to side, imparted by the screw-shaped cam, will cause the heavier particles, sulphurets, and amalgam to be carried to the opening between the inclined bottoms, where the cylinder will carry them out and deposit them in a trough below.

Claim.—1. The cylinder I, with its cams J and the peculiarly-inclined groove K, constructed to operate the table through the arm K, substantially as and for the purpose herein described.

2. In combination with the peculiar cam-cylinder I, the table mounted upon the roller F and links G, and having the double bottom A B and the discharge-cylinder M, substantially as and for the purpose herein described.

142,647.—Ore-Washer.—JOHN A. PERRY, Grass Valley, Cal. Application filed June 16, 1873.

The riffles rest upon inclined side rails, forming a chamber beneath, into which the heavy black sand and precious metals fall through perforations in the curved channels, the said heavy particles being carried out of the sluices by the revolving cylinder, which is furnished in its passage out of the machine by a plate held against the cylinder by a spring.

Claim.—1. The riffles D E, in combination with the inclined side rails *c c*, as and for the purpose described.

2. The discharging-cylinder G, rotating between the fixed flange H and the adjustably-sliding flange I at the bottom of the flume, constructed to operate as a constant-discharging device, substantially as herein described.

3. A flume or sluice riffle and discharge, consisting of the longitudinally corrugated and perforated riffles, placed as shown, in combination with the rotating discharge-cylinder G, the whole operating substantially as and for the purpose herein described.

142,648.—Printing-Press.—JACOB G. PETERSON, Morgantown, N. C. Application filed April 12, 1873.

Paper to be printed is laid on the metal plate F in supporting-frame D; the frame is then lowered and the roller-carriage is run over it to make the impression. The metal plate prevents the upper roller from injuring the edges of the type and insures an even impression.

Claim.—1. The arrangement of the reciprocating carriage I, presser-rollers G H, toothed bars L, wheels M, crank-shaft N, presser-rollers O, and stationary housings P with the type-bed, substantially as described.

2. The combination of the metal plate F with supporting-frame, the recessed bed, and the reciprocating rollers, as described.

142,649.—Railway-Car Brake.—WILEY D. PORT, Gadsden, Ala. Application filed May 31, 1873.

The brake-shaft is arranged to be raised or lowered in order to throw one of two cog-wheels into gear with a supplementary shaft, on which the brake-chain is wound.

Claim.—The combination of the two sets of gear-wheels G D and H E, the shaft F, the lever I, spring K, and shaft C, to which the brake-chain is attached, and which is provided with the ratchet-wheel M and pawl N, substantially as herein shown and described.

142,650.—Water-Meter.—TREAT T. PROWER, Chicago, Ill., assignor of one-half his right to GEORGE G. MOSHER, same place. Application filed March 24, 1873.

Two chambers are connected with the cylinder containing the two screws, one of which communicates with the cylinder at points outside of the screw-sections; the other communicates with the cylinder at a point between the two screw-sections. To one chamber is attached a receiving-pipe, to the other a discharge-pipe.

Claim.—1. A fluid-meter consisting of the chamber or cylinder *c*, having mounted therein the shaft *i* with the screw-wheels *m*, having their spirals arranged in opposite directions, in combination with the auxiliary chamber *r* with its passage *h*, and the

chamber b with its passages d d, all constructed and arranged to operate substantially as described.

2. The arrangement of the cylinder a with its shaft k, and screw-wheels m, and the chambers b and c, all as herein set forth.

142,651.—Packing-Machine.—ALEXANDER RALPH, Philadelphia, Pa. Application filed August 6, 1873.

Claim.—1. A machine for packing bottles and packages, in which the desired compression is obtained by means of a feed-screw and a weighted lever acting in opposite directions.

2. Stirring the material in the hopper and feeding it to the feed-screw by rapidly-revolving whippers or agitators.

3. The hopper A, shaft C, and the agitators C', when combined and arranged for the purpose shown and described.

4. The shaft C, in combination with the cone-friction pulleys D E, for the purpose shown and described.

5. The shaft C, pulleys D E, gear-wheels G H, and the screw F, as and for the purpose shown and described.

6. The follower J, when constructed as described.

7. The screw F, follower J, lever P, and the weight R, constructed and arranged as shown.

8. The shifting-bar S, in combination with the clutch-lever T and the trip-rod V, as shown.

9. The shifting-bar S, in combination with the clutch-lever T, trip-rod V, and the friction-pulleys D E, as shown.

10. The trip-rod V, in combination with the clutch-lever T, the weighted lever U, and the cones D E, as shown.

11. The former X, in combination with the form-retainer Y, for the purpose shown and described.

142,652.—Apparatus for Arranging Type for Type-Setting Machines.—D. BRAINERD RAY, New York, N. Y. Application filed February 24, 1873.

A series of hoppers or troughs, one for each letter or character. Type is thrown upon its face into the upper end of the hopper, when it turns over and slides down, letter-end foremost, by reason of the upper end of the hopper being concave and spoon-shaped. To cause the type to turn on its narrow edge just before entering the channel the lower end of the hopper has an angular bottom. The sides of the whole hopper are concave, that the type may touch but at two points. Some of the type have their notches turned up; some down. The channel is divided transversely, and the lower piece widened above, as shown at a, Fig. 3, so that if the channel becomes so choked that a type slides upon its flat side it will fall into the flaring edges of the lower piece and take its proper position. Just above the branches of the channel is placed a separater, H. If the type sliding down has its notches turned upward the straight edge passes right across the separator, and the type moves into the branch I right before it; but if the notched side be down a notch catches on the separator, and pressure from behind causes the type to be thrown to one side and to enter the other branch. The branches toward their ends, have each a quarter turn in a direction opposite to the other. They are thus twisted that they may present as little bearing-surface as possible to the type, and not cause it to clog.

Claim.—1. A trough or hopper having concave sides, which meet at the bottom at an angle of not more than ninety degrees, to cause the type to slide downward on the narrow edge or side, and having the upper end concave and spoon-shaped, for the purpose of causing the type to pass down into the tubes with the face or letter end up.

2. The type-channel C, widened, as shown at a, for the purpose of causing any type which by accident may slide down upon the upper edges of the tube upon its broad or flat side to fall into the lower channel and slide down upon its narrow side.

3. The separater, consisting of a thin strip of metal, H, placed at an angle with the type-channel, in combination with branches, for the purpose specified.

4. The twisted branches I and J, each having a quarter turn, or thereabout, for the purpose of turning the type, substantially as specified.

5. The combination of the hopper A with the type-channel C, widened, as shown at a, together with the separator H and the branches I and J, all arranged and combined substantially as described, and for the purposes specified.

142,653.—Chain-Propeller.—EDWIN P. RUSSELL, Manlius, N. Y. Application filed August 2, 1872.

Claim.—1. The sprocket-wheels C C when shaped to receive and sustain the paddles in their movements, as set forth and described.

2. The sprocket-wheels C C and D D, in combination with the chain a a a, substantially as and for the purpose set forth.

142,654.—Joint-Connection for Hollow Railway-Rails.—RUFUS S. SANBORN, Rockford, Ill. Application filed April 14, 1873.

Claim.—The combination, with a hollow rail, of a beveled connecting-tube, substantially as and for the purpose specified.

142,655.—Combined Shovel-Plow and Cultivator.—ALBERT SMITH, Providence township, Pa. Application filed March 17, 1873.

The combination of devices whereby a cultivator can in a moment and without removing bolts or screws be changed to a shovel-plow.

Claim.—A cultivator with main center beam and standard, carrying a main shovel, with two side beams, each carrying a smaller shovel, the side beams adjustable in width, as shown, and attached in front, so as to be removed by unhooking clevis, making a complete single-shovel plow, the whole constructed and arranged as shown and described.

142,656.—Corn-Planter.—GEORGE W. STARNETT, Dublin, Ohio. Application filed February 15, 1873.

A forward frame hinged to a rear one; the latter supported by opening-runners, the former by broad covering-wheels. Hoppers above the runners have their seed-slide actuated by a three-armed lever and treadles, which can be also worked by a hand-lever. Another hand-lever operates the wheel-scrapers. A land-marker, running on one wheel, on its outer end, is hinged to each side of the front frame.

Claim.—The combination, with a pair of treadles, O, of hand-lever J', three-armed lever O, rods N P, and dropping-slide M, as and for the purpose described.

142,657.—Machinery for Lasting Boots and Shoes.—CHARLES H. TRASK, Lynn, and HENRY F. WHEELER, Boston, Mass. Application filed June 23, 1873.

Improvement on patent No. 107,981, granted October 4, 1870. Jaws upon each side of the last-holder having lateral adjustment, also at the heel and toe portion adjustable longitudinally, serve to press the projecting portion of the upper over upon the inner sole. Springs upon the inner faces of the jaws force the upper up snugly to the form of the last.

Claim.—1. The combination and arrangement of the pivot c, the screw-nut d, and screw b¹ with the standard D and the last-toe supporter F.

2. The toe-supporter F, having yielding jaws e e, as described.

3. The toe-supporter F, provided with the yielding jaws e e and the intertoothed caps h h, arranged as set forth.

4. The toe-supporter F, provided with the auxiliary adjustable instep foot-supporter G, arranged with it, as specified.

5. The combination of the jaws K K, slides n n, levers L L, arm M, adjustable and yielding screw s, all arranged and applied together, substantially in manner and by means and to operate as specified.

6. The combination of the lever N and the adjusting-screw z with the arm M, combined with the jaws K K by means substantially as set forth.

7. The combination of each jaw K or T, the slide n or n¹, the lever L or L', the yielding and adjustable screw s or s¹, and the arm M or M', adjusting-screw z or z', and lever N or U, all constructed and arranged substantially as represented.

8. The screw-shafts S S, provided, as described, with screws of different pitches, and arranged with the frame A and the carriage R, and provided with operative mechanism, all substantially as set forth.

9. The rods w w', the swivels s', the screws r² and r', combined and arranged together, and with the levers U and the cross-bar v', all being essentially as explained and represented.

10. The combination of the toggles c² d², the lever b⁴, the links d³, and the pedal-lever A³, provided with the arm g².

11. The combination of the foot-rest F and the lever-latch m² with the pedal-lever A³, all arranged and to operate together and with the top of the slot b³, as set forth.

12. The spring or presser c³, arranged and combined with the lateral jaw and its arm M', such being as and for use as specified.

142,658.—Car-Brake.—WILLIAM WARINNER, Crecisborough, Ky. Application filed June 14, 1873.

To the bifurcated ends of a main rod are secured, by means of cross-tongues and links, the inner ends of two brake-levers, the same being pivoted near their outer ends to the truck-bolster. The brake-bars are connected to the brake-levers by rods secured each side of their fulcrums. One end of the main rod is connected to the hand-shaft by a rod or chain, while the other end of the rod is attached to a spring, which serves to release the brakes as the pawl is released from the ratchet of the hand-shaft.

Claim.—The brake mechanism, formed by the combination, with the transverse brake-bars G, connecting-rods I, and pivoted levers E, of pivoted cross-tongues F F', links a a, and main bar D provided with pronged ends d d, and the spring b, and cord a', all arranged as shown and described, to operate as specified.

142,659.—Piston.—CHARLES B. ALLEN, Philadelphia, Pa. Application filed July 19, 1873.

The piston is provided with a ring, slotted eccentrically, operating in combination with pins suitably arranged, and a ratchet and pawl for expanding the packing and retaining it in its proper position.

Claim.—1. The ring B, having eccentric slots m, in combination with guided pins D, projections of which extend into the said slots, substantially as and for the purpose set forth.

2. The pin D, guided at the rear in the hub of the piston, and at the front in the block F, and having a projection, n, adapted to one of the curved slots in the ring B, and the projection q guided by ribs f f, all as specified.

3. The pawl H, fitted to a recess in one of the ribs e of the piston, and adapted to ratchet-teeth on the ring B, all as described.

142,660.—Steam-Engine.—ROBERT T. P. ALLEN, Farmdale, Ky. Application filed July 17, 1873.

The steam-chest revolves and forms the valve, which allows steam to go to both cylinders. A cut-off plate is placed between the valve and seat, and is operated by the governor.

Claim.—The combination of the cylinders A B, with their pistons connected with right-angled cranks on the main shaft G, the seat H, cut-off plate J, with its parts, and valve K, the cut-off plate being operated from the governor and the valve from the main shaft, all substantially as herein set forth.

142,661.—Device for Blackwashing Molds.—JOHN B. ASTON, Pittsburg, Pa. Application filed June 20, 1873.

Claim.—A circular board having suitable handles and beveled edges, its upper surface being made plain, or otherwise suitably formed to distribute the black-wash, as is herein set forth.

142,662.—Core-Barrel for Castings.—JOHN B. ASTON, Pittsburg, Pa. Application filed June 23, 1873.

The core is collapsed by first loosening the bolts holding the end plates to the sides, and then removing the core bar or wedge, thus relieving the sections.

Claim.—1. The hollow center shaft A, provided with screw threads or pivots B C and an enlargement at the lower end, for the purposes herein set forth.

2. The combination of the top and bottom plates D G, bolts d, and recesses L in the outside plates H, for the purposes herein set forth.

3. The space N formed around the bottom plate G, to be filled with plugs of wood, as and for the purposes herein set forth.

4. The combination of the plates H H, connected with the central shaft A, and the separate and independent core-bar I, when said parts are constructed and arranged as and for the purposes herein set forth.

5. The lock-bolts O O inserted in the head C of the shaft A, for the purposes herein set forth.

6. The combination of the shaft A, plates D, E, F, and G, plates H H, projections K K, links M M, lock-bolts O O, and core-bar I, all constructed and arranged substantially as and for the purposes herein set forth.

142,663.—Boiler and Condenser.—BENJAMIN T. BABBITT, New York, N. Y.—B. Application filed June 25, 1873.

An arrangement, within an upright cylinder or case, of a central tubular body, constructed in sections, and provided with a number of hollow tapering radial arms, made bifurcated, and arranged in staggering relation, to be used either as a boiler or condenser.

Claim.—1. The central tubular body E, built up of ring-like sections d, in combination, with the hollow radial tapering arms F at or from points all around said rings, and arranged within an outer shell or case, A, substantially as specified.

2. The hollow radial tapering arms F, made bifurcated or with branches h, in combination with the tubular body E and case A, essentially as shown and described.

142,664.—Boiler and Condenser.—BENJAMIN T. BABBITT, New York, N. Y.—C. Application filed June 25, 1873.

Vertical tubular passages, constructed in sections, and composed of hollow tapering radial arms projecting from them, are arranged side by side, and set by turning one upon the other, thereby forming a staggering cluster of tubes, presenting a large surface to the products of combustion when used as a boiler, or to steam when used as a condenser, and connected at the top and bottom to drums.

Claim.—The combination of the straight upright tubes or passages C', composed of hollow bosses d, fitted to turn the one upon or within the other, the oppositely-disposed radial hollow tapering arms D, set staggering, as described, the drums or passages B E, the connecting-pipes f, and the case A, substantially as shown and described.

142,665.—Marine Condenser.—BENJAMIN T. BABBITT, New York, N. Y. Application filed June 25, 1873.

Two steam-chambers are arranged on the outer sides of the pump-shell, through which steam is admitted into a compartment provided for it, where it passes through numerous tapering pipes, and is condensed by the water displaced by the wheel in propelling the vessel.

Claim.—The combination of the water-box C D surrounding the propeller, the steam-chambers J with their inlet and outlet pipes, and the taper pipes K K, substantially as and for the purpose herein set forth.

142,666.—Pile or Faget.—JOHN BARKER, Covington, Ky. Application filed July 25, 1873.

Claim.—The pile for railroad-rails, consisting of the longitudinally-grooved base-slab A a, locking-blocks E e, and muck-iron head-slab B, with its longitudinal groove b and recesses C C, when used in connection with the cap D and the rail fragments F F' G G' H H', the latter being arranged, with reference to one another, in the manner herein illustrated and described.

142,667.—Fastener for the Meeting Rails of Sashes.—LORING L. BATES, Boston, Mass. Application filed June 24, 1873.

Claim.—The herein-described sash fastener or lock, consisting of the plate A, hollow boss B, latch-bar C, and cap-plate E, the rivet D and spring G being added, and the whole operating substantially as and for purposes stated.

142,668.—Street-Railway.—JOHN R. BECKETT, Gardiner, Me., assignor to himself and CALVIN B. PAYSON, same place. Application filed August 20, 1873.

Claim.—The within-described road-bed for horse-railroads, consisting of the longitudinal stringers A A, united by transverse metallic braces b extending transversely between them, substantially in the manner and for the purpose described.

142,669.—Cutter-Head.—EDWIN BENJAMIN, Chicago, Ill., assignor to himself and SAMUEL W. PEARS, same place. Application filed May 6, 1872.

Claim.—A cutter-head having six sides or faces, so arranged that the front edge of said faces shall project at an angle of about twelve degrees more than their rear edges, whereby the cutters attached to said faces are held in such a position as to present their cutting-edges to the wood at the required angle, as set forth.

142,670.—Salt and Pepper Caster.—JOHN BERG, Philadelphia, Pa. Application filed August 16, 1873.

Salt and pepper bottles are arranged on one supporting-standard, so that the whole can be readily lifted by one hand and the contents of either of the bottles be shaken out, as may be desired.

Claim.—A combined salt and pepper caster, constructed as described, with the condiment bottles or boxes B B B arranged upon the supporting stem or base A, and projecting horizontally or radially therefrom, as and for the purpose specified.

142,671.—Sewer-Basin for Street-Corners.—JOHN H. BOSCHKE, New York, N. Y. Application filed July 9, 1873.

The sewer-basin is a quarter-section of a cylinder, the cover thereof forming right lines with the flagging. The mouth projects beyond the curved face of the cover, and a trap guards the sewer-entrance.

Claim.—The culvert A, constructed as described with the V-shaped grooves d and a projecting mouth and trap, a b, in combination with the quadrant-shaped cover B having V-shaped grooves c, all constructed and arranged as herein shown for the purpose specified.

142,672.—Grain-Separater.—JACOB W. BOSSER, Canandaigua, Mich. Application filed February 18, 1873.

Shoe so arranged upon two shafts as to receive a rearward, upward, forward, and downward motion at each revolution of said shafts.

Claim.—1. Shoe A, constructed substantially as described, and hung upon shafts F, to operate as and for the purposes set forth.

2. The combination of shoe A with the cylinder D and riddle E, as described.

142,673.—Railway-Switch.—DAVID R. BROCKETT, Wheeling, W. Va. Application filed April 8, 1873.

The crank-shaft is made in two parts connected by flanges or disks bolted together, and the hand-lever is secured between them. The pitman, which operates the movable rail is made "knuckle-jointed" to limit its play and prevent buckling, and the crank which moves it is made adjustable longitudinally on the shaft in order to adapt the device to long or short rails without the necessity of cutting and fitting the shaft.

Claim.—1. In a switch constructed substantially as herein described, the long shaft G, provided with the adjustable crank J, as and for the purpose set forth.

2. The hand-lever H, having its end secured between the coupling-flanges f of the shaft G, substantially as shown and described.

3. In combination with the vibrating tongue D and crank J, the knuckle-jointed pitman I, constructed as described.

142,674.—Blind-Slat Fastener.—GEORGE W. BROOKS, Bloomington, Ill. Application filed August 16, 1873.

The upright rod is connected by a link to a block which moves vertically in a rectangular casing upon the lower part of the blind-frame. Through a hole in the side of this casing a clamp-lever works and holds the block, and, by that means, the slat at any required position.

Claim.—The combination, with the pivoted blind-slats B B and their connecting-rod C, of the rod a, slide D, and cam-lever G, pivoted, as shown, and working upon the slide through a slot in the casing E, constructed and arranged to operate substantially as and for the purposes herein set forth.

142,675.—Corn-Planter.—ELIJAH C. BROWN, Crawfordsville, Ind. Application filed May 7, 1873.

A corn-planter of V-shape, and provided at the front with a seed-box, which is supported on the furrow-opener. To the rear of the frame are attached two coverers, which close the furrow opened by the forward opener. In the lower part there is a drop-pper provided with a slide, which works in a stationary box filled with seed, by means of a spring operated by the driver.

Claim.—The combination, with the frame A, of the seed-box E, metallic plates d a, posts f f, curved spring f, slide G, and the fingers C, the seed-box being so arranged that it is mainly below the frame, and supported upon the fingers, all constructed and operated substantially as set forth.

142,676.—Washing-Machine.—SIMEON BUDLONG, Providence, R. I. Application filed April 5, 1873.

A washing-machine with a steam-tight box or case, rectangular in form, and an opening on one side. The box has a partition on one end, which is perforated for the escape of steam by a pipe, which passes through a hollow journal, with a coupling for its disconnection.

Claim.—The washing-machine consisting of the rotary casing A, having the perforated partition E near the end, the steam-pipe G, the escape-pipe H, bent upward within the ends-chamber J, the hollow journal-pieces, and standing-boxes, substantially as specified.

142,677.—Center-Board for Vessels.—JAMES CALL, Richmond, Me. Application filed July 26, 1873.

Claim.—The T-shaped center-board C, having the oblique-curved slots I, in combination with the guide-pins K, pivoted arms D, and operating-rod G, substantially as specified.

142,678.—Die for Punching Horseshoe-Nails from Plates.—ALEXANDER H. CARTL, Forge Village, Mass. Application filed June 6, 1873.

The die-plate, punch-plate, and stripper-plate present each a series of slots extending into the plate from one edge, parallel to one another, and all of one shape—that of the nail. Punches of the shape of the slots, secured in the slots of one plate, co-operate with another plate in cutting out the nails from the sheet of metal, while the third plate, attached to, but elevated a little above, the die-plate, guides the punches and acts as a stripper.

Claim.—1. The punch-holder block or plate A, for making horseshoe-nails, formed of a single piece, and having the slots cut in it, substantially as described.

2. The die-block *a* for making horseshoe-nails, formed of a single piece, and having the slots cut in it, substantially as described.

3. The stripper-plate *m* for a horseshoe-nail die-plate, formed of a single piece having the slots cut therein, substantially as described.

4. In combination with the die-plate *a*, slotted as described, the cap-plate *s* fastened thereto, substantially as shown and described.

5. In combination with the punch-block A, slotted as described, the cap-plate *l* fastened thereto, substantially as shown and described.

6. In combination with the slotted plate *h*, the punches *q*, held in place substantially as shown and described.

142,679.—Lock-Hinge for Blinds.—THOMAS CLUCAS, Jr., St. Louis, Mo. Application filed July 3, 1873.

On each side of the pintle is a projecting lug, and between these, directly in the rear of the pintle, is a horizontal bearing. The sleeve or socket of the female part of the hinge has recesses so as to form two projecting locking inclines, and also a segmental-shaped horizontal bearing, which rests upon the similar bearing of the male part.

Claim.—1. The provision, in a self-locking hinge, of the countersunk socket G, as and for the purpose set forth.

2. The co-acting locking-cams C C′ arranged on opposite sides of the pintle B transversely, and the horizontal bearing-web A′ in line therewith forming a part of the leaf A, in combination with the co-acting cams E E′ and horizontal bearing-surface F, of the socket-member, formed and arranged substantially as herein specified, so that the movable leaf shall swing horizontally clear of the frame and then drop to a lock on the co-acting cams, as set forth.

142,680.—Lifting-Jack.—ISAAC A. CRIPPEN, Philadelphia, Pa., assignor of one-half his right to SMITH LOWDEN, same place. Application filed May 26, 1873.

A main and auxiliary lever, secured together by means of a clevis for keeping the former on the latter, and adapting the jack for various sizes of wheels and heights of axles.

Claim.—1. The auxiliary lever H, in combination with the lever C, substantially as and for the purpose set forth.

2. The clevis K, in combination with the auxiliary lever H and the sliding lever C, substantially as and for the purpose set forth.

3. The sliding lever C, auxiliary lever H, clevis K, segment G, tooth F, and standard A, combined and operating substantially as and for the purpose set forth.

142,681.—Carpet.—JOHN DORNAN, Philadelphia, Pa. Application filed July 17, 1873.

Claim.—A carpet constructed substantially as described, and having an ingrain center and a damask border, woven together at one operation, and forming a new fabric, as set forth.

142,682.—Car-Coupling.—ROBERT H. DOWLING, Newark, Ohio, assignor to himself and JOHN F. WILSON, same place. Application filed May 17, 1873.

When the pin is raised the yoke, which is pivoted to the stirrup, catches at its ends under studs on either side of the draw-head and throws the lower ends of the stirrup into notches *d*, and thus the pin is held in an elevated position until the approaching draw-head, striking the yoke, frees its ends and the pin falls.

Claim.—The stirrup B, carrying the pin C and pivoted yoke D, in combination with a draw-bar, A, having the grooves *d*, offsets *e*′, and studs *b*, arranged substantially as and for the purpose set forth.

142,683.—Cigar-Mold.—NAPOLEON DU BEUL, Chicago, Ill. Application filed October 28, 1872.

A series of molds, arranged parallel to each other, receive counter-molds within them, all being of sheet metal, each series being mounted upon sheet-metal projections from strips which are let into longitudinal slots in a wooden backing.

Claim.—The fastening for the mortises of sheet-metal cigar-molds to wooden backings, substantially as above described, consisting of the metal strips B inserted in the longitudinal slots D in the backing, and secured thereto by nails E, or equivalents, substantially as specified.

142,684.—Watch-Case Latch.—JOHN C. DUMBER, Cincinnati, Ohio. Application filed February 24, 1873.

The hinged covers of the watch are held close to the central rim, when closed, by means of an external sliding latch, secured to the latter, passing over a projecting lip on the edge of the former.

Claim.—The slide E, formed with a notch, *c*, attached to the watch-case center A, and having a limited circumferential movement thereon, in combination with a lug, D, projecting from either back or bezel, substantially as and for the purpose specified.

142,685.—Casing for Bottles.—JAMES DUGAN, New York, N. Y. Application filed April 25, 1873.

Wooden slats are bent to conform to the contour of the bottle and attached at the bottom to a circular base, and are secured together around the neck of the bottle by a surrounding wire fitting in grooves, or by a cap.

Claim.—A bottle-casing composed of a base, B, attached slats C C, and ring, band, or cap for securing the slats at the top, all combined substantially as and for the purpose herein set forth.

142,686.—Button.—JOSEPH DURAND, New York, N. Y. Application filed November 11, 1872.

The button has a spring between the shell and collet with a depression to receive and hold in place the enlarged end of the shank.

Claim.—The spring *i*, with the ridge 6 and recess for the head 4, in combination with the shank *b*, with its neck 3 and head 4, and the plate *d*, slotted for passing such head 4 and securing the shank, as set forth.

142,687.—Fence-Post Socket.—GEORGE W. DURANT and JAMES B. DURANT, Bryan, Tex. Application filed June 13, 1873.

Duplex posts, embracing the stringers, stand in a metallic socket, which rests upon, and is attached to, a large metallic plate. The plate is cut away or slotted between these posts, to permit the driving of a ground stake.

Claim.—The fence-post socket-plate A, slotted at *a*, and having a socket, B, extending at the bottom beyond each side of slot, thus forming the shelves *b b*, as and for the purpose described.

142,688.—Electrical Regulator for Transmitting-Instruments.—THOMAS A. EDISON, Newark, N. J., assignor to THE GOLD AND STOCK TELEGRAPH COMPANY, New York, N. Y. Application filed March 13, 1873.

An electro-magnet, contiguous to the revolving pulsator-shaft, produces friction thereon by attraction, whenever excited by the completion of a circuit, effected by means of a Watt governor on the shaft making a metallic contact at a prescribed limit of speed.

Claim.—The speed-regulator, consisting of the electro-magnet *l*, shaft *a*, and governor, in combination with the circuit-closer and pulsator, substantially as and for the purposes set forth.

142,689.—Hammer for Sewing-Machines.—JOHN V. D. ELDERDGE, Detroit, Mich. Application filed March 8, 1873.

The scroll is formed from a plate of metal, folded, as shown, so as to form an opening for and support the fabric on both sides, and the extreme end of the plate is bent, as shown at *a*, to guide the extreme edge of the fabric.

Claim.—The scroll A, formed of a single plate, bent as shown and described.

142,690.—Reed-Organ.—LEVI K. FULLER, Brattleborough, Vt., assignor to J. ESTEY & Co., same place. Application filed March 3, 1873.

Two or more reed-boards are arranged vertically below the key-board; the upper one is connected with the bellows by an extension of the wind-chest, also vertically, called a diaphragm, which, by means of vertical passages through the sides of the instrument, communicate therewith.

Claim.—1. In combination with a series of actions, with their reed-boards F G F′ G′, placed vertically below the keys, the interposed partition or diaphragm D, when said parts are constructed and arranged substantially as herein shown and described.

2. In a reed-organ, the throats C, arranged as shown, in combination with the series of actions and their reed-boards, arranged vertically below the keys, substantially as described, for the purpose specified.

3. The series of vertical actions arranged below the keys, in combination with the throats C and diaphragm D, for operation in respect to a bellows, substantially as described.

142,691.—Manufacture of Shoes.—CHARLES W. GREEN, Pontiac, Mich. Application filed September 2, 1873.

Claim.—As a new article of manufacture, a shoe having its upper made from a single piece of leather, cut in the manner shown in Fig. 2 of the drawings, and crimped at front and rear, so that only one seam is required, and that at about the middle of the side of one quarter of the shoe, as described.

142,692.—Manufacture of Shoes.—CHARLES W. GREEN, Pontiac, Mich. Application filed September 2, 1873.

Claim.—The quarters formed as described, the part A forming a seamless quarter and back, and extending to the front on one side, and the part B attached to the quarter A by a straight vertical seam, as shown, and joining the front on the opposite or inner side, as specified.

142,693.—Street-Lamp.—JAMES S. HAGERTY, Baltimore, Md. Application filed August 15, 1873.

A device for sustaining a street-lamp so that the light is intercepted in but one horizontal direction; also for adjusting, detaching, or separately sustaining the cover of the lamp.

Claim.—1. The shoulders *b*′ and reversely-shouldered flanges *b*′ combined with the arms *c*, *c* to hold the seat C to the holder B, in the manner described.

2. A lamp-seat, C, having the subjacent stops *c*′ *c*′ combined with a holder, B, having the shoulders *b*′ *b*′ and flanges *b*′ *b*′, as and for the purpose described.

3. The grooved subjacently-concaved and curved holder-socket *b*′ combined with the sliding cap-rod G having the side stud *g*, as and for the purpose described.

142,694.—Boring-Mill.—FRANCIS E. HAMM, Philadelphia, Pa., assignor to OSCAR C. FERRIS and FREDERICK B. MILES, same place. Application filed August 4, 1873.

Claim.—1. The combination, with a boring-machine, substantially as described, of a crane, the jib of which can be raised and lowered, and swung laterally beneath the overhanging frame, as set forth.

2. The combination, with the frame A, of the rocking-shaft E, worm *d*, jib B, and toothed segment *b*, forming part of said jib, all as set forth.

142,695.—Permutation Lock.—PHINELLO W. HALL, Calvert, Tex. Application filed August 21, 1873.

The revolving wheels have projections or pins, which so differ from each other that they can be recognized by the touch alone, and hence manipulated in the dark. On the bolt is a projector, which is combined with the rotating slotted sleeves and their slides. The wheels have notched or toothed flanges on their sides, and notches on their inner sides.

Claim.—1. The bolt *b*, having a flange, pin, or projection, *d*, formed upon its side, in combination with the rotating slotted sleeves C 5 and their slides, all substantially as and for the purpose set forth.

2. The combination of revolving slotted sleeves and sliding locking devices with the rotating wheels *c* 7, having teeth cut upon their inner surfaces, into which the locking devices catch to hold the wheels in position on the sleeves when the combination is set, all substantially as set forth.

3. The spring-pin *e* upon the guard on the outer side of the lock-frame, in combination with the notched flange *g* on the revolving wheel *c*, having studs or projections on its periphery, all substantially as set forth.

4. The wheel *c*, having studs or projections upon its periphery which are distinguishable by the touch, having letters or figures and grooves, notched or toothed flange *g* on its side, and teeth or notches upon its inner surface, all substantially as and for the purposes set forth.

5. The combination of the hook or stop K, and pivoted to the inner face of the lock-frame, which serves to lock the bolt on the inside, prevents it from being moved too far back to allow the combination to be changed, and prevents the flange *d* on the bolt *b* from leaving the slots in the sleeves when desired to use the bolt as a latch, with the pin *h* attached to the bolt *b*, and extending through a slot in the lock-frame, all, substantially as and for the purposes set forth.

6. The combination, with the bolt *b* and flange *d*, of the wheel *c*, extending through the lock-frame, and having pin *i*, the interior corrugated wheel 7 with pin 9, the spring *l*, the slotted sleeves C 5, and the locking-slides 3 4, all constructed and operating substantially as herein set forth.

142,696.—Rotary Pump.—CLARK P. HOLMES, Havana, N. Y. Application filed August 1, 1873.

The tendency of the water to turn the valve back is counteracted by a brake device.

Claim.—1. In combination with the valve D, the disk *f* and set-screws *h h*, substantially as and for the purposes herein set forth.

2. The combination of the casing A with inlet E and outlet H, wheel B with pistons C C, corrugated valve D, valve-chamber G, disk *f*, and set-screws *h h*, all substantially as and for the purposes herein set forth.

142,697.—Clamp.—FRANCIS M. HOLMES, Boston, Mass. Application filed May 21, 1873.

The vertical adjustment of the clamp is made by the elevation or depression of the post B and the holes *d*. The gage of the cam-lever is regulated by the elevating-screw I.

Claim.—1. The combination of the clamp-lever A, the fulcrum-post B, screw *e*, nut C, the cam G, and the handle H, all constructed, arranged, and applied together as and to operate substantially as set forth.

2. The arrangement and combination of the bearing I with the cam G, the clamp-lever A, the fulcrum-post B, and nut C, the cam being provided with the handle, as set forth.

142,698.—Journal-Packing Rack.—WILLIAM H. HUMPHREY, Lansingburg, N. Y., assignor to W. H. HUMPHREY and D. H. HUMPHREY, same place. Application filed June 27, 1873.

An oil-reservoir divided into two sections, the inner sides perforated. A perforated plate, supported upon springs, holds the waste against the journal.

Claim.—The combination of the perforated packing-rack C C, plate G, and springs *b b*, substantially as and for the purpose specified.

142,699.—Sewing-Machine.—ELI INMAN, Estes, Ind. Application filed August 2, 1873.

The saw is reciprocated by a pitman attached to a crank, and is raised and lowered by a system of levers and rods.

Claim.—The combination of the box J, link *f*, rock-shaft L, arms K K′, rod A, and lever N, all substantially as and for the purposes herein set forth.

142,700.—Stop-Valve for Water and Gas Mains, and other purposes.—CHARLES W. ISHELL, New York, N. Y. Application filed May 23, 1873.

Two valve-disks, provided with lifting-lugs and toggle-levers, are raised by means of shoulders upon a nut, and closed firmly by the action of the toggle-levers against the openings in the main pipe. These disks are so arranged that the inside of the valve may be inspected, when closed, through openings placed transversely to the main pipe.

Claim.—1. The valve-disks provided with the lifting-lugs *a a*, the nut E, and the toggle-levers G G, the whole combined and organized substantially as and for the purpose herein set forth.

2. The arrangement of the opposite openings *i* transversely to the valve-disks and the main, substantially as and for the purpose described.

142,701.—Railway-Rail.—JAMES B. JOHNSTON, New York, N. Y. Application filed July 12, 1873.

Claim.—The railway-rail, composed of the parts *a a*′ C, having an elongated slot, *d*, said parts being connected together by the double-headed bolts B, having rounded inner faces or shoulders conforming to the curvature of the rail, when inserted in a heated state, and turned one-quarter round, thus forming a ready means of connection without the use of nuts, screws, locking devices, or swaging, substantially as specified.

142,702.—Steam-Valve.—HARVEY P. JONES, Davenport, Iowa. Application filed May 7, 1873.

The side plates are removable, in order that the valve may be seen when being set. By means of the adjustable boxes, the binding of the valve ceased by expansion, can be obviated.

Claim.—1. The valve A, in combination with the removable side plates, substantially as and for the purpose set forth.

2. The adjustable boxes G, having an offset, I, and slots K, in combination with the box C, having dovetail lugs J and with set-screws L, substantially as and for the purpose specified.

142,703.—Refrigerator for Transporting Oysters, &c.—JAMES C. JONES, New York, N. Y. Application filed June 25, 1873.

Claim.—The transportable refrigerator composed of the cask-like case, the removable concentric ice-reservoir supported by the sub-head C, and retained in place by entering a recess in the bottom of the case, as described, and the cover G, with its bung-piece I, all combined and organized substantially as and for the purpose herein set forth.

142,704.—Treadle for Sewing-Machines.—MYRON H. KNAPP, Fulton, N. Y. Application filed July 25, 1873.

Claim.—The pedals D D′ and pitman-rods E E′, constructed and arranged with relation to the shaft C, and wrist *a*, and driving-wheel B of a sewing-machine, substantially as and for the purpose set forth.

142,705.—Flour and Middlings Purifier.—EDMUND N. LACROIX, Minneapolis, Minn. Application filed June 23, 1873.

Bolting-reel has a slow revolving motion, a reciprocating and a rising-and-falling motion imparted to it, which gives a thorough sifting action to the same, and, in connection therewith, devices for keeping the meshes of the cloth clear, and drawing off the light bran and fibrous matter which rises to the top of the material by the different motions given to the reel.

Claim.—1. The combination, with a reel, of revolving, reciprocating, and vertically-shaking mechanism, substantially as set forth.

2. In combination with a bolting-reel having a revolving and reciprocating movement, of a fan or blower for forcing a blast of air against and through the bottom of the reel and an exhaust-fan located above the reel, in direct communication with it, substantially as described, for the object specified.

3. In a middlings and flour purifier, the driving-gearing and reciprocating mechanism, as set forth, so combined with the reel as to impart a slow sifting motion to the reel, substantially as described.

4. The gears or corrugations L″ upon the shaft of the reel, in combination with the segmental cams or eccentrics L′ for imparting a rising-and-falling motion to the reel, substantially as and for the purpose specified.

5. The reel-covering plate V, having one or more brushes, V′, combined, substantially as and for the purpose described.

142,706.—Corn-Planter.—MORVAL C. LANE, Wyandotte, Mich. Application filed December 31, 1872.

The rear end of the machine is mounted upon wheels, one of which is provided with a clutch, to which radiating arms are attached, and these by contact with a sliding bar, which gives a reciprocating movement to the seed-slide.

Claim.—The clutch-box C, provided with arms D D D, having the inclined cams D′ at their ends, in combination with the bar E and lever J, for the reciprocation of the dropper-slide in the rotation of the clutch-geared traction-wheel B, substantially as shown and described.

142,707.—Heating-Stove.—EZEKIEL C. LITTLE and DAVID H. NATION, St. Louis, Mo. Application filed June 24, 1873.

Claim.—1. The oval heating-stove described, provided with hearth E, hearth-plate F, and mica doors J K on one of its sides,

and exit-flue chamber and pipe-opening upon the opposite side, whereby the draft is admitted at the center of the fire-box, and extends across the narrow portion of the stove, substantially as set forth.

2. In an oval heating-stove, the combination of the flue-sheet C, extended beyond the stove body, the exterior flue-chamber D, and the damper H with the flue B, all substantially as set forth.

142,708.—Lock for Sewing-Machine Tables, &c.—JOHN B. LOGAN, Baltimore, Md. Application filed August 25, 1873.

Claim.—A circular sewing-machine-table lock consisting of a segmental bolt, guided between flanges and front and back plates, and operated by a rack and pinion, substantially as described.

142,709.—Nut-Lock.—KELLOGG H. LOOMIS, Cleveland, Ohio. Application filed May 14, 1873.

Claim.—A metal washer having a central bolt-hole, from which radiate openings *b b*, formed by removing a portion of the metal, and also provided with lips *a a*, formed on one corner of each opening, which bear against the back of the nut and hold it by frictional contact, substantially as set forth.

142,710.—Boot and Shoe Stretcher.—JOEL LYONS, Chippewa, Canada. Application filed March 17, 1873.

The toe part K is movable, and adjustable to the main portion of the last by means of a dowel. A metal plate attached to the bottom of the last supports a notched bar, which slides in a groove cut in the under side of the last.

Claim.—The last described, consisting of the parts K L, arranged as described, plates A and C, notched bar B, slotted lever D, and ratchet H, constructed and arranged as described, for the purpose set forth.

142,711.—Water-Strainer.—FREDERICK W. MAES, Oshkosh, Wis. Application filed August 16, 1873.

A removable cap for obtaining access to the interior of the strainer-cup is connected to the top of an outer cylinder, which forms a guide for the water as it passes from the strainer to the receiving-vessel. A bail is connected to the cap for the attachment to the spout.

Claim.—A water-strainer having an inside cup, A, cylinder B, neck D, cap F, and bail G, substantially as and for the purpose set forth.

142,712.—Wrecking Apparatus.—BERNARD MCGRODER and HARMS TIEDEMANN, Cleveland, Ohio. Application filed June 25, 1873.

Claim.—The ropes H, provided with loops *a*, in combination with the floats A, having transverse and longitudinal tubes B C, and cable G, constructed and arranged substantially as and for the purpose described.

142,713.—Car-Coupling.—THOMAS MEIKLE and JAMES W. MEIKLE, Louisville, Ky. Application filed January 8, 1873.

The coupling-pin is shouldered near its upper end, and so pivoted to the lever by which it is operated that when it is struck by the link it will have only a limited movement independent of the lever, and the impact will cause them both to rise in the arc of a circle until the link has passed far enough in the draw-head for the pin to fall into its loop. The pin can be elevated entirely out of the slot and swung backward until it rests on the top of the draw-head when it is desired that cars shall stand together without being coupled.

Claim.—The draw-head A in combination with the pin C and lever D, when the fulcrum of the lever is forward of the pin, and the latter has a shoulder, *c*, to lift the lever on the entrance of a link, and is so constructed and connected that it can be elevated above and supported upon the draw-head, as described and shown.

142,714.—Clothes-Drier.—ABRAHAM S. MILLER, Nottingham, Ind. Application filed July 1, 1873.

Four braces are pivoted to a central standard near the upper end; each brace has pivoted to it a number of arms, the inner ends of which are united together by means of cords, and the cords are attached to the central standard.

Claim.—The combination of the standard 1, braces 2, arms 3, and cords 5, substantially as shown and described.

142,715.—Car-Coupling.—CHARLES L. MILLER, Cuba, N. Y. Application filed June 10, 1873.

When the coupling-hook is raised it is held up by a spring acting on its lower end, which is enlarged for that purpose and to receive the concussion from the approaching draw-head, by which it is thrown down over the transverse bolt on that draw-head. When this hook is not in use it is held out of the way by another hook catching over a pin which projects from its side.

Claim.—1. In combination with the draw-heads B, the pivoted hooks D provided with the shoulders *c*, and the springs E, constructed and arranged to operate substantially as described.

2. In combination with the pivoted coupling-hooks D provided with the pins *d*, or their equivalents, the spring F, arranged to operate as shown and described.

142,716.—Furnace for Producing Malleable Iron.—DAVID R. NASH, Brooklyn, E. D., N. Y. Application filed March 11, 1873.

The ore is reduced in a series of upright retorts from a series of puddling-furnaces, and the metal from the retorts drops into the hearths. The waste gases from the puddlers reduce the ores in the retorts.

Claim.—1. In a furnace for deoxidising ores, the combination of a series of separately-removable retorts arranged around a common center, flues for conducting the heated gases from a puddling-furnace, or from puddling or heating furnaces, to and around the retorts, substantially as and for the purpose set forth.

2. The combination of the separately-removable retorts K K and the chutes *s s* for conducting the deoxidized ore to the puddling-furnaces, substantially as set forth.

3. The combination of the central induction-passage *c*, receiving chamber *d*, and deflector *g*, arranged substantially as and for the purpose set forth.

4. The combination and arrangement of the receiving-chamber *d*, induction-passage *c*, connecting-flues *i i*, flues or spaces *e e*, flue-space *h h*, and return-flues *k k*, substantially as and for the purpose set forth.

142,717.—Reservoir Cooking-Stove.—DAVID H. NATION, St. Louis, Mo. Application filed April 3, 1873.

The horizontally-swinging cover is detachably hinged at one corner. Upon its under side are flanges, which sweep over the flange on the upper rim of the reservoir-frame and clear off all the water drops, thus preventing any dripping.

Claim.—The combination of the frame A with L-shaped flanges *d d*, and studs *a a* with wings *b b*, and the detachable covers B B with slots and under flanges correspondingly with the studs and flanges on the plate, all as and for the purposes set forth.

142,718.—Hay or Cotton Press.—DAVID A. NELSON, Tyler, Tex., assignor of one-third his right to S. D. WOOD. Application filed July 22, 1873.

Claim.—1. A press-box having the hinged latched sides J J, removable side K fitting grooves of frame L and passing through frame L', and the side K', held by key M, to form a press-box from which the bale may be easily removed.

2. The follower H, beveled on its upper side, and having the shank *h'* with an upwardly-tapering extension, combined with the pivoted straps E' E' and lever E to enable the said follower to be held up against said lever, in the manner described.

3. The opposite followers G H, operated in the same press-box by two opposite levers, D E, attached together by a connection, N, in the manner and for the purpose specified.

142,719.—Adjustable Spray-Jet.—AMOS NICKERSON, East Somerville, Mass. Application filed July 5, 1873.

The diffuser is pivoted in a socket on the jet-tube, and through the rear part of its shank passes the adjusting-screw.

Claim.—The jet-tube A, the socket *s*, the spreader B, and the screws D, constructed, arranged, and connected or applied together as shown and described.

142,720.—Drawing-Knife.—ELMON PARKER, Chambersburg, Pa. Application filed June 9, 1873.

A spoke-shave is attached to one end of a drawing-knife.

Claim.—The guide-bar, Fig. 2, the cap, Fig. 3, in combination with a drawing-knife, when arranged in manner substantially as described, and for the purposes herein set forth.

142,721.—Buckle.—WILLIAM PARSONS, Palmyra, N. Y., assignor of one-half his right to WILLIAM B. BROWN, same place. Application filed June 14, 1873.

Claim.—A buckle in which the cross-bar C is constructed with the V-shaped recesses *c c* and tongue *a*, with its vertical point *d*, combined as herein described, for the purpose specified.

142,722.—Water-Filter.—JAMES PEARSON, Sacramento, Cal. Application filed May 17, 1873.

A vessel for filtering purposes, having an inclined bottom and grating, arranged with cocks, perforated air-chamber, and alternate layers of gravel, charcoal, and sand, in connection with pressure-bars and reservoir.

Claim.—The filter consisting of the vessel A having the inclined bottom B, the grating D, the cocks *b* and *b'*, the perforated air-chamber N, and air-cock *n*, the alternate layers E F G H I of gravel, charcoal, and sand, the cap K, the pressure-bars J, the cocks *j* and F, and the reservoir M, arranged substantially as specified.

142,723.—Drop-Hammer Lifter.—CHARLES PECK, New Haven, Conn., assignor to MILO PECK and CHARLES PECK, same place. Application filed April 15, 1873.

The improvement is mainly in the device for holding the pawl in contact with the ratchet-wheel, consisting of the bent bar *d*, rubber spring *f*, and nut *g*.

Claim.—The combination, with the ratchet-wheel E, pawl *b*, and cam-guard *c*, of the S-shaped lever *d* and spring *f*, constructed and operating substantially in the manner described.

142,724.—Dumping-Platform.—FRANCIS PEISLER, Bloomington, Minn. Application filed September 3, 1872.

To be used in excavating.

Claim.—The sliding hopper A, arranged upon the girders F'' of the adjustable platform, with or without the removable apron H, substantially as described, for operation in respect to conveyers J J, as set forth.

142,725.—Railroad-Switch Stand.—ROBERT A. RASH, Petersburg, Va., assignor of one-half his right to TAFFEY, LUMSDEN & CO., same place. Application filed March 21, 1873.

The cylinder revolving within the case has upon it legs *a*, fitting recesses in the top of the case, which govern the throw of the switch, the vertical crank-shaft with cylinder being lifted by the treadle G and moved by lever H. The cylinder cannot be locked nor the key withdrawn until the switch-rail is properly replaced. The cap D protects the movement from being obstructed by ice.

Claim.—1. The combination of the cylinder C, revolving within the case B, and the bolt *f* of the lock I, constructed and arranged to operate substantially as and for the purposes herein set forth.

2. The combination of the stand A, casing B, cylinder C with cap D, crank-shaft E, treadle G, and lock I, all constructed and arranged to operate substantially as and for the purposes herein set forth.

142,726.—Straw-Cutter.—ROBERT A. RASH, Petersburg, Va., assignor of one-half his right to TAFFEY, LUMSDEN & CO., same place. Application filed March 21, 1873.

The lever, pivoted to the frame on one side, is pivoted to the knife, which has its opposite bearing in a slotted plate and works behind guides, to which is attached a gage-plate for regulating the cut.

Claim.—The combination of the extended and slotted plate J, secured to one side of the frame A B, the lever H, pivoted to the opposite side of the frame, the knife I pivoted to the lever and moving in the slot in the plate, the guide-bars K E, and the gage-plate G attached thereto, all constructed and operated as and for the purposes set forth.

142,727.—Distant-Heat Indicator.—JAMES A. READ, Enfield near Sydney, New South Wales. Application filed June 15, 1872.

The bulb of an air-thermometer is placed in the hold of a vessel or other place, whose temperature is to be ascertained and, by means of a long flexible tube, communicates the variations of expansion to the siphon or liquid-scale, placed convenient for observation. An enveloping-tube protects the inner thermometer-tube from disturbances of radiation, and stop-cock, suitably arranged at the upper part of the siphon, serves for adjusting the liquid-scale.

Claim.—1. The use of a tube or tubes, one within the other, covered and protected, if necessary, by other tubes or pipes, as hereinbefore particularly described, the inner one to connect the glass chamber or vessel above spoken of and the indicating-siphon, the insulation of the two tubes by means of an air-passage between preventing the action of the heat at any place or point except where such bulb, chamber, or vessel is placed.

2. The application of air-cocks of the form and kind above mentioned, attached to the siphon, releasing the liquid in the same from internal and external atmospheric pressure, and for the purpose of restoring the equilibrium of the liquid within the said indicator or siphon, in the same manner and form above specially mentioned and described.

142,728.—Mode of and Apparatus for Varnishing Sad-Irons and other articles.—WILLIAM J. REAGAN, Royer's Ford, Pa., assignor to ROYER'S FORD IRON FOUNDRY, same place. Application filed April 18, 1873.

Claim.—1. The mode described of varnishing sad-irons and other objects—that is, by placing them in openings in a board and immersing the portions projecting below the board in a supply of varnish, all substantially as herein set forth.

2. The combination of a trough, D, in which the varnish can be raised or lowered with the board B hinged to the trough, as set forth.

3. The combination of the said board B, for carrying the sad-irons or other objects, with the detachable board F.

142,729.—Middlings-Purifier.—LEVI S. REYNOLDS, Minneapolis, Minn. Application filed April 28, 1873.

The riddle is regulated and given any pitch desired by the adjustable bars that support the frame in which the riddle is inclosed. The bolting-cloth receives a compound vibration by means of the sliding weight and horizontal concussion given to the riddle-frame, which prevents gumming of the bolting-cloth. Perforated air-tubes arranged transversely across the machine under the tail end of screen, for giving the strongest blast of air at that point.

Claim.—1. The riddle-frame C, in combination with the frame B, supporting-bars *a'*, and springs *g*, all constructed and arranged substantially as and for the purpose set forth.

2. The relative arrangement of the openings J' and perforated tubes J J J in the case, in combination with the partitions A', screen *c*, and fan for producing an accelerated draft of air, as and for the purpose specified.

3. The sliding weight H, operated as described, in combination with the riddle C having a horizontal vibration, substantially as and for the purpose set forth.

142,730.—Lamp.—FRANK REHND, Brooklyn, N. Y. Application filed August 13, 1873.

On the standard of a lamp, whose weight prevents an extinguisher from operating, is placed a spring, which, when grasped by the hand in the act of lifting the lamp, prevents extinguishment; also the substitution in such an extinguishing device of a spring with two arms.

Claim.—1. The spring 5 secured to the side of the standard *c*, in combination with the rod *c*, having the notch 1, substantially as set forth.

2. The combination of the rod *c*, foot *f*, springs 5 and 2, and arms 3, arranged to operate as specified.

142,731.—Cutter-Head for Planing-Machines.—EPHRAIM G. RICHARDS, Detroit, Mich. Application filed July 14, 1873.

Beading-cutters are attached to one side of a cutter-head cylinder, for the purpose of "beading" on the edge or interior surface of dressed lumber.

Claim.—The cylinder A, having the double-tailed groove *a* in one of its blank sides, in combination with the bit-holder B, bolts and nuts *b b'*, bits *c c'*, and gib *c''*, as and for the purpose described.

142,732.—Apparatus for Relieving Grounded Vessels. WILLIAM R. RIGHTOR, Helena, Ark. Application filed May 23, 1873.

Sectional bent pipe or tube is connected by swivel-joint to a fixed tube connected with a pump or boiler on board the vessel. Water or steam is forced through said pipe to loosen the sand or mud, and thus relieve the vessel.

Claim.—The vertical pipe G, having a horizontal extension or discharge pipe, I, and provided with a swivel-bearing in the removable head F, whereby it is adapted to be rotated, when used in combination with the pipe C, in the manner and for the purpose described.

142,733.—Circular-Saw Table.—HENRY C. ROHR, Detroit, Mich., assignor of one-half his right to WILLIAM L. BEARD, same place. Application filed July 31, 1873.

The saw-table is adjusted vertically by a lever provided at one end with a toothed segment, which acts upon a rack attached to the under side of the table.

Claim.—The quadrants C provided with the ratchet teeth *d* cut on different planes, the bar D provided with the rack *a*, the lever E pivoted between the quadrants C, having the geared sector *b* at one end, and the pawls E' and the springs *f* at the other, constructed and arranged substantially as and for the purpose set forth.

142,734.—Coal-Hod.—HENRY B. SAFFORD, Lancaster, N. Y. Application filed February 11, 1873.

Claim.—1. The coal-hod A, in combination with the vessel C, valve D, spring I, sliding catch E, and stop J, substantially as and for the purpose described.

2. The coal-hod A, in combination with the inclined shelf K, valve D, vessel C, spring-catch E, and stop J, substantially as and for the purpose described.

142,735.—Window-Screen.—JOHN F. SCHERPE, St. Louis, Mo. Application filed August 12, 1873.

Claim.—The screen-frame formed of two parts, C D, hinged together at *c*, and having pin projections *c'* and catches E F, substantially as and for the purpose set forth.

142,736.—Shuttle-Box Mechanism.—JOHN SCHRACK, Philadelphia, Pa. Application filed June 12, 1873.

To bring any one of a series of shuttle-boxes opposite the race the lifting-lever is connected to a plate-lever reciprocating in a vertical plane and limited in its movement by a pin and slot. On its face the plate-lever is provided with pins, which project over the notched ends of a series of bell-crank levers controlled by a jacquard apparatus, and one of the pins projects into the path of a series of hooked arms, also controlled by the jacquard, and pivoted to a corresponding series of levers arranged to be raised and lowered by a series of cams of different size or throw. The notched vertical arms of the lower set of bell-crank levers being of different length, their ends serve as steps for supporting the boxes at any desired point in their descent, and the hooked arms, each receiving a different lift, give the desired upward movement.

Claim.—1. The combination, substantially as described, of the lever A, from which the drop-boxes are suspended, the lever B, its pins *f*, and the series of levers E, controlled by jacquard apparatus.

2. The combination of the two series of levers E and F, controlled by jacquard apparatus, with the lever B and its pins.

142,737.—Railroad-Car Heater.—ELIPHALET S. SCHIFFLER and WILLIAM STACKMAN, Brooklyn, N. Y. Application filed May 29, 1873.

Claim.—In combination with the heater B and main trunk-pipe G with its gates and couplings, the pipes *d d* and auxiliary heater I with pipe K and lamps *f f*, all constructed and arranged and used substantially in the manner and for the purposes herein set forth.

142,738.—Self-Closing Hatchway.—ALONZO B. SEE, Yonkers, N. Y. Application filed February 17, 1873.

The hatchway-covers fold up on the approach of the elevator, to admit its passage, and expand and close the opening on its recession. Small auxiliary folding platforms fill the spaces at the ends of the main hatches, caused by the encroachment of the corner posts.

Claim.—1. The hatchway-platform E, made jointed and composed of two sections, *a b*, which fold against each other vertically when the platform is to open, and are in line with each other horizontally when the platform is shut, as specified.

2. The combination of the brace or braces *i* with the jointed platform *a b*, substantially as and for the purpose herein shown and described.

3. The rod A, connecting the cranks *f f* of the jointed platforms, to cause their simultaneous opening and shutting motion, as specified.

4. The double-armed crank *l*, fitted upon the pin *g*, to be actuated by the lever G, in the manner set forth.

5. The spring-catch F, supporting the platforms in their closed position, and combined with rod *s* and lever G for operation, as set forth.

6. The V-shaped lever G, arranged in combination with rods *s p* and *s*, as and for the purpose specified.

7. The T-shaped links H and I, applied, respectively, to the rods *n* and *p* for connection with the lever G, to be operated as set forth.

8. The elevator-frame B, provided with projections *u v* for mounting the links I and H, respectively, as specified.

9. The filling-in platform J, applied in combination with the supporting-spring *w* for filling the spaces in corner elevators, as set forth.

142,739.—Stench-Trap.—JAMES SEMPLE, Chicago, Ill.—Case A. Application filed June 25, 1873.

At the bend of the trap is secured a metallic re-enforcement to prevent the thrusting of any sticks in the trap in relieving it of obstacles.

Claim.—A stench-trap, provided with a metallic re-enforcement at the bend *a*, as and for the purpose described.

142,740.—Derrick.—JAMES E. SHERRILL, New York, N. Y. Application filed August 16, 1873.

The boom of the derrick is hung from a cap at the upper end of the mast. This boom is made double, and the parallel pieces are outside and swing free from the mast. A counterpoise is attached to one end of the boom. When the weight to be raised is not equal to that of the counterpoise the boom swings endwise until the equilibrium is obtained.

Claim.—1. A derrick, made with a double boom passing at each side of a vertical mast and suspended from a saddle that rests upon the top of the mast, in combination with a counterpoise to balance the weight, substantially as set forth.

2. A counterpoise suspended from the top of the mast, in combination with a boom and blocks or pulleys arranged substantially as set forth, so that the weight of the article raised shall act to draw the counterpoise upward and away from the mast until an equilibrium is obtained, substantially as set forth.

3. A block connected by a bridle to the base of the mast, in combination with the hoisting-tackle, double boom, and counterpoise, substantially as and for the purposes set forth.

142,741.—Coal-Delivering Sack.—WILLIAM S. SHACKLETON, Cleveland, Ohio. Application filed November 30, 1872.

Claim.—The herein-described coal-sack, consisting of the body A, lip B, handle C, leather shield D, and ears E, as and for the purpose specified.

142,742.—Washing-Machine.—CHARLES W. SHERER, Chicago, Ill. Application filed July 21, 1873.

In a suitable frame is employed a central fluted roller; above this, partly surrounding it, is a series of fluted rollers that are pivoted in a hinged weighted frame-work that slides in a slotted frame.

Claim.—1. The arc of fluted rollers F F', bearing in the hinged weighted frames G G', in combination with the central roller B, substantially as specified.

2. The hinged weighted frame pieces G G', connected together by the rigid rods *e f*, upon which turn loosely the rollers F F', as specified.

3. The arc of fluted rollers F F, bearing in the weighted frame G G', in combination with the rocker-shaped buttons A A, attached to the ends of the rod *e*, and the upright slotted guide-plates E, as specified.

142,743.—Drying Lard and Tallow.—AMOS SMITH, Cincinnati, Ohio. Application filed June 16, 1873.

Claim.—The mode of artificially drying tallow or lard containing moisture, by passing through the same, while in a fluid state, currents of hot air, substantially as set forth.

142,744.—Apparatus for Drying and Cooling Tallow or Lard.—AMOS SMITH, Cincinnati, Ohio. Application filed June 16, 1873.

A set of pipes introduced into a tank containing the melted lard, through which a stream of hot air is first passed, and then a current of cold air in like manner.

Claim.—1. An apparatus for drying and cooling tallow or lard, combining in its construction a pressure blast, a pipe for cold air, and another passing through a heating-furnace, and a tank for containing the melted material, into which a blast of hot air and of cold air may be successively introduced, substantially as set forth.

2. In combination with the tank F, and hot and cold air pipes B and C, the adjustable pipe I, and distributing-trough N, adjustable in manner substantially as set forth.

142,745.—Floor for Refrigerator-Buildings, &c.—ROLLIN A. SMITH, Fond du Lac, and ALBERT SCHMIDT, Green Bay, Wis. Application filed January 25, 1873.

The floor is made of galvanized iron, zinc, or other non-corrosive sheet metal, and is composed of sheets with their edges soldered, so as to form a continuous piece of the proper dimensions. The corrugations extend from one end to within a short distance of the opposite end, where they terminate in a groove or gutter running at right angles with the corrugations.

Claim.—The combination of the floor A, formed with parallel angular corrugations *a*, the frame B, joists C, diagonal braces D, and troughs F, arranged under the joists, and communicating with the transverse trough F', constructed and arranged substantially as shown and described.

142,746.—Core-Barrel for Casting.—WILLIAM SMITH, Pittsburg, Pa. Application filed June 4, 1873.

Claim.—1. A core-barrel formed of a series of segmental plates, G G, cast with the interior inclined seats H H in one piece, and provided with V-shaped openings cut the entire length between said plates, substantially as and for the purposes herein set forth.

2. In combination with the segmental plates G G and their seats H H, the central shaft A with plates B C, hubs C D, toggles E E, and lugs *d d*, all constructed and arranged substantially as and for the purposes herein set forth.

3. In combination with the central shaft A, plates G G, and intermediate devices, the bottom plate I, nut M, bowl K, and bed-plate L, all substantially as and for the purposes herein set forth.

4. The slotted hubs C, attached to the central shaft A by pins *b* passing through the slots in the hubs, as and for the purposes herein set forth.

142,747.—Reciprocating Engine.—ALBERT STALEY, San Francisco, Cal. Application filed April 30, 1873.

The pitman imparts the reciprocating motion given it by the piston-rod to the cranks, the rollers on said piston-rods permitting a free vertical movement thereof.

Claim.—The skeleton-link or pitman-frame I, with its cross-bars or abutment K, in combination with the pistons S and piston-rods H with their friction-rollers *l*, substantially as and for the purpose above described.

142,748.—Bee-Hive.—ADAM J. STEINBERG, Butler, Ind. Application filed June 11, 1873.

The hive is incased in an outer box of corresponding form, an air-space being left between them. The front of the outer case is removable; and the top, front, and sides of the inner box are all hinged to open out for the exposure of the comb. The frames hang on hooks in the rear, and rest on cleats in front.

Claim.—1. The interior hive D, with hinged front, sides, and top, in combination with the comb-frames G G within said hive, and the exterior hive A surrounding the hive D, with an air-chamber between the two hives, substantially as set forth.

2. The within-described bee-hive, consisting of the exterior hive A, with loose front B, interior hive D with hinged front, sides, and top, comb-frames G G, hung as described, honey-boxes H H, and cap J, all substantially as herein set forth.

142,749.—Machine for Sawing Spokes.—JOSEPH L. THEALLS, Warsaw, Ind. Application filed January 4, 1873.

The supports which carry the log are made longitudinally adjustable upon the carriage.

Claim.—The horizontally-adjustable brackets C C' of the carriage, in combination with the screws D D, vertically-adjustable combined nuts and boxes D' D', and saws E and F, constituting a mechanism for sawing blank spokes of various lengths from bolts of timber, substantially as specified.

142,750.—Car-Coupling.—JOSHUA WAITE, Yarmouth, Me. Application filed March 1, 1873.

By means of the lever *i* the link is released. The finger *m*, projecting from the lever, is suspended over the draw-head and the rear end of the hooked lever, to prevent accidental uncoupling.

Claim.—The combination of the bent lever *i*, guide *j*, catch *k*, pivoted hooked lever *a b*, having the plate *c*, and the spring or finger *m*, as herein set forth, and for the purposes described.

142,751.—Changeable-Gage Car-Truck.—WILLIAM W. WHITAKER, Gloversville, N. Y. Application filed March 11, 1873.

The wheels are secured to independent axles, which are so arranged in their boxes that they may be adjusted for a narrow or wide gage track, and kept in their proper position by means of the brake-shoes, which are combined with the brake-bars, capable of being laterally adjusted and locked in place.

Claim.—1. In combination with the wheels and axles which are laterally adjustable, the lock-bars which are adapted to be shifted from one side of the wheels to the other, to confine the wheels when running upon either a wide or narrow gage track, substantially in the manner set forth.

2. The lock-bars pivoted and connected, substantially as set forth, so that they may be simultaneously raised to permit the wheels to be shifted.

3. In combination with the lock-bars, constructed substantially as set forth, the parts E^1, E^2, E', and E^3, for raising and lowering them.

4. In combination with laterally-adjustable car-wheels, adjustable brake-shoes moving with the wheels as the latter are shifted from one gage to another.

5. In combination with the truck-frame, the metallic brackets or caps fitted around the corners of the frame, and constructed with upper and lower flanges to receive bolts passing through the flanges and frame-timbers.

142,752.—Car-Axle Box.—WILLIAM W. WHITAKER, Gloversville, N. Y. Application filed March 11, 1873.

The waste-chamber is arranged in the upper part of the box directly over the journal.

Claim.—An axle-box having the partition E, which forms a support for the waste in the chamber B, and also guides the oil to

aperture F, through which the oil flows upon the journal, substantially as set forth.

142,753.—Tobacco-Ridger.—JOHN R. WHITTEMORE, Chicopee Falls, Mass. Application filed June 6, 1873.

The scrapers are made adjustable in width at their rear, as well as in front, and the wheel may be raised or lowered and held rigidly at any height.

Claim.—1. In a tobacco-ridger, the sides or sheet-plates A A, when their rear ends are made adjustable out or in, as well as their front ends, substantially as and for the purposes herein set forth.

2. The combination of the perforated standards I I and flanges *i*, formed on or attached to the bar B, the wheel G, and frame or rods *f*, substantially as and for the purposes herein set forth.

3. The combination of the sides or sheet-plates A A, made adjustable at both ends, bars B C, and the adjustable wheel G, attached rigidly to the machine, all substantially as and for the purposes herein set forth.

142,754.—Hammer for Planishing Sheet-Iron.—W. DEWEES WOOD, McKeesport, Pa. Application filed June 23, 1873.

The face of the hammer and anvil is wider than the pack, which is supported and fed forward on friction-rolls between adjustable guide-rails; also bearing friction-rolls.

Claim.—1. In a machine for planishing metal, the combination of an anvil and hammer, a feeding-table, and side rails, substantially as described.

2. The combination of hammer and anvil, the operative faces of which are as wide as the pack, a series of friction-rollers, constituting the face of the feeding-table, and one or more adjustable side rails, substantially as described.

142,755.—Cled-Crusher and Harrow Combined.—WILLIAM YOUNG and JAMES WORTHAM, Shelbyville, Tenn. Application filed August 8, 1873.

Claim.—In combination with one or more sliding rubbers, A, a reversible harrow, the teeth of which project on both sides of the beam, substantially as set forth.

REISSUE PATENTS.

5,564.—Breech-Loading Fire-Arm.—WILLIAM CLEVELAND HICKS, Summit, N. J.—Patent No. 16,797, dated March 10, 1857; reissue No. 1,952, dated May 9, 1865; reissue No. 3,793, dated January 18, 1870; reissue No. 3,860, dated March 1, 1870; extended seven years. Application filed September 1, 1873.

Claim.—1. The combination, substantially as before set forth, of the following three elements, viz: First, the barrel, rigidly attached to the breech-frame, and constructed with a chamber for holding the cartridge; second, the reciprocating breech-piece, operating relatively to the barrel and breech-frame, in such manner that its front surface moves forward toward the muzzle of the barrel during its closing movement; third, the reciprocating extractor, so connected with the said reciprocating breech-piece that the said forward closing movement of the front surface of the breech-piece, and the forward movement of the extractor to a position in front of the annular space occupied by the flange of the cartridge, when held in the said chamber ready for firing, may be effected simultaneously by one movement of the hand, so that the unexpended cartridge may be withdrawn by the engagement of the lip of the extractor with its flange, in case the said breech-piece be withdrawn before attempting to fire or before letting down the hammer.

2. The combination, substantially as before set forth, of the reciprocating breech-piece, arranged as before set forth, the barrel rigidly attached to the breech-frame, and constructed with a chamber for holding the cartridge, and two extractors arranged in such manner that their operating ends extend in the same direction, so that the cartridge-flange is not clamped between them, and can be readily disengaged from them after its extraction from the said chamber.

3. The combination and arrangement, substantially as before set forth, of the extractor, the breech-piece, and the barrel, in such manner that the extractor may be driven forward by the hammer after the breech is closed, and that the extractor performs the two functions of transmitting the blow to the primer, and of extracting the cartridge or remnant of the cartridge from the breech of the fire-arm.

5,565.—Tire-Setter.—JOSEPH PAILCA, Ledyard, N. Y.—Patent No. 122,770, dated January 16, 1872. Application filed July 16, 1873.

The wheel is compressed by means of a hooked lever and the bench, having plates B C. The tire is put on cold.

Claim.—1. In combination, a bench, A, provided with a suitable clamp, D, and curved plates B and C to hold the wheel, and a hooked lever, E, all substantially as described, whereby the wheel may be compressed and the tire drawn on at one operation.

2. The lever E, adapted to use in connection with wheel-bench A, and provided with an adjustable hook, G, to adapt it to tires of different widths.

5,566.—Tell-Alarm.—CYRUS TUCKER and WILLIAM H. TUCKER, Indianapolis, Ind., assignors, by mesne assignments, to HETTIE TUCKER and ROBERT S. DOBBY.—Patent No. 116,022, dated December 13, 1870; antedated December 9, 1870. Application filed May 26, 1873.

A series of rocking arms is arranged to support reversible bent tumbler-rods on either side of the pivot, so they may be set for sounding or escaping the alarm. A spring presses the engaging-plate against the tripping-dog even when the tumblers are free, unless the drawer be first pressed firmly inward.

Claim.—1. The use, in combination with the key mechanism and tumbler device, of dogs or levers E, which are formed with rear and forward supporting-arms, arranged to vibrate or turn on a center, and to operate substantially as described.

2. In combination with a holding and locking or alarm-sounding lever or projection of the counter, a catch-plate, and a series of tumblers, arranged to rise and fall, and adapted to be operated upon by the tumbler mechanism of the lock, substantially as and for the purposes described.

3. In combination with the dog J of the counter and plate E of the drawer, which interlock with each other, a pressure-spring, N, for holding the said interlocking devices together by frictional contact independently of the tumblers, substantially as and for the purpose described.

5,567.—Rivet.—JOHN E. WOOTTEN, Reading, Pa.—Patent No. 67,634, dated August 6, 1867.—Division A. Application filed July 30, 1872.

Claim.—1. A tubular rivet made by coiling a strip of iron, as set forth.

2. A tubular rivet in which the grain of the iron takes a transverse course at right angles, or thereabout, to the axis of the rivet, as described, for the purpose specified.

5,568.—Machine for Boring and Mortising Blind-Stiles.—LEONARD WORCESTER, Lebanon, N. H.—Patent No. 24,668, dated July 5, 1859; extended seven years. Application filed March 26, 1873.

Claim.—1. The combination of the following elements or instrumentalities, namely: A reciprocating carriage for holding and presenting the stile to the cutter, a pattern for spacing the mortises to be cut, a reciprocating cutter for cutting the mortises, and a feeding mechanism for automatically feeding the stiles for the successive mortises, all acting in co-operative relation with each other, substantially in the manner described and specified.

2. The combination of the following elements or instrumentalities, namely: A reciprocating carriage for holding and presenting the stile to the cutter, a pattern for spacing the mortises to be cut, a reciprocating cutter for cutting the mortises, an automatic feed for feeding the stiles, and an automatic clamp for clamping and releasing the stile for the operations of feeding and cutting, substantially in the manner described and specified.

3. A rotary cutter-head carrying cutters at both ends combined with an inclined reciprocating frame, and so arranged as to automatically and simultaneously cut mortises in or bore a pair of blind-stiles as they are presented to the cutters, substantially in the manner described and specified.

4. The combination and arrangement of the transversely-reciprocating carriages A A with the cam-cylinders L L and vibrating levers E E and *f f*, constructed and operating substantially in the manner described.

5. An organized machine for automatically mortising and boring blind-stiles, constructed and operating substantially as described and specified.

5,569.—Feed-Water Heater and Filter for Steam-Boilers.—JAMES ARMSTRONG, Toledo, Ohio.—Patent No. 91,703, dated June 22, 1869. Application filed March 13, 1873.

Water enters the chamber into which exhaust steam passes, and flows over the edges of the imperforate and over the collars of the perforate pans, held together by a slide in the removable head; thence flows through a perforated shield, removable to permit access to the heater-chamber, into the filtering-chamber, from which it passes through sponge or cloth and perforated wall into the hot-well, from which it is pumped into the boiler.

Claim.—1. The filter-chamber, constructed as set forth, to form an extension of the heater-chamber, to which its walls are directly attached, and to leave an opening through which access may be had to the heater-chamber through the filter-chamber.

2. The combination of a heater-chamber, a filter-chamber, an opening of comparatively large area in the division-wall of the two chambers, and a removable perforated diaphragm or shield to close the opening while permitting the feed-water to pass through.

3. The combination of a heater-chamber, a filter-chamber, an opening in the partition-wall between the two, and a removable head or cover to the filter-chamber to afford access to the heater through the filter-chamber.

4. The combination of a heater-chamber, a filter-chamber, forming a lateral extension thereof, and separated from it by a single perforated wall, a hot-well, and a filter between the heater-chamber and hot-well.

5. The combination of the heater-chamber and its independent separable pans, arranged in series alternately perforate and imperforate, substantially as set forth.

6. The combination of the heater, the independent separable pans, the removable head, and the clamp-screw, substantially as set forth.

5,570.—Process and Apparatus for Evaporating Liquids.—JAMES J. JOHNSTON, Columbiana, Ohio, assignor of part interest to JOHN CAMPBELL and CHARLES SEIBERT, Alleghany, Pa.—Patent No. 50,935, dated November 14, 1865; antedated November 2, 1865. Application filed September 3, 1873.

Steam from the lower chamber mingles with air from a suitable blower, passes through the superheating coil beneath the still over the fire-chamber, and is conducted by the vertical pipe to the interior of the adjustable perforated disk, escaping in contact with the liquid to be evaporated contained in the upper chamber.

Claim.—1. The process herein described for evaporating and vaporizing liquids, viz., by the application or contact of superheated steam and air combined.

2. The combination of the furnace A, still B, adjustable disk h, and pipes k, l, and m, substantially as herein described, and for the purpose set forth.

5,571.—Bracelet.—JOHN S. PALMER, Providence, R. I.—Patent No. 731, dated March 19, 1861. Application filed July 24, 1873.

Claim.—1. The improvement in bracelets and similar articles, consisting in a plate made with turned edges, and another plate or part combined with the same, and protected by such turned edges, whereby the seam or joint is kept from contact with the flesh.

2. The combination of the lips *s s* of the foundation-plate with the ornamental metal plates, or their equivalents, constructed in the manner substantially as described, for the purpose herein specified.

INDEX OF INVENTIONS PATENTED SEPTEMBER 9, 1873.

	Class No.	Whole No.
Alarm, burglar, H. P. Hood	24	142,630
Alarm, till, C. and W. H. Tucker (reissue)	24	5,566
Axle box, W. A. Clark	31	142,556
Bed bottom, P. Anderson	02	142,549
Bee hive, A. J. Sternberg	9	142,748
Blind slat fastener, G. W. Brooks	24	142,674
Blind stile, machine for boring and mortising, L. Worcester, (reissue)	73	5,568
Boiler and condenser, B. T. Babbitt	150	142,663
Boiler and condenser, B. T. Babbitt	150	142,664
Boilers, feed water heater and filter for steam, J. Armstrong, (reissue)	143	5,569
Boot and shoe stretcher, J. Lyons	16	142,710
Boots and shoes, machinery for lasting, Trask and Wheeler	16	142,657
Bottle casing, J. Dugan	1	142,685
Bracelet, J. S. Palmer, (reissue)	36	5,571
Buckle, W. Parsons	23	142,721
Button, J. Durand	23	142,686
Can for holding paint, &c., G. H. Chinnock	107	142,612
Can for oils, &c., G. H. Chinnock	107	142,613
Car axle box, W. W. Whitaker	122	142,752
Car brake, W. Weriner	122	142,658
Car brake, railway, W. D. Pope	122	142,649
Car brake, railway, G. Westinghouse, Jr.	122	142,600
Car brake, self acting coal, J. D. Leonard	122	142,572
Car coupling, R. H. Dowling	122	142,682
Car coupling, P. Kendrick	122	142,634
Car coupling, T. and J. W. Meikle	122	142,713
Car coupling, C. L. Miller	122	142,715
Car coupling, J. Waite	122	142,750
Car heater, railroad, Scripture and Stackman	154	142,737
Car, pneumatic railway, H. G. Yates	121	142,605
Car truck, changeable gage, W. W. Whitaker	122	142,751
Car wheel, Sax and Kear	122	142,587
Carpet, J. Dorman	95	142,681
Carriage spring, G. W. Harlan	31	142,627
Caster, salt and pepper, J. Bird	88	142,670
Casting, core barrel for, J. B. Aston	33	142,662
Casting, core barrel for, W. Smith	33	142,746
Chair frame, G. Gardner	64	142,625
Chair seat or back, G. Gardner	63	142,624
Chairs, coupling for connecting cradles to, J. Reeves	62	142,583
Chuck, centering, G. H. Miller	100	142,642
Cigar mold, N. DuBrul	160	142,683
Cisterns, cut off for, G. W. Howell	167	142,589
Clamp, F. M. Holmes	29	142,697
Clothes drier, A. S. Miller	91	142,714
Clothes reel, D. L. Huff	91	142,631
Clutch, friction, J. J. Grant	87	142,564
Coal delivering sack, W. S. Shackleton	162	142,741
Coal hod, H. B. Safford	154	142,734
Coal mining machine, F. M. W. Price	124	142,582
Composition mastic, A. Thiele	153	142,595
Condenser, marine, B. T. Babbitt	150	142,665
Crusher and harrow combined, clod, Young and Worthen	73	142,735
Cutter head, R. Benjamin	174	142,669
Derrick, J. R. Serrell	79	142,740
Dredger, J. F. Morse	88	142,577
Drill and planter, seed, W. F. West	133	142,599
Drilling and pumping machinery, standard jack-post for, Eastman and Morris	124	142,619
Electrical regulator for transmitting instruments, T. A. Edison	50	142,688
Elevator, E. Boyden	79	142,555
Elevator, hay, C. H. Kirkpatrick	79	142,635
Engine, reciprocating, A. Staley	150	142,747
Engine, rotary, J. R. Crisp	150	142,559
Engine, rotary, F. J. Hollanweger	150	142,629
Engine, steam, R. T. P. Allen	150	142,660
Engines, heater for steam fire, W. F. Shaw	150	142,589
Envelope machine, feed box for, E. Allen	100	142,606
Evaporating liquids, J. J. Johnston, (reissue)	47	5,570
Fence post socket, G. W. and J. B. Durant	52	142,687
Fire arm, breech loading, W. C. Hicks, (reissue)	18	5,564
Fire extinguisher, F. Latta	25	142,637
Flask, powder, M. Cilik	55	142,614
Floor for refrigerator buildings, &c., Smith and Schmid	30	142,745
Furnace for producing malleable iron, D. R. Nash	99	142,718
Furnace for the manufacture of oxide of zinc, J. G. Lang	99	142,571
Gage, splitting, T. Rice	29	142,584
Glass molds, treating, J. Lydiatt	68	142,573
Hammer lifter, drop, C. Peck	60	142,723
Hammer for planishing sheet iron, W. D. Wood	125	142,754
Harrow, R. L. Taylor	73	142,593
Harvester rake, J. Irvine	74	142,632
Harvester rake, J. L. Owens	74	142,644
Hatchway, self-closing, A. B. See	79	142,738
Hay, sling for loading and unloading, G. W. Long	79	142,636
Heater for steam fire engines, W. F. Shaw	150	142,589
Hinge for blinds, lock, T. Clucas, Jr	24	142,679
Horseshoe, A. W. Smith	60	142,590
Horseshoe, sectional, J. D. Abbott	60	142,547
Horseshoe nails, manufacture of, D. Turbayne	60	142,597
Horseshoe nails from plates, die for punching, A. H. Caryl	60	142,678
Indicator, distant heat, J. A. Read	101	142,727
Jack, lifting, I. A. Crippen	79	142,680
Jeweler's show case, Martin and Studer	86	142,575
Journal packing rack, W. H. Humphrey	87	142,696
Kettle and pan scraper, E. J. Whitman	88	142,602
Knife, drawing, E. Parker	49	142,720
Lamp, L. Berns	90	142,609
Lamp, F. Rhind	90	142,730
Lamp, street, J. S. Hagerty	90	142,693
Lard and tallow, drying, A. Smith	26	142,743
Last block fastener, L. S. Wright	16	142,603
Lever for drawing framed timber together, J. N. Eames	29	142,618
Lock, permutation, P. W. Hall	93	142,695
Loom picking mechanism, W. Stearns	95	142,592
Mandrel, tube welding, H. K. Flagler	163	142,622
Mechanical movement, W. Oliver	67	142,578
Metal working machine, compound, H. B. Sevey	100	142,588
Mill, boring, F. E. Hahn	173	142,694
Molds blackwashing, J. B. Aston	33	142,661
Molding machines, cutter head for, J. Alloways	173	142,548
Needle case, Marchant and Hart	104	142,639
Needle sharpening device, Barnum and Goodrich	70	142,552
Nut lock, K. H. Loomis	14	142,709
Ore concentrator, J. A. Peer	3	142,646
Ore washer, J. A. Peer	3	142,647
Organ, reed, L. K. Fuller	106	142,690
Packing machine, A. Ralph	63	142,651
Packing, metallic piston, J. Massey	67	142,640
Paper pulp, disintegrating wood fiber for, T. B. Armitage	108	142,550
Pavement composition, S. J. Whiting	153	142,601
Paving composition, A. Thiele	110	142,594
Pile or fagot, J. Barker	125	142,666
Piston, C. B. Allen	151	142,659
Pitman, J. H. Carothers	67	142,611
Pitmen with shafts, connecting, R. Cleaveland	67	142,616
Planing machines, cutter head for, E. G. Richards	173	142,731
Planter, corn, E. C. Brown	133	142,675
Planter, corn, N. C. Lamb	133	142,706
Planter, corn, G. W. Starrett	133	142,656
Platform, dumping, F. Peteler	51	142,724
Plow and cultivator, combined shovel, A. Smith	43	142,655
Press, hay or cotton, D. A. Nelson	7	142,719
Printing press, J. G. Peterson	117	142,648
Printing presses, inking apparatus for rotary, E. Allen	117	142,607
Propeller, chain, E. P. Russell	139	142,653
Pump, rotary, C. P. Holmes	118	142,698
Pumps, hand lever attachment for steam, O. T. Earle	118	142,562
Purifier, middlings, L. S. Reynolds	57	142,729
Purifier, flour and middlings, E. N. Lecroix	57	142,705
Railroad cattle guard, Tunison and Reeve	139	142,596
Railroad rail, J. B. Johnston	139	142,701
Railroad rail joints, fastening for, B. W. Beckhelt	139	142,610
Railroad rails, joint connection for hollow, R. S. Sanborn	139	142,654
Railroad, street, J. R. Beckett	139	142,668
Railroad switch, D. E. Brackett	139	142,672
Railroad switch stand, E. A. Rash	139	142,725
Rake, revolving horse, G. Pemberton, Sr.	77	142,581
Refrigerator for transporting oysters, &c., J. C. Jones	58	142,703
Rivet, J. E. Wootten, (reissue)	14	5,567
Roof, metallic, I. S. Mettler	126	142,641
Sad irons, &c., varnishing, W. J. Reagan	107	142,733

	Class No.	Whole No.
Sandpapering machine, H. L. Hapgood	173	142,626
Sash balance, L. S. Wright	24	142,604
Sash fastener, L. L. Bates	24	142,667
Saw filing and setting machine, N. G. Ross	131	142,585
Saw table, circular, H. C. Rosin	120	142,733
Saws, gage for gang, N. C. Moody	120	142,643
Sawing machine, E. Inman	130	142,690
Sawing machine, spoke, J. L. Thralls	130	142,749
Screw blanks, machine for threading, E. Croft	171	142,560
Separator, grain, J. W. Breese	150	142,673
Sewer basin for street corners, J. H. Boschen	8	142,671
Sewing machine caster, E. R. Clark	134	142,615
Sewing machine hemmer, J. D. V. Eldredge	134	142,689
Sewing machine tables, &c., lock for, J. R. Logan	134	142,708
Sewing machines treadle, M. H. Knapp	134	142,704
Sewing machines, motor for driving, R. H. Atwell	134	142,551
Shoes, manufacture of, C. W. Green	16	142,691
Shoes, manufacture of, C. W. Green	16	142,692
Shook holder, J. L. Berry	174	142,553
Shutter, fire-proof, A. Gottlieb	4	142,563
Shuttle box mechanism, J. Schrack	95	142,736
Skirts, &c., ornamenting felt, J. W. Blackham	54	142,554
Sled brake, P. Gable	31	142,623
Spray jet, adjustable, A. Nickerson	167	142,719
Square, try, W. H. Cooper	29	142,557
Stamp, fountain hand, F. J. Contant	146	142,617
Staples, machine for making, W. Malick	103	142,574
Stove, heating, Little and Nation	154	142,707
Stove pipe for vessels, J. Hall	154	142,567
Stove, reservoir cooking, D. H. Nation	154	142,717
Stoves, elevated oven attachment for, Craine and Bloss	154	142,558
Straw cutter, R. A. Rash	59	142,726
Table, extension, J. M. Sackman	62	142,586
Table, ironing, A. J. Palmberg	91	142,645
Tallow or lard, apparatus for drying and cooling, A. Smith	26	142,744
Thrashing power, traveling, R. W. Faris	150	142,621
Tile machine, C. J. Merrill	20	142,576
Tire setter, J. Pallea, (reissue)	31	5,565
Tire tightener, M. E. Jacobs	31	142,633
Tobacco ridger, J. R. Whittemore	43	142,753
Tool handle, W. B. Hill	29	142,566
Trap, stench, J. Semple	8	142,739
Trunks, &c., strap fastening for, W. Grimsted	108	142,565
Type for type setting machines, apparatus for arranging, D. B. Ray	117	142,652
Valve for water and gas mains, &c., stop, C. W. Isbell	158	142,700
Valve, steam, H. P. Jones	158	142,702
Vegetable cutter, G. W. Parker	59	142,580
Veneers, machine for cutting, J. A. Squires	176	142,591
Ventilating building, L. B. Valk	166	142,598
Vessels, center board for, I. Call	137	142,677
Vessels, apparatus for relieving grounded, W. R. Righton	79	142,732
Wagon brake, W. F. Osborn	31	142,579
Wagons, end gate for, F. Grundy	31	142,568
Washing machine, S. Budlong	91	142,676
Washing machine, C. W. Sherer	91	142,742
Watch case latch, J. C. Dueber	36	142,684
Water cooler and filter, combined, W. J. English	167	142,690
Water filter, J. Pearson	167	142,722
Water meter, T. T. Prosser	167	142,650
Water strainer, F. W. Mase	167	142,711
Water wheel, turbine, A. A. Herriman	188	142,626
Windmill, O. B. Knapp	118	142,636
Window screen, J. F. Scherpe	30	142,735
Wood rails, machine for dressing, H. G. Angle	173	142,608
Wool drying frame, E. Duffee	49	142,561
Wrecking apparatus, McGroder and Tiedemann	88	142,712
Wrench, W. J. Innis	109	142,570

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED SEPTEMBER 9, 1873.

Abbott, J. D., Sectional horseshoe	142,547
Allen, C. B., Piston	142,659
Allen, E., Feed box for envelope machines	142,606
Allen, E., Inking apparatus for rotary printing presses	142,607
Allen, R. T. P., Steam engine	142,660
Allen Manufacturing Company, assignee	142,606, 142,607
Alloways, J., Cutter head for molding machines	142,548
Anderson, P., Bed bottom	142,549
Angle, H. G., Wood rail	142,608
Armitage, T. B., Disintegrating wood fiber for paper pulp	142,550
Armstrong, J., Feed water heater and filter for steam boilers, (reissue)	5,569
Aston, J. B., Blackwashing molds	142,661
Aston, J. B., Core barrel for castings	142,662
Atwell, R. H., Motor for driving sewing machines	142,551
Babbitt, B. T., Boiler and condenser	142,663
Babbitt, B. T., Boiler and condenser	142,664
Babbitt, B. T., Marine condenser	142,665
Barker, J., Pile or fagot	142,666
Barnum, R. S., and H. C. Goodrich, Sharpening needles	142,552
Bates, L. L., Sash fastener	142,667
Beard, W. L., assignee	142,733
Beckett, J. R., Street railway	142,668
Benjamin, R., Cutter head	142,669
Berns, L., Lamp	142,609
Berry, J. L., Shook holder	142,553
Bird, J., Salt and pepper caster	142,670
Blackham, J. W., Ornamenting felt skirts, &c.	142,554
Bloss and Craine	142,558
Boschen, J. H., Sewer basin for street corners	142,671
Boyden, E., Elevator	142,555
Bragg, M. M., assignee	142,561
Breese, J. W., Grain separator	142,673
Brockett, D. E., Railway switch	142,672
Brooks, G. W., Blind slat fastener	142,674
Brown, E. C., Corn planter	142,675
Brown, W. B., assignee	142,731
Buchholt, B. W., Railway rail joint fastening	142,610
Budlong, S., Washing machine	142,676
Call, J., Center board for vessels	142,677
Campbell, J., assignee, (reissue)	5,570
Carothers, J. H., Pitman	142,611
Caryl, A. H., Die for punching horseshoe nails from plates	142,678
Chinnock, G. H., Can for holding paint, &c.	142,612
Chinnock, G. H., Can for oils, &c.	142,613
Cilik, M., Powder flask	142,614
Clark, E. R., Sewing machine caster	142,615
Clark, W. A., Axle box for vehicles	142,556
Cleaveland, R., Connecting pitman with shafts	142,616
Clucas, T., Jr., Lock hinge for blinds	142,679
Cooper, N. H., assignee	142,620
Cooper, W. H., Try square	142,557
Contant, F. J., Fountain hand stamp	142,617
Craine, G., and J. W. Bloss, Elevated oven attachment for stoves	142,558
Crippen, I. A., Lifting jack	142,680
Crisp, J. E., Rotary engine	142,559
Croft, E., Screw blank	142,560
Dorman, J., Carpet	142,681
Dorsey, R. S., assignee, (reissue)	5,566
Dowling, R. H., Car coupling	142,682
Du Brul, N., Cigar mold	142,683
Dueber, J. C., Watch case latch	142,684
Duffee, E., Wool drying frame	142,561
Dugan, J., Casing for bottles	142,685
Durand, J., Button	142,686
Durant, G. W. and J. B., Fence post socket	142,687
Eames, J. N., Lever for drawing framed timbers together	142,618
Earle, O. T., Hand lever attachment for steam pumps	142,562
Eastman, W. W., and W. H. H. Morris, Drilling and pumping machinery	142,619
Edison, T. A., Electrical regulator for transmitting instruments	142,688
Eldredge, J. D. V., Sewing machine hemmer	142,689
English, W. J., Combined water cooler and filter	142,690
Estey, J., & Co., assignees	142,009
Faris, R. W., Traveling thrashing power	142,621
Ferris, O. C., assignee	142,694
Flagler, H. K., Welding mandrel	142,622
Fuller, L. K., Reed organ	142,690
Gable, P., Sled brake	142,623
Gardner, G., Chair seat or back	142,624
Gardner, G., Chair frame	142,625
Globe Nail Company, assignee	142,567
Gold and Stock Telegraph Company, assignee	142,626
Goodrich and Barnum	142,552
Gottlieb, A., Fire proof shutter	142,563
Grant, J. J., Friction clutch	142,564
Green, C. W., Manufacture of shoes	142,691
Green, C. W., Manufacture of shoes	142,692
Grimsted, W., Trunk strap fastening	142,565
Grundy, F., End gate for wagons	142,566
Hagerty, J. S., Street lamp	142,693
Hahn, F. E., Boring mill	142,694
Hall, J., Stove pipe for vessels	142,567
Hall, P. W., Permutation lock	142,695
Hapgood, H. L., Sandpapering machine	142,681
Harlan, G. W., Carriage spring	142,627
Hart and Marchant	142,639
Herriman, A. A., Turbine water wheel	142,626
Hicks, W. C., Breech loading fire arm, (reissue)	5,564
Hill, W. B., Tool handle	142,566
Hollenweger, F. J., Rotary engine	142,629
Holmes, C. P., Rotary pump	142,698
Holmes, F. M., Clamp	142,697
Hood, H. P., Burglar alarm	142,630
Howell, G. W., Cut off for cisterns	142,589
Hoyt, R. E., assignee	142,573
Huff, D. L., Clothes reel	142,631
Humphrey, W. H., Journal packing rack	142,696
Inman, E., Sawing machine	142,690
Innis, W. J., Wrench	142,570
Irvine, J., Harvester rake	142,632
Isbell, C. W., Stop valve for water and gas mains, &c.	142,700
Jacobs, M. E., Tire tightener	142,633
Johnston, J. B., Railway rail	142,701
Johnston, J. J., Evaporating liquids, (reissue)	5,570
Jones, H. P., Steam valve	142,702
Jones, J. C., Refrigerator for transporting oysters, &c.	142,703
Kear and Sax	142,587
Kendrick, P., Car coupling	142,634
Kirkpatrick, C. H., Hay elevator	142,635
Knapp, M. H., Sewing machine treadle	142,704
Knapp, O. B., Windmill	142,636

Lacroix, E. H., Flour and middlings purifier 142,705
Lamb, N. C., Corn planter 142,706
Lang, J. G., Furnace for the manufacture of oxide of zinc 142,571
Latta, F., Fire extinguisher 142,637
Leonard, J. D., Self-acting coal car brake 142,572
Little, E. C., and D. H. Nation, Heating stove 142,707
Logan, J. E., Lock for sewing machine tables, &c 142,708
Long, G. W., Sling for loading and unloading hay, &c 142,638
Loomis, K. H., Nut lock 142,709
Lowder, S., assignee 142,640
Lydiatt, J., Treating glass molds 142,573
Lyons, J., Boot and shoe stretcher 142,710
Mallek, W., Machine for making staples 142,574
Marchant, W. J., and H. B. Hart, Needle case 142,639
Marot, J. D., assignee 142,566
Martin, J., assignee 142,689
Martin, M., and J. A. Studer, Jeweler's show case 142,575
Mase F. W., Water strainer 142,711
Massey, J., Metallic piston packing 142,640
McGroder, B., and H. Tiedemann, Wrecking apparatus 142,712
Meikle, T. and J. W., Car coupling 142,713
Merrill, C. J., Tile machine 142,576
Metzler, J. S., Metallic roof 142,641
Miles, F. B., assignee 142,684
Miller, A. S., Clothes drier 142,714
Miller, C. L., Car coupling 142,715
Miller, G. H., Centering chuck 142,642
Moody, N. C., Gage for gang saws 142,643
Morgan, G. C., assignee 142,650
Morris and Eastman 142,619
Morse, J. F., Dredger 142,577
Nash, D. R., Furnace for producing malleable iron 142,716
Nation and Little 142,707
Nation, D. H., Reservoir cooking stove 142,717
National Tube Works Company, assignee 142,622
Nelson, D. A., Hay or cotton press 142,718
New England Glass Company 142,573
Nickerson, A., Adjustable spray jet 142,719
Oliver, W., Mechanical movement 142,578
Osborn, W. F., Wagon brake 142,579
Owens, J. L., Harvester rake 142,644
Pullen, J., Tire setter, (reissue) 5,565
Palmberg, A. J., Ironing table 142,645
Palmer, J. S., Bracelet, (reissue) 5,571
Parker, B., Drawing knife 142,720
Parker, G. W., Vegetable cutter 142,580
Parsons, W., Buckle 142,721
Payson, C. B., assignee 142,688
Pearsons, J., Water filter 142,722
Pence, S. W., assignee 142,689
Peck, C., Drop hammer lifter 142,723
Peer, J. A., Ore concentrator 142,646
Peer, J. A., Ore washer 142,647
Penisten, G., Sr., Revolving horse rake 142,581

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 12. TUESDAY, SEPTEMBER 16, 1873. PRICE { $6.00 per year—single. $5.00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DIGEST OF FOREIGN PATENT LAWS.

BRAZIL.

REPORT BY MR. PHIPPS, OF THE BRITISH LEGATION.

The law which regulates at present in Brazil the grants of privileges of inventions or patents was promulgated on the 28th August, 1830, but in consequence of its many imperfections a new project of law was presented to the Chambers in 1869 for a more complete and comprehensive legislation on the subject.

As this project has not yet become law, though more than three years have elapsed since its presentation, and thirteen years since the reform of the old law was demanded, I propose to annex the law actually in force, as well as the project recently embodied, at the same time giving in a condensed form the objections made to the old patent legislation by the "Auxiliary Society of National Industry," which has recommended its alteration. This will convey an idea of the state of public opinion in Brazil on the subject.

At a moment when the question of the total abolition of patents is being agitated in other countries, it is somewhat remarkable that Brazil, which has so much to gain from the possibility of appropriating without restriction any inventions introduced in countries more advanced in industry, has not followed the example of Holland and Switzerland, but is in course of maturing a new patent law founded on the old restrictive system.

As a patent law, however, that of 1830 is entirely behind the spirit of the age, and a great number of its provisions have become obsolete, and are not even enforced by the executive. A perusal of it will show that had industrial arts and processes attained any great development in Brazil, the law would give rise to difficulties which the practice of other countries has shown to be insurmountable.

It is founded, it is admitted, on the laws of France of 1791, of Russia in 1812, and of Holland of 1817, when the continent of Europe was still under the regimen of guilds and corporations; and while other countries have been gradually modifying the old system, the Brazilian law has remained on paper unaltered.

The preamble to the new project of law presented to the chambers thus defends the patent system, with remarks which, in the present advanced state of public opinion in England on the question, have a somewhat antiquated tone:

"Without entering into a philosophic appreciation of the nature and extension of the rights of inventors, all modern legislations on the subject agree in the principle that a patent is a contract between society and the inventor, and has the object of animating the development and progress of industry. If the inventor cannot discover anything except by means of knowledge which society already possesses, and if, on account of that, it cannot be said that an invention belongs exclusively and in perpetuity to the inventor, it is not less certain that, without the initiative of enterprising and gifted individuals, society would fail to enjoy, or would enjoy only later, the advantages due to the personal efforts of the inventor.

"The law, moreover, tends to promote and animate the spirit of undertakings, and discovers in that it protects society against adventurous speculations, imprudence, or bad faith, so as not to raise unnecessarily the price of a product which might be obtained by means of free competition, guarding at the same time the interest of free producers. Mistrust, however, timidity, and excessive government control ought not to reach the point of impeding real progress."

To these arguments the objections may be raised, cited in Prince Bismarck's message to the North German Chambers in 1868, that the present remarkably-developed system of communication and conveyance (nowhere more remarkable than in this country, where the steam communication with Europe has increased in a few years more than twenty-fold) which has opened a wide field to real merit, and enables indus-

trial men to reap promptly all benefit of production by means of large outlets for their articles, will, generally speaking, bring those who know how to avail themselves before others of useful inventions to such an extent ahead of their competitors, that even where no permanent privilege is longer admissible they will make sure of a temporary extra profit in proportion to the service rendered to the public.

Nor do the society seem to have duly appreciated the practical impediments which in other countries have met every effort to merely improve patent laws.

The following is a translation of the Brazilian patent law of 1830:

"ARTICLE I. The law secures to a discoverer or inventor of a useful industry the property and exclusive use of his discovery or invention.

"ART. II. Whosoever improves an invention or discovery has in such improvement the right of discoverer or inventor.

"ART. III. To the introducer of a foreign industry a premium will be given in proportion to its utility and the difficulty of introducing it.

"ART. IV. The right of a discoverer or inventor will be confirmed by a patent, conceded gratuitously, on payment only of the stamp and costs.

"1. It must be shown in writing that the industry in question is his own invention.

"2. He must deposit in the public archives an exact and faithful account or exposé of the means and processes to be followed, with plans, drawings, and models explanatory thereof, if possible to do so.

"ART. V. Patents will be granted according to the species of discovery or invention for periods of from five to twenty years, a longer term being concedable by law.

"ART. VI. If the government buys the secret of the invention the same must be published, but if only a patent is granted, the secret is to be kept till the expiration of such patent. This period expired, the inventor must patent the secret.

"ART. VII. The infringer of a patent forfeits his instruments, &c., and products, and pays in addition a fine equal to the tenth part of the value of the products manufactured, remaining always subject to the obligation to indemnify for loss and injury. Such instruments, &c., products, and the fine will be handed over to the proprietor of the patent.

"ART. VIII. The proprietor of a patent can dispose of it by using it himself or ceding it.

"ART. IX. In the event of two or more persons obtaining by similar processes a certain result, and applying simultaneously for a patent, it shall be given to all.

"ART. X. The patent expires if—

"1. It can be proved that the recipient has committed any fraud or has concealed anything in the declaration.

"2. If any one can prove to the declared inventor that the invention is his own.

"3. If the recipient does not put in practice the invention two years after the concession.

"4. If the discoverer obtains for the same invention a patent in a foreign country.

"In this case, according to Article III, he has a right to a premium.

"5. If the article produced is found injurious to the public or contrary to law.

"6. The right of patent cases if the recipients, before obtaining the concession, have made use of such invention, patent, or discovery."

The auxiliary Society of National Industry calls attention to certain of the above paragraphs at considerable length, but I do not propose to follow their entire analysis, which is laid before the Chambers with the project of the new law.

Article II they consider not to be explicit enough, and that the species of improvement should be defined as in the French law of 1858: "The invention of new modes, or the fresh application of known modes, to obtain an industrial product or result;" and that when an improvement applies to an invention already privileged the patent thereo should not outlast that of the original invention.

On the authority of the last year's report of the Minister of Agriculture, I may state that Article III is obsolete, for in no Brazilian budget has any such item figured as "premium to inventors."

The society remarks that in some cases such may be the difficulties attendant on the introduction of any industry, that the government may not be able to grant an adequate premium. It therefore recommends that in certain such cases privileges should be accorded, regard being had to the expense of introduction. They add that in France recent legislation has not recognized the necessity of any stimulus by a premium, in view of the facility and frequency of communication between France and foreign countries, but that Brazil cannot but, under present circumstances, encourage the introduction of industries which it does not possess, when even England, Russia, Italy, Spain, Portugal, (and they erroneously add Holland,) concede patents of introduction.

With reference to Article IV, the society observes that this gratuitous concession was doubtless intended to encourage inventors, but that such is so far from the case that it is notorious how many requests for patents are made for inventions of a trivial character and well known in other countries, but which are here put forward as new and original inventions; that, moreover, a tax is no obstacle to the serious inventor. They proceed to compare the patent dues paid in various countries, and recommend the adoption of a graduated tax.

Section 1 of Article IV, as to originality of inventions, the society declares to be most ambiguously worded, and enters at considerable length into all the well-known arguments and reflections with regard to the difficulty of ascertaining whether a so-called discovery is new or not, and to the prejudicial delays caused by discussions and litigation on such subjects, during the progress of which society is deprived of the benefit of the invention, as well as to the contradictory decisions of the law courts which successively annul and revalidate the same patent. They object to the French project law of 1858, by which an inventor has a provisional privilege for two years, the annulment of which at the end of that period, after considerable capital may have been expended, they declare to be unreasonable. They assert that the system followed in England of lodging a caveat with the attorney general to be preferable.

The Brazilian Council of State, when consulted as to the difficulty of establishing, by means of any sort of preliminary investigation, the originality of any invention, and, therefore, as to the possibility of doing away with it, alleged that though in foreign countries imposture in such matters was easily unmasked, such was not the case in Brazil, and that the liberal granting of concessions, without previous careful examination, would facilitate the possibility of adventurers obtaining monopolies in the case of articles which are already the property of the public, and which may be easily imitated by any one. Against such usurpations an appeal can, it is true, they admit, be made to the law courts, but this only would be undertaken in the case of infringements of individual rights, while in general cases it is rare that the patentee would be called to account. In such cases, when it would be the duty of the government to bring an action at law, it would by doing so lay itself open to a charge of annulling its own acts.

The Auxiliary Society, admitting the difficulty of unmasking in Brazil imposture in such matters, proposes a somewhat complicated and utopian scheme, by which it declares that security can be obtained that an invention is new, that the rights of third parties can be secured, and that the government can be relieved of any charge of partiality. It adds that the patent dues now proposed to be imposed, as well as the publicity, will drive away adventurers and proposers of fantastic projects.

The following is the proposed plan, that demands for patents, if not made in Brazil, should be made to, and registered in, one of the Brazilian legations in the principal capitals of Europe and in the United States, who will forthwith communicate the date of such demand to the home government and the other legations. All proposals to be advertised in the principal Brazilian newspapers and in those of the said capitals three times, at monthly intervals. In cases of objections, such objections to be decided in the law courts of the country where the proposal for the patent is made. A sum sufficient to cover all patent dues and expenses to be deposited with the demand for the patent.

The society, I will venture to assert, have hardly realized the enormous amount of litigation caused by a patent being disputed in law courts. The present Lord Chancellor declared that "such litigation had acquired a reputation infamous beyond every other, and that in such cases it has been often necessary to enter into the whole history of the discovery in all its numerous stages, and to beat up witnesses all over the country, so that a mass of scientific evidence had to be produced." He added that the bias being usually in favor of the patentee, the result of such trials almost always was that the public is defeated, after having endeavored to protect itself at an enormous expense.

It is well known that the law courts in England have not time to try such cases, which interfere too much with other business, and which have to be decided by arbitration at a heavy expense. It is obvious at what a disadvantage the poor inventor, unpossessed of capital, is placed.

Instead of facilitating the possibility of valuable inventions finding their way to Brazil, there is little doubt that the plan proposed would render their introduction a question of vast labor, expense, and delay, and impede the advance of industry or the likelihood of such inventions crossing the ocean as soon as they are put in practice in Europe.

With regard to Article V, the society recommends rather a curtailment of the period of concession.

Article III they consider objectionable, owing to the impossibility of several persons simultaneously preferring an identical demand.

Article X, section 2. The society very justly remarks that no sufficient distinction is made between an abstract idea and an industrial fact; between theory and practice; between an invention projected and applied.

Article X, section 3. The term of two years is considered insufficient.

Article X, section 4. This extraordinary provision, copied from the French law of 1791, is admitted to be contrary to all justice and economical principles. It could only be accounted for by two possibilities: First, if Brazil could reckon on many entirely original national inventions, whereas such cannot be hoped for, for some time; and as foreigners would not hesitate to select the market of the world instead of that of Brazil, the nation would be deprived of many inventions which it might count on; secondly, by the entirely gratuitous supposition that an invention which has obtained a patent in a foreign country is already the property of the public, and is no longer new; whereas, as long as the first privilege lasts, the products of such privileged industry can only be obtained from the patentee, unless obtained fraudulently, and if such invention is in common use it no longer comes under the category of a privileged industry.

Nor is it a fair supposition, the report of the society continues, arguing, of course, from a highly protectionist point of view, that an inventor will, for the sake of a premium, resign his invention to public competition.

The prior existence of a foreign patent, they urge, on the contrary, is a point in favor of the invention, but they allow that the patent ought only to be conceded for the unexpired term of the foreign patent.

Article X, section 6. According to this article, the merest trial on the part of the inventor might involve the sacrifice of his patent, while he might continue to enjoy the right, even if the industry is practiced on however large a scale by others. The substitution, therefore, by section 3 of Article VII of the project is recommended.

The united committees of the Chamber for Commerce, Industry, the Arts, and Public Works, after discussing the representations made by the Auxiliary Society of National Industry, of which I have given the substance above, decided that reform is required, and added that the constant concessions made by the legislative body in the form of special resolutions upon matters which the law ought to regulate, proved that it is no longer in consonance with the requirements of national industry and progress in all its branches.

They, however, add a few remarks on the general subject, and especially on premiums, or State rewards, of which the substance is as follows:

Article III of the law of 1830 grants to the introducer of a foreign industry a premium in proportion to its utility and the difficulty of introduction.

This stipulation has never been executed, but has been in practice substituted by the concession of privi-

leges of introduction for a term not exceeding ten years, owing to pecuniary considerations and the difficulty of making exact and equitable estimates, which has never permitted the establishment of regular premiums to become the rule.

This right of exclusive privilege for a definite term, though it tends to enhance the cost of the articles patented, has the advantage that only those who profit by a new industrial process pay for the same, while a premium or reward from the public purse causes an augmentation of the public expenses in favor of a limited number of persons. The inventor is prevented, moreover, by his personal interests from unduly augmenting the price of his production, and thus checking demand.

In certain rare and exceptional cases the committees would, however, accord to government the power of granting such premiums, together with a five-years' contract or privilege.

All modern legislations, they add, agree in the grant of limited terms, to prevent a privilege degenerating into an unjust monopoly, but that, in proportion that industry has in any country developed itself and attained a certain degree of prosperity, the shorter should be the term of any privilege granted, because the larger the number of inventors. Thus, while in France the term is limited to fifteen years, and in the United States to seventeen years, and in Belgium to twenty years, they consider that Brazil, whose industrial development is far from equaling that of the latter country, can at least continue to admit a similar term of twenty years.

The project of law, of which I annex a translation, was, on the 23d September, 1869, approved on the first reading, and, on the 17th May, 1871, submitted to a second discussion, approved on the 19th May, and finally, on the 13th June, adjourned for a third discussion. In the now ensuing session of the Chambers it is expected that it will become a law.

I will now briefly explain the practice of granting privileges or patents in Brazil, and the formalities to be gone through.

The proponent addresses a petition to the crown, asking for a patent or privilege, and transmitting full explanations or models according to law. This is referred by the Minister of Agriculture to the Auxiliary Society of National Industry, which, I should state, is composed of eminent or scientific men, and which is subventioned by the government, and holds bimonthly sessions. They report on the utility of the inventive process or invention. It is then submitted to the "Procurador da Coroa," or Attorney General, who endeavors to decide as to its originality, and as to its non-interference with anterior rights. Should it not be of a nature also to require reference to the Sanitary Board, or "Junta de Hygiene Publica," or other similar technical authorities, it is then discussed and reported on by the Council of State, admitted to be a somewhat lethargic body, and rather tardy in its movements and decisions.

Should it not be necessary to refer it to the legislative body whose authority must be obtained to insure any remittance of customs dues for the articles proposed to be imported, or any similar sacrifice of public resources or funds, it is then returned to the Minister of Agriculture, and the privilege granted or refused.

The actual legitimate official expenses involved by the stamps, documents, &c., I am assured, varies between £9 ($45) and £14 ($68,) the patent being granted gratuitously.

I am assured that, as a rule, several months elapse from the time when a patent or privilege of introduction is demanded till the period when the decision of the Minister of Agriculture is made public, and it is asserted that various measures must be followed and influential protection obtained to insure a grant. No distinct principle appears to regulate the grant or refusal of patents, and they appear to be as often refused as accorded, without consideration as to the importance of the invention or the scientific position of the inventor. Yet, as I have already stated, the practice is to grant as few patents as possible. During the year 1870 only twenty-two patents appear by the Minister of Agriculture's report to have been conceded, and in 1871 only twelve. The Auxiliary Society appear, however, to have examined between March 1871 and March 1872 fifty-five proposals, principally for privileges of introduction of inventions already patented abroad. The following are the patents (nineteen in number) which have been granted during the first nine months of the present year, which I enumerate, as thereby an idea can be derived of the class of inventions considered worthy of such a favor, and I am informed that most of the concessions involve the privilege of exclusive sale:

February 5, to the Stearine Light Company, for an improvement in manufacture of candles.

February 22, to Mr. Frank, for the establishment of a paper manufactory.

March 16, to W. Berry, for the machine "steam-digester."

April 30, to W. Howard, for the use of machines to condense the sap of the india-rubber plant.

May 4, to Lutz & Co., for the employment of metallic fitters.

May 4, to Romagnoli & Filgueiras, for patent water-closets.

May 15, to Wurff, for the use of molds used in the preparation of sugar.

July 3, to Rangel, for manufacture of porcelain, glass, &c.

July 3, to Wurffbaim & Just, for the sale of machines for the fabrication of gas.

July 3, to Bellido, for introduction of the "automatic regulator."

July 10, to J. Rainey, for the use of floating bridges.

July 24, to V. Keegan, for the fabrication of paper.

August 14, to J. E. Campos, for a system of transport.

August 28, to C. Guigon, for the fabrication of tubes similar to the tubes of Vecque & Co.

August 30, to Baron Campy, to introduce machines for cutting stone.

October 2, to E. Lawrence, for the manufacture of a machine for destroying ants.

October 2, to C. Nolet, for mechanism for regulating the steam-power of engines.

October 2, to Mendouca & Co., for the extraction of various products.

October 2, to Mertz, to introduce machines to fabricate gas.

I may add, in conclusion, that I am informed that the government profess to be anxious to restrict as far as possible the concession of privileges for the exclusive sale or introduction of articles or inventions which can be imported in the ordinary course of trade from foreign countries; but the general impression in Brazil appears to be that patent laws are necessary, on the ground that it would be unjust to deprive a man of the benefit of his own discoveries, and that in a young country a stimulus is required to encourage inventors and the introducers of useful industries in the shape of a monopoly for a limited period. The disposition which exists to substitute them to some extent by state rewards for the encouragement of really meritorious inventions has, perhaps, hardly yet been very closely analyzed; but the distribution of such rewards would probably give rise to endless complaints, and in a country where political-party spirit runs so high would lay any government open, however unjustly, to suspicions of jobbery and partiality.

APPENDIX.

Project of Law with regard to Patents and Privileges of Invention in Brazil.

ARTICLE I. The law insures to the discoverer or inventor of a useful industry the property and the exclusive use of his discovery or invention.

ART. II. The government is authorized to issue patents in conformity with the following stipulations:

1. To the discoverer or inventor of an entirely new industry a privilege of twenty years will be conceded.

2. Whosoever improves a discovery or invention, discovering new modes or a new application of known modes to obtain a certain result or industrial product, has in such improvement the right of discoverer or inventor, the following conditions being, however, observed:

(1) In case of the improvement applying to an invention already patented, the patent of the improvement cannot last longer than that of the original patent.

(2) Any person can obtain a patent of improvement, subject, however, to preference to the discoverer of the original invention, if it be privileged, during two years from the date of his patent.

(3) The discoverer of the original invention is not permitted to explore the improvement, nor the perfectioner the invention, unless the two patents shall have been obtained by the same individual.

3. To whosoever puts into practice a discovery or invention which is described and printed, provided it has not been also adopted either in Brazil or in a foreign country, a privilege of ten years shall be conceded.

4. To the introducer of an industry not privileged in a foreign country, nor known in Brazil, a privilege of five years shall be given, or a premium proportioned to the utility and the difficulty of introduction in conformity with special cases.

5. Longer terms than those indicated in the preceding paragraphs can only be conceded by law.

6. To the discoverer or inventor who has obtained for the same discovery or invention a patent in a foreign country, a privilege shall be conceded for the time for which the original patent has still to run.

7. If the inventors, in a patent of invention or improvement, shall make any modification in articles already privileged they can present to the government a declaration of the modification which they may have made, and this will be received, certificates being granted, which will have no other effect but to secure the use of the privilege; and it cannot be alleged that the object is not fabricated in accordance with the dispositions, models, and designs to which the patent refers.

8. Patents shall be divided into classes, and shall pay a tax in proportion to the importance of the industry, and which shall not exceed 30 millreis ($16.30) in the first year, augmenting, progressively, 10 or 20 per cent. from year to year.

9. Certificates of modification shall pay a tax of 50 millreis ($27.20) once only.

10. The classes, taxes, and fines, in default of payment, shall be established in a special regulation of the government.

ART. III. Any person who desires to obtain a patent will follow these stipulations:

(1) He shall, with the petition or proposal, deposit in the Ministry of Public Work, and in any such of the presidencies of provinces, or foreign legations, which the government may designate, an exact and faithful description of the discovery and of the means and processes to be followed, with plans, designs, and models explanatory thereof, or without them, if not necessary, further the receipt of the respective revenue office in which it has been paid, if in the empire; or, if out of it, the same amount in currency equivalent to that of Brazil, which must comprehend a tax for the first year, the seal, the preparation of documents, and the estimated cost of correspondence and publication. A list of papers deposited must also be made.

(2) Upon the regularity of the proposal being verified, and it being recognized as not being contrary to law, morality, or public health, it will be registered, the day and hour of its presentation being marked, and immediately communicated to the imperial government if it should not have been presented direct.

(3) The proposal shall be at once advertised in the principal journals of Europe and America which the government may have specified in its regulations, three times, successively, at monthly intervals, inviting all persons to come forward and establish any rights they may have.

(4) Decisions which, upon questions between such persons and those who apply for patents, may have been promulgated by competent tribunals in foreign countries in which proposals to obtain the same may have been made to Brazilian legations, shall be admitted as if they had been given by the tribunals of the empire.

(5) Three months after such last publication, there being no objection, or the objection being decided in favor of the proponent, the government will cause the patent to be issued without guarantee, consulting, in every case, the attorney-general, the crown, and the national revenue office.

(6) At the commencement of each year a list of the patents granted in the previous year shall be published in the collection of laws.

ART. IV. A patent constitutes a property of which its owner can dispose as he chooses, using the same himself, or ceding it wholly or partially to one or more persons for the whole or part of the term of privilege.

ART. V. If the government purchases the secret of an invention or discovery which, by its nature, may be for the exclusive use of the state, it shall cause the same to be published. In case, though, of concession of a patent, the secret shall be kept till the expiration of the term of the patent. Provision is made for the secret being kept.

ART. VI. The infringer of a right of patent shall lose the instruments and the products which he may have obtained, and which can be found; and shall pay a fine equivalent to one-fifth of such products which it can be proved have been fabricated, and shall be subject to a civil action for compensation for damages and injury—all in favor of the proprietor of the patent.

ART. VII. Every patent shall expire and be void if it can be proved—

(1) That the recipient has concealed or misstated essential matter in the declaration or exposition, as per article three.

(2) That the articles manufactured are recognized to be injurious to public laws, health, or morals.

(3) That before the petition for the patent has been made the same invention or discovery has been put into practice by some other person, or by the patentee, for more than one year, except in the cases contemplated under sections 4 and 6 of article two.

(4) If the recipient does not put in practice the invention or discovery within two years from the date of the grant of patent, unless the term shall have been extended by law.

ART. VIII. The regulations issued by government in execution of this law shall be at once enforced, and submitted to the legislative body at its first meeting, and cannot be altered by the government, except in respect to the presidencies and legations, and the newspapers mentioned in sections 1 and 3 of article three, which can be altered, when desirable.

ART. IX. The law of 28th August, 1830, and all dispositions contrary to the present law are revoked.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

25,736.—Jacquard Machines.—Granted to AVERY BARNETT, October 13, 1859. Application filed June 30, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,797.—Harvesters.—Granted to EPHRAIM BALL, October 18, 1859. Application filed July 18, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,807.—Hose-Folders.—Granted to LEVERETT CLARK, October 18, 1859. Application filed July 19, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,816.—Sleeping-Cars.—Granted to JOHN DANNER, October 18, 1859. Application filed July 19, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,842.—Cultivators.—Granted to THOMAS MCQUISTON, October 18, 1859; reissued May 16, 1871. Application filed July 11, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,862.—Weeding-Hoes.—Granted to JAMES M. ADAMS, October 18, 1859. Application filed July 18, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,897.—Machines for Covering Saddle-Trees.—Granted to JOHN MACLURE, October 18, 1859. Application filed July 14, 1873. Testimony closes September 16, 1873. Hearing October 1, 1873.

25,974.—Dressing-Machines.—Granted to GEORGE H. BABCOCK, October 25, 1859. Application filed July 26, 1873. Testimony closes September 23, 1873. Hearing October 8, 1873.

25,983.—Construction of Glass Ceiling.—Granted to JOHN R. CANNON, October 25, 1859. Application filed July 23, 1873. Testimony closes September 23, 1873. Hearing October 8, 1873.

25,986.—Cut-Off Valves of Steam-Engines.—Granted to EDWARD R. ARNOLD, November 1, 1859. Application filed August 1, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

25,978.—Tackle-Blocks.—Granted to ISAAC E. PALMER, November 1, 1859; reissued September 8, 1863, April 11, 1865, and December 8, 1868. Application filed July 26, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

25,984.—Bit-Stocks.—Granted to NELSON STOFFORD, November 1, 1859; reissued April 23, 1867. Application filed July 28, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

26,003.—Telegraphic Machines.—Granted to GEORGE M. PHELPS, November 1, 1859. Application filed July 30, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

26,028.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,030.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,060.—Machines for Making Box-Joints.—Granted to JAMES STIMPSON, November 8, 1859. Application filed August 2, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,069.—Sleeping-Cars.—Granted to JOHN DANNER, November 8, 1859. Application filed August 4, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,087.—Fastening Metal Hoops on Cotton-Bales.—Granted to JOHN T. BUTLER, November 15, 1859. Application filed August 7, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,090.—Machines for Folding Paper.—Granted to CYRUS CHAMBERS, Jr., November 15, 1859; and reissued August 12, 1873. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,097.—Electro-Magnetic Telegraphs.—Granted to MOSES G. FARMER, November 15, 1859; and reissued December 10, 1872. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,128.—Billiard-Table Cushions.—Granted to GEORGE D. SHARP, November 15, 1859; and reissued April 8, 1873. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,135.—Portable Pumps.—Granted to WILLIAM T. VASE, November 15, 1859; reissued February 26, 1861. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,136.—Mode of Advertising.—Granted to EDWARD WEBB, November 15, 1859. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,139.—Pumps.—Granted to WILLIAM WEBSTER, November 15, 1859. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,145.—Cocks for Water-Closets.—Granted to DARIUS WELLINGTON, November 15, 1859. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,147.—Machine for Bundling Kindling-Wood.—Granted to WILLIAM L. WILLIAMS, November 15, 1859; and reissued October 4, 1870. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,177.—Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 18, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,178.—Making Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 18, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,202.—Manufacture of Paper-Pulp.—Granted to JOHN B. PALMER and GARDINER HOWLAND, November 22, 1859; and reissued July 2, 1867. Application filed August 20, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,243.—Water-Closet Basins.—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 19, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,244.—Machines for Registering Music.—Granted to HENRY F. BOND, November 29, 1859. Application filed August 29, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,262.—Journal-Boxes for Saw-Mill Carriages.—Granted to WM. M. FERRY, November 29, 1859. Application filed August 30, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,276.—Manufacture of Rubber Hose.—Granted to THOMAS J. MAYALL, November 29, 1859; and reissued October 22, 1872. Application filed August 19, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,321.—Molding for Metal Casting.—Granted to JOHN P. BROADMEADOW, November 29, 1859. Application filed August 15, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,327.—Nursing-Bottles.—Granted to FRANCIS J. LA FORME, November 29, 1859, and reissued January 14, 1868. Application filed August 27, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,329.—Heel and Shoe Tips.—Granted to NEWMAN SILVERTHORN, November 29, 1859; reissued September 2, 1862, and August 4, 1868. Application filed August 22, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,339.—Water-Wheels.—Granted to JAMES P. COLLINS, December 6, 1859; reissued June 12, 1860, and May 13, 1873. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,401.—Mode of Applying Sulphurous-Acid Gas in the Defecation of Saccharine Liquids.—Granted to NANCY POINDEXTER BRASHEAR, executrix of ROBERT B. BRASHEAR, deceased, December 6, 1859, and reissued October 28, 1869. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,408.—Composition for Kindling Fire.—Granted to ELISABETH BELLINGER, December 13, 1859, and reissued August 7, 1866. Application filed September 15, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,410.—Seed-Planters.—Granted to WILLIAM BLESSING, December 13, 1859. Application filed August 27, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,454.—Dispensing with Switches on Railroads.—Granted to WILLIAM WHARTON, Jr., December 13, 1859, and reissued April 3, 1860. Application filed September 12, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,475.—Breech-Loading Fire-Arms.—Granted to BETHEL BURTON, December 20, 1859, and reissued December 21, 1869. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,484.—Platform-Scales.—Granted to THADDEUS FAIRBANKS, December 20, 1859. Application filed September 18, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,496.—Pipe-Molding.—Granted to JOHN FERTH and JOHN INGHAM, December 20, 1859, and reissued April 26, 1863. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,497.—Screw-Taps.—Granted to WILLIAM and ROBERT FOSTER, December 20, 1859. Application filed September 16, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,506.—Water-Traps.—Granted to JAMES A. LOWE, December 20, 1859. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,513.—Nail-Plate Feeder.—Granted to JOHN HEWELL, December 20, 1859. Application filed September 16, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,564.—Top-Props for Carriages.—Granted to GEORGE COOK and HANNIBAL I. KIMBALL, December 27, 1859. Application filed August 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,580.—Harvesters.—Granted to JOHN GORE, December 27, 1859, and reissued January 15, 1861. Application filed September 22, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,599.—Horse Hay-Rakes.—Granted to SAMUEL LEEDS, December 27, 1859. Application filed September 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE N. CUMMINGS, January 24, 1860. Application filed September 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

27,539.—Manufacture of Gun-Barrels.—Granted to JAMES H. BURTON, March 20, 1860, and antedated to September 29, 1859; reissued December 28, 1871. Application filed July 1, 1873. Hearing September 16, 1873.

EXTENSIONS GRANTED.

25,484.—Improvement in Grain-Separators, granted to JONATHAN L. BOOTH, September 20, 1859; reissued September 25, 1860, numbered 1,045; and again reissued November 29, 1864, numbered 1,886.

Claim.—1. The combination of the zigzag screens and boxes B C, when the same have a lateral-shake motion, or one at right angles to the passage of the grain, in such a manner as to have the grain pass consecutively over and through them, and arranged relatively with each other to operate substantially as and for the purpose herein set forth.

2. The series of zigzag screens and boxes B C, with or without the troughs E, and having a lateral-shake motion, in connection with the fan G, and spout H, substantially as herein set forth.

25,499.—Improvement in Railroad-Car Seats, granted to ELI WHEELER, September 20, 1859.

Claim.—1. The arrangement of box-formed supports *c c*, cushioned seat-bottoms C^a C^b, and cushioned seat-backs D D, of a pair of car-seats, in the manner herein specified, whereby, when the bottoms of the seats are turned over to fill up the space between the seats, the bed-clothing contained in the box will be exposed so as to be readily removed, and then, when the backs are turned down to fill the place occupied by the bottoms, the said boxes will be closed up and a continuous bed formed from one back edge to the other of the seat, as and for the purpose set forth.

2. The short open stationary partitions B B, in combination with sliding panels b b, which, when elevated, serve as head and foot boards, and allow ventilation under and above the berth during night-time, and, when lowered, during day-time afford more room to the upper portion of the body of passengers as they pass through the aisle of the car, substantially as set forth.

3. The short sliding closet blinds C C, arranged to operate as described and serve as foot and head boards, and allowing ventilation above and below the upper berth, in combination with the upper berths E and partitions *c c*, substantially as set forth.

25,506.—Improvement in Lamps, granted to HALVOR HALVORSON, September 20, 1859; reissued June 6, 1871, numbered 4,413; reissued December 5, 1871, numbered 4,660.

Claim.—1. The combination, in a lamp-burner, of the following elements, namely: Two wick-tubes, with a draft-passage between them; a single-slotted deflector, through which the flames from the two wicks pass in the form of a single flame; appliances for holding the lamp-chimney in place; and a screw-threaded base, substantially as herein shown and described.

2. In combination with the elements named in the preceding clause, a perforated air-distributer for steadying the draft, substantially as described.

3. A lamp-burner containing the following elements, namely: A screw-threaded base, a perforated air-distributer, two wick-tubes with draft-passage between them, a single-slotted deflector,

applicances for holding the lamp-chimney, and means for adjusting the wicks, substantially as herein shown and described.

4. In a lamp-burner in which two wick-tubes with a draft-passage between them, are combined with a dingle-slotted cap or deflector, in the manner herein described, the combination, with said wick-tubes and the base by which they are carried, of the said deflector, the air-distributer, and the chimney-rest, when arranged to be removable from and adjustable upon the other portion or portions of the burner bodily and together, substantially as shown and described.

5. The combination, in a lamp-burner substantially such as described, of the two wick-tubes and the valve for regulating the supply of air which passes between said tubes to the flames, substantially as shown and set forth.

6. The combination, in a lamp-burner substantially such as described, of the two wick-tubes, the valve regulating the supply of air passing up between said tubes to the flames, and the dome adjustable to a greater or less height above the wick-tubes, substantially as shown and set forth.

7. The arrangement of the wick-raising devices, substantially as shown and described, so that one or more of the wheels or pinions on the one shaft may gear into or engage directly with a corresponding pinion or pinions in the other shaft, for the purpose stated.

25,568.—Improvement in Tailors' Shears, granted to ROCHUS HEINRICH, September 20, 1859.

Claim.—Constructing the lower bow with its upper portion widened, and with the projection *p* thereon, so as to form a bearing for the fore-finger within the bow, substantially as and for the purpose set forth.

25,544.—Improved Try-Cocks, granted to JOHN F. COOK, September 20, 1859.

Claim.—Combining with the barrel of a try-cock a two-armed lever—one provided with springs or weight, and the other with a rubber or other equivalent disk, so that the weighted arm shall hold the valved or disk arm against the bore of the barrel of the cock, substantially as herein described and represented.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date September 16, 1873.]

6,889.—Lamp-Bowl.—JAMES S. ATTERBURY and THOMAS B. ATTERBURY, Pittsburg, Pa. Application filed August 26, 1873. Term of patent 7 years.

6,883.—Tug-Clip.—JOSIAH LETCHWORTH, Buffalo, N. Y. Application filed April 26, 1873. Term of patent 14 years.

6,884.—Watch-Chain.—HENRY H. MARKLEY and ALPHONSE MATHIEU, San Francisco, Cal. Application filed June 13, 1873. Term of patent 7 years.

6,885.—Oil-Cloth.—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignees to EDWARD C. SAMPSON, New York, N. Y. Application filed September 4, 1873. Term of patent 3 years.

6,886.—Fruit-Jar.—SALMON B. ROWLEY, Philadelphia, Pa. Application filed July 19, 1873. Term of patent 14 years.

6,887.—Aquarium-Frame.—GEORGE E. SMITH, Chicago, Ill. Application filed August 4, 1873. Term of patent 3½ years.

6,888.—Carpet.—HORATIO SMITH, Kidderminster, England, assignor to JAMES HUMPHRIES & SONS, same place. Application filed August 30, 1873. Term of patent 3½ years.

6,889.—Knitted Fabric.—THOMAS LANGHAM, Philadelphia, Pa., assignor to THOMAS DOLAN and R. WILLIAMS, Jr., same place. Application filed August 25, 1873. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date September 16, 1873.]

1,451.—Medicine.—STERLING BONSALL, Philadelphia, Pa. Application filed September 9, 1873.

"'Cholera King.'"

1,452.—Saws, Tools, Steel, and Files.—HENRY DISSTON & SONS, Philadelphia, Pa. Application filed August 1, 1873.

The figure of a keystone.

1,453.—Cigars.—GOLDSMITH BROS. & BENJAMIN, Chicago, Ill. Application filed September 2, 1873.

"G. B. and B. Cigars," in a quadrangular border.

1,454.—Cigars.—JACOB HELLER, Chicago, Ill. Application filed September 3, 1873.

A table on which are the words "The Original Habana," figure of man in standing, sitting, and reclining positions.

1,455.—Mass Licorice.—HOFFMAN, LEE & Co., Baltimore, Md. Application filed May 8, 1873.

"'El Gallo,' 'H. L. & Co.,' and the figure of a chicken cock."

1,456.—Licorice-Paste.—HOFFMAN, LEE & Co., Baltimore, Md. Application filed May 8, 1873.

"The figure of a crown, the words 'Don Carlos,' and the letters 'H. L. & Co.'"

1,457.—Stoves.—WILLIAM J. KEEP, Troy, N. Y. Application filed September 12, 1873.

"'Non-Clinker.'"

1,458.—Medicated Manila Paper.—JOHN ROBERTSON & SON, Putney, Vt. Application filed August 23, 1873.

"A spread eagle and the words 'Eagle Mills, Medicated Manilla Paper.'"

1,459.—Barrels of Whisky.—WILLIAM S. STEWART, St. Louis, Mo. Application filed August 30, 1873.

"A white ground, ornamental border, the name 'W. S. Stewart,' words 'Crown Royal,' and a crown surmounting the outer broken circle."

1,460.—Petroleum.—THE ATLANTIC REFINING COMPANY, Philadelphia, Pa. Application filed September 8, 1873.

"'Atlantic.'"

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date September 16, 1873.]

ORIGINAL PATENTS.

142,756.—Machine for Trimming and Burnishing the Edges of Boots and Shoes.—CHARLES J. ADDY, Boston, Mass. Application filed June 26, 1873.

The frame upon which the burnisher or trimming-tool is mounted is attached to a weighted lever by a universal-joint, with a spring at each side controlling its movement. The pattern is held firmly up to the sole by means of a wedge-shaped key.

Claim.—1. The combination of the clutch I^3 H^3 and the lever I^4 H^3 with the pin *i* and wheel E^5, substantially as described, and for the purpose set forth.

2. The combination of the last-holding device E E^1 and the pattern-holding device E^2 E^3 with the gears H^1 C^1 F and H^2 C^2 F^1, arranged to operate as described, and for the purpose set forth.

3. The combination of the pattern E^3 and supporter E^4 with the crank-arm E^2 and wedge-shaped key *g*, substantially as described, and for the purpose set forth.

4. The combination of the frame L, springs S S, and balanced lever L^1 L^2 with the revolving standard P, substantially as described, and for the purpose set forth.

142,757.—Car-Axle.—BENONEVILLE AHRENS and DANIEL GERHARD, Reading, Pa. Application filed July 30, 1873.

Upon divided axles, which have collars upon their inner ends, short tubes are placed. Over the short tubes, and extending from the hub of one wheel to that of the other, a long tube is placed; the tubes and bearings secured in their places by means of bolts and screws.

Claim.—In combination with the divided axle A, having the collars or shoulders *a a*, the tubes C C and D, substantially as described.

142,758.—Eaves-Trough Hanger.—THOMAS W. BAILEY, Savannah, Ohio. Application filed August 19, 1873.

The hanger-bar has one end curved to fit the curved edge of the eaves-trough. The other is furnished with a pair of lips, between which the bent edge of the trough is inserted. It is there held in place by a clamping piece or jaw, which hooks over the lips, the other end being corrugated and bearing against the corrugated central stud E. The attachment-plate is held adjustably between these latter, while its upper end is bent at the proper angle to be secured to the slope of the roof.

Claim.—The bar A, stud E, and lips *a b*, in combination with the jaw C, head D, and collar G', all constructed in the manner substantially as described, and for the purpose set forth.

142,759.—Truck for Transporting Railroad-Rails, Car-Axles, &c.—CHARLES A. BALL, Ridgewood, N. J., assignor of one-fourth his right to EDWARD WHITHORNE, same place. Application filed May 26, 1873.

Tong-shaped levers are pivoted to the end of the truck. The lower curved ends are kept open by a spring, and closed by means of an elliptic-shaped cam, which is secured to the end of a shaft journaled upon the truck.

Claim.—1. The limbs T T' of a pair of tongs, attached to the body of a truck, and having the points thereof below the level of the axle A of said truck.

2. The limbs T T' of a pair of tongs, operated by the elliptical cam C attached to the rotating tongue H of said truck.

142,760.—Alloy to Resemble Silver.—ADÈLE ELISE PISCHBAUDVIN, Paris, France, Application filed May 29, 1873.

Copper, nickel, cobalt, tin, iron, and zinc.

Claim.—The manufacture of an alloy resembling silver, substantially in the manner described.

142,761.—Machinist's Gage.—STEPHEN H. BELLOWS, Middletown, Conn. Application filed July 7, 1873.

A stock with true under surface and perpendicular side, having pivoted near its top a blade, which, near its lower end, carries a segmental slotted graduated arm, fastened adjustably to the stock, for marking angles, and having a pointer pivoted adjustably in a perpendicular slot, for marking irregularities of surface.

Claim.—The combination of the stock A, blade h *f*, and adjustable marking-bar *g*, substantially as and for the purpose set forth.

142,762.—Sewing-Case.—FREDERICK BENKENDORFF, Brooklyn, N. Y. Application filed June 20, 1873.

Claim.—The sewing-case, hereinbefore described, provided with the end caps A and B, the button-receptacle F, and reel C, having a needle-holder, E, and thimble-cap D, substantially as and for the purposes set forth.

142,763.—Stop-Cock.—JAMES W. BISKETT, Brooklyn, N. Y., assignor to HENRY M. BISKETT, same place. Application filed May 17, 1873.

The plug of the cock is held in the desired position by means of a removable locking-piece, made angular to fit a similar recess in the body of the cock.

Claim.—In combination with the body A, plug B, and confining means D, the removable locking piece M M', matching to an angular portion of the plug, and to an angular recess in the body A, so as to serve therewith, as and for the purposes herein specified.

142,764.—Bustle.—MARIE BOUPART, Fordham, N. Y. Application filed January 29, 1873.

The distension of the bustle is regulated by the laces, which draw the tongues of the diaphragm.

Claim.—As a new article of manufacture, a bustle, composed of a frame, A, covering B, binding-tape C, coiled-wire spring D, diaphragm or lining E, tongues F, and lace H, combined and arranged to operate as and for the purposes set forth.

142,765.—Mold for Plaster Pipe-Patterns.—NOADIAH P. BOWLER, Cleveland, Ohio. Application filed March 28, 1873.

Two metal cylinders are arranged concentrically to each other, the annular space forming the mold for the pattern. The cylinders are capable of adjustment to different diameters.

Claim.—The metal cylinders A C, as arranged concentrically in relation to each other, in combination with the top and bottom E F, substantially in the manner as and for the purpose set forth.

142,766.—Device for Cleaning Surface-Condensers.—HENRY C. BUCKHAM, Bucksport, assignor to JOSEPH P. BASS, Bangor, Me. Application filed January 17, 1873.

Introduces petroleum or turpentine into the condenser by means of the exhaust steam as a vehicle to remove the hardened grease and dirt therein.

Claim.—1. The within-described method of cleaning surface-condensers, to wit, by introducing and passing through said condenser, with the exhaust steam, a grease solvent, operating as herein specified.

2. The combination of the opening *c* in the exhaust-pipe of an engine with a condenser, B, and a faucet, *g*, for removing the sediment before it reaches the boiler, as set forth.

142,767.—Vapor-Bath.—JOSEPH BÜLKE, New York, N. Y. Application filed July 30, 1873.

Perforated shelves are arranged for the back and feet to rest upon, and a support for the back of the head. Above the support is an opening for the face. The vapor from the pipes connecting the retort passes up through the perforations, and is distributed around the feet and legs of the patient and over the back. Hinged covers on the top and side admit the patient to the bath.

Claim.—The arrangement of a bath-tub, A, with a hinged side, A', and cover B provided with an opening, *c*, in combination with perforated shelves C and D, and retort F having pipes *n n* passing under the shelves C, substantially in the manner and for the purpose set forth.

142,768.—Bell-Piano.—CARL G. BUTTENBERT, Toledo, Iowa. Application filed June 7, 1873.

Particular construction of the class of pianos, in which bells are substituted for strings, the improvement being mainly in the action.

Claim.—1. The combination of key A, pieces *a b*, arm d^3, levers *d f*, knee-joint *g*, arms *i i'*, with adjustable pad *m*, hammer-butt *i*, and hammer E, forming the hammer action, substantially as and for the purposes described.

2. The bell-hammer E, having weighted ends and curved tang-spring *n*, for the purpose set forth.

3. The combination of the levers *d* and *f*, connected by screws *o* with pillar A and cushion *h'*, for arresting back motion of hammer E, as described.

4. The combination of key A, damper-rod *c*, having pads or buttons c^1 c^2, damper-lever *e*, and arms *i i'*, forming the damper-action, as described.

5. The damper-lever *e*, having curved and cushioned damper G, pin *p*, and pad *p'*, weighted end e^1, and perforated lug *g*, for the purpose specified.

6. The inclined standards B and B', connected by pieces C, having stationary arms d^1 l^2, and arms *i F*, respectively, to support hammer and damper action, substantially as set forth.

7. The arm *i* of standard B, having adjustable pad *m*, as set forth.

8. The sliding pedal-bar F, in combination with rods *r*, pivoted levers r^1 r^2, and pedal and pedal-rod, as specified.

9. The combination of pedal-bar E with damper-rods *c* and damper-levers *e* for disconnecting the damper action on the bells, substantially as described.

10. The bell-frame L, having lateral pieces W, in connection with bell-rod I, as specified.

11. The bell-rod I, in combination with sounding-board M, by supporting-rod N, having eye *y* and nuts z^1 and z^2, as set forth.

12. The combination of bell H with rod I by cones and nuts c^3 and c^4, as described.

13. The frame P, having pieces P', guide-rods *p'*, lateral pieces d^3, and aprons *e*, arranged and applied for the purpose set forth.

14. The combination of frame P with rod b^1, lever b^2, pedal-rod, and pedal, as and for the purpose described.

15. The combination of the subject-matter of the foregoing clauses, consisting of the hammer and damper action, damper-pedal, bell arrangement, tone-modifying frame, and pedal, with frame D, substantially as and for the purpose described.

142,769.—Anchor.—CHARLES A. CHAMBERLIN, Philadelphia, Pa. Application filed July 11, 1873.

The yokes or links *d*, provided with spurs or trippers, serve to draw the flukes down, and also to limit the angle of penetration.

Claim.—1. The pivoted flukes *e*, in combination with the yokes *d*, which limit their motion, substantially as described.

2. The yokes *d*, attached to the arms *b* and flukes *e*, substantially as described, so as to limit the angle of penetration of the flukes, and provided with spurs or trippers *k*, to trip or throw down and hold the points of the flukes at an angle of penetration, substantially as described.

3. The yokes *d*, provided with spurs *k*, and so hinged and oscillating, relatively to the flukes *e*, that the front spurs *k* shall present the same angle of penetration as the flukes, substantially as and for the purposes described.

142,770.—Treadle Mechanism.—BARTLETT B. CHANDLER, Jr., Boston, Mass. Application filed July 5, 1873.

Pressure upon the treadle causes the band attached to the connecting-rod to unwind from the drum, and the pawl within to lock against the walls of its groove, and increase the tension of the coiled spring, the fly-wheel being moved by such action in the same direction at the same time. The release from said pressure causes the spring to recoil, carrying with it the pawl-case and releasing the action of the pawl against the walls of its groove, while the fly-wheel continues its revolutions from momentum, each revolution being increased in degree by the movement of the foot on the treadle.

Claim.—1. The combined drum, spring-and-pawl case C, constructed and arranged in manner and for the purposes as explained.

2. The combined drum, spring-and-pawl case C, friction-pawl F, grooved plate G, and spring D, in combination with shaft *a*, fly-wheel A, band I, and connecting-rod J, said parts being constructed, arranged, and applied to the frame and pedal as and to operate as herein shown and described.

142,771.—Manufacture of Wrench-Heads.—LORING COES, Worcester, Mass. Application filed July 14, 1873.

The end of the heated bar is partly upset and thrown forward by the die *c*, after which it is completed in the usual finishing-die.

Claim.—1. The process of forming a wrench-head by first forming, by means of dies, a head upon the bar, substantially like *a*, and then completing the forging by means of the second set of dies, substantially as described.

2. Wedges *g*, connected to hammer-head h by means of slotted links *i*, when operating in combination with packing *f* to close cheek-blocks *f*, as and for the purpose specified.

142,772.—Bale-Tie.—FREDERIC COOK, New Orleans, La. Application filed July 28, 1873.

Claim.—1. The cotton-tie made as shown and described, or its equivalent.

2. The plate E, having the stop H and an offset or thicker part, through which the rivets K pass.

3. The plate E, attached to the straight end of the band, and so made as to admit the bent end of the loop of the band between the hook-piece of plate E and the straight end of the band, to prevent the bent end of the loop drawing out by the strain of the expansion of the bale.

142,773.—Pressure-Regulating Valve.—WILLIAM CRAIG, Newark, N. J., and HENRY L. BENTOOSEN, Kings county, N. Y. Application filed October 5, 1872.

Two opposite-facing valves on a single stem are operated by a crank-pin on a transverse shaft projecting through the side of the case. On the end of this shaft is secured a weighted lever. When the pressure becomes too great from either side the closed valve opens and allows the surplus pressure to escape.

Claim.—The combination of the casting A, having inlet *b* and outlets *a c*, with the valves B C attached to stem D, provided with dog *d* and crank-pin *f*, and the weighted lever G, constructed substantially as and for the purpose set forth.

142,774.—Machine for Forging Solid-Belted Hinge-Pivots.—JOHN J. CROOKE, Southfield, and LEWIS CROOKE, New York, N. Y. Application filed August 30, 1873.

The dies *a a'*, each in two parts, (one of them having a recess in which to form the belt,) set into conical sockets, the upper one suspended on a cam-slide that at proper times is automatically drawn out to draw the die slightly from its seat, and thus permit it to open and release the blank, which is at this moment automatically seized between the spring-fingers of the bifurcated arm or discharger H, and carried away from the dies.

Claim.—1. The combination, substantially as before set forth, of the two pairs of gripping and upsetting dies, so operated as to gripe the blank radially to upset the blank longitudinally by the approach of one pair to the other longitudinally of the blank, and to form the opposite faces of the upset portion of the blank.

2. The combination, substantially as before set forth, of the pair of gripping and upsetting dies having a conical exterior, with a die-blank having a conical socket to receive said dies.

3. The combination, substantially as before set forth, of the pair of dies, the die-blank, and the transverse slide and incline.

4. The combination, substantially as before set forth, of the two pairs of griping and upsetting dies and the discharger for removing the pivot from between them.

142,775.—Apparatus for Cleaning Boiler-Flues, &c.—THOMAS H. DONOHUE, Washington, D. C. Application filed August 12, 1873.

The scraper consists of segmental blades provided with intersecting blades, the peripheries of which are of different curvatures and are expanded and contracted to adapt the dimensions to tubes of a diameter between its least and greatest expansion.

Claim.—1. The scraper-blades, in combination with their expanding arms, the fixed and sliding collars B C, and stem A, when said blades are connected in pairs at their one end with the fixed collar, and in like manner at their opposite ends with the sliding collar, as shown and described.

2. The scraper-blades D, constructed to form the longitudinal profile of a parabolic spindle, the outer edges of which form the arc of a circle of a diameter equal to the greatest expansion of the instrument, in combination with a similar blade, D', whose outer curvature forms the arc of a circle equal to that under the greatest contraction of the same, as shown and described.

3. The combination of the supplemental or expanding staff A', guide J, and sliding collar C with the staff A and scraper-blades D D', for operation substantially as set forth.

142,776.—Bridge.—JAMES R. DURFEE, Oshkosh, Wis. Application filed January 27, 1873.

The bridge is formed of two compound wooden arched portions, the upper one plane-concave in form and fitting closely the convexity of the lower portion. Notches F and keys G are placed along the line of juncture, and the arch is tied by the ordinary tension-rods and cast-iron shoes.

Claim.—1. The rib A, composed of the segmental portion B, having lateral notches D, in combination with the concave-plane portion E, provided with lateral notches F, both constructed as described and locked together by the keys G, for the purpose hereinbefore set forth.

2. The rib A, composed of the segmental portion B, having notches D, and the concave-plane portion E, having notches F, locked together by keys G, in combination with springers H, having studs I, connected by rods J, for the purpose hereinbefore set forth.

142,777.—Stove-Pipe Holder.—GEORGE ECKEL, Richmond, Ind. Application filed February 8, 1873.

By means of the movable clamp this device can be adapted to hold the pipe in a chimney or wall of any thickness, and the inner holding tongue or clamp can be turned down to allow the easy removal of the pipe.

Claim.—The combination of the rotary serrated bar C with the projections D and E, with the set thumb-screw F, and also the combination of the spring I with the serrated bar C, for the purposes, and in the manner and form, substantially as above set forth and described.

142,778.—Carpet-Rag Looper.—FRANZ J. EGGER, Springfield, Ohio. Application filed July 16, 1873.

The blade slides within a groove in the back of the frame, and is provided with a pivoted spring-latch, which is retracted by the external pressure of the cloth, and a lateral passage opened into the eye, through which the piece to be inserted is slipped in sidewise.

Claim.—The rag-looper, constructed as herein described, with a blade, D, provided with a pivoted spring-latch, *i*, operating substantially as and for the purposes set forth.

142,779.—Saw-Swage.—JAMES E. EMERSON, Beaver Falls, Pa. Application filed August 22, 1873.

The jaw B has an enlarged portion that fits into a socket made in body of the swage, and is adjusted by a temper-screw pressing against it for different-sized saws.

Claim.—1. The saw-swage, composed of the body A, fixed jaws A' and A'', movable jaw B, and temper-screw *b'*, constructed and operating substantially as described.

2. In a saw-swage the convexed fixed jaw A'' in combination with the plane-faced movable jaw B, in the manner and for the purpose described.

142,780.—Blank for Saw-Teeth.—JAMES E. EMERSON, Beaver Falls, Pa. Application filed June 28, 1873.

Claim.—Blanks cut from a rolled steel bar, A, of the shape in cross-section described and shown—that is to say, a bar flat on one side, *a*, round on the back, and terminating in sharp edges *a''* at the point where it joins the flat side, substantially as and for the purpose described.

142,781.—Saw-Teeth.—JAMES E. EMERSON, Beaver Falls, Pa. Application filed June 28, 1873.

The cutting portion of the teeth is rounded on the back.

Claim.—The saw-teeth herein described, as a new article of manufacture.

142,782.—Compound Tool.—FRANK W. FARRAR, Waterford, Pa. Application filed June 12, 1873.

Claim.—A compound tool, consisting of a scissors-sharpener, button-hole cutter, and carpet-rag looper, constructed and operating in the manner herein described and shown.

142,783.—Apparatus for Casting Printers' Leads.—WILLIAM FILMER, San Francisco, Cal. Application filed April 17, 1873.

A furnace and mold placed relatively to each other, so that the lead may be dipped out by a tilting ladle and run into the mold.

Claim.—1. The furnace A and pot B, with its tilting-dipper R, in combination with a lead-mold, when arranged in relation to each other, substantially as above described.

2. The dipper R, provided with the filling-holes *t t*, when suspended upon a shaft, S, and operated by the lever *v*, substantially as and for the purpose above described.

3. The frame consisting of the inclined bed-plate E, hinged side K, brace-bar M, hooks *n*, and set-screws *p p*, in combination with the removable mold-plates G A, with their flaring outer edges and the tilting dipper R, all combined and arranged to operate substantially as and for the purpose above described.

142,784.—Stove-Pipe Thimble.—JOHN R. FULTON, West Mahoning township, Indiana county, Pa. Application filed December 19, 1872.

Claim.—As a new article of manufacture, a thimble-connection consisting of the plates *a a*, secured together by the bolts *b*, and provided with the flanges *s t r* for the reception of the pipes *c h*, substantially as shown and described.

142,785.—Bridge.—JOHN M. GOODWIN, New York, N. Y. Application filed January 29, 1873.

An arrangement of girders which transmit the weight of the rolling load, at all times, directly upon the center of the supporting-girders, and with a gradually-increasing strain to reduce the vibration.

Claim.—The combination, in a bridge or other similar structure, of the principal girders G G', the supplementary girders D D D' D', and the cross-beam X, or their equivalents, in connection with abutments A A', and piers or abutments F F' or their equivalents, substantially as and for the purposes described.

142,786.—Work-Box.—EZRA HINCKLEY, San Francisco, Cal. Application filed February 21, 1873.

The eyelets of the spool-box have elastic thread-guides. The knife is for cutting thread.

Claim.—In combination with the box A, the revolving spool-case C, having eyelets E F, elastic stops G G, and stationary knife I, said parts being constructed and arranged as described.

142,787.—Cloth-Measuring Device.—OTIS R. HOLBROOK, Staffordville, Conn. Application filed March 13, 1873.

At the end of a given scale laid off upon a counter a spring chalk-marker is arranged, to be drawn to the cloth to be measured by means of a cord and pull-knob, which is also in connection with the pawl of a register-wheel, for the purpose of keeping count of the number of markings made.

Claim.—In combination with a measuring-counter, B, the spring-marker D and registering-dial K, when arranged and constructed to act conjointly, substantially in the manner as shown and described.

142,788.—Valve for Steam-Engines.—HENRY ISAAC HOYT, Norwalk, Conn. Application filed December 11, 1872.

The cushion-piston, attached to slide-valve, and working in cushion-cylinder secured directly to the steam-chest, is moved partly by tappet-arms and by steam acting through suitable passages provided in the cylinder and steam-chest.

Claim.—The combination of cylinder B, piston C, air-cock *g*, valve D, jacket E, and steam-passages and ports *i, j, k, M, O*, and *p*, constructed and operating together substantially as described.

142,789.—Reversible Pinion for Watches.—GEORGE HUNT, Chicago, Ill. Application filed March 21, 1873.

A semi-cylindrical key recessed into the arbor of the center wheel serves to hold the two firmly together in the direction of the driving strain, while it allows the pinion to slip backward by partial rotation in its seat, in case of recoil from a breaking main-spring.

Claim.—The pinion B, combined with the staff A, having in its periphery a concave seat for a correspondingly-shaped key, H, which is partially turned out from said seat by the teeth in the interior of the pinion catching its edge, and forms a step in one direction, while said key is forced snugly back into its seat by the tendency of the pinion to revolve in the opposite direction, thus allowing relief for the works in case of breakage of mainspring, as set forth.

142,790.—Core for Casting Metals.—CHARLES D. HUNTER, Plymouth, Conn. Application filed July 19, 1873.

Claim.—The combination of burned sand with an adhesive substance, for the purpose herein described.

142,791.—Fire-Place.—JAMES M. IRWIN, Pittsburg, Pa. Application filed May 17, 1873.

Openings are made above and below the grate, communicating with openings in the rear wall. The draft passes through these and feeds the rear of the fire with fresh air. The back of the fire-place is made perpendicular and the chimney-flue horizontal.

Claim.—1. The back wall of an open grate with perforations below the grate-bars, and perforations back of and opening into the basket or grate, each communicating with a chamber or passage constructed in the back wall, the whole combined with an ordinary grate and flue, substantially as described.

2. In an ordinary open-grate fire-place, the combination of the passages, extending from beneath the grate through the back wall to and into the rear of the basket or grate, with the vertical back G, smoke-flue, and grate, substantially as and for the purpose described.

142,792.—Coupling for Pipe and Oil-Well Tubing.—DANIEL JONES, Boston, Mass., assignor of one-half his right to NATIONAL TUBE WORKS COMPANY, same place. Application filed June 19, 1871.

At each end of the coupling a smooth portion is formed, called the sleeve, which projects beyond the female screw cut upon the interior of the coupling, and fits snugly upon the tube, stiffening and strengthening the joint.

Claim.—The combination, with the tubing of oil-wells, of the coupling A, having the sleeve B, all constructed and united in the manner and for the purpose specified.

142,793.—Fire-Proof Mansard Roof.—JOSIAH W. KENNEDY, St. Louis, Mo. Application filed December 4, 1872.

The frame of the roof is constructed of gas-pipe connected by screw-sockets. Flat bars are attached to the rafters, and the slates are secured to the bars by curved hooks. The partitions in the upper part of the building are constructed by attaching grooved iron supporting-bars to one or both sides of the uprights of the roof-frame and placing tiles upright in the grooves.

Claim.—1. The arrangement of the inclined or curved tubes A A', when provided with slating-bars E, in combination with horizontal tubes B B', upright tubes C C', tie-tubes D, and coupling-piece *a*, as and for the purpose set forth.

2. The improved manner of securing the slating to the slating-bar E by means of the headed hook *f*, which passes through an orifice in the slate, and is curved so as to catch over and around the slating-bar E, substantially as and for the purpose set forth.

3. The fire-proof partition constructed substantially as shown in Fig. 6, and covered with plaster or other suitable covering, substantially as described, for the purposes specified.

142,794.—Cutter-Head for Planing or Molding Machines.—JAMES D. KIMBALL, Reading, Mass. Application filed April 17, 1873.

The head is fastened to its spindle by a set-screw diagonally through the end of the head.

Claim.—The spindle A, having the longitudinal groove B, in combination with the head C and oblique screw D, all arranged and operating substantially as described.

142,795.—Fence-Post.—EDWIN KING, Dunkirk, N. Y. Application filed June 9, 1873.

The post is made in two sections, having their lower ends adjustably secured within a sectional clamp, which is secured to a base by screws. The two sections of post are embraced by yokes which bind their inner serrated edges against the horizontal rails.

Claim.—1. The stay B, consisting of two sections shouldered out to receive the posts D E, as described, in combination with the base A, in the manner substantially as and for the purpose set forth.

2. The posts D E, in combination with the stay B and yokes H, in the manner substantially as described, and for the purpose set forth.

142,796.—Refrigerator.—THOMAS D. KINGAN, Indianapolis, Ind. Application filed September 5, 1873.

Claim.—1. The drip-troughs *b a b' c*, when the same are so constructed as to combine the ice-rest *c*, the drip-plates *b* and *b'*, the troughs *b' c*, and the grooves *f* all in one single piece, and when used as and for the purpose substantially as set forth.

2. The arrangement of the troughs *b' c*, the holes by which they communicate with the trough *m*, the trough *m*, and the pipe *l*, whereby the drip-water is detained, for the purpose and in the way substantially as hereinbefore set forth.

142,797.—Coloring Leather.—JOHN KOPITZ, Boston, and FREDERIK B. MAYER, Cambridgeport, Mass. Application filed March 29, 1873.

Vinegar is added to aniline colors or pigments dissolved in alcohol and then boiled, after which the ground color, boiled in vinegar and mixed with starch, is sprinkled on the leather and the preparation of aniline applied.

Claim.—1. The employment for the purpose, and substantially as described, of ground and aniline colors, prepared in manner and by means as explained.

2. The combination or solution of an aniline pigment, alcohol, and vinegar prepared by heat, as set forth.

3. The employment, on a surface of starch, in a colored solution to resist a solution of aniline when applied to such surface, essentially as specified.

142,798.—Harvester-Rake.—SYLVANUS D. LOCKE, Hoosick Falls, N. Y., assignor to WALTER A. WOOD, same place. Application filed May 3, 1873.

The rake-driving chain beneath the platform is connected to the rake above it by a pin bent outward and upward, so as to pass beyond the edge of the platform which extends over the chain.

Claim.—The platform overhanging the rake-chain or belt, in combination with the pin connecting the rake-head therewith, bent into crank form, substantially as and for the purpose set forth.

142,799.—Car-Ventilator.—SERENUS C. MAINE, Boston, Mass. Application filed July 28, 1872.

At each end of the upper portion of the car are formed two ventilating-ducts, each provided with a swing-door opening inward. The doors are turned from within the car and held in any desired position by means of a knob connected with a revolving disk provided with a beveled lug, which, by the operation of the disk, is made to impinge against or be released from the doors. The ducts in each end are connected with finely-perforated tubes. Arranged at each end, so as to slide backward and forward, are hoods for increasing the draft.

Claim.—1. The swing doors or valves *g g'*, arranged in the ducts *f f'*, in combination with the knob *c* and revolving disk *d*, provided with a beveled lug, all arranged to operate as specified.

2. The adjustable hood or hoods *l l'*, arranged and operated as and for the purpose specified.

3. The combination of the ducts *f f'*, swing-doors *g g'*, perforated tube or condenser *k*, and ventilator *e*, provided with swing doors or valves acting reversely to those of the ducts *f f'*, all arranged to operate as specified.

142,800.—Plow.—CYRUS MARSH, 2d, Natchez, Miss. Application filed September 6, 1872.

A fin or rudder piece is riveted to the heel-end of the land-side.

Claim.—1. In a plow of substantially the described construction, the independent heel-plate *d*, removably attached to the extreme rear end of the land-side, and extending below the land-side, as described, for the purpose set forth.

2. In a plow of substantially the described construction, the share E, having its cutting-edge *e'* turned forward and located beyond the line of the standard, in combination with a heel-plate located at the rear end of a land-side, as described, for the purpose set forth.

142,801.—Float for Life-Rafts.—JOHN MASON, Detroit, Mich., and GEORGE W. ROGERS, Brooklyn, N. Y. Application filed February 21, 1872.

Claim.—A float for a life-raft consisting of the sack A, provided with eyelet-flaps B B, filled with blocks of cork strung together, the cord being secured to the sack, as and for the purposes set forth.

142,802.—Cotton-Bale Tie.—OSCAR B. MCCLEAN, New Orleans, La. Application filed July 28, 1873.

The tie-plate has two projections upon its under edge, which prevent the tie from slipping sidewise; and also two lugs, which form both a guard and a hook, by means of which the tie is firmly secured.

Claim.—1. The bale-tie plate A F B made in the form as shown and described.

2. The bale-tie plate constructed as shown, having the guard A and projections, the latter forming space B, substantially as described.

142,803.—Bale-Tie.—JOHN MCMURTRY, Lexington, Ky. Application filed May 16, 1873.

The ends of the tie are so notched that when connected the ends of the tie shall be upon its under side.

Claim.—The ends A B, having the square notches *d* and downwardly-projecting flaps *c* formed in their edges at each side of the notch *d*, so that when the ends are brought together both ends and flaps will come upon the under side of the tie next to the bale, substantially as shown and described.

142,804.—Die for Forming Carriage-Clips.—EDWIN MERRER, Bridgeport, Conn. Application filed June 23, 1873.

Claim.—The re-enforces 5 5 in the die, by which the grooves 3 3 are formed in carriage-clips, as described and set forth.

142,805.—Limekiln.—JOHN L. MERRER, Troy, N. Y. Application filed August 12, 1873.

The furnace is placed on wheels, and can be run out from under the kiln when the burned lime is to be removed. The grated top of the furnace prevents the falling down of the lime while burning.

Claim.—A removable furnace having an open, perforated, or grated top, arranged under and in combination with the discharge-passage in the bottom of a limekiln, substantially as herein described.

142,806.—Refrigerator for Transporting Ice-Cream, &c.—JOSEPH MOOS, Philadelphia, Pa. Application filed May 16, 1873.

A plate is placed across the upper part of box containing ice, and jars are passed through openings in this plate and rest upon adjustable supports. One of the jars is provided with compartments, and has pans filled with freezing-mixture in its upper and lower parts.

Claim.—1. The chest A, having the plate D, and adjustable stands E, combined with vessels H, for the purpose set forth.

2. The vessel H', formed in compartments by removable partitions or shelves O, in combination with the refrigerating-chambers at the top and bottom, as described and shown.

142,807.—Car-Ventilator.—ANDREW J. MORRISON, Troy, assignor of one-half his right to THOMAS W. C. MOORE, Mohawk, N. Y. Application filed June 6, 1873.

Three rectangular wings are attached to each other to form a wheel, and are so arranged that by a part revolution the ventilator is closed or open, and held there by spring-bolts, which also stop the revolution of the wheel.

Claim.—1. The wings D, D', and D'', constructed, attached, to the case B, and operating substantially and for the purposes as herein before described.

2. The bottom C, with adjusting-screw and nut, drop-peg, and spring-bolts, as herein before described.

142,808.—Needle for Weaving Cane-Seats for Chairs. DEWITT C. MOSHER, Washington, D. C. Application filed May 27, 1873.

The rear end of the needle is formed into a clasp, whereby the splint is held and drawn through the meshes; and the handle B has a transverse slit for turning and drawing the needle.

Claim.—1. A needle for weaving chair-seats terminating at its butt-end in jaws, to nip the end of the splint, substantially as and for the purpose specified.

2. In combination with such a needle, a handle, B, constructed with a socket to hold and turn the needle while being inserted into the web, and also a slit to catch the curved point of the needle when it is to be drawn out of the web, substantially as set forth.

142,809.—Tramming-Bolt for Grinding-Mills.—JOHN T. NOYE, Buffalo, N. Y. Application filed February 17, 1873.

Devices for tramming and securing the upper or stationary stone.

Claim.—A tramming-bolt for grain-mills consisting of the hollow tramming-screw A, upon the upper face of which the tramming-ring is supported, and the bolt I passing through said hollow tramming-screw, with a nut upon each end, all being arranged substantially as and for the purpose set forth.

142,810.—Operating Car-Doors.—JOHN A. O'HAIRE, West Troy, N. Y., assignor of one-half to W. A. JONES, same place. Application filed June 27, 1873.

A rod passes from the front to the rear of the car through a tube; on each end of the rod is a crank or lever, the front lever to be operated by the driver, and the rear one carrying a roller to work up and down in a rectangular frame secured to the rear edge of the door, and by means of which the door will move back and forth.

Claim.—The rod 4, crank or lever 3, and guiding-frame 6, secured to the door, and combined with an operating-lever for the driver, substantially as shown and described.

142,811.—Harvester.—JOHN G. PERRY, Kingston, R. I. Application filed June 3, 1872.

The chain connecting the lifting-lever with the finger-bar passes over a pulley journaled in arm, which is hinged to the tongue-frame on an axis at right angles to the axis of the pulley. The pulley-block then performs the office of the ordinary spiral sector.

Claim.—The lifting-lever A, hung on or around the axle *d* and chain *b*, in combination with the swinging pulley-block *c*, hung on a pivot at right angles to the axis of the pulley, and secured to the pole or draft-frame by arm *F*, substantially as and for the purposes set forth.

142,812.—Clamp for Sewing-Machine Attachments. JOHN G. POWELL, Philadelphia, Pa. Application filed June 9, 1873.

The hemmer or other attachment is provided with a vertical journal to enter the slot in the arm, which, at one end, is separated and provided with a latch and notch, so that the arm acts to snugly hold the journal and retain the attachment in proper working position. The parts under this construction may be adjusted to any machine, whatever may be the position of the screw-holes in the plate.

Claim.—1. The compressible slotted arm combined with a vertical journal on a sewing-machine attachment, substantially as shown.

2. The latch D and notch E in combination with the compressible slotted arm C and journal B, as described and shown.

142,813.—Table for Sewing-Machines.—HENRY O. REED, Boston, Mass. Application filed March 20, 1873.

The table is provided with hinges upon one side and one end, either of which may be used for giving it an inclination.

Claim.—The combination of the table F, having the wide slot at H, the two sets of cams *a a* and *b b*, the pin G fitting each set of cams, and the two set-screws *c c'*, with the frame A, the saw, and the mechanism for driving the saw, all substantially as described.

142,814.—Belt-Shifting Mechanism for Planers and Lathes.—THOMAS REEVE, Brooklyn, N. Y. Application filed May 7, 1873.

The shifting bar is moved by a weight operating through a system of levers. One arm, *y*, of a bell-crank weight-lever bears against a stob, I, on a spring-bolt, and the stob rests against the tension of the spring on the top of a vertical detent, J, which latter is tripped to allow the stob to fall below the end of rod *y* and thus release the weight, by a rod, H, connected to the cutter-slide or the lathe-rest.

Claim.—1. The combination lever T, three-armed lever U, weight P', and the detaining device, consisting of the latch, spring-bolt and stud, and the tool-slide, or their equivalents, when arranged to operate as and for the purpose specified.

2. The arm X, attached to the three-armed lever U, rod Y, adjustable case O, and adjustable rod H, when arranged to operate substantially as and for the purpose specified.

142,815.—Car-Coupling.—SAMUEL B. REPLOGLE, Roaring Springs, Pa. Application filed February 15, 1873.

The spring *c* has a tendency to keep the hook in a horizontal position. To "set" the coupling the hook is raised until the hook on its arm b^1 catches over the stud *i* on the spring I. When the draw-heads strike, the spring I is wedged down by the platform, and the hook is forced forward.

Claim.—1. In combination with the coupling-hook B, the chain *f* and coiled spring *e*, working in the tube D, substantially as shown and described.

2. The bar I, with its stud *i* and wedge *k*, in combination with the coupling-hook B, substantially as shown and described.

142,816.—Crank for Saw-Mills.—ALEXANDER RODGERS, Muskegon, Mich. Application filed August 30, 1873.

The crank is provided with a balance-weight, which may be readily adjusted to the varying weight of the saws and saw-gate.

Claim.—1. A balance-crank constructed as herein described, and for the purpose set forth.

2. The counter-balance E and key K, provided with the keeper *m*, in combination with the crank-body A, shank D, and bolt *b*, substantially as and for the purpose specified.

142,817.—Telegraph Switch-Board.—WILLIAM D. SARGENT, Philadelphia, Pa. Application filed March 25, 1873.

Greater certainty of good contact insured by hollow plug and the pin projecting from back strap through front strap.

Claim.—1. The hollow contact-peg, substantially as and for the purposes set forth.

2. The metallic stud or studs D, attached to one strap and projecting up to or through the other strap, substantially as and for the purposes set forth.

3. The combination of the contact-peg E, the metallic stud D, and the metallic straps B and C, constructed substantially as and for the purpose hereinbefore described and set forth.

142,818.—Car-Coupling.—JACOB B. SMITH, Jackson, Pa. Application filed March 29, 1873.

The coupling-pin is jointed so that it will "give" when struck by the link, and fall into it when it has passed far enough in the draw-head. The pin is attached to a jointed arm of a rock-shaft, which may be operated to couple either by levers at the sides of the car or by the bumpers when they are struck by the opposing bumpers. The pin may be raised by direct action or by the rock-shaft.

Claim.—1. The combination, with the rock-shaft E, arms *m n*, coupling-pin and sliding bumpers H, of the transverse rod K, lever L, and connecting-bar *s*, substantially as specified.

2. The rock-shaft E, having the jointed arm *m*, in combination with the pin F, substantially as and for the purpose described.

142,819.—Guide for Sewing-Machines.—WILLIAM A. SPRINGER, Marlborough, Mass., assignor to himself, THOMAS COREY, and CLIFTON D. HUNTER, same place. Application filed June 9, 1873.

The guide is shown as attached to the post of a wax-thread sewing-machine, and is adapted to guide a tongue-piece to be sewed to the upper, inside the row of eyelets. The guide is adjustable, and is held in position by the spring which bears against the under side of the slotted plate, and which is attached to the under side of the stud.

Claim.—The stripe E D, connected by the stud *e*, in combination with the lower spring *f*, block *d*, and slotted plate C, forming the adjustable sewing-machine guide, as herein described and set forth.

142,820.—Screw-Propeller.—HENRY K. STEVENS and SOLOMON MILLER, Waterloo, N. Y.; said MILLER assignor to said STEVENS. Application filed March 13, 1873.

Blades joined to the hub at an angle of about thirty-five degrees to the shaft, the center line of the blade being curved backward, while the extremities are curved in an opposite direction, by which a large number of blades may be used, while a free passage for the water is provided between said blades.

Claim.—1. The propeller constructed and arranged as herein described, having the blades formed and affixed to the hub, as herein specifically set forth in the above description, and for the purposes specified.

2. The joint herein described, for coupling the propeller, with the driving-shaft composed of strong jaws united together and held in place by pins, as herein described.

142,821.—Mold for Casting Car-Wheels.—JOHN BLAKE TARR, Fairhaven, Mass. Application filed August 19, 1873.

A plunger adapted to enter the hub-eye of the mold to consolidate the casting, pressure being applied by means of a lever supported at one end by a rod attached to the trunnion of the mold.

Claim.—1. The movable pressing-head J, applied to a lever which is supported at one end upon a rod, P, made detachable from one of the trunnions of a mold, for the purpose described.

2. The swiveling detachable lever-rod P, combined with the thimble P', the self-adjusting pressing-head J, and mold, substantially as described.

3. The plates F and supporting-rods *g*, combined with the receiver of a mold and a pressing-head, substantially as and for the purpose described.

4. The pressing-head J, operated substantially as described, made of a diameter to enter the hub-eye of a mold, for the purpose of pressing directly upon the hub part of the wheel.

142,822.—Stamp-Affixer.—RAPHAEL P. THIAN, Georgetown, D. C. Application filed August 20, 1873.

The stamp is picked up by the needles, and while held by them is moistened by being pressed upon a wet sponge, when it is affixed by pressing the plate upon the stamp, which forces the needles clear of it.

Claim.—1. In a stamp-affixer, the picking-up needles F, arranged as described.

2. The combination of the adjustable needles F, needle-plate L, spring M, cylinder K, rods I J arranged in the cylinder B, having the plate E at its base, and the cap A, the whole operating in the manner and for the purpose described.

142,823.—Beam-Compass.—MORTON TOULMIN, New Orleans, La. Application filed June 4, 1873.

Two parallel rods, with a continuous screw-rod between them, secured to a head-piece, form the beam upon which the center-pin and drafting pens or pencils are adjusted by means of an inclosed screw-nut.

Claim.—1. The arrangement, in a beam drafting-compass, of the bars B B, stationary screw E, and two or more drafting-pens, or their equivalents, each adjustable, back and forth upon the bars by means of nuts *n n* in the slots *s s*, working upon the screw, all substantially as set forth.

2. The needle G, arranged as shown and described, with two bearings, *b b*, between which the needle is embraced by the eye A of a bolt, *m*, extending through the stock D, and by which the middle of the needle is sprung as desired, causing an opposite deflection of the point *p* below the lower bearing, all substantially as shown and described.

142,824.—Rock-Drill.—WILLIAM WEAVER, Phœnixville, Pa. Application filed August 22, 1873.

A frictional clamp is combined with the ratchet-nut, which holds the drill as it is raised and turned. The nut in descending strikes a stop and allows the drill to be fed forward. The revolution of the drill is regulated by an adjustable finger secured to the cam. The drill-spring is kept from binding by a stationary collar having an arm sliding in a rear guide.

Claim.—1. The ratchet-nut 2, provided with frictional clamp 3, secured to the drill-rod, for the purpose of raising, turning, and feeding it forward, substantially as set forth.

2. The cam *m*, having a removable projection or catch, *n*, or their equivalent, secured to it, so as to engage with the ratchet and turn the drill-rod, substantially as specified.

3. The plate 8 and arm 9, in combination with the guide 7, substantially as specified.

4. The combination of the cam *m n*, ratchet-nut 2 3, drill-rod, spring, and stop 5 6, arranged for operation substantially as shown and described.

5. The drill-rod having the double gouge-bit 7 formed upon its end, substantially as shown.

142,825.—Telegraph Receiving-Register.—MARTIN F. WEBSMANN, Brooklyn, N. Y. Application filed February 11, 1873.

Brake G holds the paper and prevents it being paid out whenever the instrument is not receiving. Vibrating arm H presses paper down out of its line of travel when receiving, making a slack, which, straightened, gives the spacing after reception of a signal.

Claim.—1. A brake or stop, G, attached to or operated by the armature of the marking or printing magnet of an electro-magnetic receiving-instrument, operating substantially as and for the purposes herein specified.

2. A vibratory arm, or its equivalent, B, operating substantially as described, in combination with a paper-brake, G, and the marking or printing and the paper-feeding mechanism of an electro-magnetic telegraph receiving-instrument, for the purpose herein specified.

142,826.—Telegraph Transmitting-Key.—MARTIN F. WEBSMANN, Brooklyn, N. Y. Application filed February 11, 1873.

Depression of a key-lever forces down circuit breaking and making lever, which has at its end a metal piece insulated on one side, and on the other side alternate insulated and metallic spaces corresponding to a signal. On the down stroke insulated side passes a metallic side, the other side passing it on return and giving the signal. Uniform speed on return secured by a retarding device.

Claim.—1. A telegraph transmitting circuit closer and breaker, in combination with a retarding device or governor, substantially as and for the purpose herein specified.

2. A telegraph transmitting circuit closer and breaker, acting in its return movement by a regulated automatic motion after the depression of the key by the operator, and unaccompanied by the key, substantially as and for the purpose herein specified.

142,827.—Elastic-Fabric Mattress-Frame.—JOHN E WHITTLESEY and J. WILLIAM C. PETERS, Chicago, Ill. Application filed April 4, 1873.

An end plate furnished with a set-screw, and side plates with adjusting slots and bolts, are attached to the side rails for regulating the tension of the fabric fastened to the end bars.

Claim.—1. The combination of the end plate E, furnished with the set-screw F, the side plates D made with slots G G', the bolts H H', and rails A B, substantially as specified.

2. The combination of the flat side plates D, made with slots G G', the bolts H H', and rails A B, substantially as specified.

142,828.—Harvester.—JOHN D. WILBER, Poughkeepsie, N. Y. Application filed January 27, 1873.

The cutting apparatus is located in front of the driving-wheels, and its pressure upon the ground is regulated by the draft applied to the evener, which is flexibly connected to the side arms.

Claim.—1. The sliding plate *f*, constructed with stops or horns *f'*, and having pivoted to it the double-tree D^1, substantially as described.

2. The draft-chains or rods *e e*, suspended from the evener D^2, one of which is attached to the left-side arm of frame E, the other to the right-side brace G', as and for the purpose set forth.

3. The double-tree D^1 and single-tree d^2, combined and connected by rod d^3 to an evener, D^2, which extends across the tongue D, back from a vertical line from the finger-bar, the left end of said evener being connected to a draft-iron located on the rigid left-hand side arm of frame E, and the right end connected to a draft-iron located on the side brace G^1, substantially as described.

142,829.—Clock-Calendar Movement.—GEORGE R. WILLIAMS, Ithaca, N. Y. Application filed March 18, 1873.

A snail on the shaft of the twelve-hour wheel is provided with a lateral incline and cam, so arranged that the hook of the dropping-rod or calendar-trip will engage with the raising-spiral only on the second revolution after the drop.

Claim.—1. The cam A, with incline B and wedge-shaped projection E, in combination with the drop or detaching rod C, with hook C' and arm D, for the purpose of making one trip or fall of the rod C in twenty-four hours, when the cam A is fast to the twelve-hour shaft of the clock, as set forth.

2. The cam A, with incline B and wedge-shaped projection E, in combination with the drop or detaching rod C, with hook C', when operated by or on any suitable shaft or part of the clock-movement, when constructed substantially as described.

142,830.—Thill-Coupling.—SAMUEL G. WISE, Edgerton, Ohio. Application filed March 24, 1873.

A plate is interposed between the thill and a swivel-bolt, and is prevented from being pushed back by a shoulder on the clip-ber.

Claim.—In thill-couplings, the clip-ber A, having bifurcated turned ends C, and shouldered at *c*, plate F, having the slot H, rubber block I, swivel-pin G, and thill D, combined and arranged to operate substantially as and for the purpose set forth.

142,831.—Wheel for Vehicles.—JEROME B. WITHEY, Chicago, Ill. Application filed April 15, 1873.

The axle-box is in two sections, and the axle and hub are arranged to revolve together.

Claim.—The disks B B', having the projections *a* and flange D, arranged to receive the spokes, in combination with shells F F', sleeves C C', collar A', and nut E, the whole adapted to a revolving axle for vehicles, as specified.

142,832.—Cut-Off for Cisterns, &c.—CONRAD WURST, Kinnerwick, Mo. Application filed March 10, 1873.

The cut-off is made from blanks of the form shown.

Claim.—1. The blank A, provided with the opening *a* and depression a^1, for the purposes described and shown.

2. The blank a^2 a^3, for the purpose described and shown.

3. The blank A provided with the opening *a* and depression a^1, the spout B provided with the slots b^1 b^2, the flange b^3, and the slots b^4 b^5, and the blank a^2 a^3, and the studs a^4 a^5, all combined, arranged, and operating as described and shown, and for the purpose of a cut-off.

142,833.—Machine for Upsetting Tires.—JOHN L. YEAGER and ALBERT H. YEAGER, Lampeter Square, Pa. Application August 13, 1873.

Claim.—The construction and combination, as herein described and shown, of the box A, flanged bed-pieces D E, connecting-rod G, and lever H, jaws *f*, links L, ring R, pulley P, cord K, and treadle Q.

142,834.—Boat-Detaching Apparatus.—HENRY ASHFORD, Philadelphia, Pa. Application filed July 15, 1873.

Blocks carrying sheaves, and having a hook at one end, are

pivoted together, and a spring is arranged at the hub to throw the hooks apart upon their being relieved of the suspended weight. There is also attached to the upper or block end a spring-latch for locking the parts together, which is adapted to be detached by a lanyard from the vessel.

Claim.—1. In a tackle-block, the combination of two sections pivoted together, and each carrying a sheave or sheaves and a hook, with a connecting-pin uniting the sections, and a spring, the ends of which bear against the sections at or near the connecting-pin, substantially as set forth.

2. The combination of the pivoted sections A B, the connecting-pin C', and the spring-latch E, substantially as set forth.

142,835.—Means of Adjusting Paddle-Floats.—JUAN B. BAPTISTA, New York, N. Y. Application filed July 5, 1873.

Claim.—The paddle-frame D, provided with an upper and lower double or slotted cross-bar, F, in combination with paddles having two or more series of holes to adapt them to be adjusted in depth by means of pins or bolts, as specified.

142,836.—Apparatus for Elevating and Loading Hay.—JACOB H. BEAN, Macon, Ill. Application filed June 18, 1873.

A loaded hay-rake is drawn up the inclined plane by means of a windlass and dumped at the terminus of the track.

Claim.—1. The sectioned and adjustable tram-way A A' *a*, B C, D D', E E', F G, and H, substantially as and for the purpose described.

2. The automatic dumping devices T U, substantially as described.

3. In this connection, the drum K, clutch Q, and brake R S, all operating as set forth.

4. The sectioned tram-ways A A' *a*, having the described hinged attachment I to posts or legs.

142,837.—Railway-Switch.—WILLIAM H. CLARK and PHINEAS CHANEY, Jr., Oregon, assignors to themselves and JOHN H. WHITE, Hale, Ill. Application filed May 8, 1873.

The switch is operated from the locomotive through right-angled levers and long shafts and bevel gearing, and the crank-arm which throws the switch operates a spring-locking device, which secures the movable rails against accidental shifting.

Claim.—The combination, with the switch C^3 and its locking-spar A^3, of the levers D^1 D^2, with their connecting devices, arranged and operating as described, whereby, while the switch is locked in either position, it is at the same time placed under the control of the moving train, as set forth.

142,838.—Butter-Print Press.—LEWIS COATES and JOEL T. CRISWELL, Collamer, Pa. Application filed June 14, 1873.

A rectangular frame and vertical press. The die slides in laterally upon the bed, a stem passing downward through a slot. A hopper has an inclined side chute to receive the butter when the platen is up. A lever, held in a loose slot in the rear, is pivoted to a platen-rod, which it operates. Another lever (for the left hand) lifts the hopper for the removal of the print.

Claim.—1. The butter-press consisting of frame A, sliding box G, with mouth I and levers *g i*, block H, guide-posts L, follower N N', and lever M, substantially as and for the purpose described.

2. The combination of the printing-block A, having handle *d*, with guide-lugs *d'* and the supporting piece or platform F, provided with the slot *b*, as shown and described.

3. The sliding box G, having mouth I, guide stripe *e*, pivoted arm *f*, links *i*, and lugs *i'*, combined as specified.

4. The combination of the follower lever M, having notch *l'*, with the upright bar *s* and box G, as and for the purposes specified.

5. The cross-piece D, having recess *m'* and button *n* to lock post L, as described.

6. The pieces D and D', with guide-recesses *a a'*, and follower-shaft N, having the regulating-stop *o*, combined as specified.

142,839.—Sewing-Machine Power.—ALFRED W. COCHRAN, Buffalo, Ala. Application filed June 28, 1873.

Claim.—The mode of connecting the motor of a sewing-machine with the fly-wheel on a rocking-chair, having a pitman attached to the crank-pin and pivoted to some stationary object, as and for the purpose specified.

142,840.—Apparatus for Cleaning Coal-Pools, Sinks, &c.—J. P. FLORIMOND DATICHY, Brooklyn, N. Y. Application filed August 9, 1873.

The air-pumps are fixed rigidly to the rear part of the wagon-frame and rest upon platforms pierced to form guides for a frame and cross-head, operated by an eccentric upon the rear axle. Pendent from the cross-head is a sleeve, in which the piston-rod moves at such time as the two are not connected by a lock-pin.

Claim.—1. The combination of the hind wheels of the truck, having crank *g*, with the loose eccentric I of the axle and piston-rod frame H, to give steadiness to the perpendicular position and motion of the same, as described.

2. The combination of air-pump G, having bottom platform *d*, with sleeve *b*, and perforated lugs *e*, with piston-rod frame H to guide the same, as specified.

3. The regulating-gear M, consisting of hand-lever P, applied to-rack *m* of seat, intermediate lever P^2, and rods P^3 *c'*, with locking-pin *l*, in combination with cross-head L of frame H and piston-rod *i*, to establish or interrupt the working of pump G, as set forth.

4. In combination with tank A, the additional cupola O, with gage P, for communicating with the interior by pipe *q'* and stop-cock *q*, for the purposes described.

142,841.—Ornamental Chain.—WILLIAM F. DAVIS, North Attleborough, Mass., assignor to J. T. BACON & Co. Application filed May 22, 1873.

The different rows of links, being arranged to break joints, are connected together by a wire woven in and out from side to side.

Claim.—A woven chain consisting of two or more rows of beads or links A A, in combination with the continuous binding-wire H B, substantially in the manner and for the purpose specified.

142,842.—Vessel for Transporting Grain in Bulk.—FRANCESCO DEMARTINI and JOHN CHERTIZZA, New York, N. Y. Application filed August 16, 1873.

The arrangement of partitions, claimed to prevent the shifting of loose cargo as the vessel rolls.

Claim.—The combination, with cross-stays B and stanchions C, of partitions G H, constructed and arranged as and for the purpose described.

142,843.—Butter-Tub.—ANDREW J. DRAKE, Middletown, N. Y. Application filed April 12, 1873.

The ears are constructed with a part lapping on and over the cover, with a shoulder fitted to its edge, and projecting below it, for the construction of jaws. Below the top, and attached to the sides of the tub, is a plate fitted with a dovetail, which is rigidly attached to the sides of the tub and fitted to the jaws of the upper plate. On one side is a screw with a projecting head, which overlaps the upper part to hold it in position for transportation.

Claim.—The combination of the ears formed of the plates C E and D F and the screw G with the cover B and body A of a butter-tub, as and for the purpose described.

142,844.—Horse Hay-Rake.—CHARLES EDGAR, Dayton, Ohio. Application filed August 18, 1873.

Clutches, which slide on each end of the axle, (which axle serves as the rake-head,) are thrust outward, and thereby locked with the supporting-wheels by arms or links connected to opposite ends of a horizontally-pivoted lever, so as to raise the teeth and thereby dump the accumulated hay.

Claim.—The single spring *j* and the treadle-lever *n* yielding in two directions, as described, in combination with the connecting-lever and rods or wires *k i i*, the sector-bar *m* having a guide-slot provided with a retaining-notch, *l*, and the releasing-tappet *h*, arranged and operating substantially as herein set forth, for the purpose specified.

142,845.—Glass-Blowing Machine.—SOLOMON L. FLEISHMAN, Pittsburg, Pa. Application filed November 5, 1872.

To the discharge-pipe of a double-acting air-pump is connected a flexible tube, supplied at the nozzle end with a stop-cock and coupling-hood.

Claim.—The combination of the air-pump with the pipes C, the flexible tube D, cock E, and rubber hood F, for supplying a continuous current of air of unvarying pressure to a glass-maker's blow-pipe, substantially as described.

142,846.—Governor for Steam-Engines.—ROBERT W. GARDNER, Quincy, Ill. Application filed March 8, 1873.

If the belt should break, the rod secured to the sleeve in which the driving-shaft revolves is moved, thereby permitting the tube which it supports to be depressed and with it said valve, thus stopping the engine.

Claim.—The combination with tube F having groove N, and movable on rod G, of the arm M, oscillating rod O, and governor drive-shaft Q, as and for the purpose described.

142,847.—Street-Sweeper.—CHRISTIAN GRIGER, Philadelphia, Pa. Application filed June 4, 1873.

The brushes are raised or lowered by means of a rectangular frame at the front of the machine, which works in guides and is operated by a hand-wheel. The brushes revolve independently of each other, and are thrown in and out of gear by means of a shifting frame operated from the driver's seat. The position of the dirt-box is regulated by a pinion, which works in a rack which is upon the front end of the box. To the ordinary dirt-pan is hinged a tail-board, which folds down on the pan when the machine is in operation, and is raised to prevent the escape of dirt when the brushes are not in action.

Claim.—1. The rectangular frame F, in combination with the screw G, connecting side rods H, and the rocker-guides I, for the purpose shown and described.

2. The vibrating shifter J, in combination with the side rods K, brush-cylinder shaft L, and the revolving reversible brush-cylinders M, for the purpose shown and described.

3. The vibrating shifter J, in combination with the side rods H K, cylinder-shaft L, brush-cylinders M, pinions N, spur-gears E, and the guide-rockers I, as and for the purpose shown and described.

4. In combination with the frame A, carrying the operating mechanism, the rectangular frame F, working in the guides *b* and operated by the screw-rod G, substantially as described, for the purpose specified.

5. The dirt-box Q, in combination with the shaft S, pinion U, and the rack T, as shown and described.

6. The dirt-box Q, in combination with the pan W and the tail-board X, as and for the purpose shown and described.

142,848.—Ore-Washer.—IRA T. HALSTEAD, Fredonia, N. Y. Application filed July 26, 1873.

Claim.—The employment of the sieves B E, one or more, in connection with one or more sluices, A D, and pivoted boards C F, for separating the sulphurets and heavier particles of ore from the stream of water and pulverized ore passing through the apparatus, substantially as herein shown and described.

142,849.—Car-Coupling.—WILLIAM W. HAVER, Schuylerville, assignor to himself, JAMES ATWELL, same place, and WILLIAM GATES, Frankfort, N. Y. Application filed March 26, 1873.

The coupling-link is lifted on and off the coupling-pins by means of a standard rising from its center and levers attached to the end of the car.

Claim.—The standard E, slotted arm F, short shaft G, arm H, and pivoted rod I, in combination with the coupling-link D, and hook-pins or projections C attached to the bumper-heads, substantially as herein shown and described.

142,850.—Washing-Machine.—JAMES H. HILL, Boone, Iowa. Application filed March 1, 1873.

A washing-machine constructed with an oblong box, with its inner sides and bottom corrugated, having balls free to roll from end to end by its motion, the box being suspended on journals near its center.

Claim.—The combination of an oscillating tub, A, and loose balls F, the tub having corrugated sides and bottom, substantially as specified.

142,851.—Locomotive Smoke-Stack.—JAMES HOOPER, Scranton, Pa. Application filed August 4, 1873.

A cone composed of several circular plates, with their inner edges turned up to provide an easy passage for steam, serves to protect the smoke-stack from the wearing effects of exhaust steam, and also to regulate the draft by means of the adjustable top disk.

Claim.—The cone B, consisting of plates C, rings E, standard D with regulating top disk F, and ring G, arranged and constructed as described.

142,852.—Neck-Yoke Holder.—GEORGE R. HUNTLEY, Hubbardstown, Mich., assignor to himself and CARLOS E. HAIT, same place. Application filed August 24, 1872.

The perforated leathers which receive the end of the pole are inclosed by metal plates, which lap over each other at their tops and form an eye through which the yoke passes.

Claim.—The neck-yoke holder formed of the perforated leather plates A and the flexible sheet-metal plates B, formed in one piece and applied thereto on both sides, and passing around the yoke C so as to form the eye *b*, all as shown and described.

142,853.—Brush Wash-Board and Roller.—ISAAC HUSSEY, Ironton, Ohio. Application filed June 14, 1873.

Brushes on a wash-board on which the clothes are placed, to be operated on by the reciprocating motion of a revolving hand-brush.

Claim.—The rotary and reciprocating brush D, in combination with the stationary brush wash-board A B, as and for the purpose set forth.

142,854.—Machine for Cutting Carriage Lock-Plate Blanks.—THOMAS INSULL and JAMES F. DOVEY, Philadelphia, Pa. Application filed August 21, 1873.

The stock to be cut is of the same width as the cutter C. The cutter C, acting in combination with the dies D D', clips off the corners of the plate.

Claim.—The combination of the cutter C, actuated by an eccentric, cam, or its equivalent, and the die or dies D D' all constructed and arranged to operate as herein described, for the purpose of forming lock-plates for carriages, as specified.

142,855.—Spring-Hinge.—STEPHEN JOYCE, New York, N. Y. Application filed August 14, 1873.

A tubular pintle inclosing a coiled spring. The pintle is surrounded by end bands or sleeves, and also by a central or middle band, each of the three bands having a radial leaf or wing, which is mortised into the casing or door.

Claim.—A spring-butt hinge, composed of the tubular pintle A, bands D D, spring F, stop-screw C C, and bands or sleeves I J, and M, with the leaves K K, and O and screw N, constructed and arranged as shown and described.

142,856.—Steam-Jet Apparatus for Forcing and Exhausting Air and Condensing Steam.—ERNST KÖRTING, Vienna, Austria. Application filed April 14, 1873.

The steam-nozzle enters one of a series of receiving-nozzles, the small end of each of which extends slightly into the large end of the succeeding one. These nozzles are surrounded and supported by partitions, which divide the body into several chambers, each provided with an opening.

Claim.—1. An apparatus for forcing or exhausting air and condensing steam, containing a steam-nozzle, a number of receiving-nozzles having separate independent communications with the air, and a valve or valves, by which the communication between one or more of the nozzles and the air may be closed, when constructed and arranged to operate substantially as herein shown and described.

2. In combination with a steam blowing or exhausting apparatus, substantially such as herein described, a body containing coke, charcoal, gravel, or like material, so arranged that the air passes through said material, and is deprived of moisture thereby.

142,857.—Elevated Wire-Way.—HENRY T. LAMYS and NELSON DAVIS, Atlanta, Idaho Ter. Application filed June 26, 1873.

The pulleys supporting the rope are formed of two half-pulleys supported upon separate shafts, and placed face to face so as to leave a narrow opening between for the passage of a thin, blade-shaped steel hanger. For this purpose the beam is also divided and united above by a U-shaped connection. A guiding-passage for the hanger is formed by a steel frame arranged about the entrance to the pulleys. This device does away with the necessity for the ordinary saddle and bent pendent, and permits the turning of sharp angles.

Claim.—1. The divided cross-timber A, having its separated ends supported by the bridge or inverted U-shaped casting C, substantially as and for the purpose above described.

2. The half-pulleys D D, having one edge beveled or otherwise cut away, so as to provide a single pulley with a passage in the bottom of the bearing-groove, when applied in the manner and for the purpose described.

3. The oval frame K, with its lower end so contracted as to form a guiding-passage, S, in combination with the two half-pulleys D D and passage *i*, substantially as and for the purpose above described.

4. The rope M with its permanently-attached pendant O, constructed so as to pass between the half-pulleys D D, substantially as above described.

142,858.—Nut-Lock.—HOWARD C. LOWE, Northeast, Md., assignor to himself and JOHN B. HALEY, same place. Application filed March 15, 1873.

The locking-plate is formed in the shape of a Latin cross and adapted to fit in correspondingly-shaped grooves in the washer. The opposite wings of the plate are turned up against the sides of the nut. The washer is provided with projection on its lower side to prevent it from turning.

Claim.—The combination of the cross-shaped sheet-metal plate D with the correspondingly-grooved washer C, having projections *a a* on its under side, all as shown and described.

142,859.—Manufacture of Shovels, &c.—HARVEY L. LOWMAN, Birmingham, Conn. Application filed July 24, 1873.

Claim.—The combined process, substantially such as described, for making shovels, spades, scoops, or other analogous articles in one piece from sheet metal, by cutting the sheet for the body of the shovel and with a projection from the rear edge thereof, which is to form the hollow shank, and at one swaging operation between dies giving the form required for the shovels and the half form to the projecting part which is to form the projecting hollow socket, and then by the second swaging operation completing the hollow tubular projecting sockets for the reception of the handle, substantially as and for the purpose specified.

142,860.—Cock for Drawing Beer.—JOHN MOFFET, New York, N. Y. Application filed July 5, 1873.

When the cock is opened to draw beer the vent is also opened to admit sufficient air to replace the liquid drawn.

Claim.—The combination, with cocks and valve-plugs B C and D F, of an intermediate rod, K, having play in one of the plugs C, and provided with a spring, L, that tends to raise the said rod out of said plug, thereby holding both valve-plugs securely in their seats.

142,861.—Tubing for Oil-Wells.—JOHN MOLONEY, Oil City, Pa., assignor of one-fourth his right to PATRICK SARTON and JOHN C. WELCH, same place. Application filed February 1, 1873.

To the lower end of the tubing a yielding support or stop is applied, to relieve the tubing from strain and prevent its vibration.

Claim.—1. In combination with the tubing of an oil or other like well, a yielding support, C, constructed and arranged substantially as shown and described.

2. The support C for well-tubing, consisting of the body or barrel *b*, spring *c*, and piston *d*, when constructed substantially as shown and described.

142,862.—Water-Wheel.—ELI OVERTON, Utica, N. Y. Application filed July 26, 1873.

Adjustable chute and wheel gages are arranged to be adjusted together and alike at the same time that the gate is opened.

Claim.—1. The combination of the adjustable chute-gages M and wheel-gages D in a water-wheel, when connected together substantially as specified.

2. A cam, E, for the support of the wheel-gages D, adapted to form, in connection with the gate O, a double gate, substantially as specified.

142,863.—Machine for Forming the Hooks of Machine-Needles.—NATHAN PAINE, Milford, Mass. Application filed August 4, 1873.

On the end of the arbor carrying the blank-holder is a segmental gear that works on a stationary gear fastened to a center-pin, about which the arbor is swung. The milling-cutter is fixed to the end of a swinging arbor, pivoted near its end and adjusted by a screw passing through a lug on the end. As the arbor is swung either to the right or left, the needle is caused to revolve both on the pin C as a center and its own axis.

Claim.—1. In a needle-machine, the combination, with a milling-cutter, M, of the arbor F, mounted in bearings which revolve

around pivot C as a center, the gear-wheels D and G, and needle-clamp H, all operating as described, to give the needle the compound motion specified.

2. In a needle-machine, the combination, with the arbor K suspended from the pivot O at the end carrying the cutter M, and having its bearings at the other end in a vertically-sliding block, of a screw, P, and spring Q, arranged as shown and described, to operate as specified.

3. The clamp-stock secured in a groove, I, a little wider than said stock, to allow of adjusting the clamp for needles of different sizes, substantially as specified.

142,864.—Reversible Plow-Point.—ROBERT M. PATTILLO, Cartersville, Ga. Application filed April 19, 1873.

The plow-point is reversible by turning it over.

Claim.—The plow-iron C, when provided with notch *d* and bolt-holes *d'*, and reversely curved at each end, as and for the purpose described.

142,865.—Portable Fence.—WILLIAM W. POTTS, Swedeland, Pa. Application filed June 18, 1873.

Fence-panels are made flexible by pivoting the perpendicular and horizontal connections, with end battens, on opposite sides of the rails. An A-shaped support has its inclined bars rigidly fastened to opposite sides of its cross-bar, the under edge of which is notched to embrace two horizontal bars of the panels. From the cross-bar to the apex a slot receives the upper rails in pairs. The A-shaped support being fixed in position, the panels slide upon and within it.

Claim.—1. The brace or post B, consisting of the pieces *b' b' b''*, arranged and rigidly fixed together, with the piece *b''* fixed to the opposite sides of the two pieces *b' b'*, respectively, and leaving the space *i* between them, substantially as and for the purposes hereinbefore set forth and described.

2. In combination with the brace or post B, constructed as set forth, the panels A A, having their respective tie-pieces *a'' a''* pivoted to the rails *a' a'*, so as to be on opposite sides of said rails, as set forth, for the purpose of allowing the said panels to be slid, the one longitudinally along on the other, and interlocked with the brace or post B, as described.

142,866.—Boiler-Feeder.—RAFAEL RAFAEL, Havana, Cuba. Application filed April 26, 1873.

A chambered wheel is rotated between close-fitting plates. Each chamber, successively, is connected with the steam and water spaces of the boiler, which allows the water to flow into the latter. The chambers are filled by a pipe from a reservoir.

Claim.—The many-chambered revolving cylinder A, having open pipe L, and supplied by gravity from a reservoir, J, by a connecting-pipe, K, in combination with a steam-boiler connected therewith at the top by a pipe, N, leading from the steam-space, and at the bottom by a pipe, M, leading from the water-space, as and for the purpose described.

142,867.—Railroad-Car Stove.—ABRAM REESE, Pittsburg, Pa. Application filed May 9, 1873.

Reservoir of water or carbonic-acid gas opened into stove in case of accident to car.

Claim.—1. The combination of the cork A, connected, as described, to the shell of the car, lever *i*, and valve *g*, substantially as and for the purposes described.

2. The valve *g*, operated by the spring *n*, in combination with the reservoir *b* and stove *a*, substantially as and for the purposes set forth.

142,868.—Painted-Cloth Cover.—WILLIAM D. RICHARDSON, Pawtucket, R. I. Application filed May 17, 1873.

Claim.—1. The combination of a painted-cloth cover with a rigid backing of pasteboard or other suitable material for protecting the painted parts thereon, substantially as and for the purpose specified.

2. The painted-cloth cover, with a pasteboard or equivalent stiffening, and with metal bindings to protect and finish the edges of the cover, as specified.

142,869.—Steam-Engine Governor.—STEPHEN P. RUGGLES, Boston, Mass. Application filed June 14, 1873.

One of the two disks is driven by direct connection with the running part of the engine, the other by a motor whose movement is always uniform. When the speed of the engine varies from that of the motor one disk is moved more rapidly or slowly than the other, and the aperture formed by their conjunction is varied accordingly.

Claim.—The combination, with the supply-pipe A of an engine, of a pair of register valves or disks, D E, mounted on separate shafts F G, having a connection adapting them to move with different speeds, and one shaft and its valve being driven by the engine to be regulated, and the other by an independent motor not subject to the variation of the said engine, substantially as specified.

142,870.—Binder's Attachment for Harvesters.—WASHINGTON L. SANFORD, Ashton, Ill. Application filed May 31, 1873.

The cut grain as it is elevated is dropped into a receptacle, where it is held and compressed by suitable arms, and, when bound by the operator, is automatically dropped from the bottom of the machine.

Claim.—1. The arrangement of compressing-arms I and bar J with the shipping-lever *a*, for automatically throwing the retaining compressing-arms out of gear, substantially as specified.

2. The shaft D, having curved arms, and arranged in the upper open portion of the cylinder, in combination with the rods G, for the purpose of packing the grain, as set forth.

3. The retaining-arms F, combined with the receptacle A and the movable compressing-arms E, substantially as specified.

4. The combination of retaining-arms F and arms Z with the receptacle and the compressing-arms, in the manner described, for conveying the grain over the discharging-space.

5. The wheel Q, pinion O, and cam P, constructed and arranged in the manner described, for operating the movable compressing-arms, holding them during the binding of the bundles, and finally discharging said bundles.

6. The stationary arm I and the disk K at the space for presenting the bands, arranged adjustably on their supports for varying the space, substantially as specified.

7. The support J of the stationary compressing-arms, arranged to yield to the action of the movable compressing-arms and controlled by springs, substantially as specified.

8. The arm *a*, relatively arranged with the wrist-pin *d* to hold teeth H against the grain and prevent them from vibrating, substantially as specified.

9. The binder's stand, arranged adjustably on the guard-standard A, as specified.

142,871.—Trotting-Gear.—HENRY SCHMALHAUSEN, Bridgeport, Ill. Application filed August 16, 1873.

Claim.—The trotting-gear consisting of the elastic main strap A, with bolstered strap B at one end and adjustable strap C at the other end, used in connection with the hame-ring, and to be applied to the fore and hind leg, in the manner substantially as described.

142,872.—Calendering-Machine.—DANIEL SCHOFIELD, Gloucester, N. J. Application filed March 28, 1873.

The wooden rolls are kept constantly dampened, to prevent cracking under the influence of heat from the metal rolls.

Claim.—A calendering-machine in which damped or wet wooden rolls are run in connection with heated-metal rolls.

142,873.—Car-Coupling.—WILLIAM F. SENIOR, Ripley, Ohio. Application filed June, 21, 1873.

The spring-plates which catch behind the head of the link and retain it in the coupling-box have short ribs on their upper sides, by which they are opened, through the medium of a crank-rod and cam. This crank-rod has formed on it above the cam a drum, around which a spring is coiled, which spring tends to keep the block or cam parallel to the projections. A hook is placed in such a position with relation to the crank that it may be caught over the handle thereof, to hold the plates apart when it is desired that the cars shall be uncoupled, yet not be separated.

Claim.—A car-coupling, formed of the box A, pivoted arms B *b'*, springs D, block F, crank G, spring I, and drum J, constructed and arranged to operate, in connection and with the coupling-bar C, substantially as shown and described.

142,874.—Machine for Grinding Cylinder-Heads.—JAMES SHERRELL, Paterson, N. J. Application filed May 28, 1873.

Rotary motion is communicated to cylinder-head by means of a yoke attached to the head, and extension-rod having universal joints.

Claim.—The combination of shaft A, extension-bar E, and straddling bar G with cross-bar J, connected together by swivel-joints F and H and operated by suitable gearing B C and lever D, substantially as and for the purpose hereinbefore set forth.

142,875.—Armpit-Shield.—JAMES SEELEY, New York, N. Y. Application filed May 24, 1873.

Claim.—As a new article of manufacture, an armpit-protector for ladies' dresses formed of an absorbent material, *a*, provided with a water-proof lining, *b*, substantially as shown and described.

142,876.—Wheel for Vehicles.—CHARLES W. STAUD, Wilkesbarre, Pa. Application filed April 12, 1873.

Claim.—The combined spoke-socket and felly-clip D of a wheel, having one end of the socket E circular, but gradually changed in shape to an oval toward the felly to allow the spoke to be wedged, all in the manner described.

142,877.—Nut-Lock.—CHARLES H. TAYLOR, New York, N. Y. Application filed June 11, 1873.

A spring of sheet steel is placed inside the box between the nut and rubber spring, and provided with projecting corners that impinge upon the sides of the box, thereby preventing the parts from separating when the nut is removed.

Claim.—In a nut-lock, the flat sheet-metal spring D, having the outwardly-projecting corners *d* located between the elastic substance C and the nut, in combination with each other and with the metal box B, all constructed and arranged substantially as described, for the purpose specified.

142,878.—Miter-Box.—JOHN P. TIERNEY, Sacramento, Cal. Application filed August 1, 1873.

One set of guide-bars has a lateral movement for the insertion or removal of the saw. The rotary frame is secured by a bar resting in notches at one end, and by a dowel-pin in corresponding holes at the other end.

Claim.—1. In combination with the frame A and adjustable rotating table C, the operating-lever N, with its spring P, the rack O, and the perforated segment S, substantially as and for the purpose herein described.

2. The four posts G, with their adjustable guiding-collars Q, the posts being mounted upon the stationary and movable bars F F' in pairs, so as to be opened and closed to admit and hold the saw, substantially as herein described.

3. In combination with the pivoted bar F', for separating the posts G, the slotted arm H, with the operating lever-arms I and J, and the holding spring-catch K, with its disengaging-lever L, substantially as and for the purpose herein described.

142,879.—Stove-Pipe Joint.—JACOB WEAVER, Tipton, Iowa. Application filed May 16, 1873.

The middle section has rectangular rims, which embrace flanges upon the inner ends of the outer sections so that they may be adjusted in any position and held there by set-screws.

Claim.—A stove-pipe connection composed of three sections, A A A, having elliptical joints, on which they are adjustable, in the manner and for the purpose described.

142,880.—Explosive Engine.—JOSIAH M. WELBOURN, Caledonia, Ohio. Application filed August 9, 1873.

The devices for feeding the cartridges to the powder-chambers are operated by means of rods attached to the pitmen of the driving-wheels. Regularity of operation is obtained by providing the piston-rods with cross-pins, which, at the forward part of the stroke, engage with grooves in spring-rods, and are released at the proper time by bent rods attached to the pitmen of the driving-wheels.

Claim.—1. The combination of frame A, powder-chambers B, guide-frame C, pistons G, wheels E with the charging mechanisms H L and regulating mechanisms D, substantially as and for the purpose described.

2. The charging mechanism consisting of casing H with brush *i*, slide L having recess *l*, and chamber B with aperture *b'*, operated by rod *m*, pitman F, and piston G, as set forth.

3. The regulating mechanism D, produced by spring-rod M, having groove *p* for cross-head *b'*, pivoted double rod N, with rod *q*, and spring *r*, for arresting and releasing piston G, for the purpose described.

4. The guide-frame C, having pin *r'*, for retaining double rod N till ready to strike rod M, as described.

142,881.—Reel for Harvesters.—JOHN WERNER, Jr., Prairie du Sac, Wis. Application filed June 14, 1873.

An overhanging reel, (having its outer and inner supporting-arms extended rearward from the supporting standards or pivots,) is adjusted vertically by means of two bell-crank levers having connecting-links, and a lever which plays vertically and located within reach of the driver on his seat.

Claim.—The combination of the connecting-rods J, angle or bent levers K, and connecting-rod L with the pivoted bars C that support the reel, substantially as herein shown and described.

142,882.—Cotton-Press.—PAUL WILLIAMS and ROBERT A. WILLIAMS, Winona, Miss. Application filed June 21, 1873.

Claim.—The combination, with the box A of the press projecting above the frame, of the follower J, the screws G, the screw-threaded parts thereof being jointed (below the upper portion A of the press-box) to the plain-surfaced parts thereof, on which are keyed the gears H, as shown and described, for the purpose specified.

142,883.—Life-Boat.—JOHN ADAMS, Gloucester, N. J. Application filed December 13, 1872.

Claim.—The life-boat constructed as herein described, consisting of the double hull A' A', united from gunwale to bilge, and provided with the air-compartments B D at the ends to increase the buoyancy, and the central compartments C, furnished with air-tight hatches K, to serve as receptacles for provisions, all as herein shown and described.

142,884.—Portfolio-Holder.—JONAS B. AIKEN, Franklin, N. H. Application filed May 7, 1873.

A frame (hinged at its base) has fastened to it a book-support, provided with end-guards, which is connected by another frame to the rods, fastened to the upright in such a manner that when in use the portfolio will be held in a convenient position, and when closed protected from handling.

Claim.—1. The frame-work A, combined with the strips H H hinged to the foot-piece E, and the strips F F hinged to the rest D, and sliding at the upper ends on the rolls *d' d'* fixed to the frame-work, as and for the purpose described.

2. The guards J J applied to the end of the portfolio holder, rest, or support, for the purpose specified.

142,885.—Windmill.—EPHRAIM A. ATWOOD and HARRY H. BODWELL, San Francisco, Cal. Application filed September 3, 1873.

The tail or vane of a wind-wheel is hinged to a toothed segment, with which a screw engages to turn and lock the vane at any desired angle.

Claim.—1. The worm L and the segment K, for the purpose of turning the tail to any position and locking it, substantially as herein described.

2. In combination with the worm L and the segment K, the vertical pulleys M and R, and the rope O, for the purpose of operating the rudder from the ground, substantially as herein described.

3. In combination with the pulley R and adjusting-spring U, the guide-rod T, to prevent twisting, substantially as herein described.

142,886.—Pruning-Shears.—WALTER BAKER, Ilion, assignor to THE BIDDLE MANUFACTURING COMPANY, New York, N. Y. Application filed March 24, 1873.

The cutting-blade is pivoted between an arm projecting from one of the handles, and has its lower end slotted to receive a pin that projects from the other handle, so that, by being held on such pin, it will be caused to swing on its own pivot, while at the same time it follows around the pivot of the shears during the vibrations of the handle.

Claim.—1. The cutting-blade C, connected, by an independent pivot, *d*, to one of the handles of the shears, and, by a pin, *g*, with the other handle, to obtain an independent drawing cut, as specified.

2. The combination of the handles A B and pivot *a* with the blade C, pivot *d*, hook *f*, and pin *g*, all arranged to operate as set forth.

142,887.—Medicine-Case.—M. OLMSTED BALDWIN, Wamego, Kans. Application filed July 18, 1873.

The arrangement of folds, drawers, and compartments is such that when the case is opened access may at once be had to all parts without any subsequent removal of lids.

Claim.—1. That arrangement of the body of the case A, its compartments *a a*, dropping-fold B, its compartments *b b*, and tray *b'*, and drawer C, as hereinbefore mentioned, whereby the entire contents thereof are brought into convenient relation to the operator without changing the position of the case.

2. That arrangement of the folds D D of the case A and extension-folds E E, hereinbefore mentioned, whereby the latter are, when closed, contained within the former, and when open present the same relative convenience above described.

142,888.—Porter's Box.—ISAAC BARMAN, Portland, Oregon. Application filed May 21, 1873.

A box is formed with several interior compartments, and on the top are divisions for marking-ink, nails, stencil-plates, brushes, and other tools.

Claim.—The porter's box, constructed, as described, with the compartments D, E, F, G, S, and T for nails, compartments H for stencils, pots A and B for ink, with distributing-dish C for stencil-brush, as and for the purposes specified.

142,889.—Top-Prop for Carriages.—LEWIS W. BLESSING, Wilmington, Del., assignor to himself and HOWARD PUSEY, same place. Application filed August 28, 1873.

The prop is constructed with a hook or socket to embrace the bow, and with it is combined a concavo-convex washer, fastened by wood-screws passing through the base-plate into the wooden bow.

Claim.—1. A top-prop for carriages, composed of post A *a*, plate A^1, and hook or socket A^2, and wrought out of a single piece of metal, substantially as and for the purpose specified.

2. The post and fastening-plate of a top-prop for carriages, in combination with the concavo-convex washer D, which is secured by wood-screws *d* passing into the bow of the top, substantially as and for the purpose specified.

142,890.—Molding-Machine.—WILLIAM J. BODA, Dayton, Ohio. Application filed August 5, 1873.

Table-slides, with re-entering angles, are molded by once passing between appropriately-formed cutting-tools.

Claim.—1. The cutter-heads H, H, S, and T, when constructed as shown, and combined and relatively arranged to operate substantially as and for the purpose specified.

2. The cutter-heads H', H', and Q, constructed, combined, and arranged to operate substantially as and for the purpose shown.

3. The combination and relative arrangement of the cutter-heads H, H', Q, S, and T, substantially as and for the purpose set forth.

4. The apparatus, as a whole, when its several parts are constructed and combined to operate in the manner and for the purpose substantially as shown and described.

142,891.—Butter-Coloring Compound.—GILBERT BOGART, WILLIAM H. CRAMER, and WILLIAM L. LEWIS, Laporte City, Iowa. Application filed July 29, 1873.

Claim.—The compound described, consisting of annatteine, saffron, lard-oil, and butter, all as and for the purposes set forth.

142,892.—Producing Coloring Matter from Vegetable Substances.—LOUIS MARIE FRANÇOIS BERTHERIEAU, Laval, France, assignor to himself and EDWARD CROMBANT, same place. Application filed May 15, 1873.

Sawdust is treated with a solution of potassium sulphide, at a temperature of about 200° centigrade, when the coloring matter is developed. Vegetable extracts may be added to modify the color. Many other organic materials are enumerated, which may be treated by the same process.

Claim.—1. The process of converting organic substances into coloring matter, substantially as herein specified.

2. The process of modifying coloring matter for obtaining new tints, as set forth.

3. The combination of alkaline sulphurets or persulphurets, or of alkalines and sulphur, with organic substances, for converting them into coloring matter, as set forth.

142,893.—Method of Forming Soles of Boots and Shoes.—CHARLES H. BINGHAM, Marlborough, assignor to himself, G. FRED. SMITH, same place, and STEPHEN MOORE and HOMER ROGERS, Sudbury, Mass. Application filed January 29, 1873.

Shells for the soles of shoes are punched from the same piece of good leather, the larger shells successively circumscribing those of smaller dimensions, and these are afterward filled with poorer material.

Claim.—1. A middle tap or sole, formed substantially as described.

2. A boot or shoe having a sole formed with the punched and filled piece or pieces, substantially as shown and described.

142,894.—Bale-Tie.—GEORGE BRODIE, Plum Bayou, Ark. Application filed April 23, 1870.

Claim.—The method of securing and identifying bales of cotton and like material, and providing against the possible loss or detachment of the marks of identity except by disruption of the bale, by means of metallic bands and tie-plates having the names and characters indicating ownership, quality, weight, &c., indelibly stamped upon the said bands and plates, or either of them, substantially as described.

142,895.—Spring Bed-Bottom.—GEORGE W. BROWN, Buffalo, N. Y. Application filed June 27, 1873.

Each slat is suspended at each side of its ends by a spiral spring, where there is a block above and below for reversal when the slat is warped. Two supporting-bars beneath are slightly arched by a longitudinal wire and spring.

Claim.—The combination of the slats having grooved double-heads with the spiral springs *a a* located at each side of the end of the slats, and the curved cross-pieces D D, springs *f f*, and stay-rods *g g*, all constructed and arranged substantially as herein described.

142,896.—Coal and Rock Cutting Machine.—HORACE F. BROWN, Indianapolis, Ind. Application filed July 30, 1873.

Upon the annular bed is arranged the annular frame, which is connected with the projecting annular cutting-ring by means of the geared shaft. The bed, resting upon ways, can be traversed in two directions at right angles to each other.

Claim.—1. A channeling-machine in which a cutter-ring, A, is carried by an arm, B, contained within said ring, except at the point where it joins the frame, as set forth.

2. The cutter-ring A and its carrying-arm B, in combination with an annular frame adjustable upon a bed, E, substantially as set forth.

3. The cutter-head A, in combination with the arm B and its anti-friction rollers *e* and *f*.

4. The combination of the cutter-head A and its annular rack with the arm B and pinion F on the shaft F, adapted to bearings on the said arm and annular bed D.

5. The cutter-block C, having cutting-edges *w* and intermediate channels, and attached to the cutter-ring, as set forth.

6. The combination of the annular bed E and its annular frame D, carrying the cutting-ring A, with ways on which the said bed can be traversed in two directions, at right angles to each other, as specified.

7. The combination of the slide I, adapted to ways *i i*, on the frames J J, and having ways *h h* for the bed E, with the frames K K', having ways *h'*, corresponding with those of the slide.

8. The combination of the central shaft K and its worm *k*, carried by the frame D, the racks on the frames J and K' K', and within-described gearing or its equivalent, which is carried by the bed E for traversing the latter, in the manner described.

9. The sill M, its set-screws N N, and arms P P, the whole being constructed substantially as set forth, for the support and adjustment of the frames J J and K' K'.

142,897.—Sausage-Stuffer.—PENROSE W. BROWNBACK, Limerick, Station, Pa. Application filed March 29, 1873.

The lower part of the external horizontal cylinder terminates in a funnel, the delivery-pipe of which continues out in line with said lower side of the cylinder. A horizontal shaft, journaled centrally in the ends of the cylinder, has spiral wings, the pitch of which is from end to end of the cylinder.

Claim.—In a sausage-stuffing machine having a spiral conveyer of long pitch, the casing having the side wall of its lower portion or body gradually contracted without a shoulder, forming the tapering recess *k*, connecting said side wall with the discharge-spout A, substantially as specified.

142,898.—Eccentric.—JOHN C. BUTTERFIELD, Chicago, Ill. Application filed September 9, 1873.

An adjustable eccentric with an elongated aperture is provided with a fixed wrist-pin or stud in the face of the eccentric, which is locked in series of connected grooves formed in the face of the fixed disk of the shaft by a confining-nut.

Claim.—The eccentric A *a*, having a fixed wrist-pin, *b*, in combination with the fixed disk C, provided with a series of connected grooves, *c c' c''*, or their equivalents, and confining-nut D, substantially as and for the purpose specified.

142,899.—Screen for Postal Cards.—LOUGHLIN CONROY, New York, N. Y. Application filed June 25, 1873.

Claim.—The perforated screen A, covering the back of a postal card, and provided with a pocket, *b*, to receive one end of the card, and adhesive flaps *c* and *f f*, which are folded over its edges and attached to its face, essentially as and for the purpose herein set forth.

142,900.—Tip for Saw-Files.—HENRY DESTON, Philadelphia, Pa. Application filed September 5, 1873.

Claim.—The within-described rubber tip, having a central tapering orifice for receiving the end of a saw-file, as set forth.

142,901.—Spring-Coupling for Vehicles.—HACALIAH P. DOLSON, Highland, N. Y. Application filed September 1, 1873.

The bearings have projecting lugs, so that differently-shaped springs may be secured to the same bearing.

Claim.—1. The coupling sleeves or slides C of the side springs A, provided with downwardly-projecting arms G G, for adaptation to and attachment of either coiled or French head springs, as and for the purpose set forth.

2. The pivoted arms E, having offsets *e*, for the end springs B to allow of the use of narrow or wide springs without interrupting the sliding adjustment of the coupling-sleeve C upon its cylindrical bearing F, as set forth.

142,902.—Bob-Sled.—JOSEPH W. DOTY, Lockport, N. Y. Application filed February 26, 1873.

Upon the axle which carries the independent runners is secured a fixed bar. A chain, secured to the free end and to the cross-bar, limits the vertical movement of the runners. The reach extends over the fifth-wheel, and to its forward end is journaled an anti-friction roller, to allow of free movement in turning.

Claim.—1. In combination with the rocking-axle D, having the fifth-wheel C secured thereto, the axle-brace F and flexible connection *g*, by means of which the rocking of said axle may be limited as desired, all as set forth.

2. In connection with the independent runners H, pivoted to the axle D, the cross-bar G combined with the hemispherical head *i* and the slotted socket or seat A, all as set forth.

3. The combination, with the short independent runners H, axle D and single fifth-wheel secured thereto, of the reach provided with friction-roller *b* and the brace F provided with chain *g*, all as set forth.

142,903.—Harvester.—JOHN W. H. DOUBLER, West Alden, N. Y. Application filed September 12, 1873.

The pitman which operates the cutter-bar is connected with a cross-head, which, by means of a cam-wheel, is caused to reciprocate on a guide-rod, and is cushioned by springs at each end of its stroke.

Claim.—The combination of the helical plate A, cross-head B, guide-rod C, springs F F', pitman D, and cutter-bar E, substantially as specified.

142,904.—Spark-Arrester.—JOHN E. DUSTIN, Whitefield, N. H., assignor to himself, ALSON L. BROWN, and WARREN G. BROWN, same place, and AARON ORDWAY, Lawrence, Mass. Application filed May 19, 1873.

A tank surrounds the top of the stack, into which the sparks are deflected by a perforated cap. The tank is supplied with water by a pipe passing up through the stack.

Claim.—1. In combination with the stack or chimney *a* and the perforated deflector *b*, arranged as described, the reservoir *d*, when said reservoir is supplied by a continuous stream of water from a stationary head through supply-pipe *f*, and provided with a discharge-pipe, *g*, to preserve the water at the proper level in the reservoir, and to float off by a continuous current the sparks, cinders, &c.

2. The combination, with the stack, perforated deflector, and the reservoir *d*, supplied from a continuous stream from a stationary or elevated head, and with a discharge-pipe, of a water-supply pipe located within the smoke-stack, substantially as and for the purposes set forth.

142,905.—Table-Caster.—HENRY FACHS, New York, N. Y. Application filed August 7, 1873.

The stand has hinged jaws for supporting dishes. It also has hinged hoods for protecting the articles in the dishes.

Claim.—1. The caster-stand A, provided with hinged retaining-jaws C C, for supporting dishes, arranged and operating substantially as described.

2. The covers E, hinged upon the caster-frame, substantially as and for the purpose specified.

142,906.—Smoke and Spark Conveyer for Locomotives.—ERNST A. C. FOX, Frederick City, Md. Application filed July 30, 1873.

Smoke and sparks are conveyed to the rear of the train through short sections of pipe connected by flanges turned on their inner and outer ends.

Claim.—In an apparatus for conveying smoke, cinders, &c., back from the locomotive smoke-stack to the rear end of the train, the straight fixed sections of tubing T T in combination with a series of intermediate short sections, S S', having the inward flanges *v w*, arranged and operating substantially as and for the purposes specified.

142,907.—Buckle for Harness.—KASSON FRAZER, Syracuse, N. Y. Application filed May 20, 1873.

The tongue-piece is fastened to its supporting cross-bar by wire straps, and has laterally-projecting lever-arms underneath and beyond the side bars of the buckle, which terminate in knobs or thumb-pieces, and are designed to facilitate the withdrawal of the tongue. The pivoted end of the tongue-piece is constructed with a cam having a dull edge, which embeds in the strap and is released by a quarter turn or revolution.

Claim.—1. In a buckle, the tongue-plate B, constructed with one or more lever-arms, *d*, which project beyond the frame on its under side, so that the tongue-plate can be turned by them to draw the tongue out of the strap without requiring the bending of the latter, substantially as specified.

2. The tongue-piece b, seated on the cross-bar *c* of the frame of the buckle, and clamped thereto by independent wire straps E, substantially in the manner and for the purpose specified.

3. In a trace-buckle, a spring tongue-piece, B C, provided with a laterally-projecting lever-arm, *d*, and an elevated bar or knee, F, substantially as and for the purpose specified.

4. In a harness-buckle, a tongue having a knee or cam, F, constructed in such a manner that it will embed into the same in the rear of the tongue, substantially as and for the purpose set forth.

142,908.—Rubber Compound for the Manufacture of Packings, &c.—CHRISTOPHER L. FENN, Beakville, Conn. Application filed September 11, 1873.

Mixture of rubber or other vulcanizable gum is mixed with the proper quantity of sulphur, metallic filings, and refractory earths and oxides, such as plumbago, soapstone, plaster of paris, asbestus, brass filings, and the like. The packing is made of this mixture and vulcanized in place.

Claim.—1. The improved method herein described for forming compounds for packing, the same consisting in combining rubber, or other vulcanizable gum, with sulphur and other solid materials, such as named, and vulcanizing the compound in the place to be packed, substantially as specified.

2. The improved compounds herein described, suitable for steam and other packing, made by mixing, in proper proportions, india-rubber, or other vulcanizable gum, with sulphur and other solid materials, such as named, so as to form non-vulcanized but vulcanizable compounds for use, as described.

142,909.—Chimney-Cowl.—GEORGE HENRY GARDENWIRE, Nokomis, Ill. Application filed July 22, 1873.

The counterbalancing-weight is suspended from the forward end of the vane, which is attached to the revolving cowl, and counteracts the force of the wind against the cowl and aids in keeping it in its upright position.

Claim.—In combination with a revolving chimney-cowl or cap a counterbalancing weight attached to the forward part to counteract the force of the wind, substantially as shown and described.

142,910.—Fence-Post.—JASON GIBBS, Fremont, Ohio. Application filed July 3, 1873.

A burnt-clay post is made in sections, with ledges on their inner faces for supporting the rails. The two parts extend into the ground, and are held together by metallic clamps at their tops and near their entrance into the ground.

Claim.—The fence-post, made in two parts, of burned clay, with ledges or projections *a a* between them, in combination with the rails B B and clamps C C, substantially as and for the purposes herein set forth.

142,911.—Manufacture and Vulcanization of Rubber for Making Brush-Backs, &c.—EDWIN A. HILL, East Cambridge, Mass. Application filed September 12, 1873.

The body of the article is formed in a mold or die, into which fits a plunger containing pins with small diameters near the end and larger in the other portion, so that holes are formed in the article, such as a brush-back, to avoid the necessity of drilling.

Claim.—1. The hereinbefore described process for making perforated vulcanized-rubber articles, substantially as and for the purpose specified.

2. The means employed for constructing perforated articles from vulcanized rubber, consisting of the punches A and head A', combined with the die B provided with the openings *b* and flange B', in the manner and for the purpose substantially as shown.

142,912.—Machine for Turning Wheels.—JOHN W. HILL, Dayton, Ohio, assignor to himself and CHRISTIAN HERSCHELRODE. Application filed August 20, 1873.

The revolving face-plate is provided with a center, on which the end of the shaft rests, and on the cross-bar a bearing-block is secured, through which the shaft passes.

Claim.—The face-plate A and rail C of a boring and turning mill, in combination with a center, G, and bearing H, substantially as and for the purpose specified.

142,913.—Brush-Machine.—EDWIN A. HILL, East Cambridge, Mass. Application filed August 6, 1873.

A series of punches is affixed to a block, each punch having two cutting-edges, one at the extremity and one, of larger diameter, a short distance from it. These are received into a die having holes for their reception at corresponding intervals apart. Suitable material for a brush-back, placed between the block and the die, is, when operated on, ready for the attachment of bristles.

Claim.—In combination with a suitable die-plate and operating mechanism, a punch, A, provided with two cutting-faces, *a* and *a'*, substantially as and for the purpose specified.

142,914.—Piston-Packing.—CHARLES AMOS HODGE, Knoxville, Tenn. Application filed July 29, 1873.

An eccentric ring operates as a spring and keeps the piston in the center of the cylinder.

Claim.—The combination, with the shaft E and arms E B, of the solid ring A, eccentric or spring ring C, and the outside or packing rings D D, with dowels *a*, all substantially as and for the purposes herein set forth.

142,915.—Pruning Implement.—ABRAHAM C. HULME and JOSEPH S. CRUM, Palmyra, Ill. Application filed July 31, 1873.

The doubled-handled shears can be converted into a single-handled implement, suitable for cutting high branches by a rearrangement of the parts upon the series of holes arranged upon the longer of the two handles.

Claim.—A pruning-knife consisting of the handle A with a series of screw-holes, the removable strap H, and parts D E F G, and the supplemental handle I, severally constructed and arranged, as shown and described, with respect to each other, so that the device may be converted into a double-handled pruner, in the manner specified.

142,916.—Ice-Tongs.—EDWIN C. JOHNSON, South Providence, R. I. Application filed March 12, 1873.

Ice-tongs with a joint and handle made of cast metal, to which the jaws (of forged steel) are attached by being driven into a wedging dovetailed slot, or otherwise.

Claim.—1. The combination of the handled or jointed portion of a pair of ice-tongs with the claws B B by means of a dovetailed and wedged-shaped slot, *a*, substantially as described.

2. As a new article of manufacture, a pair of ice-tongs with handles A' A' and joint A make of cast metal, in combination with steel claws B B, substantially as described.

142,917.—Milking-Pail.—ANDREW J. JOHNSON, Vicksburg, Mich., assignor of one-half his right to NELSON V. JONES, same place. Application filed August 1, 1873.

An extensible and revolving tube passing laterally from the top of the pail supports a milk-receiving pan made to retain a portion of the milk, and with a deflector to prevent splash.

Claim.—The inclined guard G, in combination with the flat-bottomed milk-receptacle F and the side elbowed outlet E *f*, as shown, and for the purpose described.

142,918.—Machine for Dressing Fish.—FREDERICK KELSEY and FRANK H. HOSMER, Sandusky, Ohio; said HOSMER assignor of one-half his right to JACOB A. HOSMER, same place. Application filed July 19, 1873.

The fish are first presented to a reciprocating knife that removes the heads; the body of the fish is then placed on an endless traveling belt provided with spurs, by which it is carried by the splitting-knife, the openers, and the cleaners, and delivered at the other end of the machine. The offal is carried down a side spout.

Claim.—1. The combination of the adjustable bar P, hinged bar M, hood N, and inclined board O, substantially as and for the purpose herein set forth.

2. The combination of the revolving cutter I, openers L L, and cleaners J K, operating substantially as and for the purposes herein set forth.

3. In a fish-dressing machine, an endless traveling belt, G, with spurs or teeth projecting along its outer surface, for the purpose mentioned.

4. A fish-dressing machine having the cutter I, openers L L, cleaners J K, endless traveling belt G, and hinged board M with hood N, substantially as specified.

5. In a fish-dressing machine, the hinged board M, with the hood N extending above and over the cleaning working parts, as shown and described.

6. In a fish-dressing machine, the combination, with the horizontally-circular revolving cutter I, of the endless traveling belt G, as and for the purposes mentioned.

7. The revolving cleaner J, consisting of a disk with hooked arms *b*, for the purpose of removing the entrails, &c., of a fish, substantially as specified.

8. In a fish-dressing machine, the combination of the revolving cleaners J K, the former having hooked arms *b*, and the latter having brushes D, substantially as and for the purposes herein set forth.

9. In a fish-dressing machine, the vertically-reciprocating knife, operated by means of a crank and pitman, for cutting off the heads of the fish, as herein set forth.

142,919.—Corpse-Preserver.—HENRY KEMSTEN, Wheeling, W. Va. Application filed August 21, 1873.

Rods are passed through ears on the cooler so as to suspend it in any size coffin.

Claim.—The box or corpse-preserver A, provided with lid B, ears *a a*, spouts *b b*, and concave bottom C, said bottom and upper end of box being constructed as shown and described, and for the purposes herein set forth.

142,920.—Corn-Harvester.—JOHN KILBORN, Chicago, Ill., assignor of one-third of his right to WILLIAM GRELLIER, same place. Application filed June 4, 1873.

Alternate horizontally-arranged picking-arms, pivoted at their rear ends, are connected, respectively, to cranks of a common shaft, by links, so as to receive vertical motion for the purpose of severing the ears, the gathering mechanism being adjusted, by the driver from his seat, by a hand-lever.

Claim.—1. In a corn-picking implement, provided with a tilting and adjustable picker-frame, I, the inclined pickers J J mounted on the said frame, and each alternate one of which is rigidly attached thereto, and each other one of which is pivoted to the said

frame, and rendered vertically vibrating by means of the pitmen L L attached thereto, and to the crank-shaft K having bearings in the said frame, the said pitmen being attached to the vibrating pickers at a point between the free ends and the pivots of the latter, substantially as and for the purposes specified.

2. In a corn-picking implement, the tilting picker-frame I, provided with the pickers J J and with the aprons B' and V, and with the laterally-yielding belts E' E', all arranged substantially as described, in combination with the bent and perforated arms D' D' rigidly attached to the carriage-frame, substantially as and for the purposes set forth.

3. In a corn-picking implement, provided with a tilting picker-frame, the combination and arrangement of the yielding pins E' E', one or more, one or more perforated arms, D' D', the cord I', the pivot-lever G' connected to the picker-frame, and the notched standard F'', all substantially as and for the purposes specified.

142,921.—Sheet-Metal-Bending Machine.—WILLOUGHBY F. KETTLER, Cincinnati, Ohio, assignor to THOMAS & ROBINSON, same place. Application filed May 21, 1873.

A bed-plate, hinged clamp, and brake. One end of the clamp is detachable from its hinged arm, so as to facilitate the removal, after bending, of the metal sheet. The arm D to which the clamp is attached is hinged in a sliding block, so that the position of the clamp may be changed with respect to the bed-plate. Cam J, working on a stud on the arm D, clamps the metal sheet to the bed-plate.

Claim.—1. The bending-bar B, attached at one end to the lever D', and provided at the other end with a lug, *a*, and button *b*, in combination with the lever D, as and for the purposes herein set forth.

2. The combination, with the frame E, of the bed A, cams J J, bending-bar B, with projection *a*, bar C, hinged or pivoted lever D, with friction-roller *d* and recess *a'*, lever D', and the adjustable bevis G G, all constructed substantially as and for the purpose set forth.

142,929.—Corn-Planter.—MILLIS KNICKERBOCKER, New Lenox, Ill. Application filed November 1, 1872.

A hub, with spokes placed at the side of the planter, revolves by penetrating the ground during the advance of the machine. At the end of one of the spokes there is a block, with a spiral spring above it, to mark the spot where the seed has fallen.

Claim.—The rimless wheels *c*, constructed, as shown and described, with the foot *r* and spring *s* on the end of one of the spokes, whereby the same may pass over obstructions without sliding so as to disturb the uniformity of the distance apart the seed is dropped, and mark the ground by means of the foot *r*, as and for the purpose set forth.

142,923.—Sleeping-Car.—JAMES T. LEIGHTON and DOMINICUS R. LEIGHTON, New Haven, Conn. Application filed August 14, 1873.

The hinged seat-backs are turned up and secured in a vertical position, forming a support for the upper couch and a partition between the berth-sections. A ledge upon the car-wall, in combination with bars pivoted to the rear outer corner of each seat, and provided with a folding leg at the free end, supports the lower couch, which rests upon flexible slat-sections attached at each end to the angle of the seat. When not in use, these are, together with the pivoted bars, folded back and concealed behind the chair-backs.

Claim.—1. The upper couch, made upon and supported wholly, and at both ends alike, upon the lower edges of the seat-backs, when turned up on edge and fixed as described.

2. The chair-backs D^2, hinged upon a fixed rest, in combination with the bolts I for locking them to the car wall in positions to maintain securely the upper couch, substantially as described.

3. The free sides of the hinged backs D^2, provided with metallic rests G H for supporting the slatted bottom F of the upper couch, substantially as described.

4. The pivoted bars Q Q', in combination with the slat-sections K L and the chairs C, constructed and arranged for adjustment essentially as described.

5. The lower slat-bottom, constructed of two separate sections, K L, each secured by one end only to the chair-frame, and adapted to be stowed away, each section alike, behind the chair-backs D D^2, substantially as described.

6. The pivoted supporting-bars Q Q' for the slat-sections, having both a vertical and horizontal adjustment, substantially as and for the purposes described.

7. The pivoted bars Q Q' for supporting the outer ends of the slat-sections, in combination with the wall-ledge P and the slat-sections K L, substantially as described.

142,924.—Cartridge.—JOHN LOGAN, Jersey City, and GEORGE R. HART, Newark, N. J. Application filed January 21, 1873.

Claim.—1. The combination of the cylinder A, breech piece C, ring E, and nipple D, formed and secured together substantially as herein set forth.

2. The breech piece C, provided with a channel through the battery-cup and a nipple, D, in combination with the cylinder A and fastening-ring E, for the purposes specified.

142,925.—Electrical Stop for Looms, &c.—GEORGES F. LUFFENET, Mazargis, Department of Loiret, France. Application filed May 1, 1873.

A bent wire, hanging on the horizontally-stretched thread, above two adjacent but insulated mercury-cups forming the two electrodes of a battery, on the breaking of the thread falls straddling into the two cups, thus completing the circuit, which operates an electro-magnetic stop mechanism for the machinery.

Claim.—1. The combination, in a knitting-machine or loom, of a series of wire yokes, *f*, each hung upon a thread above the separated mercury-cups *g g'*, forming part of a circuit, which is completed upon the descent of the yoke, as set forth.

2. The combination of the split bars *g* cells *g g'*, and yokes *f*, supported by threads above the cells, as specified.

3. The combination, with the needles or other part of the machine, of a lever or levers so arranged as to be struck by such part when out of position, and to complete or break an electric current, as specified.

4. The combination, with the pulley A, of the driving-pulley B, the lever G, supported by the keeper L of a magnet, and devices described, or their equivalents, by which the pulleys are separated on the movement of the keeper.

142,926.—Combined Punching and Shearing Machine.—WARREN LYON, Mamaroneck, assignor to THE BIDDLE MANUFACTURING COMPANY, New York, N. Y. Application filed March 24, 1873.

The peculiarity that imparts novelty to a combination not otherwise new is the interposition of the oscillatory cogged-segment shear-stock E between the cogged-segment levers D and F, as shown.

Claim.—The combination of the levers D, E, and F with the punch B, shears *n o*, and rod-cutters *p p*, for simultaneous operation, substantially as specified.

142,927.—Lawn-Seat.—WILLIAM C. MEDCALF, Rochester, N. Y. Application filed May 21, 1873.

A seat has its ends or supports formed of strap-metal, bent so as to form the legs, and the seat and the back having wooden slats bolted thereto.

Claim.—1. A seat constructed with end supports A A, made of strap-metal in a single piece, bent or formed into the back *a*, seat *b*, and legs or supports *e g*, with standard-brace *d*, as shown and described, in connection with slats B B, which are bolted or riveted directly to said side supports, substantially as specified.

2. In combination with the side supports A, bent so as to form an upper and lower half, the spring *f* interposed between the said parts, in the manner and for the purpose specified.

142,928.—Bake-Pan.—JOHN G. METSKER, Logansport, Ind. Application filed April 18, 1873.

Claim.—The pan A, formed with the projections B, and provided with the plate C, in combination with the double inclosing-case D provided with the door G, as herein shown and described.

142,929.—Machine for Forming Sheet-Metal-Pipe Elbows.—HIRAM B. MORRISON, Le Roy, assignor to SARGENT & GREENLEAF, Rochester, N. Y. Application filed May 21, 1873.

A head for holding a section of pipe is connected to its shaft by a universal joint, so that the angular edge of the pipe may be properly guided between the rolls which form the bead.

Claim.—The combination of the head D and shaft E, when connected by a joint which allows vibration of the head to adapt itself to position for the passage of the angular edge of the pipe between the rollers, as herein described.

142,930.—Machine for Making Drain-Pipes, &c.—ADOLPH MÜLLER, Jersey City, N. J. Application filed August 21, 1873.

An endless belt is pivoted on adjustable bearings and passes through a water-trough. This belt constantly presses upon the pipe while being formed on the mandrel, insuring smoothness, and its tension is changed by rollers mounted on arms of the belt-frame. The sheets of material are drawn from the bitumen-bath by slight threads or wires attached to the mandrel.

Claim.—1. The endless self-adjusting belt F, combined with and impinging upon the mandrel G, on which the coated veneer sheets are wound to form pipes, substantially as described.

2. The flexible connections *y* between the mandrel G and ends of the sheets of veneer for drawing the latter out of the boiler or pan E at the commencement of forming the pipes, substantially as described.

3. In a machine for manufacturing wooden pipe, the pan or trough J for containing a fluid to moisten the exterior surface of belt F, and preventing the adhesion of the bitumen thereto, arranged and combined substantially as described.

4. In a machine for manufacturing combined wood and asphalt pipe, the troughs J, in combination with the belt F, substantially as specified.

142,931.—Reservoir Cooking-Stove.—DAVID H. NATION and EZEKIEL C. LITTLE, St. Louis, Mo. Application filed February 21, 1873.

In the aperture in the rear plate, through which communication is had with the stove-flues, a two-winged damper is placed, to close the side flues when desired.

Claim.—The combination of the base-pan C, extended rearward from a point about equidistant between the top and bottom plates of the stove, the reservoir E being free from contact with the stove excepting its bottom, the two-winged damper G, and the exit-pipe D, situated in the rear of the reservoir, all substantially as and for the purposes herein set forth.

142,932.—Reservoir Cooking-Stove.—DAVID H. NATION and EZEKIEL C. LITTLE, St. Louis, Mo. Application filed February 21, 1873.

Upon the rear plate, midway between the bottom and top, a

chamber or base-pan is cast, of the width of the stove. The bread flue through this chamber connects with the central stove-flue and delivers the products of combustion into the exit-pipe. A water-reservoir may be placed in the aperture in the upper plate of this base-pan, and when removed the aperture is covered by a suitable lid.

Claim.—The combination, with a cooking-stove, of a base-pan, C, extended rearward from a point about midway between the top and bottom plates of the stove, containing the bread flue and sustaining the reservoir D and exit-flue, substantially as set forth.

142,933.—Reservoir Cooking-Stove.—DAVID H. NATION and EZEKIEL C. LITTLE, St. Louis, Mo. Application filed August 1, 1873.

The reservoir rests upon a removable support, and is separated from the back plate of the stove by an air-chamber open at top.

Claim.—1. The combination, with the back-plate I of the cooking-stove A, of the reservoir C, arranged on a support about midway between the top and bottom plates of the stove, and the air-chamber *b* between the stove-back and reservoir-front, open at the top, and communicating with the air in the room, substantially as and for the purposes set forth.

2. The combination, with the stove A and reservoir C, of the small opening *a*, the sheet-flue G under the entire bottom of the reservoir, and the small exit passage or pipe E, all substantially as and for the purposes herein set forth.

142,934.—Reservoir Cooking-Stove.—DAVID H. NATION and EZEKIEL C. LITTLE, St. Louis, Mo. Application filed July 2, 1873.

The portable reservoir-support is detachably connected with the stove. Beneath this support is the heating-chamber.

Claim.—1. The detachable base-pan or flue-shell D, attached to the body at a point near the center of the back plate of the stove by means of hooks *a a* cast on the base-pan, and pins *b b* on the stove-body, substantially for the purposes herein set forth.

2. The portable reservoir F, with flue E in the rear side, in combination with the portable base-pan or flue-shell D, substantially as and for the purposes herein set forth.

3. The combination, with a three-flue stove having damper H arranged as described, of the portable base-pan or flue-shell D and warming-closet G, all substantially as and for the purposes herein set forth.

142,935.—Cooking-Stove.—DAVID H. NATION and EZEKIEL C. LITTLE, St. Louis, Mo. Application filed April 11, 1873.

From the top of the vertical rear-flue plate a horizontal plate extends over the central flue, which comes part way up back of the oven. The products of combustion may pass direct through a passage the whole width of the stove, and under the boiler to the exit-flue; or they may be diverted down the side flues, and then, escaping up the said central flue, will pass under the boiler and to the exit-pipe.

Claim.—1. The arrangement of the flues E F, H H, and I, and plates K K', in combination with a double-oven cooking-stove, for the purposes herein set forth.

2. The descending vertical sheet-flue E, in combination with the flues H H and I, covering-plate M, and hot-air chamber or flue E, all operating in the manner and for the purposes set forth.

3. The damper I, extending the whole width of the body of the stove below the line of the top plate of the main oven, in combination with the sheet-flue F, hot-air chamber or flue E, and flues H H and I, for the purposes set forth.

142,936.—Planing-Machine.—SOLON W. NELSON, Worcester, Mass. Application filed February 27, 1873.

The knives are ground by an apparatus attached to the standards above the cutter-head. The cutter-head spindles are adjusted laterally and held permanently when set, to prevent disarrangement; and a presser-bar, above the lower cutter, is swung horizontally when removed from position.

Claim.—1. The grinding apparatus, substantially as herein described, in combination with a cutting-cylinder of a planing-machine, and in proper relation therewith, whereby the several knives or cutters may be successively ground while properly adjusted on the cutter-head and in proper position in the machine.

2. The combination, with the matcher-head spindles, of the adjusting-screw L, and the bush-nuts *m* with their set-screws, by means of which one, or both, or neither of the spindles may be moved to or fro from the center line of the machine by the revolution of the screw, substantially as described.

3. The pressure-plate R, hinged to a sliding block on one standard, and capable of attachment to another on an opposite standard, and constructed and arranged to swing laterally away from the under cutter-head, as described.

142,937.—Apparatus for Testing the Tensile Strength of Metals.—TENUS OLSEN, Philadelphia, Pa., assignor to RIEHLÉ BROS., same place. Application filed October 31, 1872.

The metal to be strained or tested is clamped between two links, one of which is adjustably attached to the frame, and the other is connected by a lever with the compound or differential fulcrum of the testing scale-beam; the strain being applied thereto by a hydraulic pump.

Claim.—1. The combination of the compound parallel beam B, the gripe or holder for the test-piece, and the lever F, substantially as and for the purpose set forth.

2. The combination of the compound parallel beam B, the lever F, the gripe or holder H, and the hydraulic straining power, substantially as set forth.

3. The combination of the compound parallel beam B, the lever F, the gripe or holder H, and the adjusting screw-block P, substantially as and for the purposes explained.

142,938.—Clamp.—WILLIAM H. PAYNE and HENRY IMHOF, Lockport, N. Y. Application filed June 28, 1873.

Claim.—The cramp-head described, having the wooden screw E, provided with metal cap F at its end *e*, the adjustable metal head D, with the wedge *d*, and the cramp-bar A, substantially as shown and described.

142,939.—Welding Iron and Steel.—JOSEPH POPPING, New York, N. Y., assignor of two-thirds his right to HERMANN SCHIERLOH, Jersey City, N. J., and HENRY SCHIERLOH, New York, N. Y. Application filed September 9, 1873.

Claim.—1. The within-described compound, consisting of calcined borax and iron filings, substantially as described.

2. The process herein described of uniting iron to steel—that is to say, first heating one or more pieces of metal slightly, then applying the compound, and then joining the two metals, and subjecting them to a red-hot heat, and then hammering or rolling them well together.

142,940.—Tightening Device for Woven-Wire Mattresses.—DAVID J. POWERS, Chicago, Ill. Application filed December 27, 1872.

The cross-piece at the head is bolted to the side pieces, in which are slots for the bolts to slide in. In the side pieces, near the head, are nuts, in which threaded bolts are inserted, the heads of which abut against the adjustable cross-bar.

Claim.—The side pieces A B, provided with the slots *b*, and cross-piece D, in combination with the nuts *c c* and bolts *d d*, each provided with a head to fit in the recesses in the piece D, a screw-thread, and wrench-surface, all constructed and arranged as and for the purpose specified.

142,941.—Ventilating Window-Sash.—COLLIN PULLINGER, Philadelphia, Pa. Application filed August 13, 1873.

A small supplementary sash is arranged to slide above the top and to the bottom sash, thus ventilating the rooms through the windows without bringing to bear upon the persons therein a cold draft of air.

Claim.—The small sliding sash E, arranged between the upper and lower sash of a window, as and for the purpose described.

142,942.—Knives for Trimming Boot and Shoe Soles.—JOSEPH C. RATHBUN, Rochester, N. Y. Application filed July 21, 1873.

Claim.—The trimming knife herein described, consisting of the blade B, clamps C C, gage D, and thumb-lever E, when combined and arranged with the handle A, to operate in the manner and for the purpose specified.

142,943.—Car-Coupling.—JOSEPH V. REED, New Albany, Ind. Application filed May 7, 1873.

A weighted tongue pivoted to the bottom of a draw-head, said tongue being provided with a recess or shoulder on its lower side for the reception of and to hold the link in a horizontal position, said tongue having, also, an inclined orifice to hold the tip till after the link has passed in and elevated the tongue.

Claim.—The tongue D, provided with an under recess, and weighted at its forward end, and pivoted or hinged to the bottom of the bumper A, all constructed to be used substantially as and for the purposes set forth.

142,944.—Railway-Signal.—JOHN F. ROSS, Hamilton, Canada. Application filed May 6, 1872.

A suspended vane and lantern-signal, rotating on a vertical shaft, is operated by a cord wound upon the shaft; and is returned to normal position by its own weight; a pin on the rotating shaft moving in the oblique slot in the supporting-sleeve.

Claim.—The combination of the platform A, box F, tube C, having the spiral slot D, and shaft B, having a pin or button bearing the roller E, with lamp and disk or either of them, of sufficient weight to carry down said shaft, as and for the purpose specified.

142,945.—Machine for Corrugating and Beading Sheet-Metal Pipe.—JAMES SARGENT, Rochester, N. Y. Application filed May 21, 1873.

Claim.—The combination, in a machine for corrugating and beading metal pipes, of the corrugating-rollers D E and beading-heads D' E', when arranged to operate in the manner and for the purpose specified.

142,946.—Malt-Drier.—PHILIPP SCHUFF, New York, N. Y. Application filed August 7, 1873.

The axis on the rotating spreader has on each end cogged pinions, which travel on parallel horizontal racks. One end of the axis is prolonged and carries a spur-wheel, which is operated by a worm-wheel which travels on the driving-shaft back and forth with the stirrer or spreader.

Claim.—1. The reciprocating worm-wheel H, arranged upon the driving-shaft I parallel with the side racks D, in combination with the spur-wheel G, carrier-bracket J, pinions E, and shaft F of the stirring-wheel, substantially as described.

2. The guiding-hanger L, carrying friction-rollers, in combination with the side rail B, rack D, pinion E, shaft F, and stir-

ring-wheel M, substantially as described, for the purpose specified.

142,947.—Carpet.—ROBERT SCOTT, Philadelphia, Pa. Application filed June 30, 1873.

Claim.—A two-ply carpet, consisting of a surface-fabric, composed of weft-threads A, interwoven with warp-threads B, and united to a system of backing-threads, C, by backing warp-threads E, which are tied to the said warp-threads B of the surface-fabric by weft-threads D, disposed in the manner described, so as to permit the beating up of the weft-threads A into intimate contact with each other, and thereby causing the said threads A to cover and conceal the locking weft-threads D, all as set forth.

142,948.—Blasting-Plug.—DAVID SHOEMAKER, Kittanning township, Armstrong county, assignor of one-half his right to G. A. REICHERT, Jr., Manorville, and JOHN HORN REICHERT, Philadelphia, Pa. Application filed April 18, 1873.

A cylindrical blasting-plug is wound with wire to hold the sections together. When the wedge is inserted the coils of wire yield or uncoil to allow the plug to expand. The wedge may be withdrawn and the plug removed without an explosion, the spring coil serving to compress it and hold the sections together.

Claim.—1. An expansible tamping plug constructed with a flexible cylinder, C, and elastic packing, C', substantially as described.

2. The elastic outer casing E, applied and operating substantially as set forth, in combination with an expansible tamping-plug.

142,949.—Bit for Boring Minerals.—DAVID SHOEMAKER, Kittanning township, Armstrong county, assignor of one-half his right to G. A. REICHERT, Jr., Manorville, and JOHN H. REICHERT, Philadelphia, Pa. Application filed July 16, 1873.

Claim.—The plate A, tapering on its sides, as at *a b a' b'*, and formed with the cutting-edges *a a'* and triangular recess B, and with the spiral or twisted part C, substantially as and for the purpose set forth.

142,950.—Coal-Boring Machine.—DAVID SHOEMAKER, Kittanning township, Armstrong county, assignor of one-half his right to G. A. REICHERT, Jr., Manorville, and JOHN HORN REICHERT, Philadelphia, Pa. Application filed May 15, 1873.

The sliding carriage is advanced to the work by the rotation of the bit-carrying screw, which can be thrown in and out of gear by means of two eccentric cog-wheels connected with the bisected nut, through which the screw passes.

Claim.—1. The carriage Z, receiving sliding motion by means of the screw F, which carries the coring-bit, in combination with the mechanism mounted on the carriage and operating said screw, substantially as and for the purpose set forth.

2. The combination, with the bit-carrying screw F, of the bisected nut E', substantially as and for the purpose set forth.

3. The combination, with the two parts of nut E', of the eccentrics *e'*, geared to each other and operating in reverse order, substantially as set forth.

4. The screw F, the main wheel C and intermediate gearing, and the regulator D, operating upon and moving with the carriage Z, substantially as and for the purpose set forth.

5. The lever L, with hook *f'* and perforated plate *h'*, in combination with the sill or sills and the boring mechanism, substantially as and for the purpose set forth.

6. The sill A, with groove *i*, in connection with the slotted plate *h'* and the fastening bolt and nut of the housing E, substantially as and for the purpose set forth.

7. The carriage, constructed with the openings *c c d d*, substantially as and for the purpose set forth.

8. The screw-carrying carriage Z and operating mechanism thereon, in combination with the housing E and standard P, all adapted to move together laterally, for corresponding adjustment of the boring apparatus, substantially as and for the purpose set forth.

142,951.—Ice-Cream-Freezer.—CHARLES E. SIMMONS, Monroe, Wis. Application filed March 3, 1873.

Claim.—The combination of the cylinder B, cog-wheel D, pinions *b d*, shaft G, tube H, beaters I J, and scrapers K, all constructed and arranged to operate substantially as and for the purposes herein set forth.

142,952.—Egg-Carrier.—COURTENAY JAMES SIMMONS, Kansas City, Mo. Application filed May 27, 1873.

Claim.—1. A series of rows of coils having their ends fitted in obtuse-angled recesses on the inside of the end pieces of frame, and glued thereto, as and for the purposes set forth.

2. The U-shaped clamp F, applied to hold both bottom and coils in the manner specified.

142,953.—Door-Bell.—ELDRIDGE B. SIBB, Antwerp, N. Y. Application filed March 12, 1873.

An ornamental, detachable, sheet-metal band is applied to the base-plate of a door-bell for the purpose of giving a neater finish to the article.

Claim.—The bell-case A, cast in any suitable shape, when used in combination with an attachable and detachable metallic band which surrounds the same, as and for the purpose set forth.

142,954.—Railway-Rail Joint.—WILLIAM H. SNEDEKER, Philadelphia, Pa., assignor of one-half his right to CALVIN A. ELLIS, same place. Application filed August 13, 1873.

An improvement in the class of railway-rail joints where a solid block is employed, consisting of two fish-bars united by a web, adapted to embrace the sides of the rails, the web of which latter is cut away to receive the web of the block. In this case notches are made in the block and correspondingly in the rails, into which transverse pins or bolts are driven to prevent the rails from being drawn apart longitudinally except by the withdrawal of the pins.

Claim.—In combination with the block B and notched rails A A, the pins C C, as set forth.

142,955.—Die for the Manufacture of Pinchers.—WILLIAM E. SNEDIKER, Charlotteburg, N. J. Application filed July 2, 1873.

The invention consists of a pair of dies, which have suitable recesses for forming the female portion of the pinchers, and are provided with reversely-angular punches for punching out the box-joints, leaving an oblique web, which is afterward removed by another punch.

Claim.—The dies C D, constructed to receive the female portion of the box-joint within them, and provided with punches I J of reversely angular construction, substantially as shown and described, and for the purposes herein set forth.

142,956.—Soldering-Machine.—JAMES F. SPENCE, Williamsburg, N. Y., assignor to GEORGE D. BROOKS and MARY C. BROOKS, Baltimore, Md. Application filed May 22, 1873.

Hoppers for the reception of cans are provided with sliding clamps and movable rests, so that the cans may be discharged one by one into the holding-clamps. In a rotary frame are provided clamps operated by a lever, reversed wedges and inclines to seize the cans as they drop from the hoppers. By means of this frame the ends of the cans are presented to a soldering-flame and soldered. By a half-rotation of the frame the other ends are presented and soldered in like manner, after which the cans are allowed to slide upon an apron into receptacles.

Claim.—1. The tubes A, having sliding clamps *a* and movable rests A', to receive, hold, and drop cans into movable holders C, in the manner described.

2. The holders C, arranged in a rising half-rotary frame, D, to enable them to be reversed, in the manner set forth.

3. The hand mechanism, consisting of shaft E, having arms *e e'*, by which the slides are operated, at the times and in the manner specified.

4. The can-holders C, made in two parts, and combined with the separate plates J J, connected by springs, and movable to or from each other, to clamp or unclamp the cans, in the manner described.

5. A can-holder, provided with springs *c* to allow it to hold firmly cans of greater or less magnitude, in the manner set forth.

6. The fixed and reversed wedges *d d* of frame D combined with reversely-moving wedges *d' d'*, provided with studs *d''*, and moved by the slotted lever M to open and close the can-holding plates J, in the manner specified.

7. The pivoted frame D, pivoted plates N N, and the pivoted yokes O O, combined to allow the cans to be moved forward, raised, and then reversed, in the manner described.

8. The combination, with the rotary can-frame D, of an apron S, over which the cans slide gently off the said table, in the manner set forth.

142,957.—Hinge for Lounges.—AUGUSTUS SPIEGEL, Indianapolis, Ind. Application filed April 29, 1873.

When the hinge is open one of the base-plates can be moved laterally, and, at the same time, carry one leaf of the hinge with it away from the other base-plate with a circular motion, and then return it, so that the hinge proper is at right angles to its line of motion, thus forming a rigid joint that cannot be closed until the operation is reversed.

Claim.—1. The base-plates C D, provided with a circular slot, J, one edge being beveled at P, substantially as and for the purpose set forth.

2. The combination of the hinge E F G with the base-plates C and D, as and for the purposes hereinbefore set forth.

142,958.—Washing-Machine.—MOSES W. STAPLES, Richmond, Va. Application filed July 24, 1873.

A vibrating tank formed with curved bottom, ends and spaces at the top, and moving on trunnions in the side walls on a suitable frame.

Claim.—A washing-machine consisting of a suspended tank having a curved bottom merging into ends rounded, as described, so as to direct the water which flows to said ends back toward the center and upon the clothes, as set forth.

142,959.—Process and Composition for the Manufacture of Illuminating-Gas.—WILLIAM H. STERLING, San Francisco, Cal. Application filed February 1, 1873.

To crude petroleum or coal-tar there is added, in proportion to its richness or gravity, ten to twenty per cent. of water, and to this a small per cent of caustic lime is added, after which the mixture is thoroughly agitated to produce an emulsion. This emulsion is then thoroughly mixed with pulverized ashes, and the mass is molded into blocks suitable for distillation in a retort for the production of gas.

Claim.—1. The compound of powdered ashes, coal-tar or petroleum, water, and caustic lime, when compounded and used in the manufacture of illuminating and heating gases, substantially as described.

2. Powdered ashes, when combined with coal-tar or petroleum, these being mixed with water, and used in the manufacture of illuminating and heating gases, substantially as described.

142,960.—Thill-Coupling Attachment.—HARRY J. STUBBS, Kennett Square, Pa. Application filed August 21, 1873.

The case, attached directly to the axle, is provided with an arm, which is kept in place over the head of the coupling-pin by a spring wound upon a spindle connected with said arm.

Claim.—The case A, carrying an arm, B, and operating spring *c*, and adapted to be secured to an axle adjacent to a thill-coupling, as set forth.

142,961.—Thrashing-Machine.—JAMES B. SUITT, Indianapolis, Ind. Application filed September 23, 1872.

Curved shoe placed under second apron for catching all of the grain which has passed with the straw from first apron.

Claim.—In combination with the second apron B, the flipper D raised above its end, and the curved shoe 2, having its end extending up to, or above the level of, the apron, substantially as shown and described.

142,962.—Car-Coupling.—FRANK F. TAYLOR, San Francisco, and GEORGE WITHINGTON, Lone City, Cal. Application filed March 12, 1873.

The lever E is pivoted behind the lid, and has a hooked end, which, when the lid is raised, fits in a notch, *e*, of the lid and holds it up. A spring, *i*, serves to hold the lid down and prevent vibration.

Claim.—The hinged lever E, with or without the spring, and having the catch or notch S on the under side of its outer end, in combination with the hinged and channeled lid C having the recess O, as and for the purpose specified.

142,963.—Disinfectant-Package.—WILLIAM P. TENNY, Boston, Mass. Application filed March 15, 1873.

The box is constructed so that when the cap is removed the perforated top is exposed, permitting the package to be used like a dredging-box, without soiling the hands or clothing of the user.

Claim.—As a new article of manufacture, the package of disinfecting-powder inclosed in a long paper case, having the close bottom and perforated false top *b* bound securely to said case, and the removable cap *c* covering said perforated false top, and bound thereto by the wrapper, substantially as specified.

142,964.—Wheel-Plow.—TILGHMAN D. TERRY, ALONZO CASE, and CHARLES LARKIN, Knoboster, Mo. Application filed April 5, 1873.

Claim.—1. The combination, with the tongue A, axle B, and wheels C C, of the bar G, hinged at its front end to the tongue and supporting the seat E, and the bar G' pivoted to the rear end of the bar G, and having the plow H and colter J attached to it, all substantially as herein set forth.

2. The lever J', with arm A and studs *i i'*, and bars G G', staple *f'*, and support *k*, the several parts being constructed and arranged as and for the purpose specified.

3. The wheel D, constructed as described, with the outer and inner cutting-rims *d e*, substantially as and for the purpose herein set forth.

4. In combination with a plow arranged on one side of the center, as shown, the double-tree K, equalizing-bar L, single-trees M, rollers *y z*, and chain *x*, all arranged and operating substantially as and for the purposes herein set forth.

142,965.—Car-Coupling.—PHILIP M. THOMPSON, Toronto, Canada. Application filed January 11, 1873.

The link is jointed at its center in such a manner that when its sections are turned beyond a certain angle to each other they will separate, so that if one car leaves the track it will not carry the others with it.

Claim.—1. The two-part coupling-link F G, provided, respectively, with notched cup H A *h' h'* and studded tube K *h*, the studs and notches being so arranged in relation to the parts of the link upon which they are formed as that when locked together the two parts of the link cannot be separated except they be turned out of line with each other, as and for the purpose specified.

2. The flanged and notched cup H A *h' h'* of part G, provided with a spring, *k'*, combined with the studded tube K *h*, arranged under cover *g* of part F, as and for the purpose specified.

142,966.—Drilling-Machine.—WILLIAM H. THORNE and I. NORRIS DE HAVEN, Philadelphia, Pa. Application filed August 16, 1873.

The drill-heads are arranged upon the two grooved shafts *i* and 5', and are movable back and forth by means of a pinion, 7, which meshes with the rack-bar 6. As they move back and forth they also carry the worms *n* and *o'* on the horizontal grooved shafts *i* and 5' with them, from which the tangent-wheels *o* and 3' receive their motion. When it is desired to traverse the screw up or down by hand the pin 3' in the clutch-nut 1' is lifted out of the hole in the tangent-wheel 3', when the nut may be turned independently of the tangent-wheel.

Claim.—1. The sliding drill-heads arranged upon the two shafts so as to be adjusted back and forth, and which are provided with a mechanism for operating the drill-spindles, and a mechanism which will slowly feed the drills down and rapidly run them up, and which is movable with the heads, substantially as shown and described.

2. The worms *n* sliding back and forth on the driving-shaft with the drill-head, and giving motion to the tangent-wheels to revolve the spindles, substantially as specified.

3. The worms *n* on the driving-shaft and worms on the shaft 5', in combination with a tangent-wheel to revolve the spindle, and a tangent-wheel to feed the spindle up and down, substantially as shown.

4. The cross-head 9, provided with the nuck 6, in combination with the pinion on the drill-head to move the heads back and forth, and a suitable clamping device, substantially as described.

5. The tangent-wheel 3', clutch-plate 1', pin 2', nut 0, and screw 0', combined to operate as set forth.

6. The combination and arrangement of the shafts *i* 5', drill heads *a*, worms *n* 4', tangent-wheels *o* 3', nut 0, clutch 1' 2', screw 6, weighted lever 8', pinion 7, clamp 9, drill-spindles 2, and a suitable operating mechanism, substantially as shown and described.

142,967.—Bench-Iron for Harness-Makers.—JAMES THORNTON, Geneseo, and EMMIT G. LATTA, Friendship, New York. Application filed July 21, 1873.

A block of iron, flat on one side, with grooves in the opposite face, a partial filling of soft metal, and rounded corners, as a bench-iron, raising-board, punching-block, and slicker.

Claim.—The improved bench-iron herein described, for the purposes specified.

142,968.—Car-Wheel.—JOHN TIRANOFF, NICHOLAS TIRANOFF, and ALEXIS KOURAKOFF, St. Petersburg, Russia. Application filed April 23, 1873.

The wheels are made with a double-incline tread, one incline being formed to run upon the ordinary rail, and the other, of smaller diameter, to run upon an additional rail laid outside the inner rails of curves.

Claim.—A car-wheel, the tread of which is formed with double-inclined surfaces *a a*, in combination with the auxiliary rail F arranged on the inner side of curves and outside of the track, elevated to receive the smaller portion of the tread, substantially as described.

142,969.—Pressure-Gage and Alarm.—MORTON TOULMIN, New Orleans, La. Application filed April 15, 1872.

A tubular plunger, closed at its lower end by a spring valve-rod, plays within a cylinder, and is linked to weighted pendent arms, which, by raising over a graduated arc, indicate the pressure; and when a prescribed limit is reached, the valve-rod, coming in contact with a stop, allows the steam to escape through the tubular plunger into a steam-whistle.

Claim.—The combination, with a tubular piston working partly within and partly without a steam-pipe, and having a valve-seat, D', of a valve-rod, I, working partly within and partly without said piston, its valve H, the pendent arms E, and alarm M, connected with said tubular piston, the spring K, and the adjustable stop L, regulating the opening of the valve at the lower end of said tubular piston, substantially as specified.

142,970.—Car-Coupling.—WILLIAM H. WADDELL, LITTLETON WADDELL, and JOHN A. LUCE, Churchville, Va. Application filed June 20, 1873.

When the device is in position for coupling the hook on the lever A is caught by the hook on the draw-head, so that when the link strikes the curved face of the link-hook it rides over it, and on its way strikes and turns the trigger C, which raises the hook *b*, thus releasing the upper end of the lever A, when its lower end is forced forward by a spring, and locks the link-hook in position. On the upper side of the draw-head are perforated lugs, through which is passed a pin on either side of the locking-lever, to prevent accidental coupling or uncoupling, as the case may be.

Claim.—1. The lever A, provided with a foot-piece, A', on top of draw-head, by which the end *a'* may be forced off the end *c* of link-hook, in the manner set forth.

2. The treadle-hook *a* and grapple-hook *b*, combined to hold the lever A so that the cars may remain uncoupled, as set forth.

3. The combination with the grapple-hook bar B *b*, of the subjacent trigger C, to lift the same and allow the spring-pressed lever A to turn back and lock the link-hook, as specified.

4. The combination, with lever A, of the apertured lugs K K and pin L, as and for the purposes specified.

5. The lever A A *a a'*, the spring D, the link-hook E *c*, the trigger C, and the grapple-hook bar B *b*, all combined, constructed and arranged in the manner described.

142,971.—Can for Paint, &c.—OLIVER E. WALKER, Cincinnati, Ohio, assignor to himself and CHARLES F. SITTER, same place. Application filed June 7, 1873.

Claim.—A combined paint-bucket and packing-can, consisting of a metallic bailed cylinder, A, the non-removable wooden heads B C, and the plug D, constructed and put together substantially in the manner described.

142,972.—Files-Supporter.—COLUMBUS WEST, Pittsburg, Pa. Application filed September 6, 1873.

The strap which supports the adjustable arm-pad of rubber passes forward over a plate, extending down the back, and in front is passed through tubes of soft rubber. No friction of supporting-strap can, therefore, cause abrasion of the surface of the body.

Claim.—1. The supporting-straps D D and rubber tubes D'

D', when the same are so combined and arranged as to operate substantially as described, as and for the purpose specified.

2. The brass-pad C, sliding rubber sand-pad E, and double supporting-straps D and their tubes D', the whole being combined and arranged to operate substantially as described.

142,973.—Bedstead-Fastening.—CALMAN WOLF, Rochester, N. Y. Application filed June 28, 1873.

A hook has a mortise at its end for the reception of a tightening-wedge, acting against a block, in which the hook lies, the wedge having flanges working in grooves. A spring, pressing on a shoulder near the front end, retracts the hook as the wedge is being withdrawn.

Claim.—1. In combination with the hook C of a bedstead-fastening, the wedge D, constructed with the flanges *c d* upon the opposite faces, and with the blanks *b b b* for connecting the parts, said flanges *c* being dovetailed to fit the socket of the hook-shank, and said flange *d* playing in a vertical slot of the bedstead-rail, as shown and described, and for the purpose specified.

2. In combination with the hook C and wedge D, the reacting spring E, engaging with a shoulder, *m*, of the hook-shank, all constructed, arranged, and operating as shown and described.

142,974.—Transposing Key-Board.—AUGUSTUS D. R. WOLFF, Paris, France. Application filed February 27, 1873.

A key-board adapted to be placed directly upon the keys of a piano or organ, above which it slides, and at any point upon which it may be fastened.

Claim.—The combination, in a transposing key-board, of levers E, having projections D^2 D^3, and keys A' B', adjustable above the levers and resting on said projections, as set forth.

142,975.—Clock-Calendar.—NATHANIEL T. WORTHLEY, Brunswick, Me. Application filed June 14, 1873.

Claim.—1. An automatic calendar-motion composed of the rotating disk C, the four-gear wheel D, the month-wheel K, the cam L, the levers M and N, the pawls N', G, and *i*, and the lever F', with the lever J, the pawl H, and the cams *g* g^1, substantially as specified.

2. In a calendar-motion, the combination of the wheel D and lever F' with the lever J, the pawl H, the pin A, the cam g^1, the pin g^2, and the cam *g*, constructed and arranged substantially as and for the purpose set forth.

3. In a calendar-motion, the combination of the revolving cam L with the ascending curve *l*, the inclined bearing P, and the vertical return line P, and the weighted lever M with the pin *m*, the shaft m^1, the lever N, and the pawl N', constructed and operated substantially as specified.

REISSUE PATENTS.

5,572.—Composition for Dental Plates, &c.—GEORGE F. J. COLBURN, Newark, N. J., assignor to WILLIAM M. WELLS.—Patent No. 67,025, dated July 23, 1867. Application filed August 22, 1873.

The new composition is composed of shellac and asbestus.

Claim.—1. The composition of gum shellac and asbestus, substantially as set forth.

2. The plate for artificial teeth composed of the materials and substantially as set forth.

5,573.—Design for Spoon and Fork Handles.—EDWARD C. MOORE, Yonkers, N. Y., assignor to TIFFANY & CO., New York city.—Design No. 4,831, dated April 18, 1871. Application filed July 24, 1873. Term of patent 7 years.

Claim.—1. The design for the front face of the upper or enlarged end of the handle, consisting of an arrangement of branches, twigs, &c., and a perched bird, substantially as described and represented.

2. The design for the back face of the upper or enlarged end of the handle, consisting of an arrangement of branches, twigs, &c., leaving an open plain space, substantially as described and represented, on which to engrave the name, crest, or other mark of ownership.

5,574.—Vise.—GEORGE N. STEARNS, Syracuse, N. Y.—Patent No. 32,682, dated October 9, 1866. Application filed August 19, 1873.

The movable jaw is journaled upon two upright arms in close proximity to the saw. The cam-lever is interposed between the arms at the base. The stationary jaw is provided with a concave projection, extending below and beyond the line of intersection of the jaws when closed, which presses against the saw and prevents vibration in the act of filing. The movable jaw is provided with an offset at its lower inner edge, which extends into the concave projection of the stationary jaw and assists in effecting the result.

Claim.—1. The movable jaw B, having extension or lever E journaled upon and between the vertical arms C C' rising from the lower portion of the frame A, having jaw D, in combination with each other and with a cam-lever, D, journaled between the upright arms C C', substantially as herein shown and described, for the purpose specified.

2. The jaw D, having concave projection extending below the jaw B, and beyond the line of intersection of the jaws when closed, substantially as and for the purpose specified.

INDEX OF INVENTIONS PATENTED SEPTEMBER 16, 1873.

	Class No.	Whole No.
Alloy, to resemble silver, A. E. P. Baudvin	99	142,760
Anchor, C. A. Chamberlin	138	142,769
Arm-pit shield, J. Sibley	38	142,875
Bale tie, G. Brodie	7	142,894
Bale tie, F. Cook	7	142,772
Bale tie, J. McMurtry	7	142,803
Bale tie, cotton, O. E. McClean	7	142,808
Bath, vapor, J. Biller	8	142,767
Bed bottom, spring, G. W. Brown	62	142,895
Bedstead fastening, C. Wolf	62	142,973
Beer, cask for drawing, J. Moffet	19	142,860
Bell, door, E. B. Sims	24	142,953
Belt shifting mechanism for planers and lathes, T. Reeve	87	142,814
Bending mechanism, sheet metal, W. F. Kistler	136	142,921
Blasting plug, D. Shoemaker	124	142,948
Boat detaching apparatus, H. Ashford	13	142,834
Boat, life, J. Adams	13	142,883
Boiler feeder, R. Rafael	148	142,806
Boiler flues, &c., apparatus for cleaning, T. H. Donohue	146	142,775
Boot and shoe edges, machine for trimming and burnishing, C. J. Addy	16	142,756
Boot and shoe soles, knife for trimming, J. C. Ratelle	16	142,942
Boot and shoe soles, forming, C. H. Brigham	16	142,893
Boring machine, coal, D. Shoemaker	124	142,950
Boring minerals, bit for, D. Shoemaker	124	142,949
Box, porter's, I. Barman	62	142,888
Box, work, E. Hinckley	38	142,786
Bridge, J. R. Darfee	21	142,776
Bridge, J. M. Goodwin	21	142,785
Brush machine, E. A. Hill	22	142,913
Brush, wash board, and roller, I. Hussey	91	142,853
Buckle, harness, K. Fraser	23	142,907
Bustle, M. Boupart	80	142,764
Butter coloring compound, G. Bogart, W. H. Cramer, and W. L. Lewis	45	142,891
Calendering machine, D. Schofield	37	142,872
Can for paint, &c., O. E. Walker	107	142,971
Cane seats for chairs, needle for weaving, D. C. Mosher	109	142,808
Car axle, Ahrens and Gerhard	122	142,757
Car coupling, W. W. Haver	122	142,849
Car coupling, J. Y. Reed	122	142,943
Car coupling, S. B. Replegle	122	142,815
Car coupling, W. F. Senior	122	142,873
Car coupling, J. E. Smith	122	142,818
Car coupling, Taylor and Withington	122	142,962
Car coupling, P. M. Thompson	122	142,965
Car coupling, Waddell and Lutz	122	142,970
Car door, operating, J. A. O'Hare	122	142,810
Car, sleeping, J. T. and D. R. Leighton	121	142,972
Car stove, railroad, A. Reese	154	142,867
Car ventilator, S. C. Maine	106	142,799
Car ventilator, A. J. Morrison	106	142,807
Car wheel, Tiranoff and Kousakoff	122	142,968
Car wheels, mold for casting, J. B. Tarr	122	142,821
Carpet, R. Scott	95	142,947
Carpet rag looper, F. G. Egger	95	142,778
Carriage clips, die for forming, E. Meeker	31	142,804
Carriage lock plate blanks, machine for cutting, Insell and Dovey	31	142,854
Carriage top prop, L. W. Blessing	31	142,889
Cartridge, Logan and Hart	33	142,994
Caster, table, H. Fache	24	142,905
Casting metals, core for, O. D. Hunter	33	142,780
Cesspools, sinks, &c., apparatus for cleaning, J. P. F. Datichy	8	142,840
Chain, ornamental, W. F. Davis	86	142,841
Chimney cowl, G. H. Garderwine	106	142,909
Cisterns, cut off for, C. Wuers	167	142,832
Clamp, Payne and Imbof	29	142,938
Clock calendar, N. T. Worthley	36	142,975
Clock calendar movement, G. R. Williams	36	142,829
Cloth cover, painted, W. D. Richardson	54	142,898
Cloth measuring device, O. R. Holbrook	37	142,787
Coal and rock cutting machine, H. F. Brown	124	142,896
Cock, stop, J. W. Birkett	148	142,763
Coloring matters from vegetable substances, producing, L. M. F. Bretonnière	35	142,892
Compass, beam, N. Toulmin	97	142,823
Condenser, surface, H. C. Buckman	150	142,766
Corpse preserver, H. Kersten	39	142,919
Dental plates, composition for, G. F. J. Colburn, (reissue)	46	5,572
Disinfectant package, W. P. Tenny	96	142,963
Drill, rock, W. Weaver	124	142,824
Drilling machine, Thorn and Haven	100	142,826
Eaves trough hanger, T. W. Bailey	30	142,758
Eccentric, J. C. Butterfield	87	142,895
Egg carrier, C. J. Simmons	116	142,952
Engine, explosive, J. M. Welbourn	2	142,899
Engine governor, steam, R. W. Gardner	60	142,846
Engine governor, steam, S. P. Ruggles	60	142,869
Engine valve, steam, H. L. Hoyt	158	142,788
Fence, portable, W. W. Potts	52	142,905
Fence post, J. Gibbs	52	142,910
Fence post, E. King	38	142,795

	Class No.	Whole No.
Fire place, J. M. Irwin	154	142,791
Fish dressing machine, Kelsey and Hosmer	58	142,918
Gage and alarm, pressure, N. Toulmin	148	142,969
Gage, machinist's, S. H. Ballows	100	142,761
Gas, process and composition for the manufacture of illuminating, W. H. Sterling	66	142,959
Gear, trotting, H. Schmalhausen	144	142,871
Glass blowing machine, S. L. Fleishman	68	142,845
Grinding cylinder heads, machine for, J. Sherrell	70	142,874
Harness makers, beach iron for, Thornton and Latta	73	142,967
Harvester, J. W. H. Doubler	74	142,903
Harvester, J. G. Parry	74	142,811
Harvester, J. D. Wilbur	74	142,828
Harvester, corn, J. Kilborn	75	142,920
Harvester rake, S. D. Locke	74	142,798
Harvester reel, J. Werner, Jr.	74	142,881
Harvester, binder's attachment for, W. L. Sanford	74	142,870
Hay, apparatus for elevating and loading, J. H. Bean	79	142,836
Hinge for lounge, A. Spieyel	24	142,957
Hinge, spring, S. Joyce	24	142,795
Hinge pivot, solid belted, J. J. and L. Crooke	60	142,774
Ice cream freezer, C. E. Simmons	58	142,951
Ice tongs, E. C. Johnson	58	142,916
Iron and steel, welding, J. Popping	85	142,939
Key board, transposing, A. D. B. Wolff	42	142,974
Kiln, lime, J. L. Messer	153	142,805
Lawn seat, W. C. Medcalf	62	142,927
Leather, coloring, Koppits and Mayer	99	142,797
Locomotive smoke stack, J. Hughes	94	142,851
Locomotive smoke and spark conveyer, E. A. C. Fox	94	142,906
Looms, &c., electrical stop for, G. F. Lufbery	95	142,925
Malt drier, P. Schuff	19	142,946
Mattress frame, elastic fabric, Whittlesey and Peters	62	142,937
Mattress tightening device, woven wire, D. J. Powers	62	142,940
Medicine case, M. C. Baldwin	156	142,887
Metals, apparatus for testing the tensile strength of, T. Olsen	132	142,937
Mills, tramming bolt for grinding, J. T. Noye	57	142,809
Miter box, J. P. Tierney	29	142,878
Molding machine, W. J. Boda	173	142,890
Needle hooks, machine for forming, N. Paine	104	142,963
Nut lock, H. C. Lowe	14	142,858
Nut lock, C. H. Taylor	14	142,877
Ore washer, I. T. Halstead	3	142,846
Packing, piston, C. A. Hodge	151	142,914
Paddle floats, adjusting, J. B. Baptista	139	142,835
Pail, milking, A. J. Johnson	45	142,917
Pan, bake, J. G. Metaker	154	142,928
Piano, bell, C. G. Buttkereit	112	142,768
Pile supporter, C. West	156	142,972
Pinchers, die for the manufacture of, W. E. Snedicker	29	142,955
Pipe and oil well tubing, coupling for, D. Jones	167	142,792
Pipe elbows, machine for forming sheet metal, H. B. Morrison	136	142,929
Pipe, machine for corrugating and bending sheet metal, J. Sargent	136	142,945
Pipe patterns, mold for plaster, N. P. Bowler	33	142,765
Pipes, &c., machine for making drain, A. Müller	175	142,930
Planing machine, S. W. Nelson	173	142,936
Planing or molding machines, cutter head for, J. D. Kimball	173	142,794
Planter, corn, M. Knickerbocker	133	142,922
Plow, C. Marsh, 2d	114	142,800
Plow point, reversible, R. M. Pattillo	114	142,864
Plow, wheel, Terry, Case, and Larkin	114	142,964
Portfolio holder, J. B. Aiken	146	142,884
Postal card screen, L. Conroy	146	142,899
Press, butter print, Coates and Criswell	45	142,838
Press, cotton, P. and R. A. Williams	7	142,982
Printer's leads, apparatus for casting, W. Filmer	164	142,783
Propeller, screw, Stevens and Miller	139	142,890
Pruning implement, Hulse and Crum	63	142,915
Pruning shears, W. Baker	44	142,886
Punching and shearing machine, combined, W. Lyon	119	142,926
Rafts, float for life, Mason and Rogers	138	142,801
Railway rail joint, W. H. Skidmore	120	142,954
Railway signal, J. F. Ross	120	142,944
Railway switch, Clark and Chaney	120	142,837
Rake, horse hay, C. Edgar	77	142,844
Refrigerator, T. D. Kingan	58	142,796
Refrigerator for transporting ice cream, &c., J. Moos	58	142,806
Roof, fire-proof mansard, J. W. Kennedy	4	142,793
Rubber compound for the manufacture of packing, &c., C. L. Frink	35	142,908
Rubber for making brush backs, &c., manufacture and vulcanization of, E. A. Hill	35	142,911
Sausage stuffer, P. W. Brownback	25	142,897
Saw files, tip for, H. Disston	131	142,900
Saw mills, crank for, A. Rodgers	130	142,816
Saw swage, J. E. Emerson	131	142,779
Saw teeth, J. E. Emerson	131	142,781
Saw teeth, blank for, J. E. Emerson	131	142,780
Sawing machine table, H. O. Reed	130	142,813
Sewing case, F. Benkendorff	38	142,762
Sewing machine attachments, clamp for, J. G. Powell	134	142,812
Sewing machine guide, W. A. Springer	134	142,819
Sewing machine power, A. W. Cochran	134	142,839
Shovels, &c., manufacture of, H. L. Lowman	141	142,859
Sled, bob, J. W. Doty	31	142,902
Soldering machine, J. F. Spence	136	142,956
Spark arrester, J. E. Dustin	94	142,904
Spoon and fork handles, design for, E. C. Moore, (reissue)	89	5,573
Stamp affixer, R. P. Thian	146	142,822
Steam jet apparatus for forcing and exhausting air and condensing steam, E. Kerting	150	142,926
Stove, cooking, Nation and Little	154	142,935
Stove pipe holder, G. Eckel	154	142,777
Stove pipe joint, J. Weaver	154	142,879
Stove pipe thimble, J. R. Fulton	154	142,784
Stove, railroad car, A. Reese	154	142,867
Stove, reservoir cooking, Nation and Little	154	142,931
Stove, reservoir cooking, Nation and Little	154	142,932
Stove, reservoir cooking, Nation and Little	154	142,933
Stove, reservoir cooking, Nation and Little	154	142,934
Street sweeper, C. Geiger	110	142,847
Telegraph receiving register, M. F. Wessmann	50	142,825
Telegraph switch board, W. D. Sargent	50	142,817
Telegraph transmitting key, M. F. Wessmann	50	142,826
Thill coupling, S. G. Wise	31	142,980
Thill coupling attachment, H. J. Stubbs	31	142,960
Thrashing machine, J. B. Suitt	150	142,961
Tire upsetting machine, J. L. and A. H. Yeager	60	142,833
Tool, compound, F. W. Farrar	38	142,782
Treadle mechanism, B. B. Chandler	67	142,770
Truck for transporting railroad rails, car axles, &c., C. A. Ball	121	142,759
Tub, butter, A. J. Drake	45	142,843
Valve, pressure regulating, Craig and Brevoort	152	142,773
Vehicle wheel, C. W. Spayd	31	142,876
Vehicle wheel, J. B. Withey	31	142,831
Vehicles, spring coupling for, H. P. Dolson	31	142,901
Ventilating window sash, C. Pullinger	106	142,941
Ventilator, car, S. C. Maine	106	142,799
Ventilator, car, A. J. Morrison	106	142,807
Vessel for transporting grain in bulk, Demartini and Chertizza	137	142,842
Vise, G. N. Stearns, (reissue)	29	5,574
Washing machine, J. H. Hill	91	142,850
Washing machine, M. W. Staples	91	142,958
Watches, reversible pinion for, G. Hunt	36	142,789
Water wheel, E. Overton	108	142,933
Well tubing, oil, J. Moloney	51	142,861
Wheel turning machine, J. W. Hill	100	142,913
Windmill, Atwood and Bodwell	118	142,885
Wire way, elevated, Lantis and Davis	120	142,857
Wrench head, L. Coes	100	142,771
Yoke holder, neck, G. R. Huntley	72	142,839

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED SEPTEMBER 16, 1873.

Adams, J., Life boat	142,883
Addy, O. J., Machine for trimming and burnishing boot and shoe edges	142,756
Ahrens, B., and D. Gerhard Car axle	142,757
Aiken, J. B., Portfolio holder	142,884
Ashford, H., Boat detaching apparatus	142,834
Atwell, J., assignee	142,849
Atwood, E. A., and H. H. Bodwell, Windmill	142,885
Bacon, J. T., & Co., assignees	142,941
Bailey, T. W., Eaves trough hanger	142,758
Baker, W. Pruning shears	142,886
Baldwin, M. O., Medicine case	142,887
Ball, C. A., Truck for transporting railroad rails, car axles, &c	142,759
Baptista, J. B., Adjusting paddle floats	142,760
Barman, I., Porter's box	142,888
Bass, J. P., assignee	142,766
Baudvin, A. E. P., Alloy to resemble silver	142,760
Bean, J. A., Apparatus for elevating and loading hay	142,836
Bellows, S. H., Machinist's gage	142,761
Benkendorff, F., Sewing case	142,762
Biddle Manufacturing Company, assignee	142,886, 142,896
Birkett, J. W., Stop cock	142,763
Blessing, L. W., Top prop for carriages	142,889
Boda, W. J., Molding machine	142,890
Bodwell and Atwood	142,885
Bogart, G., W. H. Cramer, and W. L. Lewis, Butter coloring compound	142,891
Bowler, N. P., Mold for plaster pipe patterns	142,765
Boupart, M., Bustle	142,764
Bretonnière, L. M. F., Producing coloring matter from vegetable substances	142,892
Brevoort and Craig	142,773
Brigham, C. H., Forming boot and shoe soles	142,893
Brodie, G., Bale tie	142,894
Brooks, G. D. and M. G., assignees	142,966
Brown, A. L. and W. G., assignees	142,904
Brown, G. W., Spring bed bottom	142,895
Brown, H. F., Coal and rock cutting machine	142,896
Brownback, P. W., Sausage stuffer	142,897

Buckman, H. C., Device for cleaning surface condensers . 142,766
Biller, J., Vapor bath . 142,767
Butterfield, J. C., Eccentric . 142,898
Buttkereit, C. G., Bell piano . 142,768
Case, Larkin, and Terry . 142,964
Chamberlin, C. A., Anchor . 142,769
Chandler, B. B., Treadle mechanism . 142,770
Chaney and Clark . 142,837
Chertizza and Demartini . 142,842
Clark, W. H., and P. Chaney, Jr., Railway switch . 142,837
Coates, L., and J. T. Criswell, Butter print press . 142,838
Cochman, A. W., Sewing machine power . 142,839
Case, L., Manufacture of wrench heads . 142,771
Colburn, G. F. J., Composition for dental plates, (reissue) 5,572
Conroy, L., Screen for postal cards . 142,809
Cook, F., Bale tie . 142,772
Corey, T., assignee . 142,819
Craig, W., and H. L. Brevoort, Pressure regulating valve. 142,773
Cramer, Lewis, and Bogart . 142,891
Criswell and Coates . 142,838
Croissant, E., assignee . 142,892
Crooke, J. J. and L., Machine for forging solid belted hinge pivots . 142,774
Crum and Hulse . 142,915
Datichy, J. P. F., Apparatus for cleaning cess pools, &c. 142,840
Davis and Lantis . 142,857
Davis, W. F., Ornamental chain . 142,841
De Haven and Thorn . 142,966
Demartini, F., and J. Chertizza, Vessel for transporting grain in bulk . 142,842
Disston, H., Tip for saw files . 142,900
Dolson, H. P., Spring coupling for vehicles . 142,901
Donohue, T. H., Apparatus for cleaning boiler flues, &c. 142,775
Doty, J. W., Bob sled . 142,902
Doubler, J. W. H., Harvester . 142,903
Dovey and Insull . 142,854
Drake, A. J., Butter tub . 142,843
Durfee, J. R., Bridge . 142,776
Dustin, J. E., Spark arrester . 142,904
Eckel, G., Stove pipe holder . 142,777
Edgar, C., Horse hay rake . 142,844
Egger, F. J., Carpet rag looper . 142,778
Ellis, C. A., assignee . 142,954
Emerson, J. E., Saw swage . 142,779
Emerson, J. E., Blank for saw teeth . 142,780
Emerson, J. E., Saw teeth . 142,781
Fache, H., Table caster . 142,905
Farrar, F. W., Compound tool . 142,782
Filmer, W., Apparatus for casting printers' leads . 142,783
Fleishman, S. L., Glass blowing machine . 142,845
Fox, E. A. C., Smoke and spark conveyer for locomotives. 142,906
Fraser, K., Buckle for harness . 142,907
Frink, C. L., Rubber compound for the manufacture of packings, &c . 142,908

Yeager, J. L. and A. H., Tire upsetting machine . 142,833

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 260 of drawings; total of each volume about 1,060 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,060 pages per month: 9,000 pages of specifications, 3,120 pages of drawings—12,720 pages.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)..... 6,500

SEWING-MACHINES and attachments..... 2,000

FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes..... 4,000

PRINTING; including presses, type, and printers' furniture. 2,500

FELTING and HATS; including caps, bonnets, flock, &c..... 1,200

WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)..... 1,600

STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs..... 1,400

CARRIAGES and WAGONS..... 6,000

RAILWAYS, (in progress.)

BRIDGES, (in progress.)

CARDING, CLOTH CORDAGE, KNITTING, SILK, SPINNING, WEAVING, (in progress.)

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

The following abbreviated forms of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Aërated liquor apparatus	1	Leather	92
Air and gas engines	2	Locks and latches	93
Amalgamators, ore-mills	3	Locomotives	94
Architecture	4	Looms	95
Artificial limbs, &c.	5	Manures	96

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 13. TUESDAY, SEPTEMBER 23, 1873. PRICE { $6,00 per year—single. / $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

AMENDMENT TO RULES OF PRACTICE.

U. S. PATENT OFFICE, *October* 2, 1873.

ORDER.

Rule 10 of the Rules of Practice of the U. S. Patent Office are hereby amended by *striking out* the last clause, which reads as follows:

"Or before any notary public of the foreign country in which the applicant may be, the oath being attested in all cases, in this and other countries, by the proper official seal of such notary."

M. D. LEGGETT,
Commissioner of Patents.

DIGEST OF FOREIGN PATENT LAWS.

CHILI.

REPORT OF J. DE V. DRUMMOND-HAY, OF THE BRITISH LEGATION.

In accordance with the instructions received by me on the 27th ultimo, in a circular dispatch from your lordship's office, dated the 14th August, 1872, I have the honor to furnish the following report on the law and practice in the Republic of Chili with regard to inventions:

Article 152 of the Chilian constitution, dated May, 1833, accords to every author or inventor the exclusive proprietorship of his discovery or invention for the time which the law may cede to him, and further authorizes the payment of a proper indemnity should it be found necessary to publish the invention.

In 1840 a law was passed which expressly limits the privileges which should be ceded in Chili to patentees of an invention, and lays down the formula and conditions under which such privileges shall be granted. A new invention or discovery must be laid by the inventor before the Home Minister, who has to name a commission for the examination of the samples, models, or drawings produced. On the report of the commissioners, who are sworn to secrecy, the Minister grants or withholds the patent.

The term of a patent cannot exceed ten years.

The patentee pays a sum of £10 (about $50) into the treasury as a contribution toward the museum in which the model of his invention is kept, together with a full explanation of the use and method of the article or matter he has invented, which is preserved closed under private seal of the inventor until the term of his patent has expired.

By the same law and under the same conditions, a patent is allowed for inventions of arts or industries which may appear in foreign countries, but are unknown in Chili; but such patents are granted for shorter periods, not exceeding eight years.

The transfer of patents, or the privileges thereon, to another party is permitted, unless fraudulency be suspected.

Forgeries of an article already patented are subject to a fine of from $100 to $1,000, and the forfeiture not only of the article itself produced, but also of the establishment and implements used in the manufactory; the proceeds of such a fine and forfeiture being equally divided between the treasury and the patentee, after payment of the loss calculated as suffered by the latter.

Should a patent be fraudulently obtained—that is, by false pretenses—or by any other but the inventor himself, such a person is liable to a fine of from $100 to $1,000, or an imprisonment of from three to twelve months.

In cases of disputes arising between parties who may obtain privileges sanctioning the issue of the same article, the law provides the settlement of such causes by

arbitration, an arbitrator being named by each party and a third by the Home Minister of the government.

Patents may be granted as effective throughout the country, or be confined to one or more provinces.

Terms exclusive of the period allotted for the patent are granted for the purpose of installing the establishment, machinery, or industry for the issue of the invention, but should this term expire without the object for which it is intended being carried out, all privileges allowed for the patent are annulled; and in the same manner is all exclusive privilege disallowed if such establishment is abandoned for more than a year, or if the article produced is inferior to the original sample.

Extension of the term ceded for patents or exclusive privileges of production are allowed when the patentee is judged worthy of such an extension of his patent, but for which he must have applied six months before the expiration of his first license.

In August, 1851, a law was decreed which obliges the commissioners who take cognizance of the petition for a patent or introduction of an industry to report, not only on its utility, but also on the hindrances which might result to industry or commerce by the cession of an exclusive privilege, as also to report on the the difficulties or expenses to which the petitioners may be subjected in their undertaking, with a view to determine the allotted time for the introduction of the art or invention, in order that full knowledge may be taken of the industry which may be prejudiced by any cession of exclusive privilege. Special mention must also be made whether the petition is for a patent of invention or for introducing into the country some new article.

Under date of August 16, 1856, a law was promulgated which makes it obligatory on the petitioner for the introduction of inventions already known in other countries, that the privileges for which he solicits be published in the official journal during the term of thirty days, in order that those parties who may have already brought into the country, or established such conventions or industries, or have taken steps for their introduction or establishment, and thereby incurred expense previous to the petition for such exclusive privilege, shall have a right to oppose the cession of the monopoly.

There has been considerable discussion in congress this present year, 1872, as to the advisability of any patent law, and commissioners have been named to examine into the matter and report on the same, and to suggest what reforms are necessary should the actual patent law in force be continued.

From the feelings evinced in the discussion it would appear as most probable that all introduction of patents from other countries will be abolished, and that only inventors resident in the country will have the patent rights, or at most those inventors in foreign countries who may ask for privileges which they are already and still in possession of in other countries.

COLOMBIA.

REPORT OF CHARLES O'LEARY, OF THE BRITISH LEGATION.

I had the honor to receive on the 7th instant your lordship's circular dispatch of the 14th of August, instructing me to prepare and transmit to your lordship, with as little delay as possible, in a succinct form, a report respecting the law and practice of Colombia with regard to inventions.

I lost no time in applying to the proper department, which in this country is the Office of Public Works, for information on the subject, but it was only this morning that I was favored with a reply. The information thus supplied to me is as follows:

The power to grant privileges in Colombia, conveying the sole right to make, use, or dispose of any new invention or discovery, is limited and defined by the law of the 13th of May, 1869. This exclusive right is guaranteed by the national executive power of the union by means of an instrument called "patent of invention."

A patent may, in the terms of the law, be granted in respect of any "invention or improvement of a machine, mechanical apparatus, combination of materials, or method of proceeding of useful application to industry, arts, or sciences," and for the making and sale of any manufacture or industrial product, for a term of years not exceeding twenty nor less than five.

No privilege is given for the importation of foreign productions, whether natural or manufactured.

Inventors in possession of a foreign patent may also obtain one in Colombia for the same invention on the condition that its expiration shall coincide with that of the foreign patent.

Patents of invention are obtained upon petition to the executive power, setting forth with clearness the nature of the invention or improvement. In the event of a favorable decision, and in order to obtain the patent, the inventor must furnish the government, within forty days, with a design or model of the machine or mechanical apparatus, or with a circumstantial and complete description of the new method or process, together with a sample of the manufacture or production. Such model, design, or description, as the case may be, is enrolled and deposited in the proper department of state for the two-fold purpose of serving as a reference in the event of any controversy as to the genuineness of the invention, and of giving copies thereof to whomsoever may apply for them at the expiration of the patent.

In the patent, reference is made to the law on the subject. In it is embodied the executive decree granting the privilege and stating the nature of the invention, as well as the term to which the duration of the concession is limited. Such decree must be published twice at least in the official gazette.

A patent is granted without any previous examination as to the novelty or utility of the invention. The government does not declare that the invention is new or useful, nor that the patentee is the real inventor, nor accurate the models or descriptions of the invention. But it is open to any one whose rights may have been encroached upon by the concession to appeal to the tribunals for its reversal, and in fact the right so to do is expressly reserved in the patent itself.

Thirty days before the issuing of a patent the government is by law required to publish the inventor's petition in the official gazette.

Patents of invention are withheld in the following cases: When the provisions of the law are not faithfully complied with by the petitioners, or when the invention endangers the public salubrity or security, or encroaches upon proprietary rights already acquired.

The moment a patent expires every one is at liberty to profit by it. The descriptions of the invention are published, and copies of the models or designs given to any applicant on payment of the necessary expenses. The same publicity is given to the invention in the event of the patent becoming void from any cause.

An injunction may be obtained for the infringement of a patent, the offender being dealt with in conformity with the penal laws of the union.

A patent is void when it violates vested rights, the decision in such cases resting with the courts of justice. It also lapses if during a whole year no use is made of the invention, unless it be from accidents beyond the control of the patentee.

To secure a privilege a fee of from $5 to $10 (£1 to £2) for every year of its duration must be paid to the government, the entire sum being levied when the patent is granted. In soliciting a patent, the number of years for which it is desired to take it out is mentioned in the petition, but no petition is entertained unless preceded by a payment into the treasury of $10, (£2,) which the petitioner forfeits if the application is refused, or if granted is computed as part payment of the fee.

DENMARK.

REPORT BY G. STRACHEY, OF THE BRITISH LEGATION.

1. No laws have been passed in Denmark on the subject of protection to inventions.

Inventors are protected by royal letters patent granted through the Ministry of the Interior, in accordance with rules prescribed by the traditional practice of that department.

2. A person who wishes his invention to enjoy "gueret," or monopoly, must address to the Ministry of the Interior, accompanying his demand by detailed specifications and drawings.

3. The Ministry forwards these papers to the polytechnic school, with a request that the director will report on the applicant's scheme. The director, after consulting, if necessary, the professors of the institute, reports to the Ministry whether the alleged invention is new and deserving of protection. He also states the period for which, in his opinion, the "gueret" or patent should be granted.

4. The Ministry always adopts the director's conclusion. It is understood that a patent will be allowed whenever the alleged invention really contains something novel in principle or practice. Generally speaking, the applicant's request is granted.

5. The patents usually run for three, four, or five years. Important inventions are protected for ten years, and in special cases for fifteen years.

Patents granted to foreigners never run for more than five years.

6. The fee charged at the Ministry of Interior for the whole transaction is £1 17*s.* 6*d.* ($9.) The time occupied in the correspondence is about two months.

7. The patent is forfeited (1) if it is shown that a similar invention has been used in Denmark before, or (2) if the patentee does not carry out his invention within the year and continue to employ it.

COMMISSIONER'S DECISIONS.

NEUBOECKER AND SCHAFHAUS.—*Interference.*

[*In the matter of the interference between Adam Neuboecker and John Schafhaus.—Decided September* 18, 1873.]

APPEAL UNDER RULE 44—PRACTICE IN INTERFERENCES.

The law does not make the Examiner of Interferences a judge of the novelty of devices before him in interference; jurisdiction of that question is with the Primary Examiners and the appellate tribunals.

But, by order of the Commissioner, it is made the duty of the Examiner of Interferences to suspend an interference whenever it appears to him that an insufficient examination has been made, or when a new reference has been discovered.

LEGGETT, *Commissioner:*

This case comes up from the Examiner of Interferences on an interlocutory appeal. The interference is between the applications of two citizens of Germany.

During the progress of the trial it was developed that prior to the date of the applications a patent had been issued for the invention described, in France, to Hinkel and Neuboecker. The French patent, it seems, describes the device as the joint invention of Hinkel and Neuboecker, while Neuboecker, in his pending application here, claims to be the sole inventor.

The Examiner decided the question of priority in favor of Schafhaus, but, in view of the French patent, determined that no patent could issue, and therefore dissolved the interference. From this decision of dissolution the appeal is taken to the Commissioner in person.

Rule 59 provides that an interference may be dissolved, first, when neither party is entitled to a patent; second, when no interference exists between the applications; and, third, when there has been such irregularity in declaring the same as will preclude the proper determination of the question of right between the parties.

The action of the Examiner in this case has been under the first clause, upon the ground that neither party is entitled to a patent, for the reason that the alleged invention is anticipated by a patent issued in France to other parties. This action of the Examiner is, I think, premature. The law does not make him an Examiner as to the question of novelty. His jurisdiction by law relates solely to the question of interference.

The party has a right to be heard before the Primary Examiner upon all matters pertaining to the novelty of his device; also to an appeal from the Examiner's decision, if adverse, to the Board of Examiners-in-Chief, and from the Board to the Commissioner, and from the Commissioner to the Supreme Court of the District of Columbia; consequently, when the Examiner of Interferences had reason to believe that a new reference had been discovered, or that there had been a careless and insufficient examination upon the part of the Examiner, it was his duty to suspend the interference and refer

the cases back to the Examiner for further examination in view of the newly-discovered reference, and afterward, if his view of the effect of the new reference was sustained by the Examiner, and the Examiner's decision not appealed from, a judgment of dissolution should follow. I mean by this that it is not within the province of the Examiner of Interferences to determine that a party is not entitled to a patent because of some other invention anticipating the same. That question is made by law the province of the Principal Examiners.

By order of the Commissioner, however, it is made the duty of the Examiner of Interferences to suspend an interference whenever, in his judgment, there has been an insufficient examination or a new and pertinent reference discovered, and to return the case to the Principal Examiner for further examination. In case the views of the Examiner of Interferences are not sustained, the interference may then progress without the delay and expense of again taking testimony.

The decision of the Examiner of Interferences is therefore reversed, and the interference will be suspended and the case referred back to the Examiner for further examination in view of the French patent referred to.

LIPPMANN AND MARCHANT.—*Interference.*

[*In the matter of the interference between the applications of Phillipp Lippmann and Wm. J. Marchant, for* IMPROVEMENT IN CORSET-CLASPS.—*Decided September* 16, 1873.]

APPEAL FROM THE DECISION OF THE BOARD OF EXAMINERS-IN-CHIEF.

The Office must judge from the data given whether or not an applicant has been reasonably diligent.

Where an applicant showed only by the unsupported affidavits of himself and wife that he made two experiments with a device in 1867, which he kept secret, and it appeared he did nothing further until he applied for a patent in 1872, and gave no sufficient reason for his laches: *Held*, that what he did in 1867 must be regarded as abandoned experiments, and that one who in the meantime made the invention and conferred it upon the public was the prior inventor.

LEGGETT, *Commissioner:*

The issue in this interference may be very readily decided. The evidence in behalf of Marchant—the only witnesses being himself and his wife—shows that he made two "experiments" in 1867, which he kept secret. Subsequent to that time he did nothing whatever until he made his application for patent in 1872. He gives no sufficient reason for his delay in disclosing his invention, and produces no sample or drawing made at the time, showing his experimental construction of it. Whether or not he was reasonably diligent in following up his experiments is a matter, as the Board have remarked, of which the Office must be the judge. He has given no data by which it appears that he was. Lippmann conceived and completed the invention in 1870, and put it into practical use. Before two years had elapsed he presented his application for patent. In the light of the decisions of the courts and the Office in similar cases, what Marchant did must be regarded as mere abandoned experiments. Lippmann, an independent inventor, more diligent, actually conferred the invention upon the public through his manufacture and sale of it. This Marchant in fact has never done.

The decision of the Board awarding priority to Lippmann must be affirmed.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,590.—Defecating and Clarifying Cane-Juice.—Granted to RICHARD A. STEWART, January 11, 1859. Application filed September 24, 1873, under act of Congress approved March 3, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

25,874.—Bronzing-Machines.—Granted to GEORGE H. BABCOCK, October 25, 1859. Application filed July 25, 1873. Testimony closes September 23, 1873. Hearing October 8, 1873.

25,883.—Construction of Glass Coffins.—Granted to JOHN R. CARSON, October 25, 1859. Application filed July 23, 1873. Testimony closes September 23, 1873. Hearing October 8, 1873.

25,936.—Cut-Off Valves of Steam-Engines.—Granted to EDWARD R. ARNOLD, November 1, 1859. Application filed August 1, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

25,978.—Tackle-Blocks.—Granted to ISAAC E. PALMER, November 1, 1859; reissued September 8, 1863, April 11, 1865, and December 8, 1868. Application filed July 28, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

25,984.—Bit-Stocks.—Granted to NELSON STOFFORD, November 1, 1859; reissued April 23, 1867. Application filed July 28, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

26,003.—Telegraphic Machines.—Granted to GEORGE M. PHELPS, November 1, 1859. Application filed July 30, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

26,028.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,030.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,060.—Machines for Making Box-Joints.—Granted to JAMES STIMPSON, November 8, 1859. Application filed August 2, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,069.—Sleeping-Cars.—Granted to JOHN DANNER, November 8, 1859. Application filed August 4, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,087.—Fastening Metal Hoops on Cotton-Bales.—Granted to JOHN T. BUTLER, November 15, 1859. Application filed August 7, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,090.—Machines for Folding Paper.—Granted to CYRUS CHAMBERS, Jr., November 15, 1859; and reissued August 12, 1873. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,097.—Electro-Magnetic Telegraphs.—Granted to MOSES G. FARMER, November 15, 1859; and reissued December 10, 1872. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,128.—Billiard-Table Cushions.—Granted to GEORGE D. SHARP, November 15, 1859; and reissued April 8, 1873. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,135.—Portable Pumps.—Granted to WILLIAM T. VAIL, November 15, 1859; reissued February 26, 1861. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,136.—Mode of Advertising.—Granted to EDWARD WIENE, November 15, 1859. Application filed August 18, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,139.—Pumps.—Granted to WILLIAM WRIGHT, November 15, 1859. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,145.—Cocks for Water-Closets.—Granted to DARIUS WELLINGTON, November 15, 1859. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,147.—Machine for Bundling Kindling-Wood.—Granted to WILLIAM L. WILLIAMS, November 15, 1859; and reissued October 4, 1870. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,177.—Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 18, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,178.—Making Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 18, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,202.—Manufacture of Paper-Pulp.—Granted to JOHN B. PALMER and GARDINER HOWLAND, November 22, 1859; and reissued July 2, 1867. Application filed August 20, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,243.—Water-Closet Basins.—Granted to WILLIAM BOOM, Sr., November 29, 1859. Application filed June 10, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,244.—Machines for Registering Music.—Granted to HENRY F. BOND, November 29, 1859. Application filed August 20, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,262.—Journal-Boxes for Saw-Mill Carriages.—Granted to WM. M. FERRY, November 29, 1859. Application filed August 30, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,276.—Manufacture of Rubber Hose.—Granted to THOMAS J. MAYALL, November 29, 1859; and reissued October 22, 1872. Application filed August 19, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,321.—Molding for Metal Casting.—Granted to JOHN P. BROADMEADOW, November 29, 1859. Application filed August 15, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,327.—Nursing-Bottles.—Granted to FRANCIS J. LA FORME, November 29, 1859, and reissued January 14, 1862. Application filed August 27, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,329.—Boot and Shoe Tips.—Granted to NEWMAN SILVERTHORN, November 29, 1859; reissued September 2, 1862, and August 4, 1868. Application filed August 22, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,339.—Water-Wheels.—Granted to JAMES P. COLLINS, December 6, 1859; reissued June 12, 1860, and May 13, 1873. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,401.—Mode of Applying Sulphurous-Acid Gas in the Defecation of Saccharine Liquids.—Granted to NANCY POINDEXTER BRASHEAR, executrix of ROBERT B. BRASHEAR, deceased, December 6, 1859, and reissued October 22, 1860. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,406.—Composition for Kindling Fire.—Granted to ELIZABETH BELLINGER, December 13, 1859, and reissued August 7, 1866. Application filed September 15, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,410.—Seed-Planters.—Granted to WILLIAM BLESSING, December 13, 1859. Application filed August 27, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,454.—Dispensing with Switches on Railroads.—Granted to WILLIAM WHARTON, Jr., December 13, 1859, and reissued April 3, 1860. Application filed September 12, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,475.—Breech-Loading Fire-Arms.—Granted to BETHEL BURTON, December 20, 1859, and reissued December 21, 1869. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,484.—Platform-Scales.—Granted to THADDEUS FAIRBANKS, December 20, 1859. Application filed September 12, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,486.—Pipe-Molding.—Granted to JOHN FERTH and JOHN INGHAM, December 20, 1859, and reissued April 22, 1862. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,487.—Screw-Taps.—Granted to WILLIAM and ROBERT FOSTER, December 20, 1859. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,506.—Water-Trap.—Granted to JAMES A. LOWE, December 20, 1859. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,513.—Nail-Plate Feeder.—Granted to JOHN NEWELL, December 20, 1859. Application filed September 16, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,564.—Top-Props for Carriages.—Granted to GEORGE COOK and HANNIBAL I. KIMBALL, December 27, 1859. Application filed August 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,582.—Harvesters.—Granted to JOHN GOBB, December 27, 1859, and reissued January 15, 1861. Application filed September 22, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,584.—Machines for Planing Curved Surfaces.—Granted to JONATHAN P. GROSVENOR, December 27, 1859. Application filed September 24, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,599.—Horse Hay-Rakes.—Granted to SAMUEL LEGGE, December 27, 1859. Application filed September 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,614.—Manufacture of Porous Ware.—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, December 27, 1859. Application filed September 26, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,627.—Lathe Attachment for Cutting Veneers.—Granted to BENJAMIN F. STURTEVANT, December 27, 1859. Application filed September 25, 1871. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,679.—Double-Seaming Machines.—Granted to LESTER T. HULBERT, January 3, 1860. Application filed September 29, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,822.—Tool for Cutting Round Tenons.—Granted to LEVI A. DOLE, January 10, 1860. Application filed September 30, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE N. CUMMINGS, January 24, 1860. Application filed September 22, 1873. Testimony closes December 23, 1873 Hearing January 7, 1874.

27,539.—Manufacture of Gun-Barrels.—Granted to JAMES H. BURTON, March 20, 1860, and antedated to September 22, 1859; reissued December 28, 1871. Application filed July 1, 1873. Hearing September 16, 1873.

EXTENSIONS GRANTED.

25,565.—Improvement in Rolling-Mills, granted to JOHN FRITZ and GEORGE FRITZ, September 27, 1859.

Claim.—The application to each of the pairs of drawing or forming rolls of a feed-roll, such as described, and driven by gearing or other machinery, and turning in the same direction with said drawing or forming rolls, for the purpose of carrying and feeding into them the pile or bar of heavy iron, substantially as described.

25,569.—Improved Bedstead-Slats, granted to TYLER HOWE, September 27, 1859.

Claim.—1. The within-described bed-slat, consisting essentially of the lifter A, in combination with the slat, constructed and operating in the manner substantially as herein set forth.

2. The construction in the ends of slats, by which they are connected with the bedstead or springs, as shown by C and D, and as herein described.

25,570.—Improved Mode of Arranging Couches in Railroad-Cars, granted to EDWARD C. KNIGHT, September 27, 1859.

Claim.—The arrangement of couches in railroad-cars by means of the double-hinged rod *c c*, constructed as described, in such a manner that the couch, when not in use, may be folded up against the ceiling and retained there by means of a button or other suitable device, substantially as herein described.

25,572.—Improvement in Molding Water-Traps, granted to JAMES ALLEN LOWE, September 27, 1859.

Claim.—The application of a metallic core, constructed and operating substantially as herein described, to cast water-traps.

25,586.—Improvement in Burglar-Alarms, granted to ABBOTT Q. ROSS, September 27, 1859.

Claim.—1. Connecting the doors or windows of house to an alarm mechanism, through a system of strained wires, so that the forcing of the door or the cutting of any wire shall let off the alarm mechanism, substantially in the manner described.

2. So connecting the panels of a door with the strained wires that unite the door with the alarm mechanism, as that the cutting out of a panel or the cutting of one of their wires shall let off the alarm mechanism, substantially as herein described.

3. The combination of the swinging lever *f* on the door with the bolt *r*, and its inclined plane *s* that locks the spring-drum J, for the purpose of putting said door in connection with the alarm mechanism when said door is drawn to and shut from the outside, substantially as herein described and represented.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date September 23, 1873.]

6,880.—Printing-Types.—EDWIN C. RUTHVEN, Philadelphia, Pa., assignor to DAVID WOLFE BRUCE, New York, N. Y. Application filed September 8, 1873. Term of patent 14 years.

6,881.—Parlor-Furniture.—DANIEL SHALES and NEWMAN MCCULLY, Boston, Mass. Application filed June 30, 1873. Term of patent 3½ years.

6,882.—Printing-Types.—RICHARD SMITH, Philadelphia, Pa., assignor to MACKELLAR, SMITHS & JORDAN, same place. Application filed September 1, 1873. Term of patent 7 years.

6,883.—Printing-Types.—RICHARD SMITH, Philadelphia, Pa., assignor to MACKELLAR, SMITHS & JORDAN, same place. Application filed September 1, 1873. Term of patent 7 years.

6,884.—Chairs.—JAREZ M. WATERS, Cincinnati, Ohio. Application filed May 10, 1873. Term of patent 14 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date September 23, 1873.]

1,461.—Woven-Silk Fabrics and "Passementerie" Goods.—BERNSTEIN & MACK, New York, N. Y. Application filed September 13, 1873.

"two shields and eagles, combined with a scroll and the words 'Warranted full measure. Trade-Mark. Pat. Col. Yds.'"

1,462.—Hard Soap.—OLIVER CUTTS & Co., Port Au Prince, Hayti. Application filed July 12, 1873.

"'Extra No. 1, Palo Soap.'"

1,463.—Packing for Railroad-Car Journal-Boxes.—PATRICK S. DEVLAN, New York, N. Y. Application filed September 20, 1873.

"'Elastic Waste.'"

1,464.—Saws, Tools, Steel, and Files.—HENRY DISSTON & SONS, Philadelphia, Pa. Application filed September 11, 1873.

"'Keystone.'"

1,465.—Shirts.—FINLAY, GOURLAY & FINCH, New York, N. Y. Application filed September 13, 1873.

"'X. L. N. T.' on the figure of a shield."

1,466.—Pegs for Boots and Shoes.—KRAMBARGE PEG COMPANY, Andover, N. H. Application filed September 8, 1873.

"a star, and the words 'Star Peg.'"

1,467.—Pegs for Boots and Shoes.—KRAMBARGE PEG COMPANY, Andover, N. H. Application filed September 8, 1873.

"a United States flag and the words, 'The Flag Peg.'"

1,468.—Spirituous Liquors.—GEORGE W. KIDD & Co., New York, N. Y. Application filed August 30, 1873.

"a monogram formed of the letters S. N. P. & Co."

1,469.—Clothing for Women and Children.—MOSES NEWMAN and BERNARD LIEBMAN, New York, N. Y. Application filed September 2, 1873.

"'New York Suit Man'g Co.,' with a vignette or group between the words 'New York' and 'Suit Manf'g Co.'"

1,470.—Teas.—NEWTON BROTHERS & Co., San Francisco, Cal. Application filed August 16, 1873.

"the letters 'N. B.' inclosed in a diamond-shaped figure."

1,471.—Leaf-Tobacco.—WEISS, ELLER & KAEPPEL, New York, N. Y. Application filed September 13, 1873.

"a rose with a single leaf upon each side of the stem."

1,472.—Leaf-Tobacco.—WEISS, ELLER & KAEPPEL, New York, N. Y. Application filed September 13, 1873.

"an eagle standing erect with outspread wings."

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date September 23, 1873.]

ORIGINAL PATENTS.

142,976.—Sectional Steam-Boiler.—JOSHUA K. ABBOTT, Cincinnati, Ohio. Application filed April 30, 1873.

The feed-water enters a mud-drum common to all the sections, passing up through a section-head having reverse incline diaphragms, thence through tubes divided by partition-plates and open at one end, returning through return-bends into the other division of the double head—thus keeping up a constant circulation of the water in the boiler.

Claim.—1. In combination with the generating-pipes A, the section-heads B, when constructed with reverse incline diaphragms C C', substantially as and for the purpose specified.

2. The combination of generating-pipes A, section-heads B C C', and diaphragms E in the generating-pipes, substantially as and for the purpose specified.

142,977.—Treating Iron and Steel to Anneal and Toughen Them.—ALBERT F. ANDREWS, New Haven, Conn., assignor to THE ANDREWS MANUFACTURING COMPANY, same place. Application filed May 9, 1873.

Articles, such as cut nails, are placed in boxes heated to about a red heat. Water-gas, made by decomposing steam by means of hot coal, is passed through the box containing the nails.

Claim.—1. The charcoal-box B, in connection with the narrow tube G and the box or series of boxes F.

2. The construction of the box F in separate or detachable pieces, substantially as described.

3. The retort A, in connection with the charcoal-box B and broad perforated tube G', for treating bar iron or steel, substantially as described.

4. The within-described treatment of wrought iron and steel, by subjecting it to a slow current of free hydrogen, as herein specified.

142,978.—Device for Holding Wagon-Boxes to the Bolsters.—HENRY L. ANDERSON, Chicago, Ill., assignor of one-half his right to JAMES M. RAND, same place. Application filed August 12, 1873.

To securely fasten and hold the body and running-gear.

Claim.—The combination of the swivel D, the curved-headed hooks *a a*, and the stirrup F, the whole arranged and applied to a wagon, to operate substantially in the manner and for the purpose described.

142,979.—Riveting Joints of Sheet Metal.—PHINEHAS BALL, Worcester, Mass. Application filed July 29, 1873.

The two edges are lapped one upon the other and riveted, but with a washer or a long strip of metal interposed between the sheet and one or both ends or heads of the rivets.

Claim.—The mode herein described of forming a steam or water tight joint between the overlapping edges of thin sheets of metal, as applied to the manufacture of water pipes, tubes, or other articles of manufacture—that is to say, by riveting ribs or washers over the laps or joints—in the manner substantially as shown and described.

142,980.—Heel-Trimming Machine.—CYRUS G. BALLOU, Albany, N. Y., assignor to EAST NEW YORK BOOT, SHOE, AND LEATHER MANUFACTURING COMPANY, New York. Application filed July 11, 1873.

The shaft upon which the cutter-head is mounted rests upon vertically-sliding bearings. The guide which enters the crease between the counter and heel is kept from revolving by spiral springs, one attached to each side, which allow the guide sufficient motion to overcome any tendency of the shoe to adhere to it.

Claim.—1. The combination of the shaft J, having a cutter-head, L, attached thereto, with the sliding bearings D D, substantially as and for the purpose set forth.

2. The combination of the shaft J and sliding bearings D D with the adjusting-screw M, having a slotted head, m^2, and sliding block, m^3, as and for the purpose specified.

3. The guide Q, constructed and arranged to operate as herein described, in combination with the springs R R, as and for the purpose set forth.

142,981.—Device for Hanging Picture-Frames.—THEODORE C. BARNARD, West Meriden, Conn. Application filed July 29, 1873.

Two metallic rods are pivoted to a frame, which is vertically-adjustable upon the third rod. The two rods are freely adjustable laterally, so as to be spread at their lower ends to adapt them to different sizes of frames, and said lower ends are provided with suitable hooks, upon which the frame is hung.

Claim.—1. The pivoted arms 7, in combination with the vertical rod 1, and a suitable adjusting device for adjusting the arms 7 up and down, substantially as set forth.

2. The combination of the perforated rod 1, slide 3, and hooked suspension-rods 7, substantially as specified.

142,982.—Rotary Steam-Engine.—JOHN V. BERKMAN, Brooklyn, N. Y., assignor to himself and JOHN A. LIGHTHALL, same place. Application filed March 19, 1873.

By adjusting the cylinder laterally steam-tight joints may be maintained between it and the concave abutments.

Claim.—The combination, in a rotary steam-engine, of the laterally-adjustable cylinder B and pistons D D' D'' D''' with the concave abutments E E, as and for the purpose specified.

142,983.—Feed-Water Heater.—JOHN V. BERKMAN, Brooklyn, N. Y., assignor to himself and JOHN A. LIGHTHALL, same place. Application filed March 19, 1873.

A heating-pipe passes through the water-cylinder, which is divided into two chambers by a partition. Water enters at the top of the cylinder at one side, passes down one chamber and enters the other, and ascends to the outlet.

Claim.—The combination of the heating-chamber B with the division flanges or walls C C' within said chamber, constructed and operating as and for the purpose specified.

142,984.—Lantern.—WILLIAM J. BERRY, Brooklyn, E. D., N. Y. Application filed February 8, 1873.

The diameter of the lamp is considerably shorter than that of the gallery, allowing an air-space between the two. The lamp has two flanges, one at top and one at bottom, which govern the incoming currents of air, and it is held in place concentrically with the gallery by springs so bent as to engage with the flange of the gallery in such manner as to prevent the lamp from moving up or down.

Claim.—The flanges or deflectors *b l* surrounding the lamp-reservoir, and within the lantern, for regulating the direction of the currents of air and preventing the lamp being extinguished, as set forth.

142,985.—Insect-Destroying Compound.—WILLIAM C. BIBB, Madison, Ga. Application filed August 16, 1873.

Arsenic acid, sulphate of copper, and resin in about equal proportions, used in a dry powder or in a solution of soap and water.

Claim.—The above compound as my invention, substantially as described, and for the purpose herein before set forth.

142,986.—Water-Cooler.—ISIDOR BRACH, Philadelphia, Pa. Application filed July 25, 1873.

The ends of the percolator are passed between the annulus that supports the ice-receptacle and the legs upon which the annulus rests, and are held in position by a circular rim of bamboo pressing them tightly against the sides of the vessel. Ice is put into a receptacle before it is placed in a cooler, and a removable diaphragm supports the ice after the ice-receptacle (whose lower end is open) has been inserted and placed in the cooler, where it is supported by a bead bearing against a metallic ring.

Claim.—1. The removable felt percolator F, secured within vessel A, in the manner specified.

2. Percolator F, annulus D, and receptacle C, provided with the diaphragm H, all arranged within the vessel A, and acting together as and for the purposes described.

3. The inverted ice-receptacle C, provided with diaphragm H and open at its lower and closed at its upper end, in combination with vessel A, as and for the purpose set forth.

142,987.—Sand-Sifter.—DAN BROUGHTON, Chicago, Ill. Application filed August 1, 1873.

Claim.—The combination of the cylinder or rubber D with the cylindrical sieve C, arranged to receive the material through one end and discharge the coarser matters through the other, and operated by the collar and pulley-wheels E F, substantially as and for the purpose specified.

142,988.—Dredging-Scraper.—DAN BROUGHTON, Chicago, Ill. Application filed August 1, 1873.

A closed box-scraper for collecting sand below the shore line. The hinged scraper allows the sand to enter the box, but is supported by the hook G until the box is drawn up along the inclined ways to a sufficient height, when the load is dumped into a proper receptacle. The holes in the bottom allow the water to drain off.

Claim.—1. The hinged scoop or shovel B C, in combination with the case A, substantially as and for the purpose specified.

2. The combination of the spring-catches G with the case or box A and scoop B C, substantially as and for the purpose set forth.

142,989.—Wagon-Body.—BRADLEY BURR, Batavia, Ill. Application filed January 27, 1873.

The corners and sides are supported by means of peculiar brackets, which permit the use of continuous side rails and prevent spreading.

Claim.—1. A wagon body or box, constructed of frame-work, when the several parts are connected together without mortise or tenon, substantially as specified.

2. The angle irons or brackets L, when provided with projections *b*, *c*, and *d*, substantially as and for the purposes specified.

3. The flat brackets M, when provided with the projections *g*, *h*, and *i*, substantially as set forth.

4. The bar N, when provided with the hinge-projection *p*, substantially as described.

5. The bar K, when provided with the pins or projections *r*, substantially as specified.

6. The bar O, when provided with the pins *r* and hinge projection *s*, substantially as specified.

7. The combination, in a wagon-body, of the bars N, provided with hinged projections *p*, with the brackets R and rod S, substantially as described.

142,990.—Machine for Burnishing the Shanks of Boots and Shoes.—AUGUSTUS C. CAREY, Malden, assignor to himself and DEAN PEABODY, Lynn, Mass. Application filed August 25, 1873.

The burnisher, having free vibratory movement, may be elevated or depressed, while in motion, to accommodate itself to the form of the sole. The jack is capable of being tilted both laterally and longitudinally, that all portions of the shank-surface may be presented to the action of the burnisher.

Claim.—1. In mechanism for burnishing the shanks of boot and shoe soles, the combination, with a jack for holding the boot or shoe, of a burnisher, located above or opposite to the sole of the jack, and vibrating upon an axis movable nearer to or farther from the jack, as occasion demands, and during the continuance of the vibratory movement of the burnisher, substantially as and for the purposes herein shown and described.

2. In mechanism for burnishing the shanks of soles, a jack, jointed to its support so as to be capable of being tilted in the direction of its length, as herein shown and set forth.

3. In mechanism for burnishing the shanks of soles, the combination, with a vibratory burnisher movable bodily toward and away from the jack, as described, of a jack capable of being tilted or rocked both longitudinally and laterally, substantially as shown and set forth.

142,991.—Weighing-Scale.—WILLIAM Z. CONNER, Shelbyville, Ind. Application filed January 8, 1873.

A loaded cylindrical vessel or bucket, partly immersed in water, is suspended by a cord passing over a pulley, and having attached to its opposite end the scale pan. According to the weight in the scale-pan will the vessel in the water be more or less lifted, and an index in gear with the pulley will indicate, on a suitable dial, the amount of the weight.

Claim.—1. In a weighing-scale, the combination of a reservoir for water or other liquid, a weight-receptacle, a belt for connecting the parts, a drum over which belts pass, a platform for receiving the article to be weighed, a dial, and an indicator-hand, the parts being constructed and arranged substantially as and for the purpose set forth.

2. The combination of the auxiliary reservoir A' and the balancing-rod B, substantially as and for the purpose set forth.

142,992.—Drill for Boring Artesian Wells.—CHRISTOPHER G. CROSS, Chicago, Ill. Application filed January 14, 1873.

Claim.—1. The combination of the wheel A with the drill B and pipe C, arranged to descend together in operation, substantially as specified.

2. The combination of the cylinder H with the wheel A, drill B, and pipe C, substantially as specified.

142,993.—Car-Coupling.—THOMAS H. CROSS, East Boston, Mass. Application filed May 5, 1873.

The link is pivoted to the draw-bar, and operated by means of an upright rod and levers extending to the sides of the car.

Claim.—The link C, pivoted to the draw-bar *b*, and operated by means of the bar D, having rack *g*, and the levers E F G, as described.

142,994.—Sash-Holder.—FRANCIS MARION DAVIS, La Cygne, Kan. Application filed February 26, 1873.

A friction rubber-faced cam is secured in a mortise in a window-frame by means of a journal, which has a grooved neck to

receive a retaining-pin, which latter, while it allows of rotation, prevents displacement.

Claim.—A cash-holder, composed of a mortise-frame, *d*, a cam, *e*, with circumferential groove 1 and rubber band 2, a shaft, *f*, with squares 3 4 and journal 5 6, and a knob, *g*, with grooved neck 7, fitted to receive a retaining-pin, as herein shown and described.

142,995.—Cooper's Crozing and Howel.—WILLIAM R. DAVIS, Union City, Pa. Application filed May 13, 1873.

Peculiarly-formed howeling and crozing tools are so arranged as to form one implement and act together.

Claim.—The combination of the plow F, cutters G G', and howel H, having the spiral or carved edge J, when secured to the plate A, and arranged in the manner substantially as shown and described.

142,996.—Railroad-Rail Joint.—HIRAM DECKER, Cocheeton, N. Y. Application filed March 25, 1873.

The inclined guard-plate E is to prevent the flanges of the wheels of a car temporarily off the track from cutting off the projecting fish-bolt nuts, by which accidents to following trains are caused.

Claim.—The combination, with the plate of a fish-joint connection for railroad-rails, of an inclined plate, or plate with an inclined face, substantially as and for the purposes herein specified.

142,997.—Mangle.—ROBERT A. DUNCAN, Brooklyn, E. D., N. Y. Application filed June 21, 1873.

Constructed with an apron passing over its table and the roll, the journals of which are attached to cylinders having springs to govern the tension, and is endless and arranged to pass under and over three rolls geared to the driving-shaft, which has a crank to give it motion.

Claim.—1. The endless apron or belt A, passing around the rollers *c d e*, in the manner set forth, in combination with the table *i*, substantially as set forth.

2. The yielding roller *m*, acting to tighten the belt or apron A, in combination with the rollers *c d e* and table, substantially as set forth.

142,998.—Car-Coupling.—JACOB L. DUNCAN, Fremont, Ohio. Application filed June 28, 1873.

The coupling-jaws are recessed so as to receive the enlarged and recessed head of the coupling-rod and hold in position to couple with the approaching draw-head. The jaws have shoulders on their outer edges, which bear on ribs attached to, or forming part of, the draw-head. These ribs relieve the pivot-pins of part of the draft strain. The jaws are opened by chains attached at their rear ends and operated by a vertical rod passing down through the platform of the car.

Claim.—1. Laterally-movable coupling-jaws J J, pivoted at *e e*, and shouldered at *f' f'*, in combination with ribs *f f* on the inner sides of the coupling-head A, for the purpose of relieving the pivots *e e* from drawing strain.

2. The coupling-rods *a*, constructed with heads a^2 a^3, short necks a^4, and enlargements a^1, and applied to the recessed and shouldered coupling-jaws J J, substantially as and for the purposes described.

142,999.—Galvanic Battery.—THOMAS A. EDISON, Newark, N. J. Application November 5, 1872.

Claim.—The arrangement, in a galvanic battery, of the horizontal copper plate above the sulphate of copper and its solution, and below the zinc pole and the liquid surrounding the same, for the purposes and substantially as set forth.

143,000.—Street-Lamp.—JOHN H. ETNIER, Pekin, Ill. Application filed August 9, 1873.

A street-lamp for burning fluids is supplied with an auxiliary reservoir under the main reservoir, and connected with it by a pipe having a stop-cock. This lower reservoir communicates directly with the burner, and has a sealed indicator.

Claim.—The combination and arrangement of the lamp A, burner D, supply-pipe h, reservoir C with its indicator *a b*, cock *d* in the passage to the reservoir B, and the reservoir B, as described.

143,001.—Boot.—LUTHER H. FARNSWORTH, Hudson, assignor to THE BOOT AND SHOE IMPROVEMENT COMPANY, Boston, Mass. Application filed February 17, 1873.

Claim.—A short-legged boot or gaiter, having its upper formed of a single piece of leather or other suitable material, united by a seam over the toes, and crimped to conform to the shape of the heel, and form a seamless boot, substantially as specified.

143,002.—Lady's Under-Vest.—OLIVIA P. FLINT, Boston, Mass. Application filed July 28, 1873.

Straps are attached to the under-vest to afford suspenders for under-garments and an abdominal support.

Claim.—1. The combination, with a ladies' elastic under-garment, of a supporter for under-clothing, said supporter being non-elastic, or less elastic than the said under-garment, and sewed thereto and made to pass over the shoulder of the wearer.

2. The combination and arrangement of the bands b and stocking-supporters *g h i k*, substantially as above set forth.

3. The combination and arrangement, with the bands b, of the band *c*, substantially as and for the purposes hereinbefore described.

4. The arrangement of the bands b and abdominal supporters *d*, both made of the same piece, or each separately, substantially as and for the purposes above specified.

5. The arrangement of the bands b with the abdominal supporter *d* and band *c*, substantially as and for the purpose before set forth.

6. The combination and arrangement of the under-vest *a a'*, bands *b c d e*, and stocking-supporters *g*, the whole being combined, arranged, and constructed as set forth.

143,003.—Ice Breaker and Fender.—FREDERICK FORD, Point Pleasant, W. Va. Application filed July 18, 1873.

Claim.—The detachable ice fender or breaker A, having the front tapered to a point, and the edges of the rear inclined inwardly, and the surface of the fender beveled and covered with iron, and provided with rings *m* to receive the cable *n*, by which it is attached to the bow of the vessel, the whole constructed and applied substantially in the manner and for the purpose as shown and set forth.

143,004.—Smoke-Burning Furnace.—SAMUEL A. FORD, Chicago, Ill. Application filed August 18, 1873.

Air is heated to the desired temperature in a series of chambers; is then emitted through small orifices, and by commingling with the volatile gases and smoke assist in their consumption in the combustion-chamber.

Claim.—The combination of the air-chambers D, E, and H, the discharge-openings F F, I I, and O O, and the steam-pipe J, constructed, arranged, and operating in the manner and for the purpose set forth.

143,005.—Core-Bar for Castings.—DANIEL GALLAGHER, Cincinnati, Ohio. Application filed June 21, 1873.

Stationary arms are attached to the shaft and provided with inclined ends, which match the inclined lugs attached to the sections of the bar, expanding them by a longitudinal movement. Toggle-arms are connected to each section and to a loose collar upon the shaft, which holds the sections in position by means of a key inserted through an intermediate opening in the shaft.

Claim.—1. The sections A and shaft B, connected together by toggle-arms C, in combination with the rigid arms D, whose inclined outer ends act upon inclined lugs *a* of the sections A, substantially as and for the purpose specified.

2. The core-bar, composed of the sections A *a*, shaft B, toggle-arms E, and rigid arms D, in combination with the toggle-arms E, loose ring F, and key G, substantially as and for the purpose specified.

143,006.—Feed and Blow-Off for Steam-Boilers.—ROBERT P. GARSED, Norristown, and ISAIAH D. BUCK, Philadelphia, Pa.; said BUCK assigns his right to said GARSED. Application filed August 2, 1873.

Water is forced into the boiler at the top and conveyed to the bottom of the same by pipes leading through the steam-space and heated water, where it is discharged through a perforated pipe. When used as a blow-off the perforated pipe collects all the sediment lying at the bottom of the boiler, which is discharged through a cock provided for said purpose.

Claim.—The combination of the pipes B, C, and D, arranged and operating as either or both feed and blow-off for steam-boilers, substantially as herein described.

143,007.—Steam-Generator.—RICHARD GERNER, New York, N. Y. Application filed July 14, 1873.

A steam-generating coil is located in the fire-chamber connected to a generating steam-cylinder. The lower end of said coil and a pipe from the cylinder are connected to a vertical pipe, and also to an additional pipe containing a pump and check-valve, by which means the water is forced from the cylinder through the coil, thus keeping up a rapid circulation of the water, and thereby causing a rapid generation of steam. The end of the coiled pipe entering the boiler is provided with a perforated diaphragm, causing the water as it enters to spray.

Claim.—The combination of steam-boiler G, having two water-inlets and one outlet, coiled tube H having diaphragm or disk K, tube I connected with tube L and pump J, and tube I', also connected to tube L and pump J, and to boiler G, all arranged substantially as described.

143,008.—Steam-Engine Cylinder.—HENRY GERNER, New York, N. Y. Application filed July 10, 1873.

The cylinder is made of wrought-iron with thick wooden bands around it. Said bands are strengthened by iron rings. The cylinder-heads, valve seat, and chest are made separate, of cast-iron.

Claim.—The steam-cylinder A, with wooden bands B B and metal bands C C, in combination with the steam-chest D with ports *e e*, and heads F F with passages *g g*, substantially as and for the purposes hereinbefore set forth.

143,009.—Fly-Wheel.—HENRY GERNER, New York, N. Y. Application filed September 3, 1873.

Claim.—As a new article of manufacture, the fly-wheel D C A, having the rim cast hollow, and with openings *g g* filling the same, substantially as and for the purposes described.

143,010.—Machine for Bending Truck-Sides for Railway-Cars.—J. HENRY HELM, Pittsburg, Pa. Application filed June 16, 1873.

The upper die and the central section of the lower die are provided on their rear sides with lugs, through which passes a bolt which couples them together. The side sections of the lower die slide over two adjustable rests, and are coupled to the central section by means of gear-teeth and coupling-links.

Claim.—1. The combination of the male die B with the female die, consisting of sections I m m, hinged and geared together through the medium of links l and gear-teeth *c*, substantially as described, and for the purposes set forth.

2. The section I of the female die, provided with plate *f*, and coupled with the male die B through the medium of the lugs *a c* and coupling-bolt *e*, as herein described, and for the purpose set forth.

3. The combination of the adjustable rests *n* with the sections m of the female die, substantially as herein described, and for the purpose set forth.

143,011.—Car-Coupling.—JOHN F. L. HOLMAN, Hamilton, Canada, assignee of one-half his right to EDWIN HEMWOOD, same place. Application filed March 14, 1873.

When the draw-heads approach near enough, the link in one striking the beveled face of the "tooth" in the other depresses and passes over it, when the "tooth" is thrown back into position by the weight on its lower end, and confines the link in the draw-head. Uncoupling is effected by means of suitable chains and pulleys.

Claim.—1. In combination with the bumper-head B, the weighted tooth or pin C pivoted between the lugs E, for operation, in respect to the link of a car-coupling, substantially as herein set forth.

2. In combination with the weighted tooth or pin C and bumper-head, the chain L, pulleys I I, and link-guide F, to operate substantially as described.

143,012.—Breech-Loading Fire-Arm.—HENRY H. HORNE, Norwich, Conn. Application filed June 3, 1873.

Claim.—The combination of the barrel, stock, and hammer, and the friction-stop *d*, with the swinging breech-piece A, formed of a plate of metal in which is the aperture A, and safety-notch *i*, as and for the purpose specified.

143,013.—Elevator.—GEORGE W. HUMMEL, Philadelphia, Pa. Application filed September 26, 1872.

By means of a valve operated by an attendant in the car, through the medium of a handle, shafts, gearing, and a hollow funnel-shaped piece of the valve, and connected by tubes with the upper and lower portions of the well, the air may be directed into the well beneath the car, thus forcing it upward and allowing the air above the car to escape; or it may be directed into the well above the car, thus forcing it downward; or it may be entirely cut off and the car be held in a stationary position. The movement of the handle, through a connecting-sleeve and attached eccentric, and arrangement of rods and joints, throws the shoes of a brake against the walls of the well, and assists in holding the car.

Claim.—1. The tubes or tubes L, M, and K, communicating from the common chamber W to the two extremities of the well B B.

2. The valve H, constructed and operating substantially in the manner and for the purpose described.

3. The devices, substantially as described, by which the brake N and valve H are simultaneously operated, in the manner and for the purpose described.

4. The doors V, swinging inwardly, in combination with the vertically-moving car A, as and for the purpose described.

143,014.—Screen for Middlings-Purifiers.—WILLIAM W. HUNTLEY, Silver Creek, N. Y., assignor to W. W. HUNTLEY, A. P. HOLCOMB, and AUG. HEINE, same place. Application filed December 30, 1872.

A series of sections, covered with cloth of different numbers or degrees of fineness, are interchangeable and reversible in the frame that supports them, so that the same belt or sieve may be used while grinding different qualities of grain.

Claim.—A belt or sieve, consisting of a series of longitudinally-interchangeable and reversible sections, said sections being covered with bolting-cloth of different numbers or degrees of fineness, substantially as and for the purpose set forth.

143,015.—Fan Attachment for Sewing-Machines.—RICHARD JACKSON, Philadelphia, Pa. Application filed June 14, 1873.

Claim.—The combination of the fan A, bent wire C, and clamp D with the needle-bar E of a sewing-machine, substantially in the manner and for the purpose above set forth.

143,016.—Stripper.—WILLIAM E. JACOBS and FELIX A. JACOBS, Columbus, Ohio. Application filed July 5, 1873.

The stripper-bowl is attached to the journal and ball by extensions, so that when the handles are raised to a vertical position the rear extensions of the bowl will be released from the holding-down bar, and the bowl allowed to revolve and empty itself. When the revolution is completed the rear extensions will be caught by the holding-down bar, and the elevated spring-latch will hold the bowl up to the proper position.

Claim.—1. A revolving stripper-bowl, having its handles B B and ball J connected to its sides by means of extensions G G, in combination with extensions r r, the holding-down bar C, and a holding-up latch, *d*, substantially as described.

2. The spring-latch *d*, latched, as shown, upon the stripper C, in combination with the beveled cheek *c* on the revolving stripper-bowl, substantially as specified.

143,017.—Steering Apparatus.—BENJAMIN KING, Philadelphia, Pa. Application filed February 19, 1873.

The drum or cylinder, around which are wound the ropes or chains leading from the steering-wheel, is [illegible] the rudder-post by means of tongues and grooves, [illegible] on the upper portion of the rudder-post and [illegible] the drum and ropes or chains always retain the same [illegible] during the rising and falling of the rudder.

Claim.—The combination, with the extended upper portion of the rudder-post F, and the drum or cylinder E, of the tongues and grooves *f f*, constructed, arranged, and operating substantially as and for the purpose set forth.

143,018.—Fire-Shovel.—FRANK M. KINCHAM, Indianapolis, Ind. Application filed January 28, 1873.

A shovel adapted to be thrust under the mouth of the [illegible] der of a base-burning stove, in order to support the [illegible] while the fire-space is being cleaned out. The handle, resting on the door-space, is supported by an adjustable brace.

Claim.—The arm *b c* and the slide *d*, in combination with the perforated handle *e e'* of a shovel, constructed and arranged substantially as herein set forth.

143,019.—Cultivator.—WILLIS LEWIS, Oxford, N. C. Application filed April 3, 1873.

A center beam with diverging side beams, supplied with curved harrow-teeth, followed by disk shares, one in each beam. A semicircular blade is placed behind the shares, whose length is as wide as the rear end of the machine. A rake is attached by links to the rear end of the beams, for removing weeds.

Claim.—The combination of the solid-water-teeth D D', semicircular blade C, and rake E, as described.

143,020.—Condenser for Carding-Machines.—NOAH LUCAS, Norwich, assignee of one-half his right to BENJAMIN LUCAS, Preston, Conn. Application filed March 28, 1873.

Claim.—The combination and arrangement of vertical disks, the faces of one revolving in an opposite direction to the other, their two faces forming an acute angle, between which the sliver is guided to the vertex of the angle, where it is condensed into roving for spinning, substantially as herein set forth.

143,021.—Setting Diamonds or Carbon Points for the Faces of Metal Tools.—WILLIAM MCKENNA, Boston, Mass. Application filed March 28, 1873.

Claim.—The herein-described method of securing diamonds or carbon points in metal tools by means of wedges made from horseshoe-nails or metal of like quality, substantially as set forth.

143,022.—Nail-Plate Feeder.—JOHN MCKENELY, Pittsburg, Pa. Application filed August 13, 1873.

The griper-rod passes through a double socket, from which project, in opposite directions, two arms that are alternately struck by an arm made to revolve by a connection with the main shaft. This device parts the plate after each cut, it being fed up by a weight in the usual manner.

Claim.—The arms A, provided with the sockets B and C, mounted in bearings D, in combination with the spring and support E, and rotating lever *f*, and tong *g*, the several parts operating with relation to each other, substantially as herein described, and for the purpose set forth.

143,023.—Jeweler's Hand-Press.—JOHN MCWILLIAMS, Providence, R. I. Application filed May 13, 1873.

Back lash, resulting from wear of the screw, is avoided by means of the plate E and screws *d d*; wear of the face of the screw is diminished by placing it in contact with a hard steel stop, F, and the extent of the descent of the punch is regulated by the set-screw I.

Claim.—1. The combination of the screw C, collar *c'*, plate E, screws *d d*, and plunger D, substantially as described.

2. The combination of the hand-wheel B, many-threaded screw C, sliding plunger D, lug H, adjusting-screw I, and male and female dies, the whole operating substantially as described.

143,024.—Clothes-Pin.—HENRY MELLEN, Walpole, N. H. Application filed July 31, 1873.

The pin has a flexible prong and a rigid prong. Between the two is a spring-bar attached to the flexible prong, which clamps the line.

Claim.—A clothes-pin constructed of the open flexible prong A, the rigid prong B, with a suitable body to form the pin, as described.

143,025.—Blowing-Machine.—HIPPOLYTE MICHAUX, Higganum, Conn. Application filed October 18, 1871.

The plate to which the finger-bar is attached is hinged to the cutter-frame, and supports the slide, links, and lever, by which the cutter-bar is driven.

Claim.—The combination of the swing-block *c'*, bar *c''*, link *c'''*, lever *d'*, link *d''*, cutter-bar *c*, and finger-bar *c'*, the whole constructed, arranged, and designed for operation and use, substantially as described.

143,026.—Stitch-Fastener.—OSCAR W. NOBLE, Waltham, Mass., assignor to himself and JAMES W. HANSON, same place. Application filed August 23, 1873.

A bar at right angles to the plane of the saddle is furnished at its inner end with a bolt, and also a guiding-shank surrounded

by a coil-spring. The outer end has an arm projecting from the face-plate at right angles thereto, and is locked over it by means of a notch, which is forced over its edge.

Claim.—The thumb-piece *d*, passing through the face-plate of the casing, and provided with a notch or catch, in combination with the arm *c*, bolt *a*, and its spring or springs, all constructed and operating substantially as and for the purpose set forth.

142,027.—Sewing-Machine.—JOSEPH P. NOYES, Binghamton, N. Y. Application filed September 5, 1872.

Machine makes lock-stitch. The under thread is contained on an ordinary spool placed within a spool-case balanced or supported on levers that are alternately removed from contact with the cone to allow the passage of the loop of needle-thread, said loop being carried about the cone by a rotating hook.

Claim.—The combination, with a rotating hook, of the spool-case and supporting-levers, or their equivalents, operating substantially as and for the purpose described.

142,028.—Traction-Engine.—LOFTUS PERKINS, Seaford Street, Gray's Inn Road, England. Application filed January 21, 1873.

The boiler and engine are supported upon a centrally-arranged driving-wheel, which is secured to a circular frame, the same turning within a horizontal ring attached to the end of the body of the truck. A condenser is attached to the rear of the truck, and by means of flexible joints is connected with the boiler.

Claim.—1. The combination of the circular frame, the boiler and engine mounted thereon, the central driving-wheel which supports the circular frame, the main carriage-frame, and the horizontal ring rigidly secured to the main carriage-frame and connecting the circular frame and the main carriage-frame, the whole constructed to operate substantially as before set forth.

2. The combination of the circular frame, the boiler and engine mounted thereon, the central driving-wheel which supports the circular frame, the main carriage-frame, the condenser mounted upon the said main carriage-frame, and the horizontal connecting-ring rigidly secured to the main frame, the whole constructed to operate substantially as before set forth.

142,029.—Wheel for Vehicles.—THOMAS W. PORTER, Boston, Mass. Application filed June 30, 1873.

Claim.—1. A metallic spoke and felly coupling formed tubular through its whole length and provided with the adjustable screw-shoulder *d*, substantially as described and shown.

2. The insertible flanged plates *l m*, in combination with the outer shell, substantially as described and shown.

3. A hub divided transversely and having two metallic parts, *f g*, with the bosses *p* so formed upon one or both parts as to separate the spokes at the outer periphery of the hub, and having entire metallic spoke-sockets, and the parts *f g* being united by rivets passing through the bosses, substantially as described and shown.

4. A transversely-divided hub, the metallic portions of which constitute the entire outer wall or surface thereof, and have transversely-divided wood filling and the bosses *p* formed upon one or both of the said halves, substantially as described and shown.

142,030.—Wagon.—THOMAS W. PORTER, Boston, Mass. Application filed June 30, 1873.

The angle-plate, for the protection of the rear end of the wagon-body, is adapted to receive the end of the skid.

Claim.—1. The angle-plate *c*, formed to envelop the ends of the bed-plank, and with the skid-rest 3, substantially as described and shown.

2. The corner shield *b*, formed with the raised curb-socket *e*, and to receive the curb-plate, all substantially as described and shown.

3. The elbow *h*, formed cellular, and with sockets for curb *f* and cants for plate *g*, substantially as described and shown.

4. The metallic rocker *i*, formed with the plate 1, supports 2 3, and base-plate 4, substantially as described and shown.

142,031.—Foot-Rail for Carriages.—THOMAS W. PORTER and HENRY K. PORTER, Boston, Mass. Application filed June 30, 1873.

The rail is adjustable to vehicles of different widths.

Claim.—1. A foot-rail bar formed with a longitudinal groove, *h' m'*, substantially as and for the purpose described and shown.

2. A foot-rail bracket formed with a slot, *f'*, substantially as and for the purpose described and shown.

3. An adjustable foot-rail formed with groove *h' m'* and slot *f'*, substantially as and for the purpose described and shown.

4. Foot-rail brackets formed with a riveting-pivot, *n'*, substantially as and for the purpose described and shown.

142,032.—Carpet-Stretcher.—HENRY POWELSON, New Brunswick, N. J. Application filed April 14, 1873.

A plate with points set diagonally on its lower side, with a hollow handle extending upward from it, having a pointed spike or awl passing through it for holding the carpet, after stretching, to be nailed.

Claim.—The awl or spike A and hollow handle B, in combination with the plate C applied to carpet-stretchers, in the manner and for the purpose substantially as herein set forth, shown, and described.

142,033.—Sewing-Machine.—GEORGE T. RIDDLE, St. Louis, Mo. Application filed August 11, 1873.

The saws are hung upon opposite ends of revolving arms. They are thus brought alternately in contact with the material to be cut.

Claim.—The saws P P, at the ends of the arms M M, attached to the shaft L, in combination with the shaft D carrying the pulleys E F, the shaft I carrying the pulley H, and pinion J engaging with gear-wheel K and the belts G K, whereby the saws have simultaneous rotation on their axes O O, and continuous revolution around their common shaft L, all as herein shown and described.

143,034.—Rocking Grate.—JAMES SEDDON, Susquehanna Depot, Pa. Application filed July 29, 1873.

The hollow bar, having hollow arms, is provided with trunnions, and a valve at one end to prevent the escape of water when the grate is rocked.

Claim.—1. The hollow bar K, having hollow arms and provided with trunnions on one end, which have a bearing in the cross-bar, in combination with the circular recess in the opposite end of the bar, which is connected to the water-pipe A, substantially as shown and described.

2. The combination of the hollow grate-bar K, tube A, valve-cage B with plug F, valve D *b*, and spring C, all constructed and arranged substantially as and for the purposes herein set forth.

143,035.—Bed-Bottom.—WILLIAM W. SKAATS, Cincinnati, Ohio, assignor to JAMES D. HENRY, same place. Application filed November 18, 1872.

A bed-bottom formed of rings and links, with springs at the ends, is attached to the cross-bars by hooks, one set of the hooks being double to regulate the tension.

Claim.—In combination with the attaching hooks *e* and the double tension-hooks *f*, the springs S, links *l*, and rings *i*, constructed and arranged as described, for the purposes set forth.

143,036.—Corn-Planter.—ARTEMAS M. SMITH, Chillicothe, Mo. Application filed February 3, 1873.

The rear side of the chamber beneath the seed-cup slide, through which the seed is conducted to the furrow, is a screen for the purpose of viewing the valve within.

Claim.—The screen F, for the uses and purposes substantially as shown and described.

143,037.—Tent.—JONAH B. SMITH, Chicago, Ill. Application filed July 23, 1873.

Claim.—The box A B, constructed with respect to the superficial capacity of a tent, and adapted to be used as a support and floor of the same, and also as a receptacle for packing the tent away, substantially as described.

143,038.—Propelling Canal-Boats.—OLIVER C. SMITH, Ipswich, Mass. Application filed July 17, 1871.

Bevel-gears and vertical and horizontal shafts are arranged on a rotating frame, and are so combined as to form a joint, by which universal motion is given to a frame supporting on its end the driving mechanism. The driving mechanism receives motion from the boat, and acts upon a rail on the banks of the canal.

Claim.—1. The arrangement of bevel-gears, vertical and horizontal shafts and frames, when combined substantially as described, so as to form a joint by which a movable arm can be turned around the shaft as an axis, and raised or lowered at the opposite end.

2. The pinion-shaft O, arranged to oscillate in its bearings, so as to keep it perpendicular with the rack S.

143,039.—Apparatus for Charging Gas-Retorts.—JOHN SOMERVILLE and JOHN ROBINSON, Dublin, Ireland. Application filed October 24, 1872.

By means of a grooved rail-track and a steam-engine in the retort-house a series of trucks carry the scoops and rakes for charging and drawing the retorts. The coal is carried up by means of an elevator.

Claim.—1. The combination of the cradle D, having detents or stops arranged in pairs on rocking-spindles, with the vertical rakes and the operating-levers, as described.

2. In a machine of substantially the described construction, the employment of a water-trough and pipes, as and for the purpose set forth.

3. The revolving tool, provided with cutters, as described, and adapted to receive a stream of water, as and for the purpose described.

4. The combination of the duplex scoops, constructed and arranged as described, with the arm *b* and bar *c*, as and for the purpose described.

5. The saddle V, having a drum adapted to take up the slack or let out the chain as the cradle D moves vertically, in combination with the scoops E, as described.

6. The combination of the coiled spring in box *a'*, and pinions *a² b' c'''* with the scoops, the stop *z*, and catch *y*, as described.

7. The combination of the rake *f* and U-shaped bar *d* with the bar *c*, sleeve K, and link *l*, as described.

8. The combination of the elements of the seventh claim with lever *o*, having stud A, lever *m*, and spring in box *j*, as described.

143,040.—Water-Wheel.—JOSEPH TANEY, Bangor, Me. Application filed September 5, 1873.

A water-wheel with spiral vents above and below at the outer rim, and a central discharge, so that the water will act upon it both by impact and pressure.

Claim.—A water-wheel having the curved vents *c* in its outer rim, and the central vents *i*, substantially as herein shown and described.

143,041.—Fire-Heater.—RODERICK F. THOMPSON, Batavia, N. Y. Application filed January 27, 1873.

The heater is situated vertically upon a stove that has an opening on top. A slide can be made to close this opening when the heating-drum is not in use, in which case the smoke passes up on the outside of the drum through a flue, to the chimney of the drum.

Claim.—The combination of the stove A, cover B, drum C, and flues D and *f* with their respective dampers, the whole arranged substantially as and for the purpose specified.

143,042.—Self-Closing Faucet.—JOHN W. TRAFTON, Chicopee Falls, Mass. Application filed December 18, 1872.

A faucet operated by a spring attached to a crank, the tension of said spring regulated by a polygonal bush, both spring and crank causing the faucet to close, if accidentally left open.

Claim.—The shaft *g*, crank *i*, spring *l*, and polygonal bush *n*, in combination with the valve *d* and body of the cock, substantially as set forth.

143,043.—Balanced Slide-Valve for Steam-Engines.—JOHN F. WALLACE, Pittsburg, Pa. Application filed June 12, 1873.

The valve is prevented from wearing round on its face by lengthening the seat and making the ports wider toward their outer ends. A flexible and balance plate is provided to prevent under pressure to the upper surface of the valve. The valve is also provided with steady-pins and devices for carrying off the waste steam that may leak through the valve-packing.

Claim.—1. The combination of the lengthened valve D with the valve-seat, having the steam-ports enlarged in it their entire width, substantially as herein described, and for the purpose set forth.

2. The combination of the balancing-plate *f*, packing-ring *e*, flexible plate *n*, bolts *j*, and jam-nuts *l* with the slide-valve D, substantially as herein described, and for the purpose set forth.

3. The combination of the set-screws F and springs *s* with the packing-ring *e* and flexible plate *n*, substantially as herein described, and for the purpose set forth.

4. The bolt *j*, provided with an opening, *w*, through it, in combination with the stop-cock *i*, balancing-plate *f*, and packing-ring *e*, substantially as herein described, and for the purpose set forth.

143,044.—Toy-Whistle.—JASON WATERS, West Sutton, Mass. Application filed April 28, 1873.

A series of hollow chambers, of different diameter, arranged together lengthwise, to be whirled through the air at the end of a string held in the hand.

Claim.—1. The rotating toy-whistle, constructed substantially as described, consisting of a series of conical chambers, B, provided with apertures A, substantially as set forth.

2. The rotating toy-whistle, constructed substantially as described, being the combination of a series of air-chambers of different diameters, B, with apertures A, as herein substantially set forth.

143,045.—Governor-Valve.—HORATIO B. WEAVER, Hartford, Conn. Application filed June 18, 1873.

The valves are attached to separate rods, the one passing through the other, and are operated independently by means of a governor.

Claim.—The combination of the barrel *a*, the ingress and exit pipes, valves *c* and *c'*, and valve-rods *d* and *d'*, all constructed, arranged, and designed for operation and use, substantially as described.

143,046.—Thread-Cutting Mechanism for Sewing-Machines.—ALEXANDER WEBBER, Lynn, Mass. Application filed May 15, 1873.

The cutter is shown as applied to a machine for sewing shoes, and when the lever is depressed to raise the presser from the work, the knife, through the described connections, is moved to sever the thread.

Claim.—The swinging knife-holder *n'*, having the knife *n* and arm *g* journaled in the adjustable standard *p*, and connected by the rod *r* with the bent arm or lever *s s'*, in combination with the vertical rod or plunger *k*, spring *u*, and lever *g*, substantially as described, for the purpose specified.

143,047.—Game Apparatus.—FREEBURY WEST and GEORGE S. LEE, Worcester, Mass. Application filed July 24, 1873.

To a game substantially like croquet are added glancing-boards or cushions, upon which to make carom shots.

Claim.—The rubber or wire cushioned rail E E and glancing-boards F F, constructed and arranged as shown, in combination with a field-game apparatus, substantially as described.

143,048.—Fire-Kindler.—EDWARD P. WHEELER, Corinth, Miss. Application filed August 27, 1873.

Claim.—A fire-kindler composed of clay, asbestos, and furnace-slag, substantially as and for the purpose hereinbefore set forth.

143,049.—Gathering and Ruffling Attachment for Sewing-Machines.—JOSEPH WEBB, Watertown, N. Y., assignor to THE DAVIS SEWING-MACHINE COMPANY, same place. Application filed August 30, 1873.

The gathering-blades are supported at the lower end of an elastic or spring bar secured by a screw to the supporting-plate attached to the head of the machine. The elastic arm is pressed from the needle by a reciprocating inclined bar, and carries the material toward the needle when allowed to spring back.

Claim.—1. In a gathering and ruffling attachment for sewing-machines, the combination, with a clamp or supporting-plate adapted to be fitted and fastened to the sewing-machine head, of an arm, in itself a spring, carrying on its lower end the gathering-blade or blades, or gatherer proper, and rigidly [illegible] at or near its upper end to said clamp, as herein shown and described, said arm being adapted to operate in connection with the sewing-machine needle-bar, or other part moving in unison therewith, or so as to derive a vibratory motion therefrom, substantially as described.

2. The combination, in a gatherer or ruffler for sewing-machines, of a clamp or supporting-plate adapted to be applied to the head of the sewing-machine, and a spring-arm carrying the gathering devices and removable from and vertically adjustable on said plate, substantially as herein shown and set forth.

3. The spring-arm, carrying on its lower end the gathering device proper, and at a point intermediate between its ends bent inwardly or toward the needle-bar or other moving part from which its movement is derived, the thumb-screw or its equivalent, by which the throw of the said arm is regulated, being located on the spring-arm at this point, substantially as shown and described.

4. The combination, with the supporting-plate and the spring gathering-arm, of a regulating-screw on the said arm, and a stop-piece on said plate for the purpose of arresting the forward movement of the arm at any desired point, substantially as shown and described.

143,050.—Disengaging Towing Apparatus for Boats.—JOHN H. WYBART, CHRISTOPHER PEMBTON, and CASPER J. WESTERVELT, Hackensack, N. J. Application filed February 28, 1873.

Claim.—The lever and brake L B, in combination with the boat, for the purpose of dislodging the chain or cable from the side-grooved rimmed wheel W.

143,051.—Knitting-Machine.—CHARLES H. YOUNG, Lake Village, N. H., assignor to JOHN S. CHASE and BENJAMIN F. PEARSON, same place. Application filed February 24, 1873.

For cutting apart the stocking-feet, produced as described in patent No. 136,140, August 6, 1872, and while knitting them. A disk, toothed so as to gear with and be revolved by the needles, carries the knives, which are brought, by the revolution of the disk, into the vacant spaces in the circle of needles, and raised by a cam on the disk to cut the loose threads in such spaces. The knives are so connected as to operate like shears. The step motion shifts the driving-belt on the completion of a determined length of web. The rim or flange is to prevent displacement of the needles, by the inward strain of the work, when their holding-plates are removed for any purpose.

Claim.—1. The cutter or cutters B C, arranged and operating substantially as herein described, in combination with the needle-cylinder A and needles *a a*, substantially as and for the purpose herein specified.

2. The automatic stop, composed of the spring-catch *c*, lever K, and rod L, or their equivalents, operating in combination with the belt-shipper G and work-suspending swivel M, substantially as and for the purpose herein specified.

3. The rim or flange *y* on the needle-cylinder A, arranged in combination with the needles *a a*, substantially as and for the purpose herein specified.

143,052.—Flexible Vertically-Extensible Attachment for Boats.—JOHN R. ADAMS, Oakland, Cal. Application filed July 12, 1873.

Flexible material is attached to the gunwale of a boat, which has notched standards and an adjustable hook, to which the upper or outer edge of the material may be fastened, thus affording a shield and protection to the passengers.

Claim.—The upright supports B having adjustable hooks *a* and notches *b* combined with lateral pieces D having top and side coverings C E, as and for the purpose described.

143,053.—Machine for Manufacturing Carpet-Linings.—EDWARD H. BAILEY, Brooklyn, N. Y. Application filed August 9, 1873.

The odoriferous powder is contained in a reciprocating box or hopper placed over the fiber-feeding apron.

Claim.—1. The combination, with a carpet-lining machine, of apparatus, substantially as described, for sprinkling odoriferous powder with the fibrous material before it is inclosed by the paper, but during the process of making the lining, substantially as specified.

2. The combination of the reciprocating box I, pan N, and the contrivance for actuating the box, substantially as specified.

3. The paste troughs and rollers arranged to rise and fall under the paper-rolls, and provided with cords and weights, and the brush-rollers provided with the gage-rollers to act upon the paper-rolls, substantially as specified.

143,054.—Bench-Hook.—DANIEL BOYCE, North Providence, R. I. Application filed March 3, 1873.

The hook is operated by a rack and endless screw.

Claim.—The combination of the bench-hook B provided with a rack, F, the worm-wheel E, and handle D, all constructed substantially as and for the purpose indicated.

143,055.—Cow-Coupling.—WILLIAM A. BOYDEN, Harrisburg, Pa. Application filed May 29, 1873.

The coupling-pin is jointed to a lever which is held down by a flat spring and raised by the center arm of the rock-shaft.

Claim.—The combination and arrangement of the rocking-shaft B provided with levers D D, and lifting-arm F with the lever G, and swinging connecting-pin I, substantially in the manner and for the purpose above described.

143,056.—Device for Raising Sunken Vessels.—LEWIS W. BOWEN, Chicago, Ill., assignor of two thirds his right to TIMOTHY M. CURTISS and HENRY H. LADD, same place. Application filed May 19, 1873.

An endless rope passes around a windlass secured on the floating vessel, and through a pulley-block firmly attached to the sunken ship. Buoys or barrels have a line permanently fastened to each of them, at the ends of which lines is attached a metallic staple. As the windlass is revolved hooks, which are fastened at intervals on the rope, may be made to engage with the buoy-lines, and thus drag the buoys successively down to the sunken vessel, where they are secured by a diver driving the staples into the vessel to be raised, until sufficient number of buoys are attached to float the ship.

Claim.—The combination with the vessel A, the windlass B, rope C, pulley c, and hooks d, as described, the rope acting to draw the barrel down through the water, substantially as specified.

143,057.—Piston-Packing.—JOHN C. BUDD, Union township, Bergen county, N. J. Application filed March 3, 1873.

Two split rings, one fitting in the packing-box, the other around the piston-rod, rest on the fibrous packing. A washer forces the smaller soft-metal ring against the larger ring, and close to the piston-rod, preventing the escape of the fibrous material.

Claim.—1. A cut metallic ring, constructed substantially as described, for packing piston-rods, as set forth.

2. The soft-metal ring *l*, arranged in relation to the rod C and washer e and ring u, substantially as described, whereby the soft-metal ring is compressed upon the rod to prevent the escape of the packing material, and to receive the wear caused by the friction of the rod, as herein set forth.

3. The herein-described packing for piston-rods, consisting of the washer e and the rings t and u, with the fibrous material, all constructed and arranged to operate substantially as set forth.

143,058.—Cooler for Water.—JOHN E. CAMMEYER, Brooklyn, N. Y. Application filed July 16, 1873.

A supply-pipe conveys water into a conical vessel driven into the earth, and when the water has become cooled it may be withdrawn through a delivery-pipe whose lower end extends nearly to the bottom of the conical vessel.

Claim.—A tubular water-cooling vessel provided with a conical point, so as to be forced down into the earth, and to which vessel the pipes b and c are connected, as set forth.

143,059.—Refrigerator.—CHARLES CAMP, Mount Haven, N. Y. Application filed June 23, 1873.

A revolving perforated shaft provided with swinging shelves communicates with an ice-chamber, and is held in any desired position by a screw.

Claim.—1. The removable ice-box C, in combination with the box A and removable partition B of a refrigerator, substantially as herein shown and described.

2. The hollow perforated shaft F, the four-armed plates or spiders I, and the swinging shelves J, in combination with the box A, the removable partition B, and the ice-box C, substantially as herein shown and described.

3. The combination of the set-screw K with the perforated hollow shaft F that carries the swinging shelves J, substantially as herein shown and described.

143,060.—Washing-Machine.—ARTHUR M. CAMPBELL, Kline's Grove, Pa. Application filed July 19, 1873.

Claim.—1. The quadrangular frame C C, having legs B, embracing and combing the rude-box A, and forming the bearings of the crank-shaft O, as shown and described.

2. The combination of the U-spring K with the lever J and cam I of the pressure-board, and with the pivot-pin thereof, as and for the purposes specified.

143,061.—Device for Generating and Burning Hydrocarbon Vapor.—CALVIN CARPENTER, Jr., Seekonk, Mass., assignor of one-half his right to JAMES F. MADELL, Providence, R. I. Application filed June 23, 1873.

Steam and gas are generated together in the same boiler. After being used as a motive power the compound passes into a receiver, thence through a superheating coil in the furnace into an annular chamber, and is burned from nozzles projecting therefrom into said furnace. Gas which is not consumed is condensed by a gas-trap, passes through a water-tank.

Claim.—The combination of exhaust-chamber N, the still-worm U with water-tank condenser T, the pipe-coil O, and nozzles S S, for the purposes of regulating and applying the hydrocarbon-laden vapor of steam, as fuel, as specified and set forth.

143,062.—Faucet Attachment.—JAMES CHURCH, St. Louis, Mo. Application filed April 12, 1873.

A cup fixed with an india-rubber disk surrounds the faucet at the point where it enters the vessel, a tight joint being secured at this point by means of an india-rubber band.

Claim.—In combination with a faucet, a waste-receptacle composed of the cup A, with flexible rim F and bottom E, as shown and described.

143,063.—Broom-Manger.—MARY A. CLIFFORD, Boston, Mass. Application filed July 26, 1873.

A spring-hand for encircling a broom-handle has a spring-loop attached to it by eyes.

Claim.—The two expansible springs A B, combined in the manner described, to form a hanger for brooms and other articles.

143,064.—Pruning Instrument.—WILLIAM H. COLLINGS, Raytown, Mo. Application filed May 10, 1873.

A hook embraces the limb and holds it firmly while a saw is operated by means of a shaft, which has a vertical movement within the handle of the hook.

Claim.—The hook H and saw I, combined with the hollow socket A and a rod, B, movable in said socket, as and for the purpose set forth.

143,065.—Whip.—FREDERIC P. COMBS, Westfield, Mass. Application filed June 25, 1873.

Claim.—In a whip, the screw A, the ferrule C, the handle B, the braiding c, and the stock D, arranged and combined as set forth.

143,066.—Fire-Kindler.—JOHN C. CROMPTON, Allegheny City, Pa. Application filed July 16, 1873.

Claim.—A fire-kindling pile or faget, composed of a series of wooden blocks or strips, fastened together with intermediate air-spaces, and coated wholly or partially with a resinous or oleaginous compound and sawdust, substantially as set forth.

143,067.—Saw-Sharpening Device.—JOHN B. DRAKE, Goshen, Ind. Application filed March 28, 1873.

Claim.—The file-guide B, having, at one end, jaws C C, to hold the file, and rounded at the other, to slide in a hole, combined with a guide, F, that is adjustable laterally with the frame G H, as and for the purpose described.

143,068.—Tap-Holder Attachment for Beer-Coolers.—JOSEPH HYDE FISHER, Chicago, Ill. Application filed August 23, 1873.

The rubber packing-ring is clamped between two metal rings by means of screws, and projects within their inner circumferences so as to closely fit the faucet and prevent the escape of cold air from the cooling-box.

Claim.—A packing for tap-holes of beer-coolers composed of the metal clamping-rings D E and rubber packing-ring F, arranged in two parts, of which one is fastened to the box, and the other to the door, in connection with the tap-hole, substantially as specified.

143,069.—Barge-Pump.—CHARLES P. GAVER, Ashland, Ky. Application filed February 25, 1873.

The valves are hinged at opposite sides of the opening in the base-plate, meeting in the middle of the opening and resting on rubber packing, such arrangement allowing the valves to open inward and allow a stream of water the full size of the bore of the tube to enter when the pump-piston is lifted.

Claim.—The combination, with the tube D and base A, of the valves F F and packing H, substantially as and for the purpose hereinbefore set forth.

143,070.—Atomizer or Vaporizer.—JOHN H. GERARD, New York, N. Y. Application filed August 4, 1873.

A flexible bulb on top of the vessel containing the liquid to be vaporized or "atomized" forces a jet of air down upon the liquid so as to force the liquid up through the discharge-pipe, and another jet of air along with the small stream of outflowing liquid so as to convert it into spray.

Claim.—1. The combination in a vaporizer of an air-nozzle surrounding the liquid-nozzle and arranged to concentrate the air-blast upon the liquid-jet, in the manner described.

2. The collapsible bulb attached to the hollow stopper by stretching the mouth over the head into the groove C, substantially as specified.

3. A vaporizer having the air-inlet at the ejecting-nozzle so as to dispense with the inlet-valve, substantially as specified.

143,071.—Ironing-Table.—WALTER B. GROSS and SIMON H. FORNEMAN, Reading, Pa. Application filed August 26, 1873.

The table is formed of a frame with four hinged legs, held by braces. One brace is hinged to the ironing-board, which is hinged to a board that is permanently attached to the frame. The other end of the ironing-board rests on a movable end piece.

Claim.—An ironing-table consisting of the frame A, hinged or folding legs B, braces C C and D, hinged ironing-board E, and movable supporting end piece G, constructed and arranged to operate substantially as and for the purposes described.

143,072.—Bench-Plane.—CYRUS H. HANDY, Boston, Mass., assignor to JOHN SULLY, trustee. Application filed May 29, 1873.

Claim.—1. In a bench-plane, a curved shield or guard, A, having beveled projections of prongs b', arranged and operating substantially as specified.

2. In a bench-plane, the combination of a curved shield or guard, A, wedge-block f, and blade e, all arranged and operating substantially as described.

143,073.—Fuel for Making Steam, &c.—JOHN T. HAWKINS, Salisbury, Vt. Application filed August 20, 1873.

The mold is formed on the end of the stick, ready to be severed by a cut-off saw.

Claim.—The stock A, having the conical socket C, cylindrical socket D, gutter E, and G, and the cutter H, I, constructed and arranged, substantially as described.

143,074.—Cotton-Gin.—EMMA HUNTSMAN, Little Rock, Ark. Application filed January 25, 1873.

The cotton, being delivered into one end of a hopper over the gin, is conveyed to the other end by fingers on the endless belt passing up through the parallel wires forming the bottom of the hopper. A revolving-grooved cylinder here raises the fiber and forces it downward through the adjustable gates to the gin, said gates being cleaned in their passage by a comb in the rear.

Claim.—1. The arrangement of the bristles I obliquely to a plane passing through the axis of motion to bring them with greater force against the saws, and to prevent them from being sprung backward, as set forth.

2. The sectional collars G and sectional saws A, combined with the shaft R, as and for the purpose set forth.

3. The combination of the comb F, open-wire bottom Z, and the carrier W Y, substantially as specified.

4. The combination of the vertically-adjustable finger-board S' with the open wire bottom Z and the carrier W Y, substantially as specified.

5. The combination of the discharging-teeth U' with the carrier W Y and the open-wire bottom Z, substantially as specified.

6. The bristles arranged parallel to each other radially and in separate rows on a roll, B, as and for the purpose described.

143,075.—Fastening-Hooks.—JOHN S. HICKS, Roslyn, N. Y. Application filed August 4, 1873.

Claim.—A hook provided with index-tags bound into the hook with its leaves, and projecting beyond the side edges thereof, as shown and described.

143,076.—Windmill.—JONATHAN HOAG, San Ramon Valley, Cal. Application filed August 2, 1873.

A curved lever is pivoted on the wheel-support, one end of which is forked, and is placed between two collars on the shaft, which had a longitudinal play; the other end is connected by a brace to the hinged vane. The centrifugal force of the wheel is thus made to draw the vane around, which throws the wheel more or less out of the wind. A weight is so attached to the curved lever as to draw the vane back into the wind when the violence of the latter decreases.

Claim.—1. The shaft D of a windmill moving longitudinally in its boxes, and provided with the eccentric I, together with the lever J, connected with the hinged tail L, for the purpose of turning it to an angle with the side of the shaft, substantially as herein described.

2. The weight O, with its cord P passing over the pulley R and connected with the lever J, in combination with the tail L and the connecting-arm K, for the purpose of returning the tail to its position in line with the shaft, as herein described.

143,077.—Wheel for Vehicles.—ROLLA R. JONES, Piller Point, N. Y.—Case A. Application filed May 24, 1873.

Claim.—1. The combination of divided socket D with the screw E b, nut F, felly B, and spoke C, said parts being arranged as shown and described.

2. The combination of cap G, having flanges f, with the nut F and felly B, having open recess for said nut, as set forth.

143,078.—Wheel for Vehicles.—ROLLA R. JONES, Piller Point, N. Y.—Case B. Application filed May 24, 1873.

Claim.—The plate B, pin C, flange-cap D G, and ferrule H, constructed and combined to form an intermediate connection between spokes and follies, substantially as set forth.

143,079.—Grate-Bar.—HENRY C. KESSNER, Cleveland, Ohio. Application filed June 13, 1873.

Movable and stationary bars, having slanting teeth, are set opposite to each other to break clinkers.

Claim.—A grate composed of a stationary and a movable set of bars, and which have teeth arranged in opposite directions upon their tops, so as to break and grind clinkers, substantially as shown and described.

143,080.—Metal-Planing Machine.—JOHN T. KINSMAN and WILLIAM H. OENSATT, Philadelphia, Pa. Application filed August 16, 1873.

A circular face-plate is mounted horizontally in a frame, which is supported above or alongside of the work, by posts passing through arms made adjustable by means of the said posts and bolts. The face-plate on their upper ends, and provided with set-screws in which rests the axle-bearings. This axle is provided with a screw bearing on its outer end a pilot-wheel and engages with on the stationary frame. The shaft has an adjustable sliding pin with which a pinion engages. The cut-off is effected automatically by means of a lever, commencing at or near the center and extending toward the edge.

Claim.—1. The supporter B for said rotating tool-carrying disk, mounted on standards W, adapted for attachment to a steam-cylinder by screwing in the holes for the steam-chest bolts, substantially as specified.

2. The combination of the adjustable screw A' with the said supporter B and the stand [illegible]

3. The arrangement of the driving-shaft O, face-plates U, clutch V, driving-shafts O P, and wheels M, N, R, and S, with the revolving tool-carrying disk A, substantially as specified.

143,081.—Grain-Separator.—JOSEPH KOONS, New Antwerp, Minn. Application filed June 14, 1873.

Claim.—The shafts B, wheels C, upper rods D, lower rods E, or equivalent pins, cranks K, connecting rods L M, and wheel N, provided with an adjustable crank-pin, in combination with each other and with the rock F G H and the conductor I, [illegible] as herein shown and described.

143,082.—Automatic Toy-Dancer.—WILLIAM A. P. LA GROVE, Brooklyn, N. Y., assignor to MESSRS. CHARLES O'NEIL, same place, and HENRY H. WEBB, Newark, N. J. Application filed April 1, 1873.

Clock-work in the base gives a reciprocating vertical motion to the supporting-wire to which the figure is attached.

Claim.—In combination with the jointed dancing figure, the vertical wire A, reciprocated in the guides c by the connecting-rod d, crank e, shaft, and gearing, substantially as described.

143,083.—Car-Brake.—ANTOINE LAMBELLIN, Concord, N. H. Application filed April 16, 1873.

A friction-wheel is secured to a supplementary axle, which is journaled in sliding bearings. The friction-wheel is forced against the main wheel by means of a lever, whereby a chain is wound upon the supplementary axle, forcing outward a pair of levers, which in turn force inward the heads of the sliding ears and operate the brake.

Claim.—The brake for cars composed of the bumpers a a, b b, c c, the rods h i j, and y, the friction-wheels e e, the levers f and m with the chains thereto attached, the levers l l, the rod k with spring, the rod d with spring n, the lever o, the slide x, and the whiffletree p with the chains thereto attached, said devices or their equivalents combined and adjusted to operate as and for the purposes set forth.

143,084.—Jeweler's Bolting Device.—JOHN K. LAUDERMILCH, Lebanon, Pa. Application filed July 24, 1873.

Claim.—1. The spindle C constructed with the twisted portion x, the traversing-nut r conformed to said twisted portion, and the spring D having the bearing-cup f adapted thereto, in combination with the tubular handle A E, as herein shown and described, for the purposes specified.

2. The tubular handle A and its cap B, constructed with the notches s s' and lug y, as represented, in combination with the spring D and bit-spindle C, operating as herein described, for regulating the tension of the spring.

143,085.—Spring for Vehicles.—GEORGE W. LEWIS, Portsmouth, Va., assignor to himself and C. W. WALKER, same place. Application filed May 17, 1873.

A half-elliptic spring made in two parts, which are divided by an elastic block. The two lower leaves of the under section are bent upward, and inclose the longer leaf of the upper section.

Claim.—1. The two springs A B, the long sections of the latter held by the backwardly-curved ends of sections a b of the former, in the manner described.

2. The yoke F and medius block D, combined with spring-sections having the corrugations F, as and for the purpose set forth.

143,086.—Wagon-Seat.—MICHAEL LIKES, Mansfield, Ohio, assignor to himself and J. H. BARR, same place. Application filed July 19, 1873.

The seat is thrown forward and inclines beyond the foot-board, by means of risers produced at a certain angle, and pivoted to the sides of the wagon-box.

Claim.—The angular supports or risers B, pivoted at their lower ends to the side of a wagon or other vehicle, and supporting at their upper ends a seat, C, in combination with a step, as and for the purpose specified.

143,087.—Saddle-tree Wire Ways.—THOMAS M. MARTIN, San Francisco, Cal., assignor to himself and ANDREW S. HALLIDIE, same place. Application filed August 5, 1873.

Claim.—The combination of the inside india-rubber with the middle-frame A, substantially as and for the purpose above described.

143,088.—Book and Paper Clamp.—JAMES P. MCILRAY, Brooklyn, N. Y. Application filed February 20, 1873.

The hollow handle has a free shaft passing through it beyond either end and terminating in spools thereon, upon which the cord is wound, drawing the clamps together by the rotation of the shaft actuated by the spiral spring contained in one end of which is fastened to the handle and the other to the shaft, whose rotation is governed by a thumb-screw passing through the handle and impinging upon the shaft-collar.

Claim.—A self-winding book-clamp or paper-clamping file having a stationary cylindrical handle, A, with or without the guard B, and provided with a revolving spindle, D, [illegible] gear-wheel c, fixed nut and pin e, handle f f', [illegible] a the whole arranged and combined and operating substantially the cord d, [illegible] as and for the double purpose as above set forth.

143,089.—Apparatus for Extracting Cane-Juice.—DUNCAN MOFFAT, New Orleans, La. Application filed August 14, 1873.

A presser-guide is placed in advance of the upper roll and close to the cutting-knife to press the crushed cane down on the delivery-roll, from whence it falls into the upper chamber of the vat; becoming saturated with steam, is delivered by the revolving bottom into the lower compartment of the vat, where it is pulped, the juice escaping through perforations into a receiver, and the refuse cane onto a traveling belt.

Claim.—1. The arrangement of the compressing-guide B and spring D with the delivery-rolls A and the rotary cutters E, as and for the purpose specified.

2. The steaming-vat G, having an upper steaming-compartment, H, and a lower one, L, separated by the valve K, and the latter compartment having beaters M and N and a perforated bottom, O, substantially as specified.

3. The arrangement of the endless carrier Q and the trough R with the steaming and straining vat G, substantially as specified.

143,090.—Boy's Sled.—SAMUEL D. MOTT, Milford, Pa. Application filed August 9, 1873.

The springs, cross-bar, runner, and cords are so arranged as to be applied to a coasting-sled, which can be guided altogether by the hands.

Claim.—The springs D, cross-bar E, pivoted runner F, cross-bar H, and cord I, constructed, combined, and applied to a coasting-sled, substantially as shown and described, and for the purpose set forth.

143,091.—Propelling Mechanism for Vessels.—LINDSAY MURDOCH, Marble Hill, Mo. Application filed June 21, 1873.

Claim.—A horizontally-sliding frame, C, and a bar, B, carrying at its lower end paddle-floats sliding vertically therein and horizontally therewith, combined with the crank-shaft of a boat or vessel, as and for the purpose described.

143,092.—Quilting Attachment for Sewing-Machines.—WILLIAM H. NULL, Blandinsville, Ill. Application filed April 12, 1873.

The quilt being stitched is rolled from one roller to the other and passes under the guide-bar, and the adjusting devices enable the rollers to be moved, and the holding devices retain them in proper position. The nippers, actuated by the cord, assist the operator in moving the central portion of the quilt evenly with the carriage. The "bench" devices enumerated in the last two clauses support the carriage beyond the machine-plate, and are adjustable for machines of different sizes, and are otherwise constructed to avoid friction.

Claim.—1. The combination, on a carriage adapted to operate in connection with a sewing-machine in the manner described, of the rollers G, C, and E, guide-bar F, presser-bars I, and adjusting and holding devices R, L, and M, substantially as specified.

2. The combination of the griper Q with said carriage and rollers, substantially as specified.

3. The combination, with the griper, of the actuating-cord T, substantially as specified.

4. The combination of the stop-disk W, pointers X, and spring-stop Y with the roll C, substantially as specified.

5. The combination of the bars *c*, wheels *i*, adjusting-bars A, and wheels *j* and *k* with a carriage having the long notches *u* in the tracks, substantially as specified.

6. The vertically-adjustable standard *b*, oscillating bars *a*, and adjusting lever-support *g*, combined and arranged substantially as specified.

143,093.—Adjustable Tongue for Organ-Reeds.—MARIA PROCOPÉ, Stockholm, Sweden. Application filed February 21, 1873.

The reeds are tuned by changing their vibrating lengths through a movable clamp operated by rack and pinion.

Claim.—1. The tuning-key E, arranged in combination with the slide C and finger B, as set forth.

2. The combination of the movable tongue A, slide J, screw I, rod *e*, slide L, and plate *f*, all arranged as specified.

143,094.—Machine for Rolling Sword-Blades.—JULIUS C. RICHARDSON, Philadelphia, Pa., assignor of one-half his right to E. REMINGTON & SONS, Ilion, N. Y. Application filed June 2, 1873.

The blank cut from a strip of steel is passed successively through the grooves in the rolls—alternately through four grooves to form it, and edgewise through the others to straighten it.

Claim.—1. The dies B, having formed in their faces the drawing and edging grooves, substantially as shown and described.

2. In combination with the dies B, having the grooves formed therein, as described, the stop-bar I and the guide-bar F, having the ribs or projections *e* thereon, all constructed and arranged to operate as and for the purpose set forth.

143,095.—Sheep-Plow.—WILLIAM J. ROBBINS, Cold Spring, N. Y. Application filed May 31, 1873.

Within a frame attached forward of the engine is journaled in suitable bearings a cone-shaped snow-cutter, which is caused to revolve by its being geared to the forward axle.

Claim.—The revolving cone-wheel C, having the wings H, applied in front of a locomotive, as and for the purpose set forth.

143,096.—Compound for Sanitary and Decorative Articles used in Building.—JOHN RUST, Bond Street, Vauxhall, England. Application filed March 12, 1873.

Claim.—1. A compound formed of equal parts of ground glass and sand, or their equivalents, fused, cohered by some liquid, molded, and baked, in the manner and for the purpose described.

2. A compound of equal parts of fused and powdered glass and sand, mixed with five or more parts of clay or sand, cohered with liquid, molded, and baked, as set forth, and for the purpose specified.

143,097.—Nut-Lock.—DANIEL SAWYER, Washington, Ind. Application filed January 16, 1873.

A slotted metal plate having a flange which bears against the side of the nut, is hinged to an elongated stud having a spring attached, secured to the washer.

Claim.—The steel pieces D, having spring *d*, and secured edgewise to a washer, C, arranged under nuts B B, in combination with a hinged slotted plate, E, having turned-up edge *e'*, as and for the purpose described.

143,098.—Needle-Threaders for Sewing-Machines.—THOMAS SCHOFIELD, Grass Valley, Cal. Application filed June 7, 1873.

The hook is passed through the eye of the needle and the thread is drawn back with it. The screw adjusts the hook with relation to the guide for the side of the needle, so that the hook is opposite the eye, and it may be adapted to needles of different size.

Claim.—The screw *g*, plate *f*, and guide, combined with handle A and hook B, as and for the purpose described.

143,099.—Car-Coupling.—AUGUST SCHONE and BENJAMIN VAN VALKENBURGH, Cobleskill, N. Y. Application filed February 15, 1873.

The lower part of the mouth of the draw-head is hinged, and is held in place, when the cars are coupled, by a sliding band operated by a forked lever. To uncouple, the band is moved to the rear, and the bottom turns on its hinges, and thus the link is allowed to fall out of connection.

Claim.—1. The sliding band C applied about a draw-head, having one hinged and falling jaw, as and for the purpose set forth.

2. A forked lever, D L L, applied to the loops K K of sliding band B, as and for the purpose specified.

143,100.—Wind-Wheel.—NICHOLAS SHEPLAR and DANIEL SHEPLAR, Murrayville, Ill. Application filed July 19, 1873.

The wings are hinged at one side to the rigid wings of the shaft, and connected by cords and a weight attachment, so that the movements of the wings are made simultaneously, and the pressure on them equalized.

Claim.—1. The wings E, hinged at one side to the rigid wings D of shaft B and connected by cords F, in combination with a suitable weight attachment having a function like that shown and described, whereby the movements of said wings are made simultaneously and the pressure on them is equalized, as set forth.

2. The combination of the arm H, cord I, pulleys J K, cord L, and weight M with the hinged wings E, cord or chain F, stationary wings D, and perforated shaft B, substantially as herein shown and described.

143,101.—Rabbet-Plane.—FRANCIS SMITH, Boston, assignor to JOHN SULLY, trustee, Dedham, Mass. Application filed May 26, 1873.

The cutting-blade is inserted from the side of the plane, and held by the gib. The blade extends entirely across the face of the plane, the front end being attached to the rear end by the goose-neck.

Claim.—The combination of the bar or goose-neck *c*, formed with flanges *d e*, and block or wedge *g*, blade *f*, and plate *a*, all arranged substantially as herein set forth.

143,102.—Coffee-Pot.—MARGARET J. SIEBENECK, Youngstown, Ohio. Application filed May 5, 1873.

The perforated spraying-drum is provided with elbow-tubes connected to, but detachable from, the circulating-tubes. The coffee-bag is attached to the removable drum.

Claim.—1. In combination with the pot A, steam-chamber C, and circulating-tubes D, the detachable perforated spraying-drum F, provided with elbow-tubes E, and carrying a coffee receptacle or bag, G, as herein shown and described.

2. The bag G, provided with an upper rim or hoop, *d*, bent as shown, and supported by legs *b b* on the tubes E E, as set forth.

143,103.—Hat-Former.—GEORGE W. SWAN, San Francisco, Cal. Application filed July 30, 1873.

A cylindrical former, around which the material is wound, is provided with a clamp which holds the parts in place while being nailed or otherwise secured.

Claim.—The block A with its tail-piece B, and having the longitudinal channel C, in combination with the clamp having the two jaws *d f* and ring *h*, or equivalent fastening, substantially as and for the purpose above described.

143,104.—Shuttle for Sewing-Machines.—WILLIAM H. THAYER, Somerville, assignor of one-half his right to AMOS J. TOWNE and JOHN J. CELLEY, Boston, Mass. Application filed July 12, 1873.

The compensating-spring forces the edge of the bobbin-head against the wall of the shuttle, and the thread between the spool and the delivering-orifice in the shuttle passes through this spring, and its pressure on the bobbin-head is regulated according to the quantity of thread on the bobbin.

Claim.—The combined compensating-spring and latch-bar C *f*, when constructed, arranged, and operated in the manner substantially as described, and used in connection with a bobbin and shuttle of a sewing-machine, for the purpose set forth.

143,105.—Tanning Compound.—WALDEMAR TIELMANN, Cleveland, Ohio. Application filed August 19, 1873.

Claim.—The herein-described compound for tanning skins and hides, consisting of either the chloride of barium, muriate of baryte or baryta, in combination with tannin, sugar, or its saccharoids, substantially as specified.

143,106.—Preservation of Pulp, Paste, or Slip Pigments.—PETER COOPER TIELMANN, New York, N. Y. Application filed September 6, 1873.

The paints are packed in wooden vessels which are lined with an insoluble varnish of paraffine, shellac, wax, or oil-paint.

Claim.—The method of preserving pulp or slip-pigments, substantially as herein described.

143,107.—Oil-Can.—ORRIN H. WARREN, Baldwinsville, N. Y. Application filed August 16, 1873.

To a hollow tube, having an oil-receptacle, is secured a hollow handle provided with an air-chamber and an oil-receptacle. To the tube leading into the air-chamber is secured a rubber bulb. The discharge-pipe extends nearly to the bottom of the handle, and is provided with a valve. A small tube connects the upper with the lower oil-receptacle. The bulb being compressed, the air forces the oil through the discharge-pipe. The bulb, expanding, draws the oil from the upper to the lower receptacle.

Claim.—1. The oiler for elevated parts of machinery, consisting of tubular rod A with oil-receiving chamber D, handle C with air-chamber C', bulb E, and air-receptacle F, in combination with discharge-pipe B, all arranged and operated substantially as and for the purposes described.

2. The oil-receiving chamber D in combination with air-chamber C', tube *e*, valve *e'*, and bulb E, to draw oil down from the oil-chamber into the chamber C' by the expansion of the bulb, as set forth.

3. The combination of valve *f* of discharge-pipe B with air-chamber C' and bulb E, to force oil through discharge-pipe to elevated machinery, as described.

4. The combination of bulb E, by tube *i i'*, with air-chamber C' and F, to prevent access of oil to bulb, as specified.

5. The discharge-pipe B, having double U-shaped end with ears *l*, for the purpose set forth.

6. The valve *f*, consisting of outer guide-tube *f' g*, inner tube *f' g'* with orifice *g'*, and stop A for securing regularity in action, as described.

143,108.—Shirt.—WILLIAM B. WATSON, Somerville, Tenn. Application filed July 10, 1873.

Neck-band of the shirt is adjustable in size.

Claim.—A shirt having the bosom D, yoke A A', and collar-band C, constructed and arranged substantially as and for the purposes specified.

143,109.—Bracelet.—HARRISON A. WILLIAMS, Mansfield, Mass. Application filed June 7, 1873.

A body-plate of rubber, in the form of a buckle, a loose tongue, and a series of plates, are connected by elastic cords, the plates at the opposite end from the buckle being provided with perforations for the reception of the tongues, and which is kept in proper position by the tension of the holding-cord.

Claim.—The combination of the plates *a* and *b* with the body of the buckle and its tongue, when constructed and secured together substantially as described.

143,110.—Harvester.—THEODORE YATES, Milwaukee, Wis. Application filed December 6, 1872.

The inner bearing of the reel-shaft is supported on a pivot, and the outer bearing is made detachable, so that the reel may be swung around to permit the lifting of the platform. The reciprocating rake is driven by a belt connected by a pitman to a crank on the rake-shaft.

Claim.—1. The main frame A, having the endless belt, with its driving mechanism mounted thereon, in combination with the slotted platform provided with the reciprocating tilting rake, the latter being connected to the belt K by the crank I and pitman J, all being constructed and arranged to operate substantially as described.

2. The reel-shaft having one end mounted in a pivoted bearing, and the opposite end detachable from its bearing, substantially as shown and described, in order that the reel may be swung around horizontally.

143,111.—Windmill.—JOHN Q. ADAMS and H. RAYMOND ADAMS, Marseilles, Ill. Application filed July 9, 1873.

Weights are attached by projecting stationary arms to the sections of the wind-wheel, so that the centrifugal force made by the rotation of the wheel shall throw out the weights to open the sections and incline them from the wind. There is also a flanged disk mounted loosely upon the shaft of the wheel, connected by a coiled spring to an interior hub secured firmly to said shaft, and by radial rods to the inner ends of weighted arms, so that the centrifugal force of the weights shall act against the tension of the spring to open the sections uniformly and gradually as the velocity of the wind increases, and throw them back into the wind as the centrifugal velocity of the weights diminishes.

Claim.—1. The pivoted sections provided with transverse weighted arms, in combination with the connecting-rods and spring-disk, loosely mounted on the wheel-shaft, substantially as described.

2. The pivoted sections provided with transverse weighted arms, in combination with the connecting-rods, loose spring-disk and brake, as and for the purposes set forth.

3. The adjustable collar or hub, in combination with the flanged disk and coiled spring, substantially as described.

143,112.—Fire-Escape.—LLEWELLYN E. AINSWORTH, East Bolton, Canada. Application filed September 18, 1873.

The ladder is held in place by the tooth on the bent arm, and is released by depressing the lever-arm.

Claim.—The combination of the pronged and bent bar G, tooth *a*, and lever J, with a ladder, A B, all constructed substantially as and for the purposes herein set forth.

143,113.—Filter.—CHRISTIAN ANDERSEN, Brooklyn, N. Y. Application filed August 7, 1873.

In the center of the perforated top of a vessel containing suitable filtering material is the discharge-chamber, having a perforated bottom. From the top of this chamber extends the discharge-pipe, and from the bottom a bell-mouthed tube. The liquid is admitted to the filter through a sand-chamber, which constitutes the top of the apparatus. By this arrangement the liquid must pass down through the filtering material, and then up again, in order to reach the discharge-chamber.

Claim.—1. The arrangement of a discharge-chamber, B, with a perforated bottom, in the perforated top of the filtering-vessel A, substantially as and for the purpose shown and described.

2. The pipe D, extending downward from the discharge-chamber B, in combination with this chamber and with the filtering-vessel A, substantially as set forth.

3. The sand-vessel E, in combination with the filtering-vessel A, perforated top *a*, and discharge-chamber B, all constructed and operating substantially as and for the purpose described.

143,114.—Pruning-Shears.—WILLIAM E. HALL, Bethesda, Ohio. Application filed February 27, 1873.

The instrument can be used with a single long handle, and will cut with a simple downward pressure upon said handle. A second handle can be placed upon a tang, extending out from one of the links for that purpose; and the instrument will then serve without further change for a double-handled instrument for hedge-trimming.

Claim.—1. The cutting-jaw *b*, constructed with the long lever arm or stem *y* and the link *d*, corresponding in length to said stem *y*, and constructed with the supplemental handle-tang *w* at an angle thereto, as described, in combination with the hook-jaw *a* having a short arm or stem, *z*, and the straight extended handle-tang *c x*, these parts being pivoted together, and operating either with a long pull-handle, *h*, or a pair of short handles, as set forth.

2. The smooth hook-jaw *a*, having the spur or tooth *v* at its extremity, as described, in combination with the cutting-jaw *b* having a convex blade, for the purpose specified.

143,115.—Cream-Strainer.—RICHARD W. BARNARD, Kennett Square, Pa. Application filed July 16, 1873.

A cylindrical vessel, having an inverted conical elongation beneath it which terminates in a small cylinder, said cylinder having a close bottom, and being perforated laterally, except about a fourth of its length next the bottom, a piston moved by rod operated above serving to compress sediment and clear the perforated sides for the escape of the fluid.

Claim.—1. A cream-strainer, consisting of a vessel contracted at the bottom to form a perforated extension, B, and provided with a plunger adapted to said extension, substantially as described.

2. The tubular extension B of the said strainer, having a solid bottom and perforations *a* at the sides terminating at some little distance above the said bottom so as to form a receptacle, *b*, for the purpose specified.

143,116.—Covered Vessels.—WILLIAM BATES, Dale Hall Burslem, England. Application filed July 11, 1873.

The cover is formed somewhat smaller than the circumferential recess, and is prevented from falling off the body when tipped by sliding into said recess.

Claim.—A tea-pot or other spouted vessel, having at the upper edge of its body an internal lateral recess for receiving and retaining a cover, all as set forth.

143,117.—Violin.—JOSEPH BELKNAP, Adrian, Mich. Application filed July 15, 1873.

Claim.—1. As a new article of manufacture, a violin having the body 1 made wholly of metal, substantially as set forth.

2. The combination of the metallic body 1, bridge 2, and tubes 3, substantially as shown and described.

143,118.—Weighing-Platform.—FREDERICK BLECKMAN, Washington, assignor to JOSEPH F. IRBE, St. Louis, Mo. Application filed July 18, 1873.

A purifying-box, constructed as claimed, is provided with a cover having a spout communicating with the front end of the box, and sliding plates over the same to a flat case, for drawing off through the spout the light substances separated from the weighings by a current of air.

Claim.—1. The purifying-box B, constructed as described, with inclined seat-boards D, sieve E, inclines G G, and slide G', all arranged substantially as set forth.

2. The purifying-box B, sieve E, inclined feed-board D, inclines G G, cover H, fan K, spring-supports C C, and slide G', all combined in the manner and for the purpose set forth.

143,119.—Retractible Canopy.—WILLIAM BOURDERON, Providence, R. I. Application filed June 26, 1873.

A central hub is inside with arms which turn upon a wire that encircles the hub. On the outer ends of the arms are projecting pins which enter corresponding holes in the outer frame. The outer frame is hinged at the four corners, and is made in two sections, which are joined by sockets and pins on the two sides. Two of the arms extend through and beyond the frame, and are mortised into a block which receives the supporting-standard.

Claim.—1. The frame-work, consisting of the hub A, arms B B, pins *a a*, the hinged frame C, socket *d*, and pins *e e*, made substantially as described.

2. The combination of said frame-work with the block D, standard E, adjustable clamps F F with their thumb-screws *f f*, made and used substantially as described.

143,120.—Stove-Pipe Connection.—GEORGE F. BRINKERHOFF, Bucyrus, Ohio. Application filed July 12, 1873.

The stove-pipe is kept in place in its thimble by a hook which connects the collar to the pipe and prevents its outward movement, while two flanged springs attached to the inside of the collar prevent inward movement of either pipe or thimble.

Claim.—A stove-pipe collar having the outer guard-hook *d* and the inner spring D, each dividing to form two spring branches, *a' a'*, *b' b'*, respectively, outward and inward at their ends to keep the collar in the wall-hole and to locate the stove-pipe, substantially as specified.

143,121.—Automatic Toy Dancer.—HENRY L. BROWER, New York, assignor to JOSEPH DE F. BROWER, Yonkers, N. Y. Application filed July 22, 1873.

A toy dancing-figure, flexibly limbed, is connected by a horizontal spring extended to an escapement, with clock-work. The parts readily detach and fold together for transportation.

Claim.—1. The horizontal spring-lever C, connected to the figure M, in combination with clock-work G, substantially as herein specified.

2. The balance-spring N, in combination with the dancing figure, connecting spring-lever, and operative mechanism, as herein specified.

3. The dancing-figure M, having wiggle or loose-locking joints *a' a'*, and operated by clock-work escapement, a spring-lever, C, and a balance-spring, substantially as herein specified.

4. The folding frame A *a* B *b* and detachable lever C, in combination with such frame and with a dancing figure, M, and clock-work G, as herein specified.

143,122.—Fabric Prepared to Imitate Leather.—HENRY A. CLARK, Boston, Mass. Application filed August 23, 1873.

The prepared fabric is coated on its back with shellac varnish for the purpose of rendering it water-proof, and thus preventing its blistering and shrinking when pasted to another article, and as a protection against the moisture of the atmosphere.

Claim.—Paper or cloth, or other suitable sheet material, which has been prepared on one side or surface with flock, paint, or print, and water-proofed on the back or remaining unprepared side or surface, substantially as herein described, for the purpose specified.

143,123.—Washing-Machine.—TIMOTHY COLVIN and RUFUS M. PADDOCK, Meriden, Conn. Application filed June 4, 1873.

A vertical shaft has radial ribs, at the upper end a collar, and the lower end a collar and plate, which are attached to the head.

Claim.—In a washing-machine, consisting of the tub A with radial ribs upon the bottom, the head L fitted to a vertical shaft and rotated from above, the said vertical shaft F formed with radially-projecting ribs *r*, and the collars *b* and *f*, and the plate P attached to the head, and fitting the said ribs and shaft, substantially as and for the purpose described.

143,124.—Cotton-Bale Tie.—THOMAS CROMER, Galveston, Tex. Application filed July 31, 1873.

A rectangular oblong piece of metal, having on each side of two parallel bars slotted projections, between which the band is introduced and held.

Claim.—The plate A, provided with slotted projections *a*, when combined, as described, with the indented band.

143,125.—Bridge.—BENJAMIN F. DAVIS, Hearne, Tex. Application filed May 28, 1873.

The chord-bolt arches are constructed of short pieces of plank bolted or nailed together in layers so as to break joints. Wedge-shaped pieces of wood or metal are inserted between the ends of the chords and arches, which are firmly fastened to it and to each other by bolts and bands. The girder is strengthened by vertical struts and radial braces.

Claim.—The combination of chords and arches A B, made of successive layers of planks, the end wedges G G, the bands D, the braces E F, and the steadding I, as and for the purpose described.

143,126.—Soldering-Furnace.—JUSTUS DAY, Holley, N. Y. Application filed April 30, 1873.

The chambers that receive the irons to be heated are capable of vertical adjustment.

Claim.—The combination, with the fire-pot A, of the tubes C C and slides *b b*, when arranged for vertical adjustment, in the manner and for the purpose specified.

143,127.—Planing-Mill.—LYMAN H. DECKER, Grove Lake, assignor of one-half his right to THOMAS BOLLES, Sauk Centre, Minn. Application filed July 8, 1873.

Square-framed mill; fan in end corner thereof; screens and blanks arranged in shoe so as to give large amount of screening surface in a small compass.

Claim.—1. The combination, in and with the shoe H, of the gang of sieves A A A, sieves B, C, and D, and blank and chute boards *a*, *b*, *c*, *d*, and F, arranged substantially as and for the purposes set forth.

2. The screen D, having blank *d* and guide-strip *e*, blank *f*, and guide *g*, constructed substantially as and for the purposes set forth.

143,128.—Hand-Saw.—THOMAS S. DENTON, Philadelphia, Pa., assignor to himself and HENRY DENTON & SONS, same place. Application filed August 21, 1873.

The handle may be adjusted at different angles with relation to the saw-blade.

Claim.—The saw-handle having set-screws *b b*, adapted to nuts fitted transversely into the handle, in combination with a bolt, *a*, passing through the slotted front end of the handle and through the blade, all as set forth.

143,129.—Stump-Extractor.—WILLIAM DUFFIELD, Jasper, Ind. Application filed August 27, 1873.

To the lower ends of two levers, which form part of a system of compound levers, pivoted to the uprights, is secured a clamping device, through which the draft-bar passes. When the clamping device is lowered to take a new hold the draft-bar is retained in its position by a locking-ring.

Claim.—The combination of levers B, C, and D, frame A, block *c*, levers *a a*, bar E, and clutch-ring J, as and for the purpose specified.

143,130.—Feather-Renovator.—LEVI S. ENOS, Almond, N. Y., assignor to himself and S. B. ESTABROOK, same place. Application filed May 24, 1873.

The plate D enables different varieties to be treated separately, but simultaneously.

Claim.—1. In a feather-renovator case or box, one or more movable perforated partitions, D, for the purposes herein set forth.

2. The combination, with the box A, lining B, and pipe C, having one or more perforated partitions, D, of the steam-pipe G, with stop-cocks *d'*, branch pipe I, and partition *b*, all constructed and arranged substantially as and for the purposes herein set forth.

143,131.—Watchmaker's Chain-Clamp.—CHARLES E. EVARD, Leesburg, Va. Application filed August 5, 1873.

The jaws are provided with recesses at their upper and inner edges to receive and hold the links, leaving a sufficient space between the jaws to allow the rivets to pass between.

Claim.—A watchmaker's chain-clamp, provided with jaws A A, having recesses C C forming chain-rests *c c*, as and for the purpose described.

143,132.—Hollow Auger.—EDWARD W. FAUCETT, ELMER W. SILVER, and JOHN DEMING, Salem, Ohio, assignors to ALBERT R. SILVER and JOHN DEMING, same place. Application filed July 28, 1873.

By an adjustable ring the cutters are regulated to the size required. The stop-piece governs the length of the cut.

Claim.—1. In a hollow auger, the beveled rim *c*, substantially as set forth.

2. The cutters and blanks, or their equivalents, having bevel-ended ends, in combination with the rim *c*, substantially as shown and described.

3. The jam-nut *e*, having a left-hand thread, in combination with the rim *c*, substantially as shown.

4. The adjustable shank *b*, having the thread upon its head and steam running in the same direction, the thread on the screw being finer than the thread on the head, in combination with the jam-nut *e* and cylinder *a*, substantially as set forth.

5. In a hollow auger, the jam-nut *e*, having a recess formed in its top for receiving the cylinder *a*, substantially as set forth, constructed and operating to hold the stem *b* in a central position.

6. The combination of the rim, cutting devices having bevelled ends, cylinder, shank, and jam-nut *e e*, substantially as set forth.

143,133.—Medical Compound or Powder for Infants.—JULIUS FERER, Hoboken, N. J. Application filed September 12, 1873.

Claim.—1. A medical compound, prepared of silicate of magnesia and carbolic acid mixed together, in the manner and about in the proportions herein specified.

2. A medical compound, made of silicate of magnesia carbolic acid, and oxide of zinc mixed together, substantially in the manner and about in the proportion set forth.

143,134.—Musical Wind-Instrument.—ISAAC FISKE, Worcester, Mass. Application filed June 18, 1873.

Claim.—The arrangement of the valve-cases *a b c*, extensions *n p r*, and connections *g i*, substantially as shown and described.

143,135.—Railroad Time-Signal.—HIRAM H. FORD, Sanford, Me., assignor of one-half his right to HORACE M. FORD, Boston, Mass., and IVORY H. FORD, Great Falls, N. H. Application filed June 25, 1873.

A lever, operated by the wheels of a passing train, is connected with a valve at the bottom of a narrow glass chamber, into which sand is allowed to trickle from a reservoir above, after the manner of an hour-glass. At each time after the glass chamber is emptied through the opened valve by the passage of a train, the valve reclosing, allows the chamber to be again slowly filled, thereby showing the time elapsed since the last passage.

Claim.—In combination with a rail, A, of a railway, the hinged lever B, box C, spring S, connecting-rod D, valve F, receptacle G provided with glass sides I I', case E, and reservoir J, having a hardened steel bottom, K, provided with a small hole, L, or their equivalents, when constructed to operate in conjunction with dry sand or similar material, substantially in the manner described, as and for the purposes set forth.

143,136.—Envelope.—LOUIS G. JERICH, Ottumwa, Iowa. Application filed August 23, 1873.

Small flaps, folding to and from each other, are formed in the center of the lower flap to receive the tongue of the upper or closing flap.

Claim.—An envelope formed of the usual main part A and four main flaps, B, B, C, and D, and provided with the flaps *a* and *f f*, as shown and described, and for the purposes herein set forth.

143,137.—Spool for Boot and Shoe Soling Machines.—LOUIS GODDU, Boston, Mass., assignor to THE AMERICAN CABLE SCREW-WIRE COMPANY. Application filed July 24, 1873.

Claim.—The metal spool or wheel, having the spokes *g* and arms *i* cast with the rim A, and the removable spider or head, formed of the hub *l* and arms *m*, substantially as shown and described.

143,138.—Gas-Bracket.—JOHN F. GOLDTHWAIT, Boston, Mass. Application filed May 17, 1873.

A portion of the outer half of the socket which receives the swinging bracket is cut away to form shoulders, against which a pin in the bracket abuts, thus preventing the flame from coming in contact with the wall to which the bracket is applied.

Claim.—The socket A', provided with shoulders D D, in combination with the swinging part C, having a pin, E, substantially as described, and for the purpose set forth.

143,139.—Gun-Cleaner.—CHARLES G. GOULD, Windham, Vt. Application filed September 17, 1873.

Claim.—1. The hinged sections A and B, having external screw-threads and a securing-nut adapted to clamp or secure a wiper, and adapted by suitable means for attachment to a ramrod or other handle, substantially as described.

2. The combination of the sections A and B with the slotted hinge-plate and a clamping-nut, as and for the purpose set forth.

143,140.—Rein-Holder.—CHARLES M. GRANNIS and LAUREN M. FITCH, Morrisville, N. Y. Application filed May 31, 1873.

Arranged to be clamped to the dash-board, the rein to be held between the metal base and the yielding and beveled rubber block.

Claim.—1. In a rein-holder, the rubber piece G, having a beveled edge, and held edgewise by the lips or catches *b b* against the rims, substantially as and for the purposes herein set forth.

2. The combination of the clamp B C, arm D with lips or catches *b b*, rubber piece G, and guard *d*, all substantially as and for the purposes herein set forth.

143,141.—Casing-Spear.—VICTOR GRETTER, Richland township, Clarion county, Pa. Application filed May 14, 1873.

The tool is inserted within the tubing at any desired point. The spring-wickers, being lowered upon the incline or conical guide, expand and take a firm hold of the tube, by means of which it can be withdrawn from the well.

Claim.—The combination of the wickers W W, straps R R, and square collar M with the tapering square stem S S, having movable collar K, spring L, conical point, and shoulders Z Z, all constructed substantially as and for the purposes set forth.

143,142.—Gimlet-Handle.—CHARLES L. GRISWOLD, Chester, Mass. Application filed June 26, 1873.

The handle, made in two sections, holds the hooked end of the tool between them, the neck *a* filling the interior of the hook.

Claim.—As an improvement upon my patent of November 26, 1872, the hooked shank *b*, adapted to embrace the enlargement *d* and be clamped between the sections of the handle, substantially as shown and described.

143,143.—Wick-Raiser.—JAMES G. HALLAS and WILLIAM N. WENDEN, Waterbury, Conn., assignors to THE BENEDICT & BURNHAM MANUFACTURING COMPANY, same place. Application filed August 28, 1873.

The wick is raised by toothed adjusters, which, by turns, are raised and at the same time engaged with the wick, and lowered and at the same time disengaged from the wick. This up-and-in and down-and-out motion is imparted to the toothed upper ends of the wick-adjusters by making their lower ends elbow outward from the wick and ride the upper and cammed surface of an annular flange, which is made to rotate horizontally by turning the chimney-rest.

Claim.—1. The flange *a*, having a rotary movement around the wick-tube, and in connection with the wick-adjusters, substantially in the manner described, the said flange *a* constructed in a cam shape, so that in rotation it will impart an up-and-down in-and-out movement to the adjusters, substantially as set forth.

2. In combination with the adjusters *f* and the chimney-rest, the flange *a*, constructed as described, so that by turning the said chimney-rest the requisite rotary motion for the adjustment of the wick is imparted to the said flange *a*.

143,144.—Suspender-Buckle.—SAMUEL HAMM, Philadelphia, Pa. Application filed June 26, 1873.

An L-shaped slot in the plate B prevents accidental disengagement from the stud on the buckle.

Claim.—The combination of the buckle A, the pin C, and the attachment B having the slot D, substantially as and for the purpose hereinbefore set forth.

143,145.—Furnace for the Manufacture of Iron and Steel.—GEORGE E. HARDING, New York, N. Y. Application filed May 26, 1873.

Combines a rotary puddler, a gas-furnace, and a deoxidizing-chamber, utilizing the waste gases from the puddler to heat the deoxidizing-retorts. The rings, provided with tension-springs, prevent leakage of gas.

Claim.—1. The general arrangement of the furnace *f*, rotary *c*, flue *d*, shaft *a*, chamber *w' w'' w'''*, retorts *s s s*, and dampers *p p' p''*, as shown and described.

2. The rings *z z*, with beveled faces and adjustable tension-springs *z'*, for the purpose specified, as shown and described.

143,146.—Trolling-Spoon.—WILLIAM HARPER and WILLIAM SMITH, Montreal, Canada. Application filed July 1, 1873.

Two spinning blades, having their ears flaring oppositely as to their ends and with relation to each other, are strung on the line or its appendages through their centers, in order to revolve while trolling.

Claim.—1. In trolling-baits the spinners C and D, arranged upon the wire B to revolve in opposite directions, when constructed substantially in the manner described.

2. The propeller-shaped spinners C D, constructed substantially as described and shown.

3. The spinners C and D in combination with the sleeves *f* and the wire B, substantially as described, and arranged to spin continuously and oppositely in moving through the water.

143,147.—Wheel-Plow.—JOHN D. HARRISON, Middletown, Ohio. Application filed August 2, 1872.

The plow is supported on a crank-axle, one of the arms of which may be locked to the wheel so that the forward movement of the machine will raise the plow out of ground.

Claim.—1. The combination of arm *l*, link *j*, lever *m*, pawl *k*, and short arm *i* with studs *n i'*, crank *c*, and ratchet-wheel A, substantially as and for the purpose described.

2. The combination of the frame *a b c* with the journaled double crank *c* and adjustable tongue *d*, substantially as described, for the purposes specified.

143,148.—Shoe-Fastening.—GEORGE B. HART, Buffalo township, Linn county, Iowa. Application filed March 27, 1873.

Claim.—1. The instep-plate C, provided with a central opening through it, and having its front end bent upward to permit the insertion of the string, as described.

2. The clip D, adapted to clasp the edge of the shoe-front, and to be secured by a single rivet, as described.

143,149.—Skylight.—GEORGE HAYES, New York, N. Y.—Case D. Application filed July 14, 1873.

A stiffener of angle-iron is inserted within the hollow sheet-metal bar of a skylight. The cap-piece C is riveted to the upright portion of the bar, and is formed of lead so as to be readily conformed to the varying thickness of the glass when bent down upon the same to cover the joint.

Claim.—1. The combination, with the hollow triangular bar A, formed as described, of the single or double ribbed angle piece D, essentially as and for the purpose herein set forth.

2. The combination, with the hollow bar A, of the cap-plate C, substantially as and for the purpose specified.

143,150.—Skylight.—GEORGE HAYES, New York, N. Y.—Case F. Application filed July 14, 1873.

The pliable cap-plate is inserted between the adjoining raised portions of the divided bar and secured by rivets, being formed of a single piece folded along its middle and parted outward.

Claim.—The combination, with the bar having a divided ridge at its top, of the cap-plate C folded to give it a double thickness along its middle or tongue, but of single thickness through

cut its lateral extensions or portions, substantially as shown and described.

143,151.—Skylight.—GEORGE HAYES, New York, N. Y.—Case E. Application filed July 14, 1873.

The pliable cap-plate for protecting the juncture of the glass is attached to the side of the raised portion of the bar by rivets.

Claim.—The combination, with the ridge *r*, of the bar of the cap-plate C secured to one side of the same, substantially as set forth.

143,152.—Skylight-Cover.—GEORGE HAYES, New York, N. Y.—Case H. Application filed July 14, 1873.

The skylight-cover has a lipped flange extending upward near the hinge, the lip of which comes in contact with an inverted ledge on a cap attached to the roof and projecting over the hinge.

Claim.—The combination of the lip *s* on the back part of the cover, with the ledge *a* on the cap C of the roof, substantially as and for the purpose herein set forth.

143,153.—Skylight Turret and Conservatory.—GEORGE HAYES, New York, N. Y.—Case G. Application filed July 14, 1873.

The uprights are formed of two flanged trough-shaped pieces of sheet-metal with their flanges in contact and joined by rivets. The flanges afford a support for the glass, which is further secured by flanged cap-plates riveted to the uprights and bearing on the outer face of the glass. The swinging sashes are provided with a flying elastic flange at the lower edge, which overlaps the joint and serves as a weather-strip.

Claim.—1. The combination of flanged covering-strips D with the hollow metallic posts A, having flanges *b b*, for the support of the glasses, substantially as specified.

2. The swinging sashes C, provided with exterior and overlapping elastic flanges *f*, essentially as described.

143,154.—Machine for Threading Bolts.—MERRITT HIER, New Haven, Conn. Application filed July 9, 1873.

The levers B are provided with a recess to receive the interchangeable die-holders D; said holders are also recessed to receive the dies. Upon the die F is formed a rib or spline, *n*, which fits into a corresponding groove in the die-holder.

Claim.—1. In a bolt-cutting machine in which the thread-cutting dies are arranged in the ends of the levers, substantially as described, the said levers constructed with a recess to receive and define the position of the holders D, and means, substantially as described, for securing the holders always in the same relative position, and the said holders recessed to receive the dies F, and provided with means, substantially such as described, for adjusting the said dies, as herein set forth.

2. The dies F, constructed with the rib *n*, and the holders D with a corresponding groove, substantially as and for the purpose described.

143,155.—Carpet-Beater.—JAMES HOTHERSALL, New York, N. Y. Application filed August 20, 1873.

The ends of the oscillating beating-arms are provided with projecting stops for regulating the extent of the motion of the pivoted swinging beaters, which are pivoted to the beating-arms.

Claim.—The swinging levers E for supporting the cross-bars F, in combination with the oscillating beating-arms A having the stops *c c*, substantially as and for the purpose specified.

143,156.—Fire-Proof Shutter.—THEODORE HYATT, New York, N. Y.—Case A. Application filed September 3, 1873.

Claim.—A window or door shutter composed of sheets or boards of asbestus combined with earthy matter or its equivalent, substantially as and for the purpose specified.

143,157.—Fire-Proof Shutter.—THEODORE HYATT, New York, N. Y. Application filed September 3, 1873.

Claim.—A metal shutter having one or both of its sides covered with sheets or boards of asbestus combined with earthy material, or its equivalent, substantially as and for the purpose specified.

143,158.—Meat-Mangle.—SAMUEL D. INGHAM, Ripley, Ohio. Application filed August 8, 1873.

With a series of circular knives rotating on a shaft is a set of clearers, having a shank made adjustable, that will take into notches in the knives, to hold them as fixed cutters, when desired.

Claim.—The adjustable clearer G *g* H, nut I, and screw J, in combination with the notched circular knives A A' A² A³, substantially as herein shown and described, for the purposes specified.

143,159.—Shutter-Worker.—JAMES W. JENKINS, Monmouth, Me.—Case B. Application filed July 2, 1873.

Claim.—The combination and arrangement of the toothed disk *c* on the shaft E, the reciprocating rack C, having its teeth arranged on its inside vertical face to prevent clogging, and formed with the lug *b* on its outer face, and the rod D with the arm *a* pivoted thereto and attached to the shutter, the rack C working in a covered recess in the jamb *a* with only the lug *b* protruding therefrom, all as herein shown and described.

143,160.—Hammer for Sewing-Machines.—JOHN F. JOHNSON, Cincinnati, Ohio. Application filed August 23, 1873.

Claim.—The combination of slotted bracket E *e* with screws K K', slotted gage-plate F L, scroll-plate G M, spreader H-O P Q, and tightening-nuts J and J', all constructed, arranged, and operating as described.

143,161.—Fence.—WILBUR F. KING, Gonzales county, Tex. Application filed June 5, 1873.

Claim.—A fence in which the stringers or rails are united to the main posts, substantially as described, a medium or lower rail forming the top rail of a minor fence of brush wood having shorter posts on opposite sides, all as and for the purposes set forth.

143,162.—Thill-Coupling.—HORACE B. KINNEY, Leonardsville, N. Y. Application filed June 21, 1873.

Claim.—1. The seat *a*, having circular flange *f*, enlarged portion *a'*, and stem *b*, in combination with the ball E, all constructed and arranged as and for the purpose specified.

2. The seat *a*, combined with the spring *c*, stem *b*, knob *e*, seat D, cap H, and ball E, substantially as and for the purpose herein set forth.

143,163.—Manufacture of Fur-Coated Fabrics.—HENRY KELLOGG, Milford, Conn. Application filed January 23, 1873.

A woven or knit fabric is passed through a bath of water stiffening; then dried; then thoroughly saturated with steam-heated water; and then passed gradually over a perforated surface, B, behind which is a vacuum, D. Fur is introduced between the conductor E and the fabric, and is blown against the latter, as it passes over the suction-box, by a blast from E. The combined effect of blast and suction is to cause one end only of the fur to adhere. From B fabric passes to roll C, where an apron, F, of hair-cloth is laid upon the coated surface, and both fabric and apron then pass to a roll, G, the apron preventing the fur from coming in contact with the reverse side of the coated fabric. The roll, with fabric and apron, is then taken to a scalding-hot bath, and there rolled between several rollers until the fiber is firmly set; then the coated fabric, with the apron, is unrolled and passed like a belt around two revolving drums, H H, partially immersed in hot water. The belt passes over a table, L, and between it and presser-rollers P P which fix or felt the fur into the surface of the fabric. After thoroughly drying, the surface is "whipped up."

Claim.—1. As an article of manufacture, a knit or woven fabric having the surface coated with fur so as to present a fur surface, substantially as set forth.

2. The process herein described for coating the surface of knit or woven fabrics with fur.

143,164.—Medical Compound or Opium-Cure.—ULYSSES H. KELLOGG, Jamestown, N. Y. Application filed August 9, 1873.

Claim.—1. The combination of *lactuca elongata*, lactucin, and salucin, with or without a tincture of bitter almonds, substantially as specified.

2. The medical compound described, substantially as and for the purpose specified.

143,165.—Car-Coupling.—GEORGE E. KNOX, Ballston Spa, N. Y. Application filed March 25, 1873.

The spring in the block behind the angular end of the link serves to retain link in position to couple with cars of different heights.

Claim.—The combination of the link B with square end *a*, the block A with concaved end, opening *d*, spring *f*, and plate *e*, and the metallic strap C secured to the block and around the end of the link, all substantially as and for the purposes set forth.

143,166.—Combined Rake and Tedder.—CHARLES LA DOW, South Galway, N. Y. Application filed December 27, 1872.

A sulky-rake, in which the weight of the driver is utilized in dumping the accumulated hay, has means for attaching a tedder, so that both may be operated alternately without detachment.

Claim.—1. The combination of the yoke J, arm K, cross-bar F, and its attached straps *f f* hinged to the axle A by the bearings D D, and the right-angled ends *e e* of the rake-teeth E E, with the seat-bar L, lever G, rods I I and M M, when arranged to operate substantially as and for the purposes set forth.

2. The arm Q, having a swivel-pin R, when supported by the cross-bar P, and driving-wheel T, in the manner and for the purpose herein set forth.

3. The combination of the arm Q and driving-wheel T with the shield Z, substantially as and for the purpose specified.

4. The combination of arm Q, when attached to the rear part of a rake-frame, wheel T, endless chain U, wheel V, crank-shaft W, and tedder-tines Y, as and for the purpose set forth.

143,167.—Stop-Cock.—CHARLES W. LAURIE, Philadelphia, Pa. Application filed July 31, 1873.

The faces of the valve incline toward one side. It slides vertical in corresponding seats, in which it is held by a side set-screw.

Claim.—The combination of the prism-shaped valve with the screw G for adjusting it to its seat, as and for the purpose set forth.

143,168.—Machine for Tapping Gas and Water Fittings.—ALBERT D. LAWS, Bridgeport, Conn., assignor to THE BELKNAP AND BURNHAM MANUFACTURING COMPANY, same place. Application filed March 15, 1873.

The taps are worked forward and backward at different periods, to divide the strain upon the machine, by means of an arm attached to each of the tap-shafts, which, as it is rotated, comes in contact with a lug situated at different points upon each of the large gears upon the tap-shafts. One of the taps can be made to cut a left-hand thread by introducing an intermediate gear.

Claim.—1. The swinging and swiveling chuck V, provided with work-holding clamps c^3 f^3, arranged in relation with each other, for operation in connection with the tap-stocks E F G, substantially as specified.

2. The combination, with the tap-stocks E F G, arranged in relation with each other, as described, of the sliding pinions K M and wheel L', essentially as and for the purpose herein set forth.

3. The combination, with either tap-stock E, F, or G, of the sleeve T or T' in feather gear with said stock, the wheel L, I, or L', with its sleeve *l*, the driving stud or studs *m*, m^1, or m^2 on the face of such wheel, the radial stud *n*, n^1, or n^2 on the sleeve T or T', and the hollow screw O, O^1, or O^2, arranged to provide for lost motion of the tap-stock in direction of its length, substantially as described.

4. The arrangement of the studs *m* m^1 m^2 on the wheels L, I, and L' in relation with each other and the studs *n* n^1 n^2 on the sleeves T T', whereby the tap-stocks E F G, controlled by said wheels, are rotated at different periods relatively with each other, to effect the reversal of the taps, essentially as described.

5. The combination, with the screw O^1 and tap-stock F, of the sliding screw-box D', the rack c^4, the pinion e^4, the worm-wheel f^4, the screw e^4, the shifting-pawl g^4, the wheel A^4, and the spring d^4, substantially as and for the purposes herein set forth.

143,169.—Animal-Trap.—DAVID A. LEACH, Bloomington, Ind. Application filed May 24, 1873.

Claim.—In an animal-trap, the rear stop-catch E, with spring *e*, used in combination with the radially-winged revolving trap-platform, substantially as shown and described.

143,170.—Horse Hay-Fork.—JOHN W. LOWE, Ashland, Ohio. Application filed August 21, 1873.

Inverted U-shaped tines have pivoted auxiliary tines, the points of which are turned outward at nearly right angles to the main tines, to retain the hay for lifting after the insertion of the fork into the top of the load, the whole operated by means of levers, a hoisting and a tripping rope.

Claim.—The combination of the tines *a*, bar *c*, lever 5, hook *g*, catch *e*, connecting-rod 6, lever 7, forks 8, ring *i*, and tripping-rope *l*, all combined and arranged to operate as shown and described.

143,171.—Steam Cooking Apparatus.—JOHN LUNDGREN, New York, N. Y., assignor to JONAH R. COLE, same place. Application filed June 23, 1873.

The water-heater is provided with a concave bottom, which forms a tube leading to the condensing-chamber, thereby presenting a large area of heating-surface.

Claim.—The water-chamber D, having concave bottom, forming tube Q, interposed between the condensing-chamber E, having pot S, and the parts B C, substantially as shown and described.

143,172.—Cultivator.—EDWARD P. LYNCH, Davenport, Iowa. Application filed October 19, 1870.

Cultivator consisting of two wheels, a bent axle-tree, and two independent sets of cultivator-beams, which are hinged to the axle-tree by double-acting journal-boxes. The shovels are vertically adjustable, upon the curved beams by a sliding shoe, and are provided with a break-pin.

Claim.—1. The clevis or attachment for fastening the front end of the beam to the axle, said clevis consisting of the bar B with an upper rigid arm, *a*, and a lower hinged arm, *b*, said arms being perforated to receive the journals of the swivel-boxes *c*, and being secured together by means of a bolt or screw, substantially as set forth.

2. The shank D, provided with a vertical slot, *n*, and the holes *o*, whereby it can be adjusted vertically on the beam, and also pivoted and locked by a break-pin, as set forth.

143,173.—Double-Tree.—WILLIAM MARTIN, Clarence, Iowa. Application filed July 7, 1873.

The double-tree is steadied, and the extent of its motion regulated, by a friction device placed in front of the center-bolt.

Claim.—The combination, with a double-tree pivoted at the angle of a rear extension, F, and having the guard-pieces E *e e'*, of a friction-roll, H, arranged as and for the purpose described.

143,174.—Attaching Knobs to Latches.—LEWIS MICHAELS, Covington, Ky. Application filed January 7, 1873.
